It was also believed that one could rid one's person of fleas by leaping across the Midsummer bonfire. The 1st century writer Pliny advised those who would banish fleas to scrape up earth from beneath the right foot when the cuckoo was first heard. The ancient Egyptians smeared a slave with asses' milk to attract the insects to him and American farmers brought a sheep or goat into the house for the same purpose. The story of the fox which rids itself of its fleas by wading deep into a pond carrying moss in its mouth, until all the fleas retreat into the moss, and then lets it float away, is generally held to be a fable.

Children's Night-Lights

Luminous insects, such as the fire-fly and glow-worm, are so unusual that myths were devised to explain their origin. Among the tribespeople of Orissa in India a number of such myths are current. It is said that after a battle among the gods many were killed but their eyes remained and became fire-flies. Another story relates that sparks from a fire kindled to drive off mosquitoes were transformed magically into these insects. Among these tribes, bats were reputed to carry fire-flies to their homes because their children could not endure any other light.

In the island of Nias in Indonesia the sorcerer treated a sick person as if his soul had escaped and had become, or taken refuge in, a lantern-fly, so he would catch one in a cloth and place it on the patient's forehead. In parts of China a luminous insect whose larvae live in decaying vegetable matter appears in swarms in hot weather about the time when the summer festival of the dead was celebrated. At such times illness tends to be commoner than usual and the insects were held responsible. The 'vital spirits' of corpses were believed to give rise to these flies which were said to have appeared as five girls in embroidered garments representing north, south, east and west and the centre of the universe. If these insects entered a house some calamity might be expected. Burning incense was used to expel them.

In England it was said that glow-worms were born of putrefaction. Possibly this belief was encouraged by observations of luminous fungi. During the Second World War the

Ants on the March

The 'vagrant' calls the ants to arms.

To arms! To arms! The road between the blades of grass
Is threatened. Do you hear? The cranny from blade to blade,
A span of earth from grass to grass, your sacred rights,
The greatest interests of the state, the greatest problem in the world,
All is at stake. Ants, to arms!
How could you live, if another possessed
The world between two husks. If another carried
Ant-baggage into a strange ant-heap.
A hundred thousand lives for these two blades of grass
Are too few. I was in the war, oh,
That's a handiwork for insects, indeed. Dig trenches,
Root yourself in clay, hurrah, an attack in extended order,
At the double over stacks of corpses, fix bayonets,
Fifty thousand dead, to capture
Twenty yards of latrines. Hurrah, to arms!
The interest of the whole is concerned, the heritage of your history is concerned,
Nay more, the freedom of your native land, nay more, world-power,
Nay more, two blades of grass. Such a mighty cause
Can be settled only by the dead. To arms! To arms!

CHRYSALIS The whole earth is quivering
Something mighty it is delivering,
I am being born.

To the beating of a drum the troops of the ants advance with rifles, bayonets, and machine-guns, with metal helmets on their heads, and line up in ranks . . .

VAGRANT (*Passing along the ranks.*)
See what good training does. Attention! Sound the roll-call.
Soldiers, your country is sending you to war,
That you may fall. Two blades of grass
Are watching you.

Josef and Karel Capek, *The Life of the Insects*

In Rumania the caterpillar is thought to have originated in the Devil's tears, and in Switzerland there is a superstition that they creep into men's brains and drive them mad: the caterpillar in Lewis Carroll's *Alice in Wonderland* sits on a magic mushroom: illustration to *Alice in Wonderland*

floor of a London anti-aircraft site was thought to be covered with glow-worms but in the morning they were found to be fragments of decayed wood infected with a fungus.

The fly had a place in early forms of worship according to Pliny, Pausanius the Greek traveller and geographer, and Aelian the Roman teacher and writer. A Jewish legend relates that Elisha was recognized as a prophet because no fly approached his place at table. Among the Greeks an ox sacrifice took place annually at the temple of Zeus at Actium to honour him as an averter of flies. Apollonius of Tyana is said to have freed Constantinople from flies by setting up a bronze fly. Hera is reputed to have set a gad-fly to chase Io because of her amorous relations with Zeus and in Norse mythology Loki transformed himself into a fly to torment his enemies.

In the folktale motif of 'hiding from the Devil' the hero conceals himself first in a raven's egg, then in a fish and finally in an insect. There are affinities with the Irish myth in which Etain is transformed into a fly. Among Christians, flies were regarded as having devilish affinities but the legend of St Colman mentions a kindly fly which marked his place in a book when he went to take part in services.

In northern tundra regions mosquitoes and midges may occur in such numbers as to make life difficult. Throughout much of northern Asia and in Mongolia a tale, known in a number of variants, explains how these insects originated. The Ostyaks of western Siberia say that a cannibal demon woman in the far north created them. According to other versions a hero, sometimes said to have been born of a virgin, attacked a man-devouring monster and slew him. From his decaying carcass came clouds of mosquitoes to plague mankind. A different version tells of the monster being reborn again and again until his carcass was burnt; then the mosquitoes appeared from the ashes.

Inspiration

Breathing in: in Genesis God breathed into Adam to bring him to life: poets, prophets, oracles, diviners, medicine-men and shamans are frequently believed to be inspired by the presence of a god or spirit in them which enables them to discern truth: in Christian theology inspiration results from the direct action of the Holy Spirit: sacred scriptures are often believed to be divinely inspired and the Vatican Council of 1869–70 confirmed the old doctrine that the Old and New Testaments 'have God as their author'.

INTERROGATION OF THE DEAD

IN ISLAMIC TEACHING the interrogation of the dead begins when the burial is complete and the mourners have retired. Tradition describes this in detail, but it is not clearly spoken of in the Koran.

It is commonly said that two angels, Munkar and Nakeer, come to examine the dead. They make the dead person sit up, and question him. The righteous replies that his Lord is God, that Islam is his religion, that Mohammed is God's messenger, and that he has learned this from reading God's book and believing in it. A voice then cries from heaven that he has spoken the truth, that a bed and clothing from paradise are to be provided for him, and that a door is to be opened towards paradise. This is done, he is refreshed by the air and perfume, and abundant space is made for him.

The infidel is made to sit up and is asked the same questions, to which he replies that he does not know. A voice from heaven cries that he has lied, that a bed and clothing from hell are to be provided for him, and that a door is to be opened towards hell. Some of its heat and pestilential wind come to him, the grave closes in on him and crushes his ribs. He will remain there suffering severe punishment until the resurrection.

The Koran speaks clearly of a final judgement in which man has little chance to defend himself, for everything is recorded and so is a foregone conclusion; but sura (chapter) 16.112 mentions man's attempt to defend himself. Judgement takes place on the day of resurrection. There are vivid accounts of the terrors of the last day, when mankind will be raised up and stand before God to receive justice.

The Koran speaks of the books, or scrolls, to be produced containing the record of everyone's deeds. The righteous will receive their books in the right hand and the unbelievers will receive theirs in the left. This is followed by the reward of the Garden (paradise), or the punishment of hell. The evidence of the books makes interrogation unnecessary: 'When the scrolls shall be unrolled . . . then shall a soul know what it has produced.'

There is also reference to the balances. Several passages speak of those whose balances are heavy prospering and of those whose balances are light losing their souls. It is commonly held that the deeds are weighed, the good and the bad being in opposite scales, and men being judged according to which is heavier. On the day of resurrection the balances will be just, and no one will be wronged.

Tradition speaks of the *Sirat* (literally a road), which is a bridge over hell, 'finer than a hair and sharper than a sword', which all must attempt to cross. Believers will keep their footing, but unbelievers will slip and fall into hell.

The Koran does not speak of such a bridge, but attempts have been made to show that it does. 'Not one of you but shall go down to it' (sura 19.72) does not really bear such an interpretation, for it is obviously addressed to the Meccans who rejected Mohammed's teaching about resurrection. The following verse says, 'Then we shall deliver those who have shown piety and leave the wrong-doers kneeling there.' It is evident that this verse refers to hell and not to a bridge over it.

Al-Ghazali, the famous theologian and mystic quotes sura 3.23 regarding the wicked, 'Guide them to a road to hell and stop them for they shall be questioned.' The word sirat is here used for 'road', but there is no indication that it is a bridge over hell. The wicked, although they are to be interrogated, are to be led on the way to hell before the interrogation seems to take place. It is striking that from a comparatively early period statements of belief include belief in this bridge.

Inverted Symbols
Symbols which are upside down, backwards or the wrong way round, usually connected with evil; inverted crucifixes or other Christian symbols are used in black magic because they deny God and the accepted order of things, and state disorder, abnormality and evil; prayers are sometimes said backwards in the Black Mass and it was long believed that demons write backwards.
See PACT; PENTAGRAM; and SYMBOLISM.

INVISIBILITY

THE HERO who owns a ring or a cap, hood or helmet which makes him invisible is a familiar character in folktales and legends. A ring which makes its wearer invisible plays a crucial part in J. R. R. Tolkien's *The Lord of the Rings*. Perseus, the great Greek hero who slew Medusa (see GORGONS), had a cap of darkness which prevented anyone from seeing him.

The idea of the cap or hood of darkness may be based originally on the simple ostrich principle employed by a small child who hides from you by putting his hands over his eyes: if your head is covered so that you cannot see other people, then they cannot see you. There is something nf the same principle in the symbolism of the taking of the veil by nuns, who retreat into 'invisible' seclusion from the life of the everyday world.

The Buried Head

Some invisibility magic attempts to make you literally invisible, even to yourself, but more often the aim is the slightly less ambitious one of preventing people from seeing you, as in the charm recommended by a 14th century Jewish work, the *Sefer Gematriaot*, which is to recite Genesis 19.11: 'and they struck with blindness the men who were at the door . . .' This depends on the principle that the power inherent in holy writ will cast an enchantment of blindness over those about you.

Similarly, the *Malleus Maleficarum* (15th century), in its day the leading authority on witchcraft, says that witches 'can take away the male organ, not indeed by actually despoiling the human body of it, but by concealing it with some glamour . . .' It cites the experience of a Dominican friar, who was visited by a young man who 'woefully said that he had lost his member.' The friar examined him and, finding no sign of the missing organ, asked him whether he suspected anyone of bewitching him. The young man said yes, he suspected a woman of his acquaintance, and the friar advised him 'to soften her with gentle words and promises.' The young man followed this advice and returned a few days later to show that he was whole again. 'First,' says the *Malleus*, 'it must in no way be believed that such members are really torn away from the body but that they are hidden by the devil through some prestidigitatory art so that they can be neither seen nor felt.'

A process in the *Grimorium Verum* for becoming invisible says that you must begin the operation before sunrise on a Wednesday. You need seven black beans and the head of a dead man. Put one bean in the head's mouth, two in its ears and two in its eyes (which makes only five beans – presumably the other two are meant to go in the nostrils). Then trace a certain symbol on the head, and bury it in the ground, with the face turned up to the sky. Every day for nine days, before sunrise, water the buried head with good brandy. On the eighth morning a spirit will appear to you and ask what you are doing. You reply, 'I am watering my head.' He will ask you to let him do the watering but you must refuse until he shows you the same symbol that you traced on the the head. This proves that he is the spirit of the head and not a deceiving spirit. Let him water the head, and on the ninth morning you will find that the beans have ripened. Test them by taking one of them at a time, putting it in your mouth and looking in a mirror. 'If you cannot see yourself, it is good.'

What you have done, in effect, is to give the beans the deadness of the head (and you have also identified yourself with it by announcing, 'I am watering *my* head') so that when you put them in your mouth the invisibility of the dead and buried head is transferred to you. It is better not to swallow the beans because you can only become visible again by removing them from your mouth.

The link between invisibility, death and burial appears again in the frequent references to shrouds in a long invisibility ritual devised by the Order of the Golden Dawn. After certain preliminaries, the operator recites an 'Enochian Spirit Invocatinn' beginning: 'Ol Sonuf Vaorsag Goho Iad Balt, Lonsh Calz Vonpho. Sobra Z-ol Ror I Ta Nazps . . .', and continuing in this vein for some time.

The Blue-Black Egg

Next he invokes the Recording Angel, 'O Light invisible, intangible, wherein all thoughts and deeds of all men are written,' commanding him to 'concentrate about me, invisible, intangible, as a shroud of darkness, a formula of defence; that I may becnme invisible, so that seeing me men see not, nor understand the thing that they behold.' It is clear that the ritual is not intended to make the operator literally invisible but to allow him to pass unnoticed, inscrutable.

The magician continues by conjuring the Lady of Darkness to clothe him with ineffable mystery and tu send the great Archangel Tzaphqiel to formulate about him a shroud of concealment. After further incantations, the ritual instructs the operator to 'formulate the black egg around you, the idea of becoming invisible. Imagine the results of success, then say, "Let the shroud of concealment encircle me, at a distance of 18 inches from the physical body . . ."' Next, the operator declares that he is formulating around himself the blue-black egg of Harpocrates (the Graeco-Egyptian god Horus the Child – see HORUS), 'as a shroud of concealment . . . that I may pass unseen among men to execute the will of my Genius.'

Presently, he repeats a fine incantation which states that he has formulated 'the light that shineth in darkness, but the darkness comprehendeth it not' (the reference is to John 1.5). Then, mentally formulating the blue-black egg with great force, the magician declares: 'Darkness is my Name, and Concealment. I am the Great One Invisible of the Paths of the Shades. I am without fear, though veiled in darkness, for within me, though unseen, is the Magic of the Light divine.'

In the Abyss

Incantation for becoming invisible:

I have set my feet in the North, and have said: I will shroud myself in mystery and concealment. The Voice of my Higher Soul said unto me, Let me enter the path of darkness, peradventure thus may I attain the Light. I am the only being in an Abyss of Darkness; from the Darkness came I forth ere my birth . . . And the Voice of Darkness answered unto my soul. I am He that formulates in darkness, the light that shineth in darkness, but the darkness comprehendeth it not. Let the Mystic Circumambulation take place in the Place of Darkness.

Israel Regardie *The Golden Dawn*

Invocation

Appealing to a god or spirit by prayer or incantation; summoning up a god or spirit; the poets of antiquity invoked the Muse for inspiration; invocation, 'calling on' a good supernatural being or force, is sometimes distinguished from evocation, 'calling out' an evil one, but the two words are frequently used interchangeably.

See INCANTATION; MAGIC.

Iris

Greek goddess of, and personification of the rainbow; sister of the Harpies in Hesiod, in the *Iliad* she is a golden-winged messenger of the gods; she seems to have had no cult.

See RAINBOW.

IRON

THE TAMING OF FIRE opened the door to the mastery of metals, which in turn forged the key to human progress. Iron was the agent of this transmutation which enhanced the quality of life from the brutish to the civilized. This would in itself have been sufficient in non-materialistic ages to have given iron a reputation for the supernatural – a reputation which it also acquired on the grounds that the first iron, having descended from the heavens in the form of meteors, was of celestial origin. It was called by the ancient Egyptians 'the metal from the sky' and by the Aztecs, among whom it was a rarity, 'the gift of heaven'.

The earliest known iron implements date from the third millennium BC but long before this period iron had been regarded with admiration and awe. Ancient monarchs were won over with presents of iron or steel daggers and Achilles proposed a ball of iron as a prize in the funeral games instituted in honour of Patroclus.

The technical development of iron has now completely overshadowed its psychic aspects although it is still within living memory that schoolchildren would touch cold iron for luck and recite the magical charm, 'Touch wood, no good, Touch iron, rely on.' In the more distant past, humanity testified to iron's magical qualities by attitudes which might appear contradictory in that this metal was regarded as both dangerous and protective.

Iron was tabooed in certain religions, no tool of iron being permitted in the temples of ancient Greece, while in the Temple of Solomon 'neither hammer nor axe nor any tool of iron was heard in the house when it was being built' (1 Kings 6.7). A relic of this old antipathy survives in the custom which prohibits the use of scissors to cut a baby's fingernails until the completion of its first year.

As long ago as 1350 BC amulets of meteoric iron were placed reverently in the tomb of Tutankhamen to protect the sarcophagus against evil spirits, thus testifying to the ancient role of this metal as protector of mankind. The Romans believed that the association of iron with the war god Mars endowed it with its protective powers, but this must be regarded as no more than a rationalization of what was even then a universal myth.

Chris Barker

Iron has been credited with supernatural powers for many centuries, and in Italy it is still thought to afford protection against the Evil Eye: charm made from a lemon pierced with iron spikes

Long after the fall of the Roman Empire the magic of iron continued to dominate the folk practices of peasant life. In Italy iron pyrites were used as a charm against eye diseases; in China they kept dragons at bay; in Burma they intimidated crocodiles; while throughout Europe they guarded the home against lightning. In the 19th century iron bars used to be laid across barrels to protect the beer from thunderstorms in Europe, and in India cold iron was integral in funeral rites; it was believed to counteract any ill-effect from spirits which succeeded in escaping from the corpse.

The power of iron over ghosts was proverbial and as recently as 1854, on the occasion of the evocation of the spirit of Apollonius of Tyana, which took place in London, it was considered expedient to create a magic circle of magnetized iron to neutralize all dangers from the ghost.

Medieval man approached the fairy kingdom fearfully and took elaborate precautions, many of which involved the use of iron. He who ventured into a fairy mound ensured his safe retreat by driving his knife into the earth by the threshold. Iron was also laid in the cradle of the new-born baby to prevent the fairies from substituting a changeling. It would appear that one group of supernatural beings alone was impervious to the power of iron – the Teutonic dwarf, traditional miner and ironmaster of northern Europe, and forger of enchanted swords (see DWARFS).

The nightmarish forces that haunted the waking hours of ancient man were fortunately believed to be susceptible to iron's magic power, whether it took the form of the horseshoe attached to the cottage door or a knife secreted beneath it. According to the Roman historian Pliny, iron coffin nails on the lintel of the door provided protection against all wandering spirits.

A form of white magic which was employed against suspected witches until well into the 19th century consisted of filling a bottle with pins and heating it intensely, which had the effect of so tormenting the hag that she was compelled to relinquish her hold upon her victim. Equally potent and still observed in modern Italy is the custom of touching cold iron to counteract the Evil Eye (see EYE). A *jettatore*, an individual with the power to 'fascinate' or cast the Evil Eye, can also be overcome by the jangling of iron keys, since to all devils the very sound of iron is anathema. Even in this century the hapless King Alphonso of Spain, a notorious jettatore, was embarrassed by the constant jangling of iron keys wherever he travelled in Italy, and was actually refused an audience by the Italian dictator, Benito Mussolini.

On the outer walls of some English cottages large spiral ties may be seen as reminders of the old superstition that iron afforded protection against fire. Much of the magical aura of the blacksmith was largely derived from the fact that he was a worker of iron; in comparatively modern times the primitive smiths of the Celebes maintained a god of iron in their forges to oversee the quality of the metal.

Although the majority of Iroquois are now Christian, there is a remnant whose beliefs and culture are based on the visions of the prophet Handsome Lake

IROQUOIS

THE ORIGINS of the Iroquois, the most advanced group of American Indians north of the Pueblos, are lost in the confusion of archeological time. Their legends assume that they were always in their historical homeland of New England.

The Iroquois had many gods, who were essentially the powers of Nature. It was very apparent to the Indians that they were dependent upon the goodwill of powers beyond direct human knowledge; the wind and the rain, the passing seasons, the lightning and the sunshine, the forests and the rivers, all were active and seemingly alive. Thus it was felt that men must act so as to propitiate the living powers of the universe they saw around them.

It does not follow that life is dull and oppressive when people feel the gods are all around them; on the contrary there was a feeling of being part of the whole world of Nature. When Nature rejoiced mankind also danced and shared the happiness; when she was preparing for winter mankind also stored away the things of summer and rested hopefully for the coming of spring.

The gifts of Nature were maize and beans, wild deer and beaver, many kinds of timber, birch bark, apple orchards, maple syrup and honey. These things the Iroquois received with gratitude and cared for them, developing their usefulness as best they could. If a hunter killed an animal he made a little offering to its spirit so that more animals might be reborn. If a woman planted a maize field she walked naked around it, sharing her fertility with the food plants.

There were many tricky and dangerous spirits to be charmed away, and they were conjured with in the dances of the False Face society, so called because of the carved wooden masks worn by the performers (see FOOL). Unhappily there were cruel and deadly human enemies, and they were weakened by magic and defeated by the young warriors. The overshadowing presence above was felt mostly through the spiritual life-force known as Orenda, coming in varying degrees to human families.

Some families descended from great ladies whose magical powers were greater than most other ancestresses. Some chieftainesses had sons and nephews who were vehicles of the inner wisdom gleaned through contact with ancestral spirits. Some men were given great powers direct from the spirit world. Such men were like lone pines standing high among the forest trees. Such a one was Dekanawida, the law-giver and friend of his fellow philosopher and law-maker, Hiawatha.

The two great law-givers of the Iroquois lived at the time when Elizabeth I was ruling in England and the great Mogul, Akbar, was ruling in India. They were different from those civilized monarchs, however, for their work was done among peoples dressed in skins and living in houses made from tree bark. In those days the life of those Iroquois was not unlike that of Europeans at the end of Neolithic times, about 4000 years ago. The tribes used arrow-heads of flaked stone, cultivated the ground with wooden hoes and cut down the forest with stone-bladed choppers.

Mary Evans Picture Library

An Iroquois philosopher and law-maker, who later became a demi god, Hiawatha lived during the 16th century; in his narrative poem *Hiawatha* Longfellow used the name of this great Iroquois chieftain, but all other material is Algonquin: in this illustration to the poem, Hiawatha's grandmother Nokomis attempts to dissuade her grandson from setting off on a dangerous quest

Their villages consisted of a few hundred people living in two or three long-houses in separate family rooms in a vast apartment dwelling. The huts were surrounded by earthen defences surmounted by a defensive wall of wooden stakes. Inside the village were storehouses for dried maize and beans, which were always built on bluffs near a river so that water could be drawn up in buckets made of birch bark in times of trouble. Stores of nourishing pemmican, made from animal suet beaten up with wild berries, ensured a store of food rich in vitamins. It was used by hunters and traders, and was a reserve in time of trouble.

The five nations who spoke Iroquoian languages were always at war with one

Rochester Museum of Arts & Science, New York

another in those early days. It was because of the sorrows and stupidities of wars between related people that Dekanawida and Hiawatha came together. Like all innovators they were unpopular and treated with suspicion, but after a period of exile they persuaded the tribal councils to come in peace to a series of conferences.

Hiawatha was a Mohawk, but his work began among the Onondaga tribe. The opposition from the Onondaga chief Wathatotaro was so intense that he caused Hiawatha's daughters to be murdered. The teacher then went to the Oneida who persuaded the Mohawk to join them and to invite the Cayuga to the gathering. Then the three nations approached the Onondaga again, and this time Wathatotaro agreed provided that they would bring the Seneca to join them. the Seneca agreed and the whole five nations joined into a league of mutual friendship and protection which they called 'The Extended Lodge', meaning that the Council Lodges of each nation were now joined together.

The five nations now controlled the area from the shores of Lake Erie to the lower reaches of the Hudson River, the greater part of New York State. Yet a century later, at the time of their greatest power, their total population was only about 16,000.

Dekanawida was traditionally of Huron birth, but his parents tried to drown him because of a prophecy that he would cause trouble to the nation. He survived, and later left home to live among the Iroquois, where he was the great law-giver and was also regarded as a prophet and magician. He is ranked by the Iroquois among the demigods.

Among the laws he established was the one which ended the blood feud among the Iroquois. It laid down that a human life was valuable, and a death by violence was to be atoned for by the payment of five strings of wampum. However the man who had committed the crime had also forfeited his own life, and that was worth five strings of wampum also. Hence the next of kin of the slain man was to receive ten strings of wampum from the killer. Wampum was a high unit of value and such a penalty was a great discouragement to homicide. It was largely instrumental in preventing the recurrence of inter-group wars among the people of The Extended Lodge.

Wathatotaro has become also a demigod of a thoroughly terrifying demonic character in more recent Iroquois belief. He was regarded as having strange powers in his own day, and was renowned for pride, sexual prowess and strength, as well as a subtle mind. These qualities made him a very great chief and in spite of his stubborn resistance to the idea of a union of the tribes he was able to gain a predominant position for his Onondaga people within that group. They had 14 hereditary chieftainships in the council of the confederacy whereas each of the other four nations only had ten each. The chief holding Wathatotaro's position was to be the only one empowered to summon a meeting of the confederation.

Thus the three most important chiefs who were concerned with making the league became demigods in tradition and entered the realms of the legendary while still remembered as historical persons.

History Told in Beads

While the Iroquois had developed agriculture and the communal hunt for food production, and had evolved an advanced social system based on inheritance in the female line, they had not reached the point where money was necessary for trade, and their writing was still in the primitive symbolic stage. They engraved pictures of events on pipe-stems to record an adventure, and they used strings of wampum beads often made up into belts with symbolic patterns as historical reminders.

The wampum was made from the thick valve of a spondylus shell. The valve was broken off and polished on a stone, then it was slowly bored through from end to end. The resulting beads, some white and some purple, were carefully polished and strung on sinew. The message on a wampum belt could not be read in our way but it was a reminder of a story, in much the same way as a page of pictures may remind a child to recite the appropriate nursery rhyme. Each nation had an official Keeper of the Wampum, who on ceremonial occasions could bring out the belts in his possession and recite remembered verses telling of the event which the belt commemorated.

The coming of European settlers and military forces was a disaster for the Iroquois. At first there were minor squabbles

The many gods of the Iroquois Indians were essentially powers of Nature, for it was clear to the Indians that they were dependent on the goodwill of powers beyond direct human knowledge – wind, rain and sunshine *Left* Food crops were thought to be blessed by protective feminine spirits: watercolour showing the corn, bean and squash maidens, by Earnest Smith, a Seneca Indian *Right* The products of the earth were used for ceremonial costumes, emphasizing the close relationship between man and Nature: mask made from maize leaves. Husk Faces, wearing these masks, guide evil away from the house

New York State Museum

at the same time as a good deal of trade; but later the rivalries between the great powers of the day brought the Iroquois as mercenaries into the wars of the colonial epoch. Mostly they fought on the side of the English, because they had been attacked by a party of Canadian Indians under French command and they resented the insult.

The wars altered the way of life terribly. Villages were raided and burnt and the people massacred. Money was paid for scalps of captured enemies, and there were reports of Europeans occasionally assisting the tribesmen in the ghastly tortures of captured enemies which had for long been part of the war honours system of the tribe. The wars brought no happiness to the Iroquois; they were fought by foreigners for overseas possessions rather than for the benefit of the Indian inhabitants of the land. Sometimes honourable men insisted that the treaties signed with the Iroquois must be kept, but more often the pressure for land and power drove the white man to dispossess the Indians and drive them from their native soil.

The Visions of Handsome Lake

In this period of increasing uncertainty the Iroquois were threatened with total disruption. Some of them opposed the American Revolution and eventually removed over the Canadian border, while others remained on their reservations, trying to preserve something of the past. The old religion was much weakened, and the missionaries persuaded most of the people that there was another way of life with regard to the spiritual powers behind the world of Nature.

The Iroquois now have a heroic and persistent little saint of their own in Kateri Tekathawitha, who suffered much to ease the ancient barbarism. She was a member of the Catholic group of the Iroquois who had settled at Cauhnawaga in Canada.

Other missionaries worked in the United States among the Iroquois, and most of the people became Christians, though there was always a minority opinion against the preachers who persuaded them to accept the many injustices which they suffered at the hands of the master race. The minority became the followers of Handsome Lake, the brother of the famous chief Cornplanter. In June 1799 a vision came to Handsome Lake; he saw three noble beings who told of happier days to come. Later he was introduced to a fourth who was the Creator, who had taken pity on the suffering Indians.

The new religion was a serious effort to reorganize the ancient Iroquois beliefs and preserve old customary ceremonies, while adapting to the new knowledge which had become available. It was rather strict, and stood firm for abstinence from alcohol. This followed another vision in which the prophet saw a lake full of Indians in their canoes, who were trading good food for liquor handed out by an evil being in the guise of a trader. This was the Devil leading the Indians to self-destruction.

Handsome Lake's prophetic mission was to bear its fruit much later, but he had given his people a new focus of unity in the revival of old tradition and in the re-creation of a mystical unity in the long-house which symbolized the meeting-place of the founder nations of the Federation.

The prophecies of Handsome Lake are unusual in the history of prophetic visions among peoples suffering from cultural oppression, because they gave rise to no insurrection. They rather led to a withdrawal from close contact with the white man on the part of the older and more conservative among the Indians. This continued to be the case for nearly a century, so that the traditions remained alive only through a small minority of the Iroquois. Since the first accounts of the prophecies were transmitted by word of mouth there grew up a disagreement on what was actually said, and there were two later attempts to codify the system. It is now printed and the consensus of opinion is that the tenor of the original revelation has been faithfully preserved.

The present codified state of the Handsome Lake beliefs is well adapted to the needs of a new kind of Iroquois community living within a highly organized modern state. It is more important than the actual membership would suggest, because it has become a focus for the preservation of the Indian basic culture. The majority of the Iroquois however go to one or other of the Christian churches.

Early treaties gave the Indians the right to move freely between their reservations and in modern times they have fought politically to keep their freedom of movement across the frontiers. Their struggle against giant corporations which would make good use of their lands has also been intense, not because of any obstructionist will to resist, but because there were constant threats to override the rights of the communities as guaranteed by past treaties, and sealed by the exchange of wampum belts. The struggle has become a political one, not against the white man but against the covetousness of commercial interests.

Fertility and Healing Dances

Some of the ancient customs have survived, half as ritual, and half as folklore. They have altered less than the Godiva rides and maypole dances of Europe; the False Face society still knows healing rituals and the Husk Faces, who wear masks made of plaited maize leaves, still whisper and guide evil away from the house. An ancient happy occasion used to be the Naked Dance in which the young people used to dance

British Museum

Wampum beads constructed from shells were made into belts with symbolic patterns that served as reminders of Iroquois tribal history; each of the nations that spoke the Iroquois language had a Keeper of the Wampum who recited the stories commemorated in the belts on ceremonial occasions

entirely naked and a chosen couple brought fertility to the plantations in sexual intercourse while the others danced around. Now the original purpose of the dance is commemorated in the name Shaking the Branches (really the maize plants shaking in the wind and fertilizing the seed in this way); the dancers, now clothed, dance waving imaginary leafy plants in their hands. The overt sexual magic is no longer there.

Dances are seasonal affairs, and the New Year Dance is perhaps the most important nowadays. In this the heralds of the festival are the Husk Faces. They bring in the other dancers and open and close ceremonies, whispering like the breath of the wind and teaching by signs. The formal dancers are masked and wear modern clothing. By tradition men and women exchange clothes and, like European mummers, pretend to be of the opposite sex. It could be that this may have come from contact with the early settlers who preserved many of the folk customs of their homeland; but the basic idea was Iroquois. One can imagine the difficulties of the young warriors trying to dance in girls' long skin gowns.

The False Face dancers at this ceremony did not have to show their healing magic. They represented diseases and had the power to take disease away with them. In old times the members of the society cut their masks from a living tree, but now they are made of wood from the timber yard.

Apart from the New Year festivities the False Face society used to hold special dances for healing sickness. The patient was laid down beside a wood fire. The dancers wearing their hideous masks and carrying rattles capered around chanting an appropriate song. They scooped up hot ashes from the fire and rubbed their hands in the hot embers, showing no signs of pain. Then they would turn the patient and rub hot ashes into selected parts of his body. This was magic, they thought, taught to the first members of the society by an ancient giant who had been subdued by the Great Spirit.

The giant was the giver of illness, and he was forced to teach the healing ritual to counteract his powers of evil. In fact, the heat and massage stimulated nerves and internal organs and could have a beneficial effect. However the more precise powers of modern medicine have in most cases driven the False Faces into being symbols of bad luck who, by their dance, can charm ill fortune away from the household where they perform. In due course their ritual will be simply a folklore frolic like the Helston Furry Dance.

In the modern world the Iroquois people have become normal citizens, with special treaty rights securing their home reservations from total assimilation into the national states. Many of their younger men earn big wages as steel erectors. In this dangerous trade they have earned a reputation for fearlessness and skill. This appears to have replaced to some extent the ancient initiation into warrior societies; and it is in fact far more dangerous. After nearly four centuries of contact with the civilized world, and much suffering, the Iroquois have managed to retain a tribal organization, some old customs, and a homeland in the shape of a group of reservations.

C. A. BURLAND

IRVING

A misfit in the grim severity of Scottish Presbyterianism, Edward Irving went to London to attract the fashionable world by his stirring oratory. His belief in the imminence of the Second Coming was taken up by his followers after his death

Radio Times Hulton Picture Library

Edward Irving, founder of the Holy Catholic and Apostolic Church: he believed that he was the leader of a faithful group of worshippers whom God was gathering together as the end of the world drew near

SUNDAY SERVICE for a Victorian Presbyterian was a long, serious and hardly colourful affair. Yet for those who had followed the fashionable Scots preacher, Edward Irving, Sunday worship became three hours of ritual, intricately performed with incense and holy water by nearly 50 clergy and servers, all clad in colourful liturgical vestments. It was indeed a rather startling product for the dour Scots' Church of the time and hardly reflected its Calvinistic origin. No wonder that these erstwhile Presbyterians had chosen for themselves the name Catholic Apostolic Church, while the world tended to continue to call them Irvingites.

At the age of 30, Edward Irving had had a rather unsuccessful ministry in Scotland and was on the point of leaving for the mission field when the Caledonian Church in London's Hatton Garden invited him to be their minister. His congregations in Edinburgh had found their young minister's sermons rather bewildering and even a prominent divine of the day was prompted to compare them to 'Italian music – only appreciated by connoisseurs'. Nevertheless, Irving was a success among the poor, bringing a simple Christianity into the slums and entering each home with a blessing 'Peace be to this house'. He had an impact on the lives of ordinary people which derived from the two opposite sides of his character: he was both dramatic and sincerely humble at the same time. It was this contrast within his powerful personality which was to bring the crowds to Hatton Garden.

London in 1822 presented Irving with a challenge much more suited to his taste than had his Scottish ministry. He went to the Caledonian Church with the avowed purpose of attracting the fashionable world. He believed that he could find a way to their hearts by speaking to them in the words that they used and drawing his illustrations from the current plays, novels, and newspapers. Here would be the audience of connoisseurs which he needed.

His assessment was right. The Londoners of the Regency were inveterate sermon tasters and a fashionable preacher would draw congregations from all quarters, almost irrespective of denomination. Irving's remarkable oratory was soon mentioned by George Canning, then Foreign Secretary, in a speech to the House of Commons. Society took Canning's hint and the chapel in Hatton Garden was soon too small to accommodate all who wished to hear Irving. In 1827 the congregation moved into a new building in Regent Square where Irving continued to attract the crowds.

His success was due largely to his ability to project his personality, but also to the ringing modernity of his tones. He was a great controversialist and sharply critical

of the current fashions, so that the publication of a volume of his sermons became a real literary event, drawing the fire of all who had suffered from his denunciation. He strove to be a fashionable preacher and his personality needed the limelight, yet he continued to combine publicity-seeking with a real humility and undoubted sincerity.

Sense of the Dramatic

By this time Irving's teaching had become highly personal rather than Presbyterian. The fashion for his preaching began to fade and as it did so his opponents began to question the validity of his views and the orthodoxy of his doctrines. He had been increasingly influenced by Adventist beliefs and his sermons were made the more immediate by his growing insistence that he and his congregation were living in the last days before the Second Coming of our Lord. The mystical works of Coleridge and of a Roman Catholic priest who wrote under the pseudonym Ben Ezra influenced Irving considerably and he began to point to the portents which heralded the end of the world. His willingness to acknowledge spiritism, faith healing, and 'speaking in tongues' as signs of this Second Coming was too much for the Presbyterian Church and in 1833 he was deposed from the ministry by his home presbytery of Ancrum.

Yet it was the London presbytery which had made the first move when, three years before, it had excommunicated Irving for teaching that Christ's human nature was not perfect but liable to sin. The validity of this charge is difficult to assess. His doctrinal position was inconsistent and changed with remarkable rapidity. He would often allow his sense of the dramatic to make him overstate a perfectly legitimate point, and it would seem that it was not so much what he said but the way he said it which was under attack. Irving's followers were certainly extremely orthodox in their teaching on the historic doctrines of the Church and it does seem likely that the London presbytery had picked on some loose language in order to be rid of a minister and his flock who seemed generally to be moving further and further away from what they knew as Presbyterianism.

As a result of growing hostility, the Irvingite members left Regent Square in 1832 and moved to a dark chapel in Newman Street, where they set themselves up as the Holy Catholic and Apostolic Church. Irving was beginning to see himself as the leader of a faithful remnant whom God was gathering together as the end of the world came near. His Romantic views which, as a young man, had meant that he had carried a volume of Ossian's poems about with him, had been further strengthened by his contact with Coleridge and he was more and more convinced that the new Apostolic Age was about to burst upon the world. Further proof of the imminence of the Second Coming came during a tour of Scotland when spirit manifestations and speaking in tongues were recorded. The stage seemed set for a Pentecostal revival, with perhaps a few Romantic additions suited to the temper of the age and Irving's own predilections. Yet when Irving died in December 1834 he left behind him no distinctive body of doctrine, no blueprint for a Church, no liturgy or ministry; and every expectation was that the fledgling Catholic Apostolic Church was destined to an early oblivion.

Awaiting the Second Coming

This, however, was to reckon without the remarkable influence which Irving's personality had had upon his followers. Meeting at the home of a banker named Henry Drummond, the leaders of the Catholic Apostolic Church drew up a constitution for the new body. They were preparing a suitable vehicle for the gathering together of God's elect for his impending coming. From the Church emerged 12 apostles who were to be the interpreters of God's mysteries. They appointed 12 prophets who were to explain the Scripture and exhort the people to holiness, and 12 evangelists to teach doctrine. There were also 12 pastors to care for the people and seven deacons to aid them. Each of the apostles was assigned a tribe and the Apostolic College was set up at Albury in Hampshire, where Henry Drummond had his seat and where he built a fine church in the Gothic style.

The movement was under way and all vestiges of spiritism and speaking in tongues were soon removed. The followers of Irving differed from the High Church members of the Church of England in their assurance that the Second Coming of Christ was near and in their conviction that they would be among the first to welcome him. Their services became more and more elaborate and in 1842 the liturgy of the new Church was compiled, based upon Roman, Greek, and Anglican models. Regulations for daily prayers and services were laid down and on Sunday the Solemn Eucharist would take nearly three hours. The distinction between priest and preacher meant that equal emphasis was placed upon the sacraments as upon preaching; and the Catholic Apostolics believed in the real presence of Christ as fervently as any Anglo-Catholic.

Small, Pious Group

The new Church prospered financially. Besides Drummond, a number of rich men belonged and all its members paid a tenth of their income to the church. A tenth part of this tithe went to the headquarters at Albury and the rest was used for the upkeep and growth of the movement. It grew rapidly. Soon there were seven churches in London besides others in many of the main provincial towns and the Irvingites spread overseas, particularly to Germany and the United States.

There was however no provision for the continuation of the hierarchy. The Advent of Christ was so firmly expected that although the apostles, who were alone able to ordain, were manifestly mortal, the Irvingites faced the likelihood of the Church's dissolution with equanimity. The ritualist movement within the Church of England meant that there was increasingly no real need for the Catholic Apostolics. They became a small, pious group, very orthodox in belief and less and less insistent upon the Adventism which had been their one distinctive trait. Their churches passed into the hands of other bodies which needed them: Anglican, Roman Catholic, and Orthodox. Individual members made their submission to Rome or to Canterbury and finally in 1963 the great cathedral church in Gordon Square was leased to the Church of England as their chaplaincy to the University of London. The last apostle died in 1903 and there are now no clergy left, although some services from the Irvingite liturgy are still read in Gordon Square. The Church, now dedicated to Christ the King, stands as a magnificent memorial to a movement founded by a small group of connoisseurs whose lives Edward Irving had changed.

Michael Holford/British Museum

Ishtar was a radiant goddess rapt in beauty, terrifying and tempestuous, 'lady of resplendent light': eight-pointed star, symbol of Ishtar, from a boundary stone, c 1120 BC

ISHTAR

ISHTAR was the Semitic name for the old Sumerian goddess Inanna, the most powerful goddess in Mesopotamia. Representing the full potency of womanhood and maidenhood, and possessed of subtle powers in shaping the fortunes of man, she was worshipped for more than 2000 years. Doubtless many facets of her character altered during this period; and different aspects of the goddess were venerated in different cities.

For the appraisal of Ishtar there is no more revealing source than the Sumerian hymn, *The Exaltation of Inanna*. Composed in about 2350 BC by Enheduanna, the daughter of King Sargon of Agade in Akkad, in the north of Babylonia, this long poem describes the struggle for her supremacy over Nanna, the moon god in the southern city of Ur, and her final acceptance in the city of Uruk (Erech), also in the south, by the high god, An.

Reading between the lines, we can see how King Sargon, a usurper, set the divine seal to his empire over Sumer and Akkad by equating Sumerian Inanna with Akkadian Ishtar. Here is a glimpse of the kind of

political and religious struggle so frequent in the long history of ancient Egypt, but more rarely revealed in Mesopotamia.

This poem, which begins with the description of Inanna as the lady who possessed all the attributes of divinity, tells of her many accomplishments. Following the description of the dramatic struggle against the older divinities and against the wicked collusion of the older gods in Ur and Uruk, we end in a hymn of praise, through which the high priestess and her goddess emerge triumphant.

Inanna is the radiant lady rapt in beauty, terrifying and tempestuous, but she is also seen as a lady of resplendent light, beloved of heaven and earth. Inanna-Ishtar is also the dread goddess, who can, if she will, accurse vegetation and command fear in mankind. Not only is she possessed of sexual potency, able to control both fertility and sterility, but she is also a mighty goddess in battle, and this martial quality of Ishtar was as pervasive as any in the later development of her character.

Terrifying Seductress

In the hymn, she is described as 'the lady mounted on a beast' and as 'lent wings by the storm'; and in art she is frequently shown mounted on a lion or lioness, or leading both together. For example, on the high rock carvings of Maltai in Assyria, she occupied a prominent place in the procession of the gods; she was mounted on a lioness, and no doubt gave her blessing to the Assyrian armies as they marched through the defiles which separated Assyria from Iran, on their annual campaigns.

The description of her as having been 'lent wings by the storm' recalls the goddess's many sinister images, among which one of the most striking is the great terracotta, known as the Burney relief, in which the naked, winged goddess, usually called 'Lilith', with feathered legs and birds' talons, mounted on lions, appears in the guise of a seductive vamp of terrible aspect. Here she is seen to be of 'terrible countenance', in the words of the poem. In the early poems another side of Inanna-Ishtar's character is revealed, namely, of the goddess who presided over divination, incubation and oneiromancy, the interpretation of dreams. She was invested with all the great powers of womankind, and while possessed of seductive beauty and charm, could, if so moved, turn rivers to blood.

Inanna-Ishtar presided over one of the most important ceremonies of the year – the ritual marriage of the god, in the course of which the king was wedded to the high priestess and in this way induced for his people the promise of agricultural prosperity. Indeed, on the famous stone vase from Uruk, c 3300 BC, Inanna herself may perhaps be recognized, taking part in the spring festival. There is certainly evidence from later periods of the king's special relationship to Ishtar, the goddess who in the words of A. L. Oppenheim 'becomes the carrier, the fountainhead, of his power and prestige'.

For the people of Agade, Ishtar was an incarnation of the planet Venus, which was known as Dilbat. In military history, Ishtar of Nineveh and Ishtar of Arbela are prominent in battle and ensure victory for the Assyrian armies. A famous war poem of Tukulti-Ninurta I, referring to an event in the 13th century BC, tells how Ishtar intervened at a critical point in the battle as a result of which the Assyrians triumphed over Kashtiliash, King of Babylon.

Ishtar was also invoked as a healer: indeed she made a memorable journey in about 1375 BC from Nineveh to Thebes, in Egypt, in order to lay hands on the aged and ailing King Amenophis III. This was not the first occasion on which her powers had been so used. But the most sinister episode in the mythology concerning this goddess is the account of her descent into Hades, a tale of early Sumerian origin, in which Inanna strives dangerously with her sister, the queen of the underworld, and only narrowly succeeds in escaping from it.

The Eyes of Death

In a Sumerian poem, the judges of the underworld pronounce death on Inanna:

The pure Ereshkigal seated herself upon
her throne,
The Annunaki, the seven judges, pronounced
judgement before her,
They fastened their eyes upon her, the eyes
of death,
At their word, the word which tortures the
spirit . . .
The sick woman was turned into a corpse,
The corpse was hung from a stake.

S. N. Kramer *Sumerian Mythology*

Lady of the Dawn

Ishtar, however, is often thought of as an erotic goddess concerned with sexual intercourse, and later in history her hierodules or prostitutes were to earn a licentious and evil reputation, especially in the city of Uruk, where there was an elaborately organized college of priestesses of Ishtar, the head of which was the high priestess herself. This cult enjoyed a considerable expansion elsewhere, and finally emanated in the lewd practices of the Phoenician Astarte, and Hebrew Ashtaroth, so much condemned by the Old Testament prophets.

There is evidence that organizations similar to the one in Uruk existed first in Ashur, and then in Babylon. In Ashur, the religious capital of Assyria, the remains of a temple which belonged to Ishtar *dinitu*, 'the lady of the dawn', or the 'lighting up' have been excavated. What happened within the sacred precincts may be deduced from a series of lead discs and tokens found elsewhere in the same city. These plaques showed men, and women who were probably hierodules in the service of the goddess, enjoying sexual intercourse on the brick pillars of the temple. Other figures are also engaged in an erotic dance.

This practice has an interesting counterpart in Herodotus's account of a strange marriage practice in Babylonia, in the course of which eligible women sat in the temple and intending suitors cast a coin in their laps, invoking the name of the goddess in settlement and witness of the marriage contract.

ISIS

THE GREAT GODDESS of the ancient Egyptians, Isis was the wife of Osiris, the god who died and was restored to life. He had been king of Egypt, but his evil brother Seth, whom the Greeks later identified with the monster Typhon, had killed and dismembered him and buried the pieces in various places. Isis searched for and found the pieces, put them together and revived him. Osiris became king of the underworld and their son Horus, called Harpocrates by the Greeks, became ruler over Egypt.

As Queen of Egypt, Isis' hieroglyphic symbol is the throne. She is also the exemplary mother who has taken infinite pains to nurse, protect and bring up her son Horus and she is frequently depicted suckling him. With care and incantations she protected him from all diseases, and after the death of Osiris she saved him from Seth who wanted to murder him. When Seth brought a lawsuit against Horus before the court of the gods, intending to become king of Egypt himself, Isis intervened and enabled her son to win the case. Isis therefore did everything that a good woman can do for her husband and child, and became the model for all Egyptian women.

Her sacred animal is the cow, the mother of calves and provider of milk, 'the fruitful image of the all-producing goddess'. For Isis gives life, fertility and prosperity to people, animals and fields.

As man fertilizes woman, and Osiris Isis, so did the annual flooding of the Nile fertilize the soil of Egypt; coming in the middle of the hot summer, this inundation was looked upon as a miracle and attributed to Isis. When the river dried up in the summer, it meant that Osiris was dead, killed by Seth-Typhon, the hot wind of the desert. But Isis searches for the dead Osiris and finds him on the day of the Nile flood in the river's holy waters. The water, Osiris, flows over the withered earth, Isis, and fertilizes it.

The Nile flood coincides with the first appearance of Sirius, just before sunrise, and this was interpreted as a causal event; Sirius (Egyptian Sothis) was seen as the star of the Nile flood and the star of Isis.

The day of the rising of Sirius and of the river's flooding became the sacred New Year's Day of the Egyptians.

After the conquest of Egypt by Alexander the Great in 331 BC the country was ruled by Greeks for 300 years, and during this period the cult of Isis became completely Hellenized. When the Romans took over the government in 30 BC they relied on the support of the Greek middle class in Egypt and the language of administration remained Greek; during this era, the goddess's cult spread over the entire Mediterranean basin. It was only when Constantine the Great, after his victory at the Milvian bridge in 312 AD raised Christianity to the level of the national religion, that the Isis cult lost its importance and was subsequently prohibited.

Seeking the Dead Osiris

The Greeks identified the Egyptian Isis with their Greek goddesses: Isis, the provider of corn, was the Greek Demeter; Isis, the goddess of love, was Aphrodite; Isis, wife of the king of the gods, was Hera; Isis, the goddess of magic arts, was Hecate, and so on. By depicting Isis as the prototype of the human woman, she was put on a par with the Greek heroine, Io, who was loved by Zeus and had been changed into a cow, the Isis animal. A gad-fly sent by Hera chased poor Io over land and sea until, after a long and frantic flight, she came to Egypt. There, on the banks of the Nile, Zeus changed her back into a woman. This myth was a consolation for everybody who was hunted throughout life as Io was; at the same time it demonstrated the close connection between Greece and Egypt.

Isis was also compared with other goddesses such as Artemis, Persephone and Nemesis, and especially with Tyche, the goddess of fortune (the Roman Fortuna), and with Providence. These various identifications are the expression of living religious feeling. The great goddess appears in many different forms and always reveals new aspects. She is called *myrionymos*, 'the one with ten thousand names', and a Latin inscription is translated as: 'Thou, the one who is all, goddess Isis.' Her whole being is impenetrable, but behind her many faces and names there is one and the same divine Unknown.

Next to Isis are always her husband Osiris and her son Horus and she can never be viewed individually, without her family. However, during the Greek period of Egypt a change set in as other sides of the nature of Osiris were given prominence, and he was given the name of Osiris-Apis, abbreviated to Serapis. Apis was the sacred bull of Memphis, the old capital of Egypt, and Serapis was the god of this city. However, he also became the god of the new capital Alexandria and of the new Greek dynasty, the Ptolemies.

Isis' ancient role as throne goddess, the Queen of Egypt was perpetuated among the Greek kings; Cleopatra appeared on official occasions in the costume, one might even say in the guise, of Isis. The Isis religion therefore had a political element, it was the national religion of the Egyptian state: those who worshipped Isis and Serapis acknowledged their loyalty to the reigning royal house.

This fact encouraged the spread of the Isis and Serapis cult in the Greek ruling circles of the Ptolemies, in Cyrene, Cyprus, Crete, the coastal towns of Asia Minor and the Greek islands whose religious centre was Delos. On the other hand, for political reasons, an expansion beyond the sphere of influence of the Ptolemies was not regarded favourably anywhere. There were only branches of the Isis cult in seaports, such as Athens, Salonika and on Euboea. But even in Egypt itself, linking the royal cult with the Isis-Serapis religion was in many respects a disadvantage as pure religious feelings cannot arise when the practice of a religion is welcomed and rewarded so distinctly by those in high places.

The political decline of the Ptolemies, which started in 200 BC, followed by the complete loss of autonomy that resulted from Egypt's incorporation into the Roman Empire, provided a real opportunity for the Isis religion to expand. Having lost its political aspect, it became possible for the religious and ethical aspect to be strengthened. On Delos, for instance, the Isis cult became purely religious, and as Delos was an important centre for trade with Italy, the Delian cult even reached that country.

The transformation of the cult of Isis into a religion of Mysteries first occurred in the Roman Empire. Because there was no longer a political aspect to worshipping the goddess, the cult now appealed to people as individuals: each one was personally offered salvation, and promised regeneration after death. If a man entered into the service of Isis it was his own personal decision.

The consecration ceremonies of the Isis Mysteries during the Imperial period are described in detail in *The Golden Ass* of Apuleius. There was a wealth of rites: the morning opening of the temple, the vigils, the abstention from wine, meat and love; the rites of cleanliness which included wearing white linen clothes, shaving the head and ablutions. Novices lived for a time within the precincts of the temple; the statue of Isis was contemplated, there was ecstatic prayer and obligatory tears were shed. The worthiness of the candidates was tested at a kind of hearing, and anyone who had sinned gravely was rejected. Sins were confessed and forgiven through immersion in water, and worshippers pledged themselves under oath to the service of the deity and to secrecy. With every new variation the sacred myth of Isis was restated, the seeking and the finding; in each procession Isis sought the dead Osiris, and found him every time the holy water was drawn.

The initiation into the Mysteries was in three stages and consisted of a voluntary ritual death and revival. The initiate stepped on to the 'threshold of Proserpina' (the Greek

Roger Wood Studio

Isis was the mother of the god Horus, with whom the pharaoh was identified: in this wall painting from a tomb the goddess is shown embracing Prince Amun-kher-khopsh, son of Ramses III: 12th century BC

Persephone) and went on a journey 'through all the elements' for which mechanical appliances were probably used. As in the case of Freemasons, there also seems to have been a coffin ritual, and perhaps a baptism of fire. In all probability, a 'sacred wedding', a sexual union, was an integral part of the initiation. Finally, the initiate received a new name and the mystics then partook of a communal meal, with music and dancing.

Garden of Religion

There was an entire vocabulary of religious symbols: the life of man was a pilgrimage or a sea journey, the sinful world was the sea, the religion of Isis was the ship and the haven, and Isis herself the mast and the sail. Her priests were the fishermen who rescued the souls from the sea, the evil world, or bird-catchers who caught the souls (birds or butterflies) with their lime-twigs; the mystics were soldiers on holy military service for Isis, or gardeners who laboriously cultivated the garden of religion. The Isis priests were the true philosophers, who attained the perception of God, and the functionaries in the religious organization of the community were the legitimate 'consuls'; the community itself was called Ecclesia, like the Greek general assembly and later the Christian Church.

The wheel was the symbol of Isis, the sponge indicated the purification of the mystics, and the ladder their spiritual advancement. The anchor symbolized the religion that granted security, the bosom the all-providing goddess, the amphora, a two-handled vessel, the holy water; the lamp stood for the night-feast of the goddess, and the yardstick, justice. The winnow, in which the grain is separated from the chaff, represented the cleansing of the soul in the initiation, the palm the 'victory' of the mystic and his rebirth.

Great pilgrimages were undertaken in the service of Isis, from Rome to Egypt, and indeed as far as Syene, now Aswan, where the source of the Nile was said to be, and where the holy water was drawn when the Nile was in spate. Above all, outstanding festival cycles took place in the service of Isis. One of these was the festival of the goddess as mistress of navigation on 5 March. This was a spring festival, when the beginning of the navigation period was ceremonially inaugurated by the 'voyage of Isis'. The goddess's worshippers walked through the town in a long procession, wearing masks, and accompanied by music and choirs, and the first ship was then put to sea. The festival was also called *ploiaphesia*, which can be roughly translated as a 'launching'. Isis herself inaugurated the navigation for the year, as according to the myth she had been the first to set sail on a ship. There were two other important festivals, one on 24–25 December and the other on 5–6 January, dates which were also important holy days in the competing Christian religion.

The abolition of all frontiers in the Mediterranean area under the *Pax Romana*, with trade and communication among countries restricted less than at any time in history, encouraged the spread of the Isis Mysteries. Like the Jews and the Christians, the Greeks from Egypt formed small communities in all the towns of Asia Minor in order to practise their native cult, and also helped one another in other ways. Anyone who came into an Isis community did not suffer materially; he would have friends and helpers.

It is clear that the 'church' of Isis had a 'mission' during the Imperial period, and that Memphis and Rome were the holy cities. At four places in Greece and Asia Minor, when Isis sanctuaries were being excavated, identical sacred texts were discovered, depicting Isis proclaiming her power. There is therefore no doubt that propaganda was being spread. It may be assumed that there were Isis sanctuaries or shrines in all the Mediterranean ports, and also in many inland cities and towns.

The cult's growth was partly because of its rather exotic nature: the strange and mysterious rites were an attraction, and at the same time it was Hellenized to such an extent that people quickly became accustomed to it. On the other hand many Egyptian concepts still clung like tiresome and disregarded eggshells to the Isis religion. This was particularly the case with regulations concerning priests. They had to be born into the caste, as they could not be elected, they had to cut their hair, wear only linen garments, refrain from eating various kinds of food and on the whole observe many taboos. Only a native Egyptian could be considered for high office in the priesthood; a large-scale mission was impossible and in view of the tolerant nature of the religion was probably never envisaged. In any case a type of lay clergy had evolved in Greece and Rome, the 'bearers of the shrine', who held leading positions in the religious community. In Egypt itself they were a group of laymen who were called in to act in a subordinate capacity without being accepted into the priest-caste.

Mistress of the Elements

In the Roman Empire the Isis and Serapis shrines had characteristic features in common. The temples were built in the Greek style; but instead of the old roof construction they often had vaulted roofs. Most of the statues were in the Greek style but there were also those in the style of Egypt, or simply stiff-limbed statues imported from Egypt. There were also representations of Apis, the son Horus with a hawk's head, the servant Anubis with a dog's head, and the sacred animals.

Several hymns were written in honour of Isis, but *aretalogies*, reports of the miraculous deeds of Isis and Serapis which were recorded in the temple, are the most characteristic feature of the literature that developed through the worship of the goddess. For fishermen who were dying with thirst on the high seas Serapis changed the salt water into fresh water; he helped one of his priests on Delos in a critical legal dispute; and he also lengthened the life of a servant by causing a stranger to become drunk and die in his place, for this god was able to 'change the clothes of destiny'.

Michael Holford/British Museum

The exemplary mother of the ancient Egyptians, Isis was later identified with various Greek and Roman goddesses; her cult eventually became a religion of Mysteries: glazed porcelain bust of Isis *(above)* and *(facing page)* relief of the goddess; she wears a disc set between cow's horns on her head-dress

According to a recent theory, the literary form of the love story developed from these accounts of miracles. Several classical novels such as the story of Psyche and Cupid by Apuleius, would therefore be coded texts of the Isis religion.

During the period of the Roman Empire the Mysteries of Isis were strongly influenced by Greek philosophical theories. Isis is 'provider of all things in Nature, mistress of all the elements'. She embodies all contrasts: light and dark, day and night, fire and water, life and death, beginning and end. Whoever enters her service as a slave will achieve true freedom. Apuleius describes Osiris as Creator of the world.

The psychology of the Mysteries was apparently quite Platonic: the soul is not bound firmly to the body but comes from the Beyond; it plunged into the sinful body and must try to free itself and return to God. The whole life of man is governed by the goddess. The many external vicissitudes of life, all mishaps and trials, appear to be afflictions of wayward chance, of the goddess Fortuna. But if a man becomes converted and enters the service of Isis, it will be seen that all the vicissitudes were caused by Providence only in order to lead mankind to salvation. Fortuna and Providence therefore come together in Isis. The influence of the stars, blind Fate, so much feared by the people of late antiquity, was broken by Isis; her servants were confident that the goddess was standing above the stars and, as Providence, was guiding both them and Fate.

ISLAM

The faith of Islam encompasses both a simplicity that a child can understand and complex mysticism which is far beyond the grasp of the ordinary Moslem; the creed 'God is the only God; Mohammed is God's messenger' is whispered in the ear of the new-born baby, repeated throughout life and traditionally is the last utterance of the dying

ISLAM (properly al-Islam), a word which indicates submission to God, is the name given to the religiously-based system resulting from the mission of the prophet Mohammed in Arabia in the 7th century AD. One who submits is a Moslem, a title including nominal adherents. A distinction is made in the Koran between submission and belief, or faith; belief is not mere acceptance of doctrine; it involves a pattern of behaviour.

At about the age of 40 Mohammed began to receive revelations in Mecca, but he had much opposition to face, and his movement was not really established until after his migration to Medina about 12 years later, in 622. There he found a larger number of followers and gradually built up a community of Moslems, a kind of theocracy in which he, as God's representative, must receive obedience. Islam does not distinguish between the sacred and the secular; it regards all aspects of life as coming under God's control.

There are divisions within Islam, but the vast majority of Moslems belong to the main

The Koran, God's eternal and uncreated word, revealed to Mohammed, is regarded as infallible... it threatens severe punishment in the hereafter, or promises delights in the garden of paradise

body commonly called Sunnites, who developed a system with four bases. First, the Koran, God's eternal and uncreated word, revealed to Mohammed from time to time during the Meccan and Medinan periods, is regarded as infallible. It gives guidance on many subjects, summoning man to submit to God and to do God's will, threatening severe punishment in the hereafter, or promising delights in the garden of paradise, commending those who observe worship and pay legal alms, and at times expressing mystical thought in language of great beauty. But as Islam expanded many problems arose with which the Koran did not deal, so another authority was sought.

This was eventually provided in Tradition, traced to Mohammed, or at least to his Companions. During the first two centuries much energy was expended in collecting such material, but only in the 3rd century of Islam were the collections of Tradition which became canonical written down.

In the collections each tradition is preceded by a chain of transmitters, and remarks are commonly added about the quality of its reliability. An elaborate science developed regarding the transmitters, types of traditions, methods of receiving and transmitting. The chain, while an important element in deciding reliability, was not the only one.

Schools of the Sunnites

The third basis is agreement of recognized authorities, even perhaps of the general community, for a tradition represents Mohammed as saying, 'My people will never agree on an error'. This basis has an element of vagueness, for Islam has had no councils for formulating doctrines or reaching decisions. But with the passage of time matters of agreement were recognized.

The fourth basis is deduction by analogy *(qiyas)*. In earlier times some authorities gave decisions on the basis of their own opinion, or held that a certain procedure was for the good of the community. This was too subjective, so eventually qiyas prevailed; so qualified authorities form decisions by seeking an analogy in the other three bases.

According to Sunnite theory these bases provide guidance on all subjects. Schools of thought developed in Sunnite Islam, four of which survived. The Hanafi is traced to Abu Hanifa of Kufa who died in 767, but the real founders of the school were two of his pupils. It became the school of the Turkish Empire and the Indian subcontinent. The Maliki school is traced to Malik ibn Anas of Medina (d. 795) who compiled a law-book, and whose ideas were developed by followers. It is now mainly found in North Africa.

The Shafii school goes back to Mohammed ibn Idria al-Shafii (d. 820), an outstanding authority whose writings exerted great influence. He studied with Malik and spent some time in other centres, eventually settling in Egypt. This school has been predominant in southern Arabia, Indonesia, Upper Egypt and East Africa. The Hanbali school is traced to Ahmad ibn Hanbal (d. 855) who had been a pupil of Shafii. In some respects it is stricter than others. It is now found in central Arabia, and has had some influence on certain reformers in Egypt.

These schools are not sects, for there is no serious difference on matters of theology; but their views differ regarding a number of details of legal practice. The law, called *sharia* (path), is a divine law, given by God and developed from this in matters of detail under divine control. It deals with all subjects, for God's law applies in every sphere.

Sonia Halliday

Paul Watkins

The Five Pillars

In modern times adaptations have been made to the teaching of the schools. Some modern states have made selections from the teaching of different schools, but in some aspects of the law, states have separated from the sharia. In subjects such as family law and inheritance they follow the sharia, but other matters are dealt with in civil courts. To Algeria and the Indian subcontinent this is nothing new. In Turkey the ancient Moslem system has been completely replaced. Egypt and Tunisia have abolished sharia courts; the sharia family law is now administered in civil courts. Tunisia has enacted a law enforcing monogamy. There is a growing tendency for states to change the administration of the law without interfering with the conduct of purely religious practices.

There are five pillars of practical religion. The first is the recitation of the attestation of belief: 'God is the only God; Mohammed is God's messenger.' This stresses God's uniqueness and Mohammed's mission as the final prophet. It is whispered in the ear of the newly born child; it is continually repeated throughout life; it should be the last utterance of the dying; and mourners chant it as they carry the bier to the grave.

The second pillar is worship. The formal worship *(salat)* is performed five times daily, preceded by ceremonial ablution and an expression of one's intention. The times are before sunrise, after midday, in mid-afternoon, soon after sunset, and when the night has closed in. Worship is performed facing Mecca, the focal point towards which all prayer is directed being the *Kaaba*, God's House, in Mecca. Various postures are adopted, standing, bowing, kneeling, prostrating, and sitting back on one's heels. Koran verses, expressions of adoration, and some petitions are recited. Worship is essentially adoration, which may be followed by private supplications.

A certain number of sections *(rakas)* are prescribed for each period, and some supererogatory prayers are recommended in addition. These are said individually without a leader; but the prayers said in company with others in a mosque or elsewhere

The Blue Mosque in Istanbul: it is customary for Moslems to attend a mosque for midday worship on Friday, but apart from this it is not considered necessary even to pray in company; although worship is led by an imam, who stands in front of a group of worshippers, he cannot be compared with the Western clergyman as Islam allows no priest between man and God

must have a leader *(imam)* who is followed by the company in words and postures. One need not pray in a mosque, or even in company, but if a group worship together one member must stand in front as imam. Mosques have their regular imam, but he is not to be compared with a clergyman; Islam allows no priest between man and God. Attendance at the mosque is customary at midday worship on Friday, when a sermon is preached; afterwards people are allowed to resume their business, for Friday is not a sabbath.

Legal almsgiving *(zakat)*, the third pillar of religious duty, is now largely neglected because of other methods of taxation, but there are many who still pay it gladly. It is a tax on property possessed for one year, provided it exceeds a prescribed minimum. Assessments vary according to the nature of the land and whether the agricultural land is irrigated or depends on rain (the latter has a higher tax). Other criteria for the tax are animals, money and general possessions. It may be paid to a collector or directly to one of the classes entitled to benefit. In paying the intention must be expressed, otherwise it is just voluntary charity.

The fourth pillar, fasting, applies mainly to Ramadan, the ninth month of the Moslem lunar year, when one must abstain from food, drink and bodily satisfactions from early morning when one can distinguish a black from a white thread till after sunset. Travellers and invalids are exempt, but when the journey or the illness is over they should make up for the days of abstention missed. The lunar year is 11 days shorter than the solar, so the months go round the seasons in 33 years, which means that the observance is severe in hot countries when Ramadan occurs in summer.

A sincere Moslem carefully observes the fast, the only modification being in a country of high latitude with long days in summer and short in winter, when he may calculate an average length of day. Some, however, are content to fast at the beginning and end of the month, and others pay little heed. Fasting on a festival is forbidden. The two main festivals are the day of sacrifice during the Pilgrimage and the day following Ramadan, when the holiday often lasts four days. Ascetics have observed additional fasts, but Tradition states that three days at a time are the limit. Some

misdemeanours or sins of omission are expiated by fasting (see FASTING).

Pilgrimage is the fifth pillar of practical religion. In the pre-Islamic period rites were observed at the Kaaba at different times, and at some places within about 12 miles from Mecca in the twelfth month of the lunar year. The purely Meccan rite is called *umra* and the other *hajj*. The umra may be performed at any time; the hajj, which has specified days in the twelfth month, is a duty which should be performed once in a lifetime by adults who are sane and have sufficient means. Women must be accompanied by a relative. If a person has the means to observe the hajj, but is incapacitated, he may pay the expenses of a deputy to perform it on his behalf, the deputy acquiring no merit for himself.

Kissing the Black Stone

Pilgrims must halt at a station outside the sacred area and don the pilgrim garb *(ihram)*. Men wear two garments, one thrown over the left shoulder and tied at the right side, the other tied round the waist and reaching below the knees. Women wear a long robe and commonly, though not necessarily, cover the face. In donning the ihram one must express the intention. If careful about the wording, a person entering Mecca some time before the hajj may remove the pilgrim garment after the umra and resume it later in time for the hajj.

The umra consists of going round the Kaaba seven times, kissing, or at least saluting, the Black Stone fixed in the wall, praying at certain holy spots, and running seven times between two hillocks, al-Safa and al-Marwa; a rite connected with Hagar's search for water when Abraham sent her away with Ishmael.

A sermon giving instructions about the hajj is preached on the seventh day of the twelfth month, the eighth day being the first day of the hajj proper. The people go out to Mina, but some go straight on to Arafat where, from after midday till sunset on the ninth day the people stand on or round a sacred hill, this being the high point of the hajj. The pilgrims next stampede to Muzdalifa and go on the following day to Mina where there are three pillars, at which they throw stones. They are said to be stoning Satan, but the origin of the practice is not clear. Animals are sacrificed, a rite observed that day throughout the Moslem world.

This is the great festival. The head should be shaved, or the hair cut, after which ordinary clothing is assumed. For three days the pilgrims throw stones at the three pillars in the valley of Mina, at one on the first day, and at all three on the others, then go to Tanim where they put on the pilgrim dress before performing a farewell umra, after which they may leave. Many come to Mecca hoping to die there, bringing their shrouds which they dip in the sacred well Zem Zem; pilgrims commonly take some of the water home with them. Many visit Mohammed's tomb at Medina, a natural act of piety, but not a religious duty.

Islam has had its theological differences. The Koran is not a theological treatise, for Mohammed was primarily a preacher, and like many preachers he was inclined to overemphasize the point he was making. This is clear in references to God's omnipotence at one moment and to man's responsibility at another. If one chooses one's texts from the Koran, ignoring those which contradict them, it is possible to argue that man is responsible for his actions and able to do right, or that God is the only agent with man somewhat of an automaton.

Mohammed obviously did not believe the latter, for if so it would have been useless to urge men to obey God. But some who felt that he did, turned the argument against him by saying, 'Had God so willed we should not have served anything apart from him' (sura 16.37), to which Mohammed's only reply was that their fathers had spoken similarly. Discussions soon took place and parties arose.

Out of the discussions an important movement developed which made use of rational arguments to uphold its views. It was called Mutazilitism, coming from a root meaning 'to withdraw'. The conventional explanation speaks of someone seceding from the community, but there is reason to question this. The Mutazilites called themselves the people of unity and justice,

Many Moslems come to Mecca hoping to die there, bringing their shrouds which they dip in the sacred well Zem Zem

indicating two important doctrines. They believed so strongly in God's unity that they rejected the doctrine of the eternity of the Koran, as this suggested an eternal being alongside God. For the same reason they denied that God has attributes, for this seemed to indicate multiplicity; and when it was said that God's attributes were in his essence, this appeared even worse than the Christian Trinity. They held the attributes were God's essence. The insistence on justice means they held that God does what is best for his creatures, and this involves man's free will.

Some earlier Western scholars thought the Mutazilites were free-thinkers, but further knowledge has discredited this. They were sincere Moslems, and although some of them indulged in speculation, insistence on God's unity – the fundamental Islamic doctrine – coloured all their thinking. It was unfortunate that the Caliph al-Mamun issued a decree in 827 stating that the Koran is created. There was violent opposition, and an inquisition started, but so persistent was the opposition that some 20 years later the Caliph al-Mutawakkil declared official the doctrine of the eternity of the Koran, and instituted persecution of the Mutazilites.

The doctrine of al-Ashari (d. 935) who had been brought up in Mutazilite teaching but eventually abandoned it, and of others like him, was argued by rational methods learned from them. The Sunnite theology hardened under the scholastic theologians, among their chief doctrines being the eternity of the Koran, God's decrees, an acceptance of Koranic anthropomorphic phrases without asking how they could be used of God, and acceptance of items of eschatology, such as the bridge over hell (see INTERROGATION OF THE DEAD).

An attempt at mitigation was made regarding the decrees by a doctrine called *kasb* (acquisition), meaning that while God is the only agent, man can acquire his actions. It has been said this means little more than that man is the place where they occur. 'God will not burden any soul beyond its power. It will be credited with the good it has acquired and debited with the evil it has acquired' is claimed as a basis for the doctrine. Some may argue that if God is the only agent it matters little where his actions occur, and man's being credited or debited with actions cannot be called just.

The famous mystic and theologian, al-Ghazali (d. 1111), argued that tyranny can occur only when one interferes with another's property. As all property is God's, what he does cannot be called tyranny. This may do justice to God's omnipotence, but it suggests a low conception of man. One must not, however, assume that because of theological doctrines all Moslems are fatalists. There is an element of fatalism, especially among the common people, but no one can be a practical fatalist. Many stoutly uphold man's free will.

The Path of the Sufis

There were ascetic tendencies in early Islam, connected with which a significant movement developed. This was that of the Sufis, a name derived from *suf* (wool) referring to the coarse woollen garments of ascetics. Sufis have similarities to mysticism in other religions, but their beliefs are closely related to the Koran and Mohammed. Those who wished to join the Sufis normally attached themselves to a spiritual director who demanded implicit obedience as he guided them in following the Path and controlled their excitable tendencies.

From the 12th century Sufi orders developed, tracing themselves to some great Sufi. In addition to the prescribed prayers they have their own rituals observed by those who spend their lives in worship and by others who visit their centres to share worship. A typical practice is the *dhikr*, which may consist of repeating the name Allah, or some sacred phrase, and is often associated with music which has no place in mosque worship.

Many Moslems have held that there is something evil in music, especially stringed and wind instruments, which have been called the Devil's pipes. A dance may also be associated with the dhikr, the Mevlevi dervishes being specially noted for this (see DERVISH). The dhikr may lead to a state of trance, novices being under the supervision of a spiritual director.

The Sufi Path has for its goal union with God, and some Sufis have uttered what orthodox Moslems consider as blasphemy. A notable example is the saying of al-Hallaj, 'I am the Truth', for which he was crucified in 922. There are sometimes suggestions of pantheism, especially connected with the doctrine of the Oneness of Being which teaches that God is the only absolute reality. But Sufism found a place within Islam, thanks largely to the influence of al-Ghazali, the great teacher who resigned his chair in Baghdad and devoted himself to solitude for 11 years.

Belief in the virtue of saints developed, and still has a firm hold on the common people. There are different categories of saints, in descending scale from those who sustain the world to saints connected with Sufi orders and local saints. They have the virtue of conveying blessing *(baraka)*, so their tombs are often visited and their prayers are sought. Each saint has also a special season when people gather at the tomb for the annual visit *ziyara*, when a fair is held.

In North Africa *marabouts* (hermits and monks) exert great influence, both alive and dead, and are consulted in time of need. In Shiite Islam visits are paid to the shrines of the *imams* (hereditary semi-divine rulers) at Meshed, Karbala, Najaf and Kazimayn; and so important are the imams that many feel such visits are equivalent to the hajj.

In the early period the caliphate's role was also important although at no time had the caliph the right to determine matters of faith, however some might have liked to do so. He is not to be compared with the pope, as was sometimes done in the past. He was simply the defender of the faith and head of the community.

The Imams of the Shia

There is, however, within Islam a party which considers a leader of paramount importance. This is Shiite Islam, the official religion of Iran and the religion of important communities in Iraq, India, Pakistan and elsewhere. The Shiites speak of an imam whose function as a leader is more comprehensive than that of a caliph. The movement, with political origins as is characteristic of Islam, developed among supporters of Ali, Mohammed's cousin, who, they felt, should have been first caliph.

In the course of time some doctrines, different from those of the Sunnites, began to develop. The Imamites, the main body of the Shia, believe in 12 imams, the first being Ali, the next two his sons al-Hasan and al-Husayn, and the remainder in direct line

Sonia Halliday

Sonia Halliday

The basis of the Islamic faith was founded on revelations received from God in about AD 610. However, the movement was not truly established until some 12 years later; even then there was strong opposition in many quarters to the teachings. Fierce battles were fought with the unbelievers. These miniatures from the Topkapi Museum in Istanbul show some of the major events in the history of Islam. These include some interesting battle scenes, in which the enemy forces make use of elephants in their cavalry

of descent from al-Husayn who, with his followers, was killed at Karbala, an event which is remembered annually. The imams are held to be sinless, and it is believed that a divine light passed from one to another. The 12th imam, Mohammed al-Muntazar, withdrew from human affairs in 878, but is still ruling the world. At its opening early this century the first parliament in Iran was said to be held under the auspices of the hidden imam.

The imams are invested with an almost divine aura, not conveying any idea of incarnation, but rather that they are endowed with divine qualities. The 12th imam, who is to return at the end of the age, is believed to have absolute rule. Love of the imams is necessary for salvation. It is believed that on the bridge which all the dead must attempt to cross, one of the barriers is love of the imams. No one lacking this can cross.

Shiites have their own collections of traditions, transmitted through imams, but there is no place for the analogical deduction and consensus of recognized authorities of the Sunnites. Instead there are *mujtahids*, 'men who exert effort', agents of the imam, who have complete knowledge of the Koran and traditions and guide the people.

In doctrine Shiites teach free will, and they differ from Sunnites in minor details of ritual, as well as adding a phrase to the call to prayer. A temporary marriage with a specific date for its termination is allowed. A Shiite may dissemble his beliefs when in danger because of them.

The Ismailites are a smaller branch of Shiites, but came into prominence earlier than the Imamites. They believe in seven imams. A dynasty was established in Tunisia in 910 headed by Ubaydallah, called the Mahdi, a reputed descendant of Mohammed's daughter Fatima. This was the Fatimid Caliphate which conquered Egypt and ruled there till overthrown by Saladin in 1171. During its ascendancy Egypt was a centre of culture, and many Fatimid buildings and works of art remain.

There have been splits among the Ismailites. The Aga Khan, head of one section, is invested with an element of divinity. The Nusayrites in north Syria broke off from the main stream, a notable feature of their doctrine being belief in Ali's divinity.

'The Only True Moslems'

Another early split in Islam was that of the Kharijites who had fought on Ali's side against Muawiya, but objected to the dispute being put to arbitration. They were originally warlike and puritanical, some more so than others, and for long were a thorn in the side of the caliphate.

They taught free will, insisted that faith must be proved by works, held that serious sin is apostasy, and felt they were the only true Moslems. They admitted no superior class or hereditary claim, holding that anyone, no matter what his origin, was eligible to become caliph, provided he was a sincere Moslem and possessed the requisite qualities. If a caliph proved unworthy he could be deposed. For them fighting to spread the faith was a missionary task.

Today they are represented by the Ibadites in Oman, East Africa, and parts of North Africa, but are not uncompromising like their ancestors. They are prepared to intermarry with other Moslems, making no excessive claims for themselves. They do not believe the Koran is uncreated, they allegorize Koranic anthropomorphisms, and hold that serious sinners will go to hell for ever, contrary to the common Sunnite view that Mohammed will intercede for his people and that all who have had a grain of faith will eventually be taken from hell.

Early Islam saw much fighting, first in Arabia, then farther afield. The word *jihad* (striving) has been used for what is called the holy war, but it has a much wider connotation. The Koran rebukes men who failed to go out to fight, but Mohammed was fighting against Arab pagans.

In later times many have argued that jihad is not primarily armed conflict, but

Sonia Halliday

Moslem worship is essentially adoration of God, and is performed facing towards the Kaaba, the house of God in Mecca: the worshippers recite verses from the Koran, expressions of adoration of God, and sometimes pray for God's help: Moslems praying in Dakar, West Africa

Picturepoint London

is striving in general, the hardest struggle being that against one's lower nature. This does not mean that the sphere of Islam was not spread by the sword in many regions. The extensive domains, at one time stretching from Spain to the borders of China were certainly gained by fighting; but the fighters were more interested in spreading the sphere of Islam than in compelling conversion, for Jews, Christians and others with scriptures were accepted as protected peoples and allowed to retain their religion.

In many regions the extension of Islam has been due to the influence of traders, notably in Malaya, Indonesia and farther east, also in East, Central and West Africa. In addition Islam has conducted a lively missionary work in Europe and America.

In the 19th century a new spirit seemed to be stirring within Islam. A strong movement for a liberal presentation of Islam was making its views known. Thinkers such as Sir Mohammad Iqbal, Abdul Kalam Azad and Asaf A. A. Fyzee advanced ideas that would bring Islam into line with modern ideas, and laws passed in the mid 20th century reflected this. Women in Iran, for example, were given a greater degree of equality and the wearing of the *chador* became an anachronism. But in the late 1970s, a conservative backlash showed that a majority of Moslem fundamentalists disapproved of the relaxation of traditional values. In 1979 Iranians led by religious leader Ayatollah Ruhollah Khomeini overthrew Mohammad Reza Pahlavi, the Shah of Iran, thereby ending the constitutional monarchy and declaring the country an Islamic republic. The new government based its laws on the teachings of Islam. In the same year Islamic zealots occupied the great mosque of Mecca, an act that brought about changes to enforce Islamic law more strictly.

The shooting of the Egyptian president Sadat in 1981 raised many questions as to where responsibility lay. Again, Moslem fundamentalists had been vocal in their disapproval of governmental flouting of Islamic principles.

In Iran, women now veil themselves again, and the practice is becoming usual in other Moslem countries.

The religious fundamentalists who held the Grand Mosque made similar protests against the Saudi Royal Family that the Iranians made against the Shah: profligacy and corruption of royalty had led to the collapse of morality in the kingdom. It is this belief, that adoption of the ways of other cultures leads to the erosion of the best Moslem principles, that has ensured the current ascendancy of conservatives over liberals.

The witches of Italy were famed as masters of their craft. They were heirs to a tradition which reached back to the time of the Romans and Etruscans and which continues today, particularly in Sicily and the south

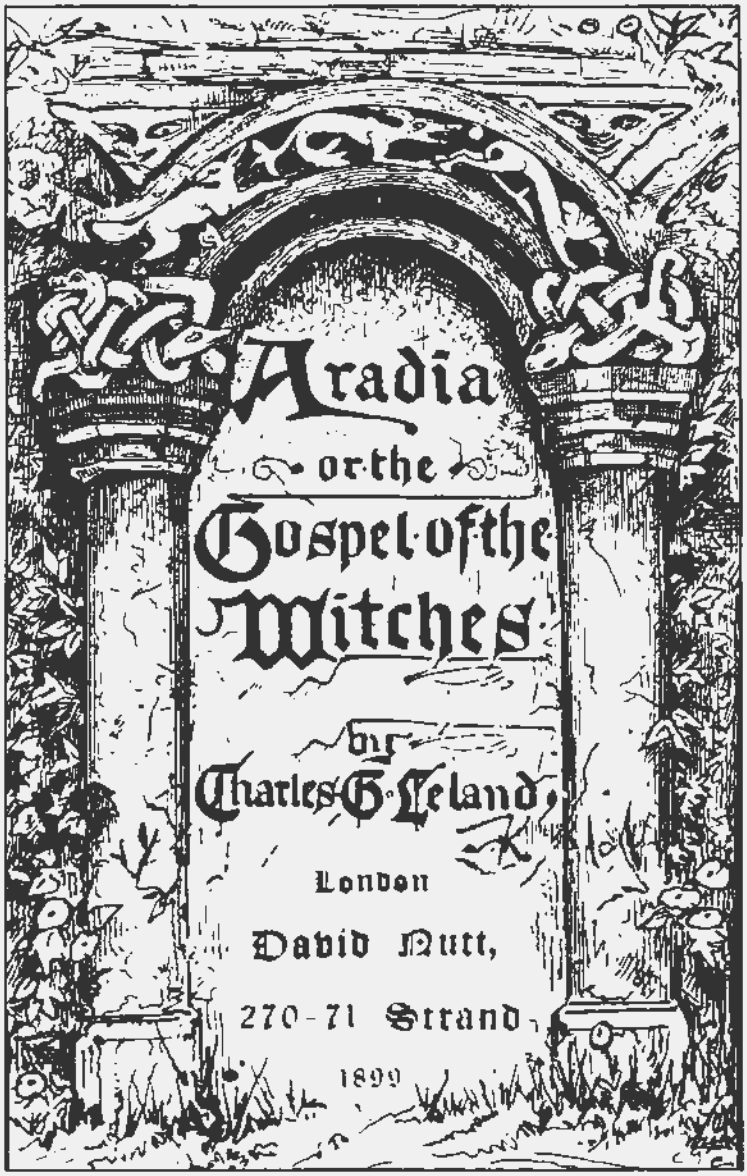
ITALIAN WITCHCRAFT

LA VECCHIA – the Old Religion – is still the title given to both black and white witchcraft in Italy and Sicily. Since these practices have their foundations in the beliefs of the ancient colonizers, the name is highly appropriate.

Greek, Etruscan and Egyptian rites were incorporated into the official Roman religion; and astrology, augury and divination were employed in imperial policy making. Yet it is important to understand that pagan authority condemned the dark side of magic just as zealously as the Inquisition of Christian times. Frequently, all sorcerers were driven from Rome, accused of harming state or emperor with their evil spells. Nocturnal ceremonies to invoke the infernal deities, the making of wax images and the tying of knots to cause pain, death or sexual impotence, and of course the manufacture of poisons (employed to speed up the supernatural processes) were offences punished by crucifixion or being thrown to the wild beasts.

The Roman poet Horace (1st century BC) among other classical writers described the feared magical practices in minute and horrifying detail. Apuleius (2nd century AD) gave an account of old and ugly crones and their gruesome art in *The Golden Ass*, a story about a young man who is turned into an ass through dabbling in witchcraft. The similarity between their exploits and those revealed under hideous torture during the witchcraft trials, some 1400 years later, is quite startling. Another of his works, the *Apologia*, made a careful distinction between harmful and helpful magic, the

The people of southern Italy, perhaps more than anywhere else in Europe, still retain their belief in witchcraft. Villagers in a remote district of the Campania burn a lamb in a ceremony designed to keep witches at bay *Patellanni*



Above left Pope Urban VIII: in the early 17th century, three friars, a cardinal's nephew and a notorious sorcerer were convicted of casting spells and holding a mortuary mass in an attempt to shorten his life *Above right* Title page from *Aradia,* the book in which Charles Leland described the practice of witchcraft in Italy and Sicily; Aradia, or Herodias, was the daughter of Diana, goddess of witches

latter including astrology and the conjuration of demons to give the sorcerer advance knowledge of future events. The Roman witch, therefore, named *strix*, *saga* or *volantica* – nocturnal bird, wise woman or night flyer – was the forerunner of the Italian *strega*, the peak of whose dreadful persecution endured from the 15th to the 18th century.

In the first years of Christianity all private magical rites were forbidden and only public augury permitted. The Ostrogoths, who invaded Italy under their leader Theodoric in the 5th century, were Arian Christians; they classified divination as paganism, and therefore an offence to be punished by death. In 500 AD all sorcerers were driven from Rome. When in the following century the Lombards reached Italy they sold magicians as slaves outside their province, irrespective of whether the magic was successful.

Pagan Under the Skin

Only fragmentary evidence exists of witchcraft during the Dark Ages. While feudal rulers fought to gain control of the new kingdoms left vacant by the collapse of the Roman Empire, the Church was involved in consolidating her own supreme authority over temporal powers and destroying the early heresies. It took many centuries for the majority of simple folk to absorb Christian tenets. Gradually pagan temples were rededicated, and St Apollinarius presided over the healing spring which had once belonged to Apollo. For a long while Christianity must have been only a veneer covering far older customs, especially since the priests were often not much better informed than their ignorant flocks. The evidence produced by the Inquisition shows that paganism and Christianity merged into a curious paradoxical faith.

Though virtually at the heart of Christian Europe, Italian peasants adhered to their ancient rites and beliefs. In the lonely glades and woodlands set aside for such pre-Christian revels they continued to honour Venus, Bacchus or Diana Herodias. The last goddess was the evil spirit said in later centuries to lead countless bands of witches on flights through the night. It is reasonable to assume that the pagan gatherings survived in the form of the notorious witches' sabbaths.

Two strands must be distinguished in Italian witchcraft. The wise women dealing in love and healing potions, and their destructive opposites, who told simple fortunes, gathered herbs by moonlight and muttered charms, were only to be found in country regions. Although sometimes subjected to village lynch laws the pastoral witch, on the whole, remained unharmed until the hysterical outburst against witchcraft provoked by the Inquisition at the beginning of the 15th century.

Her urban counterpart, associated with the major cities of Rome and Naples, was a more sophisticated exponent of magic, a descendant of the classical sorcerers. Such people studied astrology and divination, and their interests extended to alchemy, medicine and astronomy in pursuit of a wider knowledge of the universe. Their clients were not an illiterate peasantry but the educated members of the ruling class.

The Church's attitude to sorcery was imprecise and depended upon the varying opinions of her leaders. Among the educated

Federico Arborio Mella

there was a passion for knowledge and desire to see into the future, using part-magical, part-scientific processes. Popes, kings and learned men studied astrology and thereby indulged in the same grisly practices ascribed to sorcerers. To the superstitious anyone seeking to probe the unknown was disobeying God's laws, approaching heresy or in league with the Devil.

Poisons and Potions

Throughout history the particular Italian failing seems to have been making and using poisons. With their potions the witches were apparently following the national tradition. One of the earliest examples of secular legislation against such practices was instigated by the 12th century Norman king of the Two Sicilies, Roger II. He stated that the concoction of love potions, whether they worked or not, was a crime. In 1181 the Doge Orlo Malipieri of Venice also passed laws punishing poisoning and sorcery.

Emperor Frederick II of Sicily (1194–1250), known for his wide learning as '*stupor mundi*', 'the wonder of the world', employed Saracen diviners and invited to his court the Scottish sage, Michael Scot, who was reputed to be a wizard. With Frederick's permission his astrologers practised the forbidden augury, using flights of birds and victims' entrails, but the Emperor had no real belief in sorcery, despite the reputation his clerical adversaries gave him. He upheld the law made by Roger, and set down that anyone tampering with food or drink to provoke love or hatred must be executed if the recipent died or lost his senses; if nothing happened the would-be sorcerer faced a year's imprisonment.

Throughout the 13th century sorcery was in Italy an offence punished in the secular courts. Astrology was not included among the forbidden arts, and papal decisions were sometimes made with the aid of astrologers. Every royal court in the kingdoms which made up Italy had its resident astrologer. But such practitioners, even though they were respected and believed, walked on thin ice. If, like Peter of Abano and Cecco d'Ascoli, they were led by their studies into heresy, they were in as much danger from the Inquisition as the sorcerers.

The witch mania which swept through Europe reached Italy in the mid-15th century; the northern territories, nearest Germany, were particularly affected. The more the Inquisition sought, the more cases of witchcraft came to light. Papal Bulls, like the one issued by Innocent VIII in 1484, turned the persecution of witches into an uncontrolled epidemic. In the first year of its publication 41 people were burned in

Como after the zealous investigations of the Dominican Inquisitors.

Fear, ignorance and superstition, fanned by the desire to stamp out heresy, sent countless innocent people to the stake. Anything out of the ordinary was thought to indicate witchcraft. A woman, neither young nor pretty, who inspired love in a man, would be suspect. The village wise woman who healed, procured abortions or made love philtres was naturally assumed to have the Evil Eye and to work in conjunction with demons. When children became sick their hysterical parents sought a scapegoat and confused, lonely old women were accused of witchcraft. The most terrible tortures were then employed to extract confessions. Details of witches' sabbaths obtained in this way varied very little from those found in the rest of Europe, which suggests that the Inquisitor, wherever he might be, asked the same questions until the required answers were given.

La Volta

One particular characteristic of Italian witchcraft was the dance called La Volta. This was described as having such fantastic leaping steps as to make it incredible to the onlookers. At Como and Brescia children between eight and twelve years old, who had attended sabbaths but been reclaimed by the Inquisition, performed this dance. It appeared so difficult and skilful that the learned men concluded it could not have been learned from human beings.

It is not really surprising that reports were soon circulating which suggested that witches would outnumber the faithful. In 1510, 140 witches were burned at Brescia, and 300 in Como four years later. Fantastic stories spread that at least 25,000 people attended a sabbath near Brescia. At Valcanonica 70 more people were burned and the Inquisitor claimed to have another 5000 under suspicion.

Venetian secular authority protested vigorously because the area was threatened with depopulation. In theory, the secular court was supposed to carry out the sentences if they agreed with the findings produced by the Inquisition. In 1521 Leo X issued a Bull which gave the real state of the law, and showed that the secular court was expected to do no more than confirm the proceedings. The Inquisition was given the right to use excommunication and interdict if sentences on witches were not carried out.

The Venetian Council of Ten bravely produced a most enlightened reply and suggested proper legal regulations for future trials. They pointed out that the witch-hunters' greed for money prevented anyone from being found innocent, adding that if so many of the ignorant peasantry were in error they had need of really good preachers rather than persecutors. Such sensible attitudes were ignored.

More sophisticated magicians turned hurriedly to astrology to prevent being charged with witchcraft, but the Italian sorcerer's reputation was known far afield. When in 1439 a French baron, Gilles de Rais, had wanted to procure gold by supernatural means he had sent to Florence for a priest and necromancer named Francesco Prelati (see GILLES DE RAIS).

Despite his thirst for knowledge the cultured man of the Renaissance was extremely superstitious. The new classical studies revived interest in magic. Omens were studied. There was a widespread belief in ghosts, and in ceremonies that could evoke devils to do man's bidding. Such attitudes among literate people increased the witch-hunting atmosphere.

Devils in the Colosseum

In his autobiography, the great goldsmith and sculptor Benvenuto Cellini wrote of a learned Sicilian priest who invited him to take part in some magical ceremonies to conjure up the spirits of the dead. Accompanied by some friends, Cellini went to the Colosseum. The priest donned sorcerer's robes, drew circles on the ground and heated perfumes. The rites continued for an hour and a half, in which time Cellini said the Colosseum was filled with legions of devils.

In a notorious case in 1633 the pope himself was the victim of sorcery. A certain Giocinto Centini was told by a prophecy that his uncle, Cardinal d'Ascoli, would be the next pope. In order to shorten the life of the present pope, Urban VIII, Centini hired an Augustinian friar and notorious sorcerer, Peter of Palermo. Two other friars helped cast spells and celebrate a mortuary mass. Their attempts failed and they were all arrested.

A picture of a typical sabbath emerges from the evidence at a witch trial in 1646 when an old woman known as La Mercuria was arrested at Castelnuovo. Long suspected of being a witch, the woman was charged with the offence that, instead of swallowing the host at two Communions, she held it in her mouth to use afterwards for some devilish purposes. It was also alleged that her spells had caused a young noblewoman to miscarry. Under torture La Mercuria named other witches who in turn were tortured. One, Domenica Gratiadei, described the sabbaths at which they feasted, danced and worshipped Satan. They smeared themselves, she said, with ointments made from dead babies, among other equally appalling ingredients, and then had sexual relations with the Devil, to whom they also gave the hosts they had purloined. When the trial ended in 1647, eight people were beheaded and their bodies burned.

In 1789 Giuseppe Balsamo, known as Count Cagliostro, and his wife set up as sorcerers in a house in the Piazza Farnese in Rome (see CAGLIOSTRO). His illustrious clientele included princesses and priests. Three years later the Inquisition condemned him to death. Pope Pius VI commuted the sentence to life imprisonment and shut Cagliostro's wife in a convent.

At the end of the last century Charles Leland wrote a book entitled *Aradia*, in which he described practices that were still rife in Italy and Sicily. In most cases witches claimed to be descendants of families where the craft had been practised for generations. At their sabbaths they wore no clothes, said incantations over meal, salt, honey and water, and worshipped Diana and her daughter Aradia, or Herodias, as the female messiah. After supper they danced, sang and had sexual intercourse. Stones with natural holes through them were valued as having special powers, and the witches dealt mainly in the preparation of love philtres.

Almost more than anywhere else in modern Europe, the people of southern Italy and Sicily still retain the customs of La Vecchia. The Evil Eye is feared and the phallic sign invoked to destroy its power. Wax hearts and images are stuck with pins, and wise women consulted for charms to make people fall in or out of love, and to gain lucky lottery ticket numbers.

JACK

Mary Evans Picture Library

Jack in the Green – a man hidden inside a framework covered with green boughs – figured in the old May Day festivities, often representing the spirit of the reviving vegetation

AS LONG AGO as 1414 it was recorded that anyone called John was likely to be nicknamed Jankin or Jack, and Jack also very early became a general term for an ordinary man, one of the common people. In the Coventry Mystery Plays and the Towneley Mystery Plays, both dating from the mid-15th century, the names Jack and Jill are used to mean any boy and girl.

Jack is the central character of several nursery rhymes. One of them is 'Jack Sprat', which in a version of 1639 also contains Jill – 'Jack will eat no fat, and Jill doth love no lean'. Another is 'This is the house that Jack built', first printed in 1755, in *Nurse Truelove's New-Year's-Gift: or, the Book of Books for Children*. But the rhyme is probably much older and has equivalents in many European languages. Then there is 'Jack and Jill' itself, which seems to date from c 1600–1650, though it has often been suggested that it contains older mythological and folklore themes, partly because the top of a hill is the last place to which anyone would normally go for water. One theory is that it is based on a Scandinavian myth in which the two children are kidnapped by the moon while they are drawing water. They can still be seen in the moon, with the water-bucket hanging from a yoke on their shoulders.

The Wise Fool

Jack is also the hero of many folktales, well-known in Britain and the United States, and with parallels on the Continent where the central character's name is Hans, Jean, Juan or whatever is the local equivalent. Jack is sometimes the wise fool, the young man whose rustic naivety is really an openness to experience that brings him rich rewards, rewards that are denied to the more cynical and materialistic. Sometimes he is the crafty, aggressive opportunist who tricks the stronger but stupider giant (and the popularity of the stories may owe something to the underlying motif of the common man turning the tables on the rich and powerful).

An example of the 'wise fool' role is the story of 'Jack and his Bargains', in which Jack is the son of a poor farmer who is heavily in debt and sends Jack to sell a cow at the fair. This happens three years running and each time, to his father's despair, instead of selling the cow for a good price, Jack exchanges it for something magical, first a wonderful stick which beats people on command, next a dear little bee with a lovely singing voice, and finally a beautiful fiddle that plays by itself. But all turns out for the best, because Jack and his three magical possessions are the only things which can make the king's daughter laugh, for she has never been known to smile. So Jack is given her hand in marriage, 'an' if they ain't dead, they're livin' yet.'

The famous tale of 'Jack and the Beanstalk' begins in much the same way, with Jack being sent by his poor widowed mother to sell a cow, but he exchanges it for five magic beans which, planted in the evening, have grown by morning into a towering beanstalk which reaches to the sky. The insatiably curious Jack promptly climbs up it till he comes to the sky, where he finds an enormous woman in an enormous house. She is the wife of an ogre who loves to eat 'boys boiled on toast', and when the ogre appears she hides Jack in the oven. The ogre sniffs the air and says:

> Fee-fi-fo-fum,
> I smell the blood of an Englishman,
> Be he alive or be he dead,
> I'll grind his bones to make my bread.

The ogre's wife puts him off the scent and while he is asleep, Jack steals a bag of gold and takes it home. On later visits he steals a hen that lays golden eggs and a golden harp which plays by itself. Eventually the ogre catches Jack red-handed and chases him down the beanstalk but Jack cuts the beanstalk down with an axe. 'Then the ogre fell down and broke his crown and the beanstalk came toppling after' (there is a parallel line, of course, in 'Jack and Jill'). Jack and his mother become very rich on the giant's treasures, he marries a princess and they all live happily ever after. The version current in the hill country of the American South follows the same pattern but the objects Jack steals are a rifle, a skinning knife and a coverlet with gold or china bells on it.

In this story Jack turns from wise fool at the beginning to crafty trickster by the end, and one begins to feel rather sorry for the giant. Again, attempts have been made to discern mythological themes under the

surface. According to one not very probable theory, the bag of gold stands for raindrops, the hen for the sun and the harp for the wind, and the whole story is about the restoration of the fertilizing activities of the forces of Nature to the earth.

The Giant-Killer

Jack's greatest fame is as a slayer of giants. One version of 'Jack the Giant-Killer' is set in Cornwall in the time of King Arthur and Jack kills the giant of St Michael's Mount, who in early Arthurian legend is slaughtered by Arthur himself. This giant, named Cormelian, is 18 feet high and 9 feet round. Jack digs a pit outside the giant's cave, camouflages it with a covering of sticks and earth, and then sounds a blast on his horn. Cormelian rushes out, falls into the pit and is finished by a blow from Jack's axe. Jack is awarded the giant's treasure.

Later, putting up for the night at a house, Jack discovers that it belongs to another giant, who welcomes him in. But in the night Jack hears the giant singing to himself, 'Though here you lodge with me this night, you shall not see the morning light; my club shall dash your brains outright.' So Jack puts a log of wood in his bed. The giant creeps in and batters the log with his cudgel. Astonished to find Jack alive and well in the morning, the giant gives him a hasty pudding for breakfast. Jack puts it in a bag and hides it inside his coat. Offering to show the giant a clever trick, he stabs the concealed bag with his sword and the pudding tumbles out. The giant tries the same trick, plunges a sword into his vitals and expires.

There are many versions of the giant-killing story, differing in detail and containing many motifs known in folktales. They are part of the widespread general theme of the human hero who outwits a giant, kills him and so obtains his treasure.

Jackal

In Indian folktales, a shrewd and cunning animal, like the fox of European folklore which it resembles; as a scavenger and eater of carrion, often associated with death; Anubis, the Egyptian guardian of cemeteries who guided the dead to the judgement of Osiris, was depicted as a jackal or dog: traditionally a timid creature, and Bushmen would not eat the heart of a jackal in case they should become cowardly themselves.

JADE

THE TOUGHEST STONE on earth, jade has been used since prehistoric times for the making of tools, ornaments and weapons. It has also, among certain peoples, been credited with mystical significance and medicinal properties. The English word 'jade' comes, through the French, from the Spanish *piedra de ijada*, the 'stone of the loin'. The mineral acquired this name because Europeans first encountered it not, somewhat surprisingly, in their contacts with the Far East, but when the Spaniards invaded Mexico early in the 16th century. The Aztecs offered their unwelcome visitors objects and pebbles of jade which they themselves regarded as of the highest value, not only for their beauty and rarity but because of their powers of healing.

Jade was considered effective for curing and warding off ailments of the groin and kidneys. (Hence it was also sometimes called the 'kidney stone', which ultimately led to the use of the word 'nephrite' for a variety of jade, from the Greek for kidney.) Sir Walter Raleigh, writing his *Discoverie of the Empyre of Guiana* in 1596, tells how the 'Amazones' would barter gold for jade to treat disorders of the spleen. It may be that as jade was harder than all other stones, it was thought it would break up gallstones and kidney stones. It seems that the original inhabitants of Central America treated these ailments by laying jade against the skin near the affected part, encouraged

sometimes by the stones being similar in shape to the diseased organs. However, 50 years after the discoveries of Cortez, European doctors were recommending jade, crushed and powdered and mixed with water, as a specific not only for spleen and kidney troubles but for a variety of more common ailments, including biliousness and swollen feet. We may be sure, however, that quacks and charlatans took advantage of the simple-minded and did not scruple to use other ingredients when claiming to prescribe jade. Perhaps this was as well, since powdered jade taken in any significant quantity would be harmful, if not fatal.

Some experts make a similar point about the Chinese use of jade for medicinal purposes; they suggest that what their doctors claimed as jade may in fact have been a form of marble, similar to Parian marble, which can often look very like off-white jade and is less harmful when taken. Chinese physicians prescribed 'liquor of jade' for manifold disorders, from weak blood to asthma, and pronounced it good for the voice and for shining hair. They believed that the material grains of jade passed through the body, while its immaterial virtue remained to do its healing work. The Chinese also believed that jade could prevent, or at least retard, the decomposition of corpses. The nine orifices of the body were stopped with jade plugs or had amulets of the mineral laid upon them – a cicada on the tongue and almond-shaped discs on the eyes. The Aztecs and certain Pacific islanders had similar customs.

Stone of Emperors

Jade objects have been regarded in many parts of the world as talismans of good luck – a belief that survives to the present day, even in 'advanced' countries. The most intriguing examples of these talismans are the *hei-tiki* of the Maoris of New Zealand. (There are quantities of jade in the South Island.) Hei-tiki are curious amulets or pendants resembling a little man. Some believe them actually to picture the human embryo and to be symbols of fertility but others consider they represent a more abstract idea of continuing life force. The objects are handed down in families or from friend to friend. Eskimos and North American Indians also regarded jade as lucky but did not appear to attach mystic or medicinal significance to the stone.

It is the Chinese above all who have held jade in the greatest veneration. The Chinese word for jade, *yu*, also signified beauty of spirit or body and the stone was a symbol of the five cardinal virtues of charity, modesty, courage, justice and wisdom. The ideogram or written character also signified jewel and treasure. Jade was considered the most precious and beautiful substance of all. The emperor wore jade sandals, worshipped at a jade altar and carried a jade seal and sceptre. The stone was used for badges of high rank and for the most prized grave ornaments, as well as for the loveliest works of art.

The most sacred Chinese objects made of jade, from the earliest times, included symbols of heaven and earth and of the deities of the four cardinal points of the compass. Heaven was represented by the *pi*, a circular disc with a hole in the middle, and earth by the *ts'ung*, a vertical cylindrical tube, square on the outside. The god of the east was symbolized by a green tablet, that of the north by a ring, the deity of the south by a red sceptre and that of the west by a tiger tablet. These objects are frequently of astonishing beauty and are among the supreme achievements of Chinese, or indeed of human, art. A typical example of the more practical side of the Chinese genius is the use of a jade plate as a tiny gong. Records of the 23rd century BC show that jade's ability to produce a pure musical tone was known even at that early date.

Jade Queen of the West

It is interesting that jade is not found in China proper. For thousands of years all the jade worked in China came from the far west, from what is now the province of Sinkiang. It was not until 1784 that a regular trade in Burmese jade began. An ancient Taoist legend reflects the distant origin of jade. It tells how the beautiful Jade Queen lived in a fabulous palace in the inaccessible Mountains of the West. She was sought out by the emperor, who reached her fastnesses in the course of a single night by riding eight bewitched stallions in turn. Another ancient Chinese tale relates that the moon is the home of Yu-t'u, the Jade Hare, who brews the elixir of life from crushed jade.

Jaguar

An animal which plays an important part in South American Indian myths, being regarded as a brother-in-law, as man's rival in killing game, and as a rival in sexuality: some tribes believe that the hero who gave them their culture was a jaguar and that a Celestial Jaguar will one day make an end of the world: in Brazil it is thought that the sun takes the form of a jaguar at night and shamans are possessed by the jaguar spirit, sometimes turning into were-jaguars at death. See BRAZIL.

Constantino Reyes-Valerio

Non-violence is carried by the Jains to an extreme; this small but influential Indian sect go to elaborate lengths to prevent the accidental killing of even a fly or a mosquito, or the harming of atoms in wind or water

JAINS

THE RELIGION of the *Jains*, or *Jainas*, an Indian community some 1,700,000 persons strong, is of great antiquity. It derives from the same school of thought which produced Buddhism and the Sankhya philosophy (a branch of Hinduism). Whereas Buddhism, whose origins roughly coincide with the growth of Jainism, became a world religion, the latter remained confined to India. The onerous demands its austere doctrine makes on its adherents as well as its uncompromising atheism may have militated against its spread to other countries and restricted its appeal even within its homeland.

The name Jainas is derived from the title *jina*, 'the conqueror', given to Mahavira, the last of the prophets or saviours of the Jain faith. Mahavira, a historical figure and contemporary of Buddha, born about 540 BC, has sometimes been described as the founder of Jainism and his was certainly a prominent role in the development of the community and its ideology. But Jains regard him not as the first but as the last of a long line of saviours, a line believed to stretch far back into primordial times. The traditional number of these saviours is 24. They are said to have attained complete liberation from the world. They are transcendent, cleaned of temporality, omniscient, actionless and absolutely at peace.

The 23rd Saviour

The penultimate saviour, Parsva, is supposed to have attained liberation 246 years before Mahavira, that is, about 743 BC. There is reason to believe that Parsva actually lived and taught a doctrine approximating to the historic Jain ideology. His life story as preserved in Jain tradition is a prototype for the lives of all Jain saints. In his previous incarnation he ruled as the god Indra in the 13th heaven, and when

the time for his return into the human world came he descended into the womb of Queen Vama, the wife of King Asvasena. He grew to be a prince of great beauty and strength, but showed no interest in mundane pleasures and ambitions. He renounced the world and achieved a state of omniscience by overcoming his *karma*, the accumulated results of deeds in previous existences (see KARMA). After this enlightenment he lived for many years teaching and moving among mankind until he died at the age of 100. Parsva, like the previous 22 saviours, revealed by his example and teaching the Jain religion, which is believed to he eternal, having existed throughout the ages from the very beginning of time.

Vardhamana Mahavira, far from being the 'founder' of Jainism, was the son of pious Jain parents and worshippers of Parsva, who were of Kshatriya caste and lived in Bihar near the present town of Patna. He married and had a daughter, but like the Buddha he left his family and possessions and led the life of a wandering monk, preaching and gathering many disciples. Though Mahavira and the Buddha moved through the same country at the same period, and both attained great fame in their lifetime, there is no record of any meeting of the two great religious figures.

The disciples of Mahavira were organized in communities of monks and nuns, to which their leader gave a constitution and a code of laws. According to tradition his followers consisted of 14,000 monks, 36,000 nuns, 150,000 laymen and 358,000 lay women. At the head of these communities were 11 chief disciples; there was great emphasis on discipline and a rigid regime of austerities, penances and fasts, besides meditation and daily routine duties.

For some two centuries the Jains remained a small community of monks and followers. But in the 4th century BC they gained strength and spread from Bihar to Orissa, then to South India and westwards to Gujarat and the Punjab, where Jain communities became firmly established, particularly among the mercantile classes.

Clad in Space and Whiteness

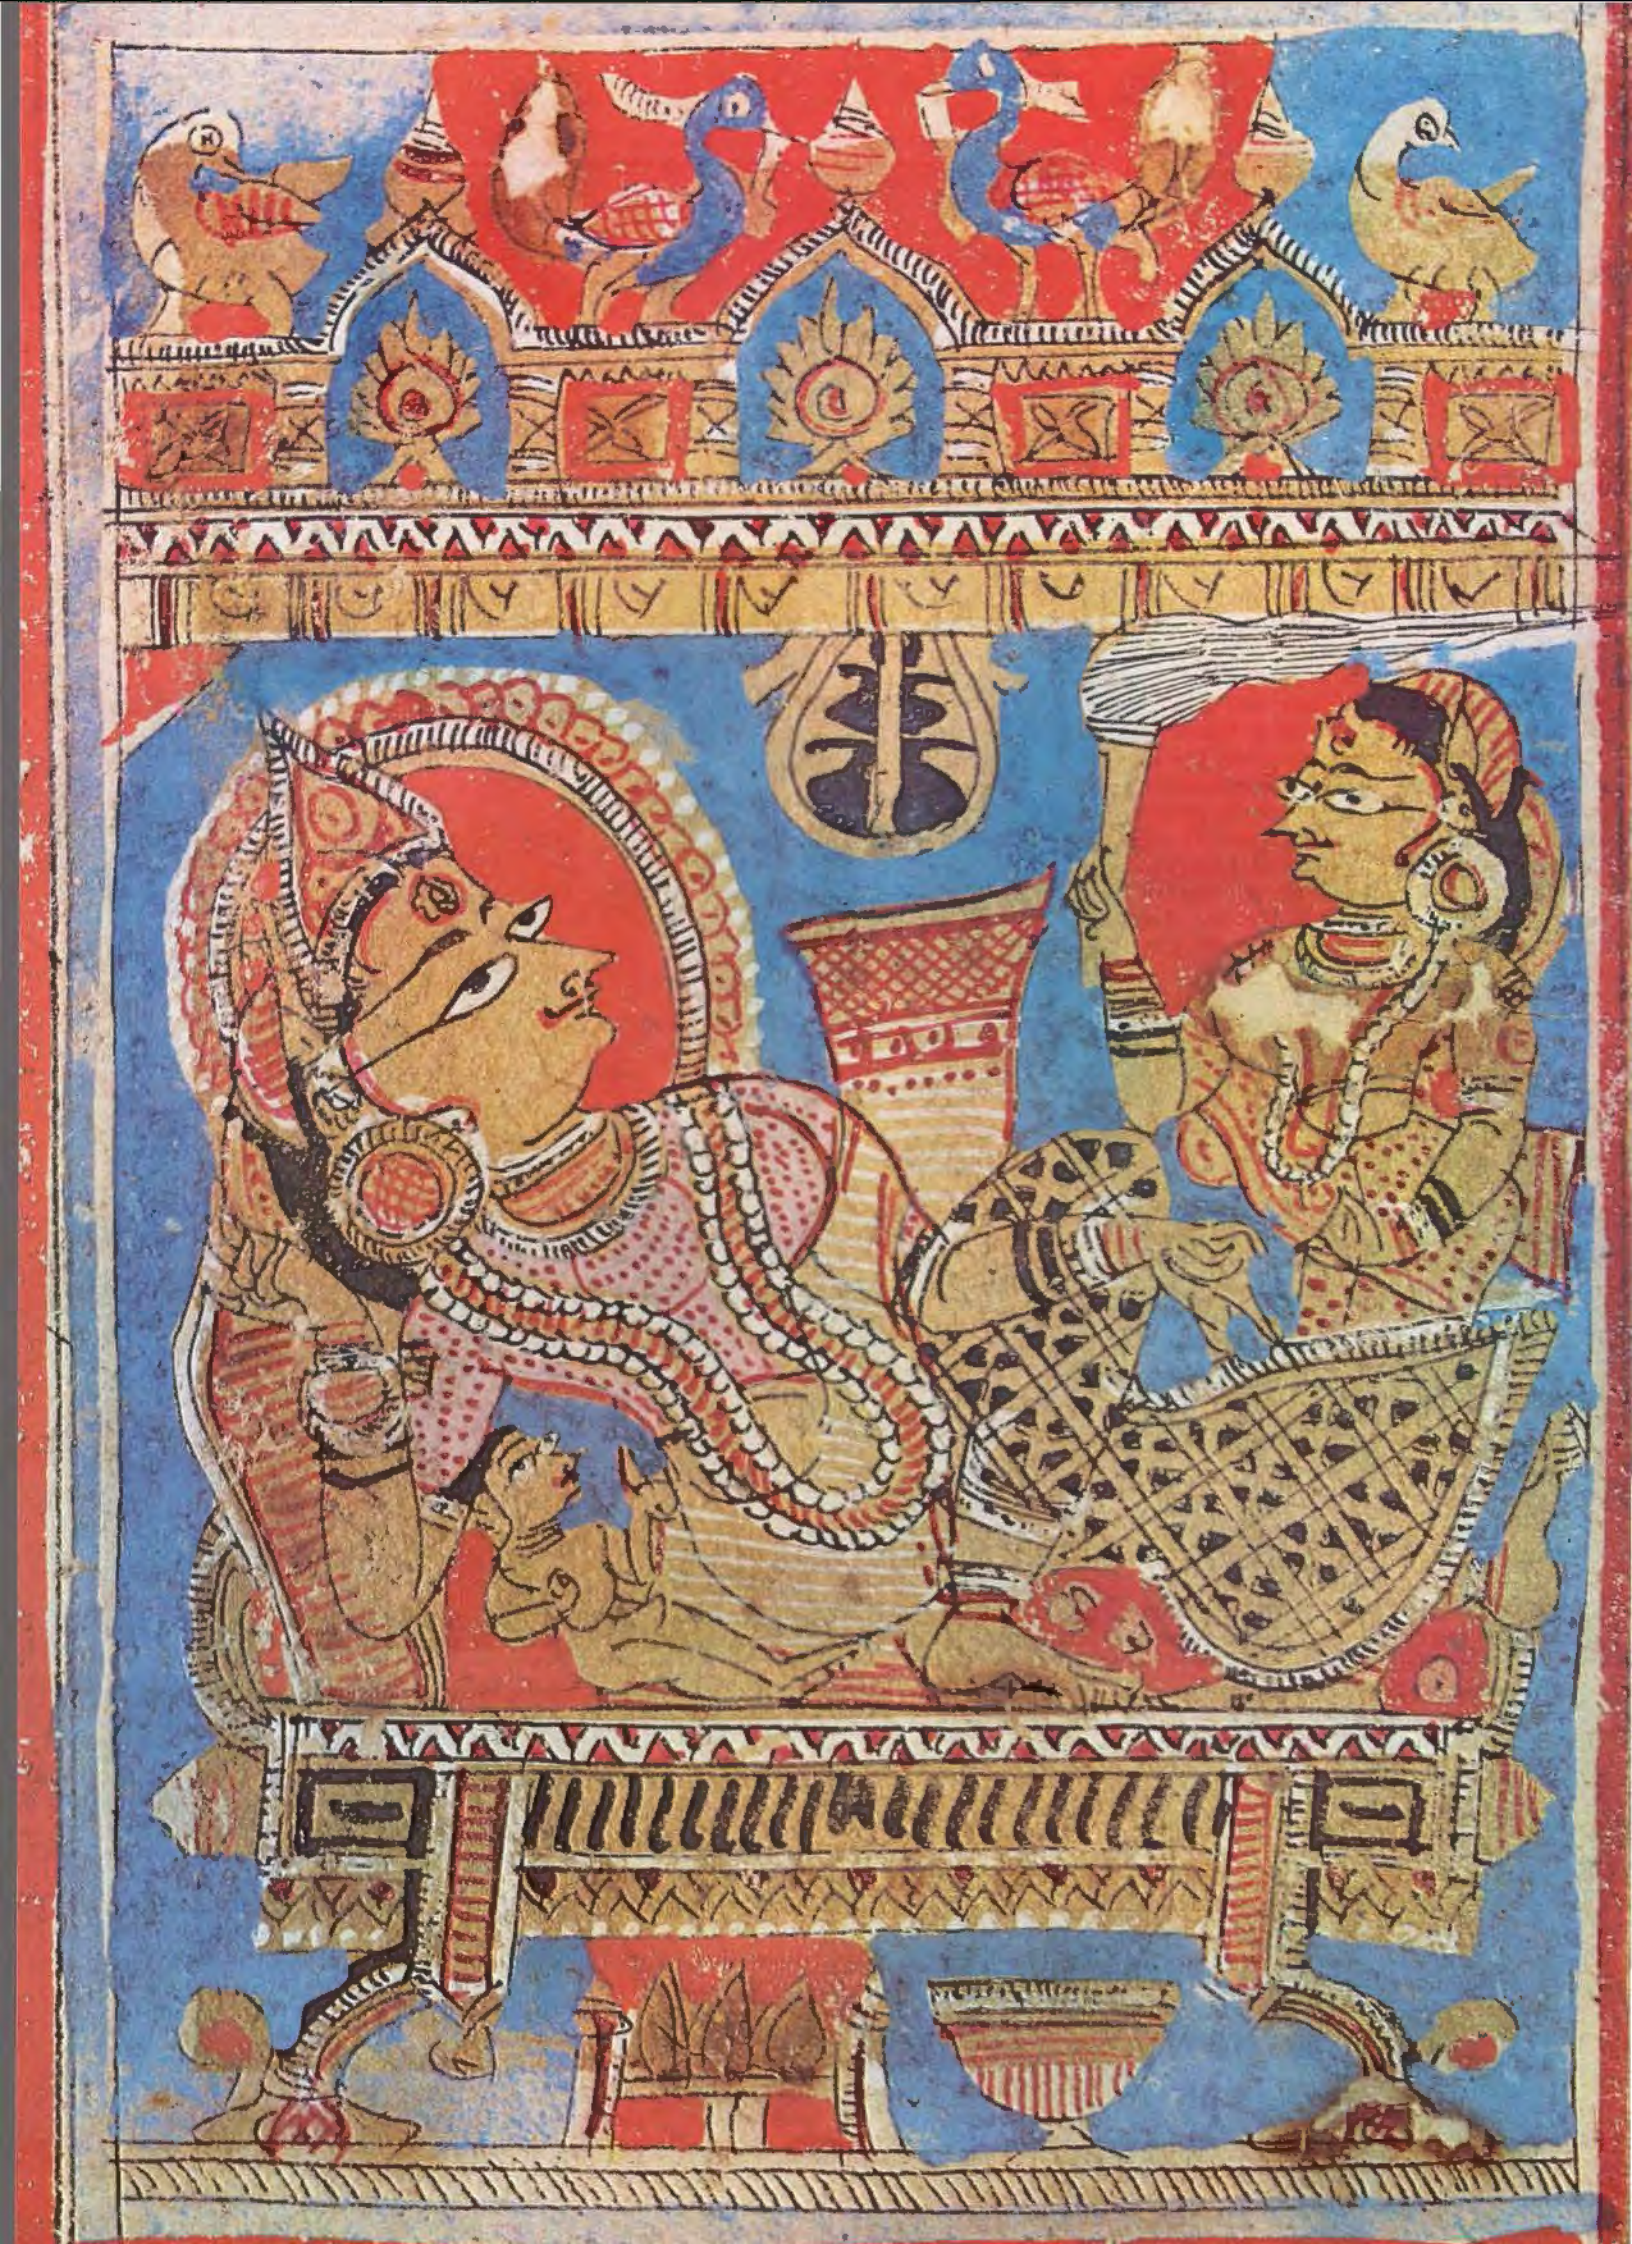
In South India, and notably Mysore, Jainism attained considerable importance, and it was there that the sect divided into separated branches known as the Digambaras ('space-clad' or naked) and the Svetambaras ('white-clad'). The monks of the former branch dispensed with all clothes, and went about as completely naked as Mahavira is believed to have done. The members of the other sect owed their name to the white clothes which they wore. This difference in appearance gradually led to opposition between the two branches of the Jain community. The Digambara sect denied the ability of women to attain liberation, arguing that because in the context of Indian society women could not completely dispense with clothes, they also could not reach the necessary degree of asceticism.

The two sects, Digambara and Svetambara, have separate sets of ceremonial books. An oral literature was passed down from the days of Mahavira, but when the recollection of the original texts became unreliable, a council was called to reconstruct as accurate a canon as possible. Only the Svetambaras accepted this as authentic, and at the end of the 5th century AD it was committed to writing at a council in Kathiawar. But by that time many texts had become corrupt and new material had been added.

Richard and Sally Greenhill

The doctrine of non-violence and reverence for every part of creation is central to Jain beliefs. Jain monks wear a cloth in front of their mouths, to avoid damaging any of the atoms of the air, and carry brooms with which to sweep the ground before them, in case they should inadvertently crush some small insect

Jain philosophy is as pessimistic as that of Buddhism, but in its content it is very different. It is characterized by a strictly mechanical materialism in its simple view of the universe, which is regarded as eternal and indestructible. It functions through the interaction of six constituents. First there are the countless life-monads *(jiva)* or living souls, each of which is uncreated, imperishable and endowed with infinite energy. Though intrinsically all alike, they have been modified and diminished by perpetual contact with the non-living entities *(ajiva)* which comprise space and everything other than life-monads. The third constituent of the universe is *dharma*, a word having many meanings and in this context standing for the medium through



The birth of Parsva, the 23rd saviour of the Jain faith and an incarnation of the god Indra: his mother, Queen Vama, had seen a serpent by her 'side' one night during her pregnancy and the child was accordingly named Parsva, meaning 'flank'

which movement is possible; it is comparable to water in its relation to the fish which move through it. The fourth constituent is *adharma*, the medium which makes immobility possible; the fifth is *kala*, time, which facilitates change, and the sixth and last constituent is *pudgala* or matter composed of minute atoms.

The life-monads, which are eternal, take on innumerable transient forms of life as so many masks. According to Jain philosophy even the gods are nothing but life-monads wearing temporarily favourable masks in fortunate circumstances. Jains believe in the freedom of the individual: thoughts, words and deeds, if virtuous and unselfish, lead the life-monad to enlightenment, but if bad and unconsidered fling it into darker, more primitive conditions. This belief in the effect of accumulated merit and demerit on the fate of the individual in a future reincarnation, Jainism shares with Buddhism and Hinduism. When a life-monad or soul is freed from all bondage created by previous actions, it obtains release from the cycle of births. It then achieves *moksha* of complete deliverance and enters Nirvana (see NIRVANA). But Jains believe that the escape from transmigration, by shedding all the subtle matter adhering to the soul in fine atomic form, is a difficult process. Many souls will never accomplish it and will continue to transmigrate for all eternity. Full salvation is not possible to the layman. To attain Nirvana a man must abandon all material fetters, and consequently a monastic life is essential for salvation.

Jainism is characterized by an extremely severe practical discipline and vigorous standard of conduct, not only for the ascetic but also for the layman. It emphasizes enlightenment, faith and right knowledge as well as a long list of acts of self-control and restraint. Purification of the mind through meditation is insisted upon as the starting point of all ethical life. Anger, conceit, intrigue and greed are regarded as the cardinal sins, and central to the ethical system is the doctrine of *ahimsa* or non-violence, which involves a deep respect for all life including the lowest forms of animal life.

Value in all Living Things

Jains carry non-violence to an extreme. Even lay-followers must take care lest they cause unnecessary inconvenience to their fellow beings. They must not drink water after dark, for some small insect may be swallowed and killed. They must not eat meat of any kind, or kill flies and mosquitoes which annoy or bite; indeed credit may be gained by allowing them to settle and have their fill of blood. Bed bugs may not be killed, and wealthy Jains employ special persons to lie on their beds and attract the bugs before they themselves go to sleep.

The ban on even the incidental killing of any living being rules out many professions. Agriculture, involving such activities as ploughing or hoeing the soil, is incompatible with Jain ethics, and Jains are mainly engaged in trade, certain crafts, banking and money-lending. While laymen have to avoid only violence affecting living beings, the obligation of non-violence imposed on a monk goes even further. He must not snap his fingers or fan the wind, for that disturbs and causes damage; if he falls into a river he must not swim with violent strokes but should float gently in order not to injure the water atoms. The Jain community, therefore, preserves in an extremely fundamentalist form the doctrine of universal piety and respect for all forms of life, which first came into existence in the first millennium BC, and which has since gone through numerous changes in the civilization of India.

Jainism encouraged the commercial virtues of honesty and frugality, and the Jain lay community became largely mercantile at an early period. The wealth of its members was utilized for the construction of impressive temples, such as those on Mount Abu, and the raising of colossal rock-cut images, such as the 10th century statue at Sravana Belgola in Mysore. Although there was no real compromise with theism, Hindu gods were accommodated in Jain temples, and the Jain community adjusted itself to the Hindu social order by dividing into distinct castes.

(See also HINDUISM.)

C. VON FÜRER-HAIMENDORF

The word 'janitor' is derived from the name of Janus, the mysterious two-faced Roman god of gateways and passageways, who was also the protector and promoter of beginnings

JANUS

THE PRECISE ORIGIN and earliest character of Janus eluded even Roman savants. His name denotes any passageway, usually the classical arch, and yields the common Latin word for 'door' *(ianua)*. The god was considered present in every door or gate. Nevertheless he remains best known for his function in certain public arched gateways which did not belong to a fortification system. It is not clear whether *ianus* primarily meant the passageway itself or its god. Equally unclear was Janus's function within the passageway.

The month of January and invocation of Janus by the Salian Brothers, an ancient priestly group, authenticate Janus's long-standing worship. The Salian Brothers, serving the god Mars, and the month were traditionally instituted by Numa Pompilius, Rome's second king, around 700 BC. Although over five centuries later it became the first month of the civil year, January was reckoned the eleventh month of the

Victoria and Albert Museum

Michael Holford/British Museum

Roman coin with a double-headed Janus: the god facing both ways was believed to be present in every gate, door and passageway

liturgical year. The reasons for making January the first month were entirely secular but the Romans interpreted the choice as a sign of Janus's protection of all beginnings, which had developed from his supervision of entrances. On 9 January Janus received his only regular state sacrifice, which took place in the Regia, the chief pontiff's house in the Forum, where Rome's priest-king offered a ram. Ceremonies on his behalf must have been observed at the famous arched gateways and his few temples on diverse occasions. Scraps of the very old Salian Hymns contained special prayer-songs to Janus. These were sung in March at planting time when Janus seems to have aided vegetation: rather curiously, since a god particularly concerned with passageways seems to have little relationship with a vegetation deity.

The Good Creator

In the 2nd century BC, Janus appears in connection with two private sacrifices. One was made to Ceres, goddess of the growth of crops, and took place before the harvest. This association recalls the Salians' invocation of Janus as 'the good creator', for Ceres meant no more than 'growth' before her apotheosis. In the harvest ceremony Janus was invoked along with Jupiter and Juno. The second ceremony was an agricultural rite of Mars which required preliminary invocation of Janus and Jupiter. Preliminary invocation of Janus in these and a few other ceremonies is assumed to derive from his function as protector and promoter of beginnings. However, his name does not stand first in most prayers and rites. In the oldest surviving records the god belongs to a group of vegetation deities and deserves the name of good creator. The passageway does not occur in such invocations.

According to Roman belief Janus was exclusively Roman. Early in the 2nd century Rome's first specialist in the calendar stated that the name January came from Latium, a region surrounding Rome, and had not originated at Rome itself. The Romans also recognized Janus in a cult image taken in 241 BC from Falerii, a town of the middle Tiber valley. The Faliscans were related by language to the Latins and by culture to the Etruscans and Sabines. Rome remained the paramount centre of Janus's cult. Some of her oldest coins carry the usual and famous representation of Janus *bifrons*, 'two-faced'. Occasionally a four-faced Janus, *quadrifrons*, is mentioned. The former anthropomorphic Janus belonged to the simple passageway and the latter to the gateways comprising two intersecting paths, where Janus faced in the direction of each of the four ways.

Some of the god's epithets were thought to indicate his divine functions; Patulcius and Clusivius (or Clusius) pointed to Janus being open or closed (from *patere* and *claudere*), while Consivius was related to the root of the word for sowing seed, *conserere*. These old interpretations are subject to the linguist's doubt. Both Patulcius and Consivius seem to be found in Janus's Salian song. Other epithets are Junonius, Curiatius and Quirinus. The first recalls Janus's association with Juno in the harvest ceremony. The altar of Janus Curiatius was paired with an altar of Juno Sororia. Curiatius must be referred to the *curiae*, primitive divisions of Rome. His rites may have comprised purification of adolescents on their coming of age and entrance to their ancestral curia. Quirinus belonged to the same civil system and his name also derived from this word. However, Janus Quirinus was worshipped by all the curiae and was a state god. (See FOUNDING OF ROME; MARS.)

The Closed Doors of Peace

Janus Quirinus possessed the most famous 'temple' of Janus, situated off the Forum. The origin of the shrine is clouded in antiquity overlaid by folktale. The small rectangular building had double doors at each end, which caused this Janus to be called *geminus*, 'twin'. The side walls did not reach the roof, but were surmounted by grates. A statue of the two-faced god stood within this bronze enclosure that was presumably a monumental gateway on the street leading from the civic centre. This unusual temple stood as a symbol of war or peace to the Romans. Many Latin writers confirm how the open Janus betokened war and the closed Janus peace, the opposite of what might be expected. In explanation of this anomaly, students in modern times have argued that Janus was imbued with the vigour of war and therefore was closed in peace and open in time of war. Except for the connection with Mars, who was also an ancient god of vegetation and fertility, Janus shows few signs of belligerence. Moreover, when Augustus Caesar closed Janus Quirinus to herald a new era free from civil war, he mentioned only one closing in 235 BC, some six years after the first war with Carthage. There is very little truly old evidence for understanding the occasion of opening and closing Janus, when one normally expects a gate or passage to be closed during war. A recent study attempts to solve the problem by arguing that a *ianus* had originally been a bridge with a simple structure of two uprights and a crossbeam at both ends which was dismantled and thus 'open' during war. This theory depends upon a close topographical connection of ianus to water crossings; since archaic Rome was covered by a network of streams of which very few needed a bridge convertible to defence, this ingenious thesis cannot be proved.

Janus appeared unwarlike to the Romans, and so they stressed his role in peace. Such a divinity of peace does not recall the modern aspiration for peace. Rather the closed Janus put the mark of success and security upon the Roman empire and its policy of peace through armed intimidation. Putting aside his relation to agriculture, ancient and modern authors have laid particular emphasis on Janus in an original capacity of lord of beginnings. This capacity owes much to the accident of January's position in the civil calendar.

On the peak there is a sanctuary dedicated to Sengen-Sama, the goddess of Fujiyama *Right* Sumo wrestlers, of huge size and strength, compete naked except for a loincloth. The patron god of wrestlers is Sukune, winner of the first bout ever recorded in Japan, in the 1st century BC. Contests are conducted with great formality and semi-religious ritual

For 1000 years Buddhism dominated life in Japan; now its power is largely spent, its heritage remembered only in rituals and temples. But modern Japan is remarkable for the number of new sects which it has produced, many of them containing Buddhist elements

THERE IS A PARALLEL between the adoption of Christianity in England and that of Buddhism in Japan. Neither religion was indigenous to the country, and in both cases the derivation was not a direct one from source but through an intermediary: in the case of England not directly from Palestine but through Rome; in the case of Japan not directly from India but through China.

The Buddhism that percolated through to Japan in the 6th century of the Christian era was what is called Mahayana Buddhism (see BUDDHISM), an essentially liberal elaboration of Buddha's teachings with a tendency to compromise with foreign beliefs. On its way through Central Asia and China this Buddhism had absorbed Taoist and Confucian teachings and thus, by the time it reached Japan, contained philosophical modifications and theistic accretions and rituals unknown to Buddhism in its more primitive form.

The early Buddhist sects established in Japan in the Nara Period (628–784 AD) remained strictly Chinese in their use of Chinese styles in temple architecture, Chinese costumes, Chinese rites and even the Chinese language. With the dawn of the Heian Period (784–1185 AD), however, the Japanese founded two sects – *Tendai* and *Shingon* – of their own. While these sects certainly borrowed extensively from parent organizations on the Asian mainland, they nonetheless compromised sufficiently with the indigenous Japanese religions to represent a true departure from a Chinese tradition that, until then, had been wholly dominant. Finally, while Buddhism was waning in India, the land of its origin, Japan produced in the Kamakura Period (1187–1333 AD) forms of Buddhism – Amidaism, Zen Buddhism, Nichiren – that not merely represented a great spiritual awakening but were distinctively Japanese in all their essential elements. Since that time no major developments have taken place in Japanese Buddhism, though some of the earliest sects

have dwindled away to nothing and many sub-divisions have appeared within the larger sects.

Faith from Across the Water

The date 552 AD is usually given for the official introduction of Buddhism into Japan. In that year the King of Kudara (Paikche) in South Korea sent an envoy to ask for Japanese aid against an invasion from the North and the envoy brought with him as presents a small image of Buddha, scriptures and commentaries. At once a conflict arose in the Japanese court; a progressive and liberal faction favoured the acceptance of the new religion, while a conservative faction, fearing retribution from the native Shinto divinities, urged its rejection. This conflict was only resolved when a female sovereign, Suiko, ascended the throne, while the young crown prince, Shotoku, assumed control of the government as prince regent on her behalf. Shotoku was a devoted scholar of Buddhism; in his desire to bring about political reforms in his country he despatched a large official delegation to China, he sent a military expedition to Korea and inaugurated a new governmental system in which promotion depended on ability and merit. Above all, he wanted to bring a spiritual awakening to his subjects. At his instigation Buddhism became, in effect, the state religion of Japan; its function was to secure divine support for official policies. In consequence, during the Asuka Period (552–628), the heads of many of the ruling families not merely adopted Buddhism but vied with each other in the building of superb Buddhist temples. A great number of Japanese scholars and religious leaders were sent to China for study and training; and with the introduction of Chinese culture on a large scale, since philosophy, art and literature were all imported with the new religion, Japan emerged from being a primitive society and took her place among the civilized nations of the East.

The nature of Buddhist belief at that time was not of a generally high level; it was often regarded as little more than a formula for the invocation of happiness and prosperity or the banishment of illness. Prince Shotoku was an exception in his profound understanding of Mahayana Buddhism: he studied the scriptures, wrote commentaries on them and gave himself up to long periods of contemplation. In Chuguji Temple in Nara there is an inscription which he is said to have composed for his wife: 'False is the world, only the Buddha is true.' A favourite subject in Japanese art is the victory of Shotoku over Mononobe-no-Moriya, who championed the old native Shinto religion against the Buddhist innovators. Mononobe-no-Moriya had set up a candidate for the Imperial crown of whom Shotoku, the Regent, disapproved; an appeal to arms was made, the Shintoists were beaten by Shotoku and Mononobe-no-Moriya was killed. Perhaps the contest is symbolic of the ascendancy Buddhism now gained over Shinto.

On the death of Prince Shotoku the national enthusiasm for Buddhism showed no signs of waning, and the court continued to take a lead in embracing the new faith from across the water. The Emperor Shomu was especially pious; he ordered that a Buddhist temple should be erected in every province so that Buddhism might spread throughout his kingdom. He built the famous Todaiji Temple in Nara and set in it the great image of Buddha Vairocana, perhaps the most magnificent in the world. He prostrated himself before this image, calling himself 'Servant of Buddha'.

Although no one would question the genuineness of the religious faith of men like Shotoku and Shomu, in general the Buddhism of the 7th and 8th centuries was embraced by the ruling class not so much out of a deep belief in the teachings of Buddha as from a desire to cement a centralization of power. What was remarkable was that the adoption of the new faith

Kukai regarded all phenomena as activities of Buddha's body, voice and mind; these three aspects of Buddha he termed 'the three secrets'

was attended by such a vigorous development of the fine arts and music. The Todaiji Temple, the Yakushiji Temple and several other temples dating from the same time remain to this day as monuments to the Buddhist culture of the period. But brilliant though this culture was, it was enjoyed and appreciated chiefly by government officials and temple priests: it was a culture not for the masses but for an elite.

The Lotus and the Three Secrets

With the removal of the Japanese capital from Nara to Kyoto in 794 and the inauguration of the Heian Period, one of the most brilliant in the whole history of the country, there were significant developments in the Buddhist faith. Two influential priests, Saicho and Kukai, crossed over to China in search of more spiritual forms of Buddhism and eventually each returned to found a sect of his own. The Tendai sect was founded by Saicho in 805, and the Shingon sect by Kukai in 809; both these were to dominate the spiritual and cultural life of Japan for centuries. The Tendai monasteries on Mount Hiei and the Shingon monasteries on Mount Koya soon became centres of learning, from which Buddhist doctrines emanated.

Saicho (767–822), known posthumously as Dengyo Daishi, had early recognized the need for reformation and freedom from the orthodoxy of Nara Buddhism. The Tendai philosophy that he founded was essentially eclectic, embracing as it did almost all the contradictory sectarian teachings of Chinese Buddhism and leaving the choice of a method of salvation to the individual alone. Its comprehensive teachings included esoteric mysteries, abstract contemplation and faith in the saving grace of the Buddha Amida – all the basic Mahayana doctrines. However, Tendai especially emphasized the *Lotus Sutra*, which it considered to be the greatest of all Buddhist scriptures, and taught that 'the supreme truth' is to be realized only through meditation.

Kukai (774–835), founder of Shingon Buddhism, became posthumously known as Kobo Daishi. His philosophy, a peculiar mixture of realism and idealism, was one of pantheistic mysticism. The whole universe, according to his teachings, is the body of the cosmic Buddha Dainishi, and since his body is the whole of material existence, then it must follow that even a grain of dust partakes of his spiritual life. As differentiated aspects of this all-embracing Buddha, Kukai's faith included a pantheon of numberless Buddhas, Bodhisattvas (Buddhas-to-be), deities, demons and angels. He regarded all phenomena as activities of Buddha's body, voice and mind. These three aspects of Buddha he termed 'the three secrets', since most people are incapable of understanding them without enlightenment. By assiduously training himself in these 'secrets' an individual could make himself identical with Buddha in this life, by performance of mystical signs with the fingers, by the recitation of magic formulae and, above all, by constant meditation. Although Kukai imported many of his mystical doctrines direct from China, he contributed a number of innovations of his own.

Even if Kukai's life had lasted 600 years instead of 60, he could hardly have carved all the images, painted all the pictures, scaled all the mountain peaks or performed all the miracles with which he is popularly credited. But there is no doubt that he is the most remarkable figure in the whole history of Japanese Buddhism. It is asserted by his followers that he did not die but merely retired into a vaulted tomb on Mount Koya (still in existence), where he awaits the coming of Miroku, the Buddhist Messiah. Kukai also attempted the unification of Buddhism with Shinto, identifying the indigenous Japanese gods with Buddhist deities. Saicho, too, made an attempt to merge the two religions: the term 'Ryobu-Shinto' (dual-aspect Shinto) was, in fact, coined by him.

From the 9th to the 12th centuries, Japan enjoyed peace and prosperity; the foreign culture imported during the Asuka and Nara periods had by the Heian period been absorbed into a new culture that was at last distinctively Japanese. The great achievements in the arts, literature and architecture were all ascribable to the continuing spread of Buddhism. One of the most impressive Buddhist buildings of the period is the Amida Hall of Byodoin Temple in the southern suburbs of Kyoto, erected at the behest of a powerful politician of the time. The elaborate decorative work in the interior, the way in which the whole temple seems to float on the water of a pool, preparatory to taking flight, and above all the image of Amida Buddha, quietly contemplating, in the centre of the hall, were deliberately planned to suggest an earthly paradise. It was from the latter half of the 10th century that faith in Amida Buddha began to gain in popularity; a book by the priest Genshin of the Tendai sect, setting forth the way in which the earthly paradise could be attained, enjoyed great popularity among the noblemen of the time.

A Religion for the Populace

For 400 years, from the end of the 12th century to the latter half of the 16th century, civil war and natural calamities were frequent. Inevitably, the uncertainty of life and the mutability of all worldly institutions forced people to look for salvation and solace in religion. With the removal of the political centre of Japan from Kyoto to Kamakura and the start of the Kamakura Period in 1185, a great spiritual awakening took place. Tendai, already established by Saicho, had within it seeds which fructified under the influence of a number of dynamic leaders. These men founded new sects, based on Tendai teaching, which still remain the dominant Buddhist influences in Japan. Reacting against the aristocratic Buddhism of the Heian period, their aim was to establish a faith for the common people.

The first significant development in this religious revival was the rapid spread of Amidaism. Amidaism had a great popular appeal for it offered salvation on easy terms; all it demanded of its followers was absolute belief in the Buddha Amida; and rebirth in the western paradise was promised to all those who called on the name of Amida in simple faith (see AMIDA). In 1175 Honen, a Tendai priest, founded the Jodo sect; he was followed by one of his disciples, Shinran, who in turn founded the Jodo Shin sect in 1224. The doctrines of both these reformers rapidly spread among the less educated people.

The second major development in the great spiritual awakening of this period was the introduction of *Zen*. Zen, like Amidaism, was known in Japan in the Nara Period, but its teaching did not become the basis for a new school of Buddhism until a Tendai priest named Eisai founded the *Rinzai* sect in 1191. The *Soto* sect, founded

One of the chief surviving functions of Buddhism in modern Japan is to bury the dead and hold memorial services. Priests of the Nichiren sect, one of the main branches of Japanese Buddhism, celebrate San-Ju-San Kaiki, the 33rd anniversary and final official service for the departed; previous ceremonies will have been held on the 1st, 3rd, 7th, 13th, 17th and 23rd anniversaries *(1)* Priests pray in the cemetery before beginning the service *(2)* The relatives also pray before the tombstones; on the left are stacked boards inscribed by the monks with wishes for the dead *(3)* Within the Homyo Temple on the outskirts of Tokyo, priests offer up prayers in front of the gilded altar before *(4)* the chief priest takes the lead in conducting the ceremony. He burns incense *(5)* and the mourners step forward to pray at the altar and offer incense in their turn *(6)*; the boards bearing wishes for the dead will be implanted beside their tombstones after the ceremony is over. A great bell, rung by swinging a wooden beam against it *(7)*, sounds the end of the service

The Art of Tea

Two aspects of Zen as it developed in Japan were unique. One was its unexpected alliance with the military classes. The other was its enormous influence on everyday life. In China, the influence of Zen, even in its heyday, tended to be largely restricted to the monasteries. In Japan it permeated every facet of Japanese culture, from architecture and landscape gardening, costume and theatre, to the presentation of food and the art of flower-arranging. It exercised perhaps its most profound aesthetic influence through the tea-ceremony and the formulation of what was called 'Tea-Taste'.

Tea has been known in China from very early times. The ancients drank it as a medicine, the Taoists considered it an essential ingredient of the elixir of immortality, and in the Buddhist monasteries its invigorating effect was utilized to combat drowsiness during the long periods of meditation. Apart from this practical use in keeping awake, the Zen monks also drank tea on ceremonial occasions. In particular, they were accustomed to gather before an image of Bodhidharma, the legendary founder of the Zen sect, and in turn sip tea from the same bowl in a solemn ritual which was no less than a communion service. The choice of beverage is significant. Ogata-sensei considered it most appropriate that tea, which refreshed but did not excite, should be closely associated with a religion which preached dispassionate calm and detachment, while wine should be associated with Christianity – from the Buddhist point of view a heady, passionate, intoxicating faith. It was this ritual drinking of tea in the Zen monasteries which developed into *Cha-no-yu* or the 'Art of Tea'.

Wim Swaan *Japanese Lantern*

by Dogen in 1244, assisted in the spread of Zen philosophy. By the 14th century Zen Buddhism had become the most influential religion in Japan. Its adherents engaged in silent meditation and abstract contemplation, attempting through mental discipline to attain intuitive perception of the fundamental truth of reality. Zen required of its followers complete detachment of the self from all transitory phenomena and from concern for personal gain. Its strict spiritual discipline secured for it many adherents among the *Samurai* or warrior class, who found that Zen gave courage in battle and self-reliance in administration (see ZEN).

The third major development of this period was the appearance of a fiery reformer named Nichiren. He believed that all the sectarian interpretations of his day, including Amidaism and Zen, were perversions of Buddha's true doctrine. After studying at the Tendai institution on Mount Hiei, he eventually decided that true Buddhism was to be found only in the teaching of the Lotus Sutra. He set about attempting to reform Japanese Buddhism, proclaiming that anyone who recited the sacred formula 'Adoration to the Sutra of the Lotus of the True Law' would receive moral virtue and attain paradise. At the same time, he not only attacked the teachings of the established sects as heresies but also was bold enough to denounce the policies of the government in Kamakura. Although he was persecuted mercilessly by both ecclesiastical and political authorities, his supporters soon numbered many thousands, becoming a vital factor in the religious life of the nation.

Nichiren's zeal and intolerance appear to have been inherited by his spiritual children, the *Nichiren-shu* or *Hokke-shu*, as the sects derived from him are also called. The chief outward and visible – or rather audible – sign of their temples is the drum, which the faithful beat for hours together to keep time to their chanting of the sacred formula.

While Zen Buddhism tended to be a religion for an aristocratic elite – the whole code of *Bushido* (Japanese chivalry) was markedly influenced by Zen principles – the Shinshu and the Nichiren sects have always been the most democratic of Japanese Buddhism. The Shinshu, which is divided into ten branches, has never regarded married life on the part of the clergy as an obstacle to salvation, the founder Shinran having married and left hereditary successors to the headship of the sect, or rather of each branch.

Through the great spiritual awakening of the Kamakura period, Buddhism became truly indigenous to Japan. The Shingon, Tendai and some of the Nara sects continued to have a following; but three other of the earliest sects did not survive the rising tide of Amidaism, Zen and Nichiren which swept the country. It is worth noting that the seeds of each of these three new doctrines had been present in the eclectic Tendai philosophy, expounded by Saicho, so that the monasteries which he founded on Mount Hiei may be regarded as the fountainhead of the revival of the 12th and 13th centuries.

Priests and Politics

In the Ashikaga Period (1333–1568) many minor sects appeared within the larger sects, but there were few men of real stature to carry on the work of the great reformers, and priests and institutions once more became involved in politics. Despite its loss of religious vitality Buddhism dominated the political and cultural life of the nation as never before. The Tendai priests on Mount Hiei were by now persecuting the newer sects and intimidating the helpless court. There were incessant minor wars between the different factions, with armed monks roaming the streets of the capital, fighting duels and terrifying the common people.

Zen Buddhism, owing to the support it enjoyed from the warrior class, became virtually the state religion of the Ashikaga Period. At a time of turmoil, the Zen monks contributed much to the country, engaging in business and devoting themselves to the betterment of society. They also played an important role in the preservation of the national culture. Many of them were thinkers and intellectual leaders and in their monasteries they created and preserved masterpieces of literature and art which otherwise might have perished. Buddhist painting and sculpture reached their peak at this period. Painting in black and white was closely related to Zen; as was the Tea Ceremony, tea being first brought from the continent as a medicinal herb by the Zen priest Eisai.

After the period of civil war that lasted almost a century from the close of the 15th to the end of the 16th century, the reunification of Japan was at last achieved and a feudal system securely established. The art of the Momoyama Period (1568–1615) shows evidence of a complete emancipation from the fetters of religion, symptomatic of a decline in Buddhist belief. A ruthlessly authoritarian shogunate (office of hereditary military overlords) sought for some moral sanction to ensure the efficient functioning and permanence of its rule. Buddhism, which in no way represents a unified body of religious opinion, could not provide this; nor could Shinto, which was now in a weak position. Confucianism could. This is not to say that the spread of Confucianism robbed Buddhism of all authority. Household registration, burial services and memorial services for the dead were still a Buddhist responsibility; learning still throve in the great monasteries; and new sects continued to multiply. But the peak had been passed.

When the revolution of 1868 took place, with the ousting of the shogun and the restoration of the authority of the emperor, extremists urged the total suppression of Buddhism and the establishment of Shinto as the sole religion of the nation. But the reform was eventually limited to the complete separation of the two religions, the Buddhist priests being expelled from the Shinto temples which they had so long 'contaminated' with their sway.

The modern Japanese take religion calmly, even indifferently. Like Christianity in Europe, Buddhism in Japan has left behind a rich heritage of art, architecture, music and literature; but as a vital religious force it is spent. There are new sects that appeal to a vociferous and usually ignorant minority; and Zen still exerts an influence over a thinking few. But in general the role of Buddhism in modern Japan is merely to bury the dead and to keep their graves. It may seem paradoxical to say this of a religion that still has a priesthood, possesses scriptures, conducts regular services, maintains magnificent temples and large estates, administers

Courtesan engaged in the Tea Ceremony: 18th century print by Kitagana Kikumaro. The elaborate Tea Ceremony, a central feature of Japanese culture, developed out of the ritual drinking of tea in Zen monasteries

schools and engages in social welfare. But among the intelligent young in Japan it is far more common to find a burning faith in Marxism than in Buddhism. Buddhism has become a matter of rituals, of services and of festivals; it has long since ceased to have an organic life of its own.

Writing in 1907, the English scholar Basil Hall-Chamberlain could say: 'One, alas! of the characteristic features of the Buddhist temples of today is the decay into which most of them have fallen, not because of any general conversion to Christianity, but owing to the disendowment of the priesthood and the materialistic tendencies of the age.' The priesthood remains disendowed, the materialistic tendencies have accelerated. But the wooden architecture of the temples, so attractive when fresh and so shabby and ramshackle when neglected, is probably in better repair now than at any time since its first erection. A parallel can be found here with the stately homes of England. Both the Buddhist religion and the English aristocracy have become anachronisms; but the monuments left by the power they once enjoyed continue to survive for purely historical and aesthetic reasons.

FRANCIS KING

Modern Japanese Sects

Allegiance to sectarian movements has grown steadily in many parts of the world since the end of the Second World War; but nowhere have sects had quite the dramatic impact that they have had in Japan. The sects that have grown there have not been the Christian splinter movements but indigenous cults, sometimes embracing Shinto and Buddhist elements. Most of them have made very little impact outside Japan except among expatriate Japanese communities in Latin America and among a few American ex-servicemen who have married in Japan and been converted there.

A number of Japanese sects trace their origins to the 19th century or to the 1930s, but their dramatic growth has occurred only

Tenri-kyo teaches that there is no evil, nothing more than types of dust that lodge on the soul and represent hatred, greed, arrogance and other reprehensible dispositions

since 1945. That year marked the disruption of traditional life-patterns, of political authority and of the nationalist, ethnic and religious myth that had been fostered in Japan in and before the Second World War. To the shock of defeat was added the diffusion of American values by the occupying forces and, in particular, the establishment of official attitudes of tolerance in religious matters. Sects that had emerged earlier and suffered state prohibition revived in a favourable atmosphere for growth: their values were clearly divergent from those of the now discredited government. And new sects also emerged.

Most of the sects active in modern Japan have adapted important features of Buddhist and Shintoist belief, but they have combined these with other elements, so that many of them offer a new philosophy of life in which certain strains of traditional Japanese culture are still evident. The older sects, founded in the 19th century, betray more magical and miraculous elements, whilst the newer movements are characterized by a variety of radically adjusted values drawn largely from American sources: freedom of expression and the overcoming of inhibitions, formerly denied by Japanese culture, are conspicuous examples.

It is not easy to say just how many new sects there are in Japan. After the war Japanese taxation laws gave certain exemptions to religious movements and in consequence a number of astute but essentially secular Japanese businessmen registered their premises as places of religious worship to take advantage of this financial concession. The law has been changed and the number of sects has fallen accordingly, but estimates of new movements still vary from 170 to more than 700. Even if the smaller figure is more nearly accurate, the size and influence of Japan's new sects is still impressive. Several of them have recruited hundreds of thousands of members, built impressive headquarters and have sometimes constructed holy towns as their centres.

Emphasis on Healing

One of the longest established of the new sects is *Tenri-kyo* (Divine Teaching), which originated in the middle of the 19th century. A middle-aged farmer's wife, Nakayama Miki, became possessed by a deity in 1837 and subsequently became convinced that ten deities had forced themselves upon her. Miki was clearly a somewhat mentally disturbed woman, who had at various times attempted to commit suicide. The emphasis of the cult which evolved through her agency was on healing and painless childbirth. As is typical of religioua movementa in non-Western societies, Miki did not immediately demand that her followers should avoid other places of worship. Towards the end of her life, she wrote down all her revelations, included in 17 books of *Ofudesaki*. Like other cult leaders, in later years she held herself aloof from her following; this enhanced her reputation for saintlineas and facilitated the accumulation of legenda about her miraculous power.

The Tenri-kyo Church arose only after Miki's death at the age of 90 in 1887, a period when the new movement was experiencing some harassment from the Japanese government which, at that time, was promoting the Shinto religion. Fear of government persecution led to the modification of Tenri-kyo doctrines and practices to gain protection as a Shinto cult. A similar adjustment was made during the Second World War, when Miki was claimed as a great Japanese patriot by her followers. After the war these tendencies were quickly reversed and older forms of worship were restored with a new emphasis on the then fashionable principles of democracy.

Tenri-kyo has been likened to Christian Science by some commentators, although it evolved quite independently and, indeed, rather earlier. It teaches that there is no evil, nothing more than types of dust that lodge on the soul and which represent hatred, animosity, greed, arrogance and other reprehensible dispositions. From Buddhism, Tenri-kyo acquired a belief in reincarnation but the movement has been increasingly influenced by Christianity in recent years, and more and more has come to emphasize joy, and the acceptance of voluntary labour in menial tasks as a way of overcoming greed and learning humility. Much of this voluntary work is undertaken in public parks, prisons and in relief work for the needy. Miki stressed generosity to the poor, but in recent decades the leaders of the movement have preferred to collect benefactions from their followers and to distribute them from headquarters rather than to encourage purely spontaneous local charity. This development may be seen as an example of the institutional and bureaucratic trend that typically takes place in established religious movements. It also reflects the fascination of the Japanese with their newly learned facility in voluntary organization.

Understandably, given its origins, Teurikyo has an inheritance of primitive magical concepts: animal deities and fertility symbols abound. These elements were closely associated with the preoccupations with the miraculous of the founder and her early followers. There is also a belief in a type of millennium when heaveuly manna will fall and bring into being an age of joy and brotherhood among mankind. This optimistic vision is a central theme in the sect's extensive propaganda, which is now disseminated by methods of modern mass communication. Tenri city is a place of pilgrimage for believers, both as a shrine with sacred objects and a place for the performance of important liturgies, and as the headquarters of the sect. Tenri-kyo claims to have more than 15,000 churches and hundreds of thousands of followers.

Great Honourable Goddess

A sect of quite different origin, *Tensho Kotai Jingu-kyo*, was also founded by a farmer's wife, Kitamura Sayo. Very much in the style of Miki, Mrs Kitamura claimed, in 1945, to speak with the voice of God, and she was thereafter referred to by her followers as Great Honourable Goddess. Like Miki, she believed that God had come to dwell inside her body, but she refused, at least until the early 1960s, to build a church. Her teachings are simple and little formalization has occurred since Mrs Kitamura, as a supreme charismatic leader, has resisted such a development. She preaches that there are six roots of evil: to regret; to desire; to hate; to covet; to love or to be loved intensely or beyond reasonable limits. The world is peopled by evil and benign spirits. Mrs Kitamura does not claim to expel evil spirits but to redeem them, and this she does by chanting a short prayer. Her sermons are often chanted, interrupted by hand-clapping and scrubbing motions to sweep away evil.

The most renowned aspect of Tensho Kotai Jingu-kyo is its emphasis on dancing and it is sometimes called 'the dancing religion', even though dancing occurs in

many modern Japanese sects. The importance of the dance for this sect is that if one has sincerely confessed one's sins and accepted with gratitude others' assessments of one's faults, then one has been brought to the gates of heaven: the dance of non-ego, *Muga no Odori*, will dance one through the gates. Estimates of Mrs Kitamura's following vary because of the absence of formal organization, but they generally fall between 100,000 and 200,000 persons.

A third woman, the unhappiness of whose life was responsible for a formerly important sect, *Omoto* (the religion of the Great Source) was Mrs Nao Deguchi. The decline of the sect has been caused by schisms which have given rise to several offshoots, today counting many more adherents than Omoto itself. Nao had eight children when she became a widow. Two of them went mad and another was killed. In her distress she turned to the Shinto sect, *Konko-kyo*, but in 1892 she had a revelation of a messiah soon to come and she left the Konko-kyo movement. Soon after her vision a wandering religious enthusiast, Ueda Kisaburo, who later called himself Onisaburo Deguchi, arrived at her village claiming to have had identical revelations, and he was eventually recognized by Nao as the promised messiah. He married Nao's daughter and organized the Omoto cult into a separate sect which, until Onisaburo was prosecuted by the government in 1921, grew rapidly.

An immensely active man, Onisaburo sought to establish a World Federation of Religions; he dictated 81 volumes of his experience of the spirit world; and he recruited some two million followers to the faith. The government moved against Omoto again in 1935; Onisaburo was imprisoned for seven years. Only in 1945 was the sect permitted to practise again, and Onisaburo reorganized it under the name *Aizen-e*, (Garden of Divine Love). Its following had fallen away, however, and it has remained small. The sect has an elaborate set of teachings. The spirit world is emphasized and man's eternal life there. An interesting teaching that is curiously parallel to the Mormon doctrine of baptism of the dead is that ancestors who died unsaved might be saved by the faith of their successors.

Offshoots of Omoto

Several sects were founded by former members of the Omoto religion. One of these, *Ananai-kyo*, was founded in 1943 by Nakano Yonosuke, who had been a fellow pupil of Onisaburo as a young man. Nakano claimed to have experienced revelations long before he set out to found his own religion. Although he followed an independent path, he remained on good terms with the leaders of Omoto, in keeping with a tenet that both sects shared – the kinship of all religions. Nakano taught that there would be a world catastrophe but that men might escape it by obtaining God's spirit in special meditation and by the saviour that God would send to lead men into happiness. This movement emphasizes the return to pure Shinto faith. It also teaches that religion and astronomy are one and for a long time devoted resources to building observatories. In common with the Bahai faith, a movement of Persian origin with which it established links, it organized international conferences at which the unity of all religion was the central theme.

In 1930, a 38-year-old man named Masaharu Taniguchi began to have revelations. He had been one of the scribes to Onisaburo and a devotee of Omoto; later he had become an adherent of *Ittoen* (Garden of Light), a movement that emphasized arduous toil as the way to nobility. Taniguchi recorded his revelations and soon after he began a magazine that proved to be the beginning of a sect, *Seicho no Ie* (House of Growth). Initially he denied that his movement was a religion: it was rather a philosophy of life. In its early days it was more like a publishing concern, but eventually it came to claim that it was indeed a religion. Its teachings are highly eclectic, embracing ideas from Omoto, Ittoen and elements that the founder acquired from his study of Christian Science, Spiritualism and orthodox Christianity.

Seicho no Ie teaches that the individual may attain absolute freedom, conquering pain and disease. One of its messages is, 'Do not love your enemy – because there is no enemy.' Another, reminiscent of Christian Science, urges believers, 'Drive the disease-idea out of your mind and you are sure to recover health at once.' The sect suffered in the years immediately after the war because Taniguchi had been a vigorous nationalist, but the recovery of Japan in the 1950s produced a more favourable climate for Taniguchi's demands for the restoration of traditionalism in education. The sect has come out strongly for the revision of the Japanese constitution and the annulment of laws imposed in 1947 when the Americans were very much in control. It claims over a million adherents and has a strong appeal to the more prosperous and to some intellectuals.

The best-known of the Omoto sects is *P L Kyodan*, even the name of which reveals the strength of Western influences, since P L stands for Perfect Liberty (Kyodan stands for Church). Under other names this movement existed long before the Second World War, but took its present name after the leader's release from prison in 1945.

J. Allan Cash

Persecution by the Japanese wartime government was, at this time, a great advantage to the renewed sect which quickly adopted American styles and emphasized modernization. The pre-war ethic of *Hito no Michi* (the name by which the sect had then been known) was reasserted with these modern trappings. That ethic had encouraged virtue in familial and work relationships and promised rewards for right conduct. The 21 precepts of the faith were re-established. They assert that life is art, that the individual, as a manifestation of God, should live radiantly, equally with others, revealing himself by effacing his ego. The environment is said to be a mirror of the mind, but everything makes for progress and development. To forget that one is an artist is held to be a way of encouraging misfortune. Dancing, poetry, baseball and other sports are encouraged and opponents have called P L Kyodan 'the golf religion'. But daily early morning services are also part of its way of life with a communal breakfast afterwards. Voluntary good works are also sometimes performed.

The organization of P L Kyodan is tightly-knit but in many ways traditional. An extensive counselling system is maintained, the therapeutic principles of which are that suffering is a warning from God that there is something wrong in a person's thought, that he is failing in artistic self-expression. Teaching is also undertaken over a wide range of subjects, including traditional Japanese arts. At the head of the faith are a small elite of *Oyasama* (parents) who are endowed with a divine gift of diagnosis of personal ills and who can take upon themselves the ills of others. They do not, however, act as ordinary counsellors, whose work involves a large clerical staff. The strong psychotherapeutic emphasis of the movement does not preclude it from maintaining a modern hospital of a conventional kind. P L Kyodan promotes extensive propaganda, trains able young men as administrators and recruiting agents and urges all its followers to bring in 20 new believers every month. In the early 1960s the movement claimed more than 700,000 members.

Mandala and Lotus Sutra

Several modern Japanese sects have arisen in the name of Nichiren, the 13th century Buddhist monk who believed himself to be designated as the nation's saviour, and who considered that all necessary truth was contained within the Lotus Sutra. The Sutra was held to contain the final teachings of the Buddha, that promised salvation to men by faith and invocation. Nichiren composed a recitation to the Sutra and taught that the mandala, the scroll on which this salutation was written, should be adored. An element of belief in a messiah was also found in the Nichiren teachings, which were carried on by a number of older Buddhist sects.

Reiyuka (the Association of Friends of the Spirit) came into being when a worker in Yokohama who had lost two children began to tend the graves of the temple cemetery. He encouraged others to do likewise and, in 1925, Kakutaro Kubo and his sister-in-law, Kotani Kimi, launched a new movement which attributed contemporary evils to failures in duty to the spirits. The mandala and Sutra were central features of the movement, particularly the transfer of merit to ancestors by reading the Sutra. The home remained the place of worship and an altar and a copy of the mandala were set up by each family of adherents. The movement never developed any intermediary organizations between the home of the believer and headquarters, although periodic conferences are arranged at which individuals are encouraged to express their opinions freely. Perhaps because of this looseness of its structure, and also because of a series of scandals about tax evasion, in which Kotani Kimi was involved in the early 1950s, the movement has been highly schismatic. Nonetheless it claims about four million members.

One of the rapidly growing offshoots of Reiyuka is *Rissho Koseikai*, the Society for Righteousness and Friendship. It began in 1938 when Niwano Nikkyo, then 32, and the 47-year-old Mrs Naganuma Myoko combined as organizer and spiritual medium respectively to form a new movement which was not, initially, very different from Reiyuka. Subsequently, although continuing to practise two sorts of divination (foretelling the future from a person's name, and by astrological means), Rissho Koseikai came to display a less magical attitude to the still important mandala, regarding it as a liturgical instrument without the intrinsic power imputed to it by other Nichiren sects.

Hamlyn Group/British Museum

Utensils for the Japanese Tea Ceremony: the serving of tea was elevated by Zen Buddhism into a dignified ritual expressing the beauty to be found in the mundane routine of life. Tea was first brought as a medicinal herb to Japan from China by a priest, Eisai, at the beginning of the 13th century, along with the philosophy of Zen

Nichiren is not claimed to have been the eternal Buddha and, since her death in 1957, the extreme reverence that had grown up for Mrs Naganuma, who had come to be regarded as a living Buddha, has been discouraged.

Repentance, good living, ancestor worship and neighbourliness are demanded. A practical demonstration of neighbourliness is provided by voluntary public service. More central to the sect's success, however, is its development of the counselling system that it inherited from Reiyuka. Each day at headquarters, and at other centres, small circles gather under a teacher to discuss their personal problems and seek religious solutions. The *hoza* (truth-sitting) is a dramatic departure from Japanese traditions of reserve and social inhibition; each sitting is usually drawn from one particular age and sex group. The hoza, the dramatic festivals sponsored by the movement and its well-disciplined organization are perhaps principally responsible for the growth of this style of lay Buddhism. In the mid-1960s it claimed some two million adherents.

Aggressive and Intolerant

The most important sect in Japan is *Soka Gakkai* (Value Creation Society) which denies being a religion at all. It claims to be a lay organization that promotes the Nichiren cult *Shoshu*, an extremist cult that emphasizes not only the mandala as intrinsically powerful, but the mystical oneness of Buddha, Nichiren and believers. This aggressive movement, which unlike other Nichiren sects is completely intolerant of all other religions and which maintains a vigorous political party, began in 1930 with the publication of the first volumes of Value Creation philosophy by Makiguchi Tsunesaburo. He and some of his small following were imprisoned in the Second World War, after which leadership passed to Toda Josei, who promoted the utilitarian creed of Makiguchi with unexcelled vehemence. The Nichiren Shoshu was held to prove its superiority to other faiths by its literary, theoretical and practical value, the only source of genuine happiness.

Soka Gakkai, in a way not dissimilar to the publishing organization of Jehovah's Witnesses, became the agency of evangelism. Its methods of 'break and subdue' *(shakubuku)* earned the movement a bad reputation – but they achieved results, not least in winning many adherents in Hokkaido, the northern island in which the miners' union, Tanro, had previously held undisputed sway. Part of its appeal is the clear manifestation of power communicated by the movement and its methods of proselytizing. It provides, too, a simple folk Buddhism focused on daily worship of the mandala: it demands no initial faith, and offers its practices to pragmatic test. The movement has evolved an elaborate system of ranks and titles and confers a variety of semi-academic distinctions. It is, in some ways, ruthlessly modern and efficient; in others it maintains the attraction of an ancient, nationalistic cult. The denigration of other religions, the condemnation of political parties as corrupt (and its own support of a Clean Government Party which attained considerable success in the early 1960s soon after its foundation) and the military-like discipline of the movement are calculated to give the impression of certainty of purpose and resolution. In the cultural confusion, civic disorders and political scandals of the last two decades, this image has had great appeal in Japan. Soka Gakkai claims over three million families among its adherents: from its political successes this claim may not be exaggerated. (See also SHINTO; ZEN.)

Acknowledging duty only to the one true god, Jehovah, the Witnesses look forward to the early return of Jesus and the establishment of the New World society on earth; to this end they make use of the media of the competitive business world, proselytizing with pamphlets, recordings, radio and doorstep canvassing

JEHOVAH'S WITNESSES

ONE OF THE MOST RAPIDLY growing Christian sects during the post-war period has been Jehovah's Witnesses. Distribution of the movement's publications, *The Watchtower* and *Awake!* is done voluntarily by members. The world membership in 1981 peaked at 2,361,896, and in that year several million people attended the sect's annual memorial supper services in Kingdom Halls throughout the world. In 1981 there were some 588,000 witnesses in the U.S.A., 85,000 in the U.K. and 101,000 in Germany. In 1981 in Zambia, Witnesses constituted over 10,000 of the population. World membership was calculated to have increased in 1981 by 3.3%.

The movement began in 1870 when Charles Taze Russell, a draper's son from Alleghaney, Pittsburgh, became convinced that the Second Coming of Christ was imminent. This idea has been a recurrent enthusiasm in America; in the 1830s thousands had believed the prophetic exposition of William Miller by which he calculated that Christ would return in 1843 or 1844. Russell adopted some of Miller's calculations, and in 1875 became convinced that Christ had already but invisibly returned during the previous year. He soon came to believe that Christ would be visibly present on earth by 1878. Later he believed that 1878 was the year that the dead had been resurrected in heaven, and he regarded 1914 as the year destined to end the time of the Gentiles, in the great battle of Armageddon foretold in scripture.

Using his considerable means, he devoted himself to promulgating these ideas. A group of Bible students gathered and Russell became their pastor: the different congregations of Russellites were linked together by a periodical, *Zion's Watch Tower*. In 1884 he formed a legal corporation, Zion's Watch Tower Tract Society, to control the movement's publications which, over the following years, included his seven-volume work *Studies in the Scriptures*. A system of full-time workers (later called pioneers) was recruited to distribute the movement's publications. Never before had adventist ideas been so widely diffused so quickly as by this organization: by 1914 Russell had followers in all the northern European countries, South Africa and in many American cities, and his publications were circulating in central African territories. Disappointed expectations for 1914 caused some to withdraw, and after Russell's death in 1916 the movement reached a low ebb. But for the efficiency of his successor, Judge Joseph Rutherford, it might have dwindled away.

Deathless Millions

Rutherford inherited a disenchanted rank and file, a revolt in the hierarchy over leadership, schisms among European followers as well as in America, and the suspicion of the United States government that Watch Tower propaganda was subverting the war effort; on this account Rutherford and some of his closest associates were imprisoned in 1918, sentenced to 20 years, but released in 1919. Under the slogan 'Millions Now Living Will Never Die', Rutherford launched the movement on a new path, whilst continuing to assert the imminence of the millennium. The year 1874 was superseded by 1914 as the year of Christ's invisible Advent. Gradually Russell's writings were allowed to go out of print, to be replaced by the many books of Rutherford himself. From 1931, when the name Jehovah's Witnesses was adopted, a mass recruitment policy has been implemented, with door-to-door canvassing, gramophone records and later by street advertising and radio broadcasting.

Throughout the 1930s the central direction of the movement grew: local officials became nominees of district or national authorities that were in turn controlled from Brooklyn, where the movement had

Mass baptism at an International Convention of Jehovah's Witnesses in London. Witnesses hope that they will see the time of the battle of Armageddon when Christ will defeat Satan, the United Nations, the Churches and other forces thought to be hostile to Jehovah

Keystone

its printing and publishing concern and effective headquarters. In the last years of his life Rutherford receded from his central position, and authority in the movement became increasingly anonymous in keeping with its theocratic claims. This trend was continued under the presidency of Nathan Knorr, who succeeded Rutherford in 1943 and Frederick W. Franz who succeeded Knorr after the latter's death in 1977.

The central belief of the Witnesses has remained the imminence of Christ's appearing and the establishment of the New World society on earth. Since 1914, when Christ is held to have established his heavenly kingdom, the movement has not fixed specific dates, although 1918 is regarded as the time when he cleansed the heavenly temple (an analogue with the purging of members disloyal to Rutherford) and 1925 was a year of intense expectation. Informally, there was great hope of 1975 as the time of the battle of Armageddon when Christ and his heavenly hosts will defeat Satan and the armies of the nations, the Churches and the United Nations.

The interim period between 1914 and the establishment of the New World order is held to have been a period in which the last of the anointed class of 144,000, who will reign in heaven with Christ, were being gathered. Some of these are thought still to be alive, and those Witnesses who are certain of this election alone partake of the emblems at the annual memorial supper, whilst others simply attend. From the number who partook in 1966, of the two millions present at the supper throughout the world, it appears that about 10,000 of this class, sometimes collectively referred to as 'God's Woman', then remained alive. This class is the elite of the movement: the differentiation in types of salvation arose under Rutherford and was the theological concomitant of becoming a mass movement. The elect would reign with Christ, whereas other Witnesses, who came to be called Jonadabs, would inherit eternal life on earth. To these must be added a more obscure category of those who had not rejected the truth, who would have a chance to prove themselves during the millennium. Those who failed this test, and those killed at Armageddon, and those who had persecuted Jehovah's Witnesses, would be annihilated.

Prophetic exposition and eschatology (doctrine of the 'last days' and the state to come) constitutes the core of Witness doctrine. Jehovah's principal concern is to vindicate his name, Witnesses are called for this end, and this is the purpose of all history. Jehovah's power is more evident than his love, and man's redemption is only a secondary purpose in his plan. The Trinity is rejected: Jesus in the flesh was not God but a man. His resurrection was spiritual, and it was then that he received immortality. This representation of Christ is analogous to the destiny of the anointed class. As in other adventist movements there is a denial of the immortality of the soul.

Witnesses use their own New World translation of the Bible, which gives renderings that support their teachings. *The Watchtower* is not merely the main vehicle of propaganda, but it is also a vital catechizing instrument. Each week a Watch Tower Study is held in each Kingdom Hall, and a procedure of question and answer ensures that doctrine is thoroughly understood. A public talk is also given weekly, and two other meetings are devoted to methods of evangelization and training of 'publishers'. At a fifth meeting one of the official texthooks is used as a basis of teaching and discussion.

Pioneers and Publishers

Each congregation is presided over by a congregation servant, assisted by five others, and these officials are not locally elected but appointed by 'the Society'. Beyond them, circuit servants and district servants co-ordinate the work of local congregations. Central organization is established through three separate corporations with interlocking directorates who run the publishing concern. Apart from the full-time officials at international, national, district and circuit level, there are also 'pioneers' who, for very modest expenses, devote at least 100 hours a month to selling the movement's literature. Beyond this, every Witness who can is expected to spread the truth, giving his spare time to doorstep canvassing without recompense; all congregation members in fact are known as 'publishers'.

The movement has a dual structure. There is a community of Bible students supposedly held together by nothing but their recognition of the truth, and there is the publishing agency, a human organization working to bring God's word to mankind. In practice the Bible students are organized by the publishing agency, which collects statistics from every 'publisher' for every hour of his active work for the movement, very much on the model of a large-scale corporation. Divine service is not worshipping but 'publishing.' The organization is not so much concerned with persons as with activity stated in work hours, production figures and sales. The dual structure allows the movement to resolve one of the central paradoxes facing contemporary religious movements: the apparent contradiction between the value-commitment of religious activity, which is essentially extra-rational, and the need for rational organization in the competitive modern world. Distributing literature provides a practical (in contrast to a ritual) activity for members. Continued activity is ensured by the steady flow of titles from the publishing house: old publications are superseded by new periodically, and the existence of a large following ensures a ready market for new books and the possibility of fixing economic prices for them.

Every Jehovah's Witness who can is expected to give his spare time to canvassing from door to door: 'pioneers' devote at least 100 hours a month to selling the movement's literature

Jehovah's Witnesses

At Odds with Government

The movement has frequently been in difficulty with governments in various countries. Witness teaching demands primary loyalty to Jehovah: nation states are sinful entities soon to be swept away, so that Witnesses claim to belong to a different and superior organization. From the mid-1930s Witnesses stopped saluting national flags and in the war years this led to a conflict with the United States government and to widespread public hostility to Witnesses, who eventually obtained exemption from this observance for their children, who would have been expected to salute the American flag at school. In Germany they were banned by Hitler and were put into concentration camps, where they gained a reputation for being able to withstand torture better than most prisoners. The movement was banned in Australia and New Zealand in the Second World War. It has long been banned in Russia, and more recently in Egypt and Malawi.

Witnesses are not pacifists, since they would fight at Christ's command. But they have been conscientious objectors in wars between nations. They sought, but failed to obtain, exemption from military service as ministers of religion in a test case in Scotland. They come into periodic conflict with medical authorities when they refuse blood transfusions on the basis of biblical injunctions (Psalm 16 and 1 Chronicles 11, 17–19). In other matters they accept normal medical treatment. Whilst not intensely ascetic, they follow a rather rigorous code of sex ethics. For moral lapses, as for doctrinal deviations, the offenders are expelled from the fellowship. Dancing, drinking and tobacco are not absolutely prohibited, but the good Witness is too busy and too serious about his evangelizing work to have much time for entertainments and diversions.

JERUSALEM

JERUSALEM

THE CITY OF JERUSALEM, the capital of King David and his successors and since 1948 the capital of the state of Israel, has been from ancient times a centre of great religious significance. It is mentioned for the first time in ancient Egyptian texts of the 19th–18th century BC, but archeological excavations have proved it much older. The name of the city means 'Foundation of Shalem (God)' but was later interpreted – as a result of the similarity of sound in the Hebrew word *shalom* meaning peace – as 'City of Peace'.

Jerusalem seems to have been a cult centre from time immemorial. At an early date a hill-fortress, it became a holy city for the Israelites after David had conquered it from the Jebusites at the beginning of the 10th century BC. There David established his capital and brought the central Israelite sanctuary, the 'Ark of the Lord', to Jerusalem. David's son and successor Solomon built a magnificent temple and Jerusalem soon became in Israelite belief the city which 'God had chosen'. This belief was taken for granted by biblical prophets such as Isaiah, and by historians in the books of Samuel, Kings and Chronicles. The Psalms are eloquent witness to the significance of Jerusalem and Zion (one of the hills of Jerusalem, probably the Temple Mount, but used as synonymous with Jerusalem) in Israelite piety and devotion. Jerusalem became the symbol of God's covenant with his people and with the royal house of David; it was regarded as a spiritual capital from which the word of God was to issue forth to all mankind (Isaiah 2.3), as the seat of justice and righteousness (Isaiah 33.5) and as the messianic city of God (Isaiah 66.8) in a redeemed world. The attachment of the Jews to the city, both as an earthly reality and as a symbol of their historical identity and future hopes, is evident both from the ancient Psalms: 'Pray for the peace of Jerusalem!' (Psalm 122.6), 'If I forget you, O Jerusalem, let my right hand wither!' (Psalm 137.5), from the constant evocation of Jerusalem in Jewish liturgy and ritual practice, and from the modern nationalist movement of Zionism.

The spiritual and eschatological significance of 'Jerusalem' became more pronounced during the period of the second Temple built by Herod the Great and after its destruction in 70 AD; and the image of the heavenly Jerusalem complemented that of the earthly city.

The role of Jerusalem in Christian piety and symbolism is determined by two elements. The decisive events of the ministry of Jesus such as the Last Supper, his Passion, Crucifixion and Resurrection, took place in or near Jerusalem and hence Jerusalem, as a city of 'holy places' associated with the life and death of Christ, has always been an object of pilgrimage. To this was added the idea of the earthly Jerusalem as a symbol and terrestrial reflection of the true, ultimate and spiritual Jerusalem in heaven. The latter was symbolically identified with the Church, and a great wealth of images and symbols expressed this identification in poetry and iconography. Occasionally, the idea of Jerusalem fired religious enthusiasm, and together with other social and political factors stimulated powerful religious movements such as the Crusades. Christian spiritual writers (unlike the Jews, for whom the earthly concrete city was always primary in spite of the many additional spiritual meanings) often exhibited an ambivalent attitude to the terrestrial Jerusalem; pilgrimages and the like were seen as a possible temptation to substitute a crudely material conception for what should have been a spiritual symbol for the Kingdom of Heaven.

By the time of the rise of Islam in the 7th century Jerusalem had been established for many centuries as a holy city for both Jews and Christians, and since the founder of Islam had been profoundly influenced by the two earlier religions, Jerusalem very soon came to hold a special place in Moslem tradition. The associations were of course not historical as they had been for Judaism and Christianity but were based on a verse in the Koran (sura 17): 'Praise to Allah who brought his servant at night from the Holy Mosque to the Farthest Mosque.' Whatever the precise original meaning of this verse the earliest Moslem tradition already interpreted it as referring to Mohammed's miraculous journey on a winged steed from Mecca to Jerusalem. During the night of his ascension to heaven to receive his revelation, the prophet was first transported from the 'Holy Mosque' at Mecca to the 'Farthest Mosque' at the site of Solomon's Temple in Jerusalem. Thus Islam absorbed the Judaeo-Christian traditions regarding the sacred character of Jerusalem and the city ranks for Moslems as the third holiest after Mecca and Medina. In fact the Arabic name for Jerusalem is simply *Al-Kuds* ('the Holy One'). In Islam the emphasis is on the prophet's miraculous night journey to the site of the Temple and the Rock; hence the two mosques there are called the 'Dome of the Rock' and the *Al-Aksa* ('the farthest') mosque. In Christianity the emphasis is on the heavenly Jerusalem as a symbol of the Church and man's spiritual home. The earthly Jerusalem, its holy places, Via Dolorosa, the Holy Sepulchre, the Mount of Olives, serve as a reminder of the earthly ministry of Christ. In Judaism, the holiness of Jerusalem derives from the city's character as the centre and concrete symbol of God's covenant with his people, the promise of an ultimate restoration and messianic future. Few cities have acquired so many and so varied religious symbolic significances as Jerusalem.

Those who have questioned the existence of 'Jesus' have often confused Jesus of Nazareth, who is recorded as having been executed by the Jews, with his theological interpretation, Jesus Christ; the transformotion into the Saviour of mankind was largely due to the Apostle Paul

IT WAS ONCE FASHIONABLE in certain circles to deny that Jesus of Nazareth had ever existed. Although this view never became widely established and was rejected by most scholars, it was not wholly wrong. Its chief error lay in confusing 'Jesus of Nazareth' with 'Jesus Christ'. For 'Jesus Christ' generally represents a theological interpretation of the person and career of the historical Jesus of Nazareth, who was crucified by the Romans, outside the walls of Jerusalem, c 30 AD. In other words, it is necessary to distinguish between the historical Jesus and the theological interpretation of him. The task, however, is not easy; but it is vitally necessary, if the origins of Christianity are to be understood.

The historical existence of Jesus of Nazareth must first be established. Generally, the existence of some person from the past is not questioned, unless what is recorded is incredible in terms of ordinary experience. Thus, for example, we do not doubt that Socrates existed and was condemned to death by the Athenians for impiety; but we are sceptical about Osiris whom the Egyptians believed had risen from the dead and had become the ruler of the next world.

Ironically, the best-attested fact about Jesus is that of his death. His execution for sedition, on the orders of Pontius Pilate, the Roman *praefectus* of Judaea, is recorded both by Christian writers and the Roman historian Tacitus, who wrote early in the 2nd century AD. The Christian evidence is especially significant. The execution of Jesus as a rebel against the Roman government of Judaea was an embarrassment to the early Christians. It caused Christianity to be regarded as a politically subversive movement by the Roman authorities, and prompted them to persecute Christians. The gospel writers, therefore, would have never invented such an end for Jesus; in fact, they endeavoured to explain it away.

The Roman execution of Jesus constitutes the strongest evidence of his existence as

Sonia Halliday

It is evident that the Christian gospels contain genuine traditions about Jesus, but, on closer examination, it is clear that they are not accurate historical records of the career of the historical Jesus

a historical person. The subsequent Christian interpretation of his death as a sacrifice to save mankind from perdition must be investigated as a basic factor in the development of Christian theology; but it does not detract from the historicity of the event, which in any case was recorded by Tacitus, an independent witness.

A 'Pernicious Superstition'?

From the certainty of the crucifixion of Jesus by the Romans one must work backwards in an endeavour to reconstruct the course of his life, for our only information about Jesus comes from the New Testament writings, and almost exclusively from the four gospels. Tacitus tells us nothing more than that Pontius Pilate executed Jesus, and that the 'pernicious superstition', as he called Christianity, not only broke out again in Judaea, but spread to Rome. There is a passage about Jesus in the *Jewish Antiquities* of Josephus, the Jewish historian. If the passage were genuine, it would be of great value, because Josephus lived in Judaea shortly after the lifetime of Jesus. However, there is strong reason for suspecting that, as it stands, the passage is a later Christian forgery which replaced the adverse account that Josephus originally wrote.

The Christian gospels appear, at first sight, to be biographies of Jesus, and it is evident that they contain genuine traditions about him. But, on closer examination, it is clear that they are not accurate historical records of the career of the historical Jesus. Instead, they are presentations of someone whom the authors believed was the incarnate Son of God. For example, the earliest gospel, that of St Mark, describes itself as 'the gospel of Jesus Christ, the Son of God'. This fact is of fundamental significance for an evaluation of their testimony since it means that the authors of the gospels were not writing history, but theology. They were using material about the historical Jesus; but they interpreted it to demonstrate that Jesus was the divine saviour of mankind. This estimate of the gospel writers is not intended to convict them of conscious deceit or distortion of their evidence. They were not writing as historians, even though Luke professes to do so (1.1–4); they were writing as convinced Christians about their master, whom they believed was divine, who had risen from the dead, and ascended into heaven, which they located in the sky. They were writing also for fellow Christians, and they drew not upon their own experience of the historical Jesus, but upon traditions which they had inherited about him. Moreover, they all wrote long after the Crucifixion, when the original community of Jesus's disciples and apostles had disappeared in the destruction of Jerusalem in 70 AD. And they wrote for Greek-speaking communities of Christians situated in various places in the Roman Empire, outside Judaea.

The Message of the Gospels

The problem is that a Jew named Jesus of Nazareth, who was executed as a rebel by the Romans about 30 AD, is the subject of four biographical accounts, written some 40 years or more later by followers who believed that he was the Son of God. These accounts were designed to attest his divine origin, to show that he was the Messiah of Israel, that his death was for the redemption of mankind, that he arose from the dead three days after his crucifixion, and that he ascended into heaven, whence he would shortly return with supernatural power and glory to judge the world. Thus, the basic issue is how these extraordinary things about the historical person whom the Romans executed came to be believed during the course of some four decades.

There are two obvious answers. First, that Jesus had told his disciples that he was divine and that his coming death was designed to save mankind, and second, that he did in fact rise from the dead and was seen to ascend into heaven, as the Christian sources relate. But both answers are so fraught with difficulties of various kinds that they cannot be accepted as adequate explanations. For example, no authentic writing by Jesus survives, and we cannot be sure that we have an exact record of his teaching, of what he said and the circumstances in which he said it. Indeed, every recorded saying is essentially obscure, and often conflicts with other sayings. The accounts of his resurrection and ascension are similarly at variance. For example, there is a fundamental divergence of testimony about the location of these extraordinary events. According to the author of the gospel of Luke and the Acts of the Apostles, the appearances of the risen Jesus took place in and around Jerusalem, and he ascended into heaven from the Mount of Olives: and the disciples were expressly forbidden to leave Jerusalem at this time (Acts 1.4). On the other hand, the gospel of Matthew, with which Mark's gospel appears to concur, locates the appearance of the risen Jesus to his disciples in Galilee, where they had been told to go; and the Ascension apparently took place there (Matthew 28.10,16; 16.7). It is amazing that a difference of opinion about such important events should occur within some 50 years of their happening. And it serves to warn us of the inexact nature or fluidity of the earliest traditions concerning Jesus. There is a similar conflict between the accounts of the birth of Jesus in Matthew and Luke (Matthew 1.18–2.23; Luke 1.26).

The existence of such contradictions about Jesus in the primitive tradition makes one despair of obtaining any reasonably reliable information about him, apart from his crucifixion by the Romans. But the problems already mentioned are not the most serious ones that concern Jesus in the earliest Christian writings. There is another even more basic problem but, paradoxically, although it is so serious, it actually provides the key to a better understanding of the historical Jesus and of the process that led to his divinization.

The Interpretation of Paul

The earliest surviving Christian writings are not the gospels but the Epistles of St Paul (see PAUL). They were written about 20 years before the gospels, and provide evidence of Christian life and thought some 20 years after the Crucifixion. When these epistles are carefully examined they reveal that already an amazing conflict of opinion existed about Jesus. In two separate letters, Paul denounces certain opponents who 'preach another Jesus' and 'another gospel' (Galatians 1.6–9; 2 Corinthians 11.4). Since Paul cannot possibly mean that these opponents were preaching about another person named 'Jesus', his denunciation must signify an interpretation of Jesus different from his own.

This problem is very complicated, and

Jesus driving the money-lenders out of the Temple, by El Greco: his attack may have been primarily directed at the priestly aristocracy, to whom the economic activities of the Temple were a rich source of income

The Sweet Cold Death

After this Christ shewed part of his Passion near his dying.

I saw his sweet face as it were dry and bloodless with pale dying. And later, more pale, dead, languoring; and then turned more dead unto blue; and then more brown-blue, as the flesh turned more deeply dead. For his Passion shewed to me most specially in his blessed face, and chiefly in his lips; there I saw these four colours, though it were afore fresh, ruddy, and liking, to my sight. This was a sorrowful change to see, this deep dying. And also the nose clogged and dried, to my sight, and the sweet body was brown and black, all turned out of fair, lively colour of itself, unto dry dying.

For that same time that our Lord and blessed Saviour died upon the Rood, it was a dry, hard wind, and wondrous cold, as to my sight, and what time the precious blood was bled out of the sweet body that might pass therefrom, yet there dwelled a moisture in the sweet flesh of Christ, as it was shewed. Bloodlessness and pain died within; and blowing of wind and cold coming from without met together in the sweet body of Christ. And these four, – twain without, and twain within – dried the flesh of Christ by process of time. And though this pain was bitter and sharp, it was full long lasting, as to my sight, and painfully dried up all the lively spirits of Christ's flesh. Thus I saw the sweet flesh dry in seeming by part after part: dying with marvellous pains.

And as long as any spirit had life in Christ's flesh, so long suffered he pain. This long pining seemed to me as if he had been seven nights dead, it meaneth that the sweet body was so discoloured, so dry, so clogged, so deathly, and so piteous, as (if) he had been seven nights dead, continually dying. And methought the drying of Christ's flesh was the most pain, and the last, of his Passion.

Julian of Norwich *Revelations of Divine Love*
ed Roger Huddleston

here a summary statement only can be given of its solution. It would appear that Paul, who had not been an original disciple of Jesus but had been converted by some profound inner experience, became the exponent of a new interpretation of Jesus. Paul believed that this interpretation had been specially revealed to him for the evangelization of the Gentiles. For, although he was a Jew, Paul had a hellenistic background and appreciated the spiritual needs and outlook of contemporary Graeco-Roman society. He was convinced that the interpretation of Jesus presented by the original apostles of Jesus was not adequate to Gentile needs, and that God had therefore given him this new interpretation or 'gospel' (Galatians 1.15–17). Paul's 'gospel' can be reconstructed from his epistles. The main outline is that mankind had become enslaved to the demonic powers that ruled the planets. To save humanity from this fatal condition, God sent into the world a pre-existent divine being, whom Paul called the 'Lord of glory'. Incarnated as Jesus, the demonic powers mistook him for a human being, and crucified him. In so doing, they lost their control of mankind, because the Lord of glory could not be held by his death and rose triumphantly to life (1 Corinthians 2.6–8; Colossians 2.14–15). In his interpretation, Paul paid scant regard to the historical circumstances of Jesus's career; even his crucifixion is ascribed to the demonic powers, with no reference to Pilate and the Jewish authorities.

The 'Other Gospel'

If this was Paul's gospel, what was the other interpretation of Jesus against which he inveighed so strongly? The evidence points unmistakeably to the original apostles and disciples of Jesus, located at Jerusalem, as Paul's opponents and the protagonists of the 'other gospel'. As Jerusalem was destroyed in 70 AD, and the primitive Christian community there and its records lost, this 'other' gospel has to be reconstructed from various indirect sources, including Paul's own writings. However, enough can be learned to know its chief tenets. It appears that the original disciples of Jesus believed him to be the Messiah (*Christos*) of Israel. His death at the hands of the Romans had been a hard blow to their faith; for, according to contemporary Jewish thought, the Messiah should overthrow Israel's enemies, not be killed by them. However, through visions experienced by certain disciples of Jesus after his crucifixion, it was believed that God had raised him from the dead, in order that he might return again, with supernatural power, to 'restore the kingdom of Israel' (Acts 1.6). His death was explained as a martyrdom for Israel, caused by the nation's failure to accept him as the Messiah. These original Jewish Christians continued to live as devout Jews, worshipping in the Temple. They did not regard their faith in Jesus as constituting a new religion, separate from Judaism; neither did they regard Jesus as divine, because Jewish monotheism precluded any conception of the Messiah as a deity.

Critical analysis of the New Testament writings reveals, therefore, that within two decades of the Crucifixion two different interpretations of Jesus were current within the Church. The original disciples of Jesus proclaimed him as the Messiah of Israel, who had died a martyr's death for his people; but God had raised him up and he would shortly return to complete his messianic role. Paul, in contradiction, taught that Jesus was the incarnation of a divine 'Lord of glory'. His death had been planned by God, in order to save mankind from their fatal enslavement to the demonic rulers of the world.

These evaluations of Jesus were mutually incompatible. As soon as the Jerusalem Christians realized the nature of Paul's gospel, they repudiated both it and him. They sent emissaries among Paul's converts, warning them that Paul was not an apostle and that his teaching was not the original form of the faith. Paul's situation was basically insecure: he could not repudiate the authority of Jesus's own apostles and his own doctrine could easily be rejected as the errors of a late-comer to the faith, who had not shared the original experience of Jesus. Paul's cause suffered defeat, and it is probable that all trace of his teaching would have been lost but for the Jewish revolt against Rome in 66–70 AD when the original Christian community at Jerusalem disappeared during the destruction of the city, and with it its authority and teaching. A rehabilitation of Paul followed, which assured that his interpretation of Jesus as the divine saviour, incarnated and crucified to save mankind, should prevail and become orthodox Christian doctrine.

Thus, the historical Jesus of Nazareth was transformed into the Saviour God of Christianity. Is it possible to discern behind this transformation something of the original human Jesus? The evidence of the gospels is very puzzling. They all admit that Jesus was executed by the Romans for sedition. This fact would be of superlative importance if Jesus had indeed been guilty of rebellious activity against the Roman government in Judaea for it would mean that, as the Messiah, he had sought to deliver Israel from the oppression of heathen Rome. Such action would not have made him unique; because as Josephus records, many others sought this end and died at the hands of the Romans.

The gospels, however, maintain that Jesus was innocent of sedition, and that the Jewish authorities forced Pilate to execute him on such a charge. Such a miscarriage of justice is feasible; but there is strong reason to think that this gospel presentation of Jesus as innocent of sedition against Rome resulted from consideration of defending Christianity. Critical analysis of the account in Mark of the trial of Jesus, which set the pattern for the other gospels, shows that its author, writing in Rome about 71 AD, sought to explain away the embarrassing fact that Jesus had been condemned as a rebel by transferring the responsibility for the Crucifixion from Pilate to the Jewish leaders. Mark also represents Jesus as ruling that the Jews should pay tribute to Caesar (Mark 12.13–17) and, significantly, he disguises the fact that one of Jesus's apostles was a Zealot, that is, a member of the Jewish 'resistance' against Rome (see ZEALOTS).

Pacifist or Rebel

Looked at carefully, it appears that Pilate condemned Jesus because he thought that he was truly guilty of sedition. And this conclusion is borue out by certain other facts recorded in the gospels. For example, Jesus deliberately planned a triumphal entry into Jerusalem as the Messiah King on his last visit to the city. He checked to see that his disciples were armed before going to Gethsemane (Luke 22.36), and there was armed resistance at his arrest. Such actions are not consistent with a pacifist who endorsed the Roman rule of Judaea, and who wanted

Mural by Giotto, of the triumphal entry of Jesus into Jerusalem; this is one of the actions of Jesus which suggest that he may have regarded himself as the divinely appointed deliverer of Israel from subjection to rulers other than God. 'And such actions render intelligible his execution by the Romans for sedition'

to keep himself aloof from contemporary Judaeo-Roman politics. Instead, they suggest the action of one who believed himself to be the Messiah, divinely charged with the deliverance of Israel from its current subjection to masters, both Jewish and Roman, other than God. And such actions render intelligible his execution by the Romans for sedition.

As far as it is possible to reconstruct the career of Jesus from the problematic evidence of the gospels, it would seem that he succeeded John the Baptist in proclaiming the imminence of the kingdom of God and in seeking to prepare Israel for its coming. The idea of this divine kingdom involved the end of the prevailing world order and consequently the overthrow of the Roman government. Widely supported in Galilee and popularly regarded as the Messiah, Jesus became increasingly conscious of the opposition of the Jewish authorities, including the priestly aristocracy, from which the high priest was appointed by the Romans. The members of the priestly aristocracy supported Roman rule both in their own interests and because they believed it to be in the best interests of the nation. Furthermore they derived a considerable income from control of the great Temple at Jerusalem.

It is possible that Jesus finally decided to challenge the Jewish authorities on their own ground, the Temple, and perhaps to seize it and set up a new high priest, who was not a Roman nominee. The Zealots did just this in the revolt of 66 AD. Whether that was his intention or not, Jesus did enter Jerusalem as the Messiah, with his followers, and attacked the economic activities of the Temple, which was a lucrative source of income to the priestly aristocracy. His attack on the Temple seems to have coincided with a Zealot attack on the Romans, which was probably commanded by Barabbas. This apparent

coincidence raises the question of Jesus's relations with Zealots. The fact that one of his disciples, Simon, was known as 'the Zealot' indicates that the rest were not; but it also suggests that belief in Zealot principles was not incompatible with adherence to Jesus and that there was probably a close bond of sympathy.

According to the gospels, it would seem that Jesus's attack on the Temple was abortive, but he was too strongly supported to be arrested. The Zealot revolt was suppressed by the Romans with casualties, and Barabbas and others were captured. Jesus stayed on in Jerusalem until the night of the Passover. Realizing that his attempt had failed, he decided to withdraw to Galilee. But his rendezvous in Gethsemane that night was betrayed by Judas Iscariot, and he was captured after an armed struggle. After interrogation, the Jewish authorities handed him over to Pilate, charged with sedition. It would seem that they accused Jesus as being the leader of the recent revolt, and not Barabbas. Pilate accepted the charge and ordered the Crucifixion of Jesus as the rebel Messiah King of Israel. He also ordered that Jesus should be crucified between two Zealot prisoners, whom he evidently regarded as Jesus's followers.

The story of the empty tomb (Mark 16) appears to be a later explanation of the disciples' conviction that they had seen Jesus alive again after his death. However, although they believed that he had risen from the dead, Jesus was not seen by any non-believer nor did he resume his former life. Instead, it was claimed that he had ascended to heaven, whence he would soon return to complete his messianic mission. His Jewish disciples devoted themselves to proclaiming him as the Messiah to their compatriots; and it was left to Paul to transform Jesus into the Saviour God of mankind.

(See also CHRISTIANITY.)

Ashmolean Museum

The bishop's ring, gold with an amethyst, is worn on the third finger of the right hand. In the occult tradition, the amethyst is 'the jewel of the high priest, of one who is not confused, distracted or overwhelmed by the intense fascination of external phenomena.' In this sense it protects the wearer from drunkenness, which is its old traditional role. It is also used in magic to gain political power

From the regal diamond to the humble coral jewels and semi-precious stones have been valued not only for their rarity and beauty but for their place in occult symbolism; their traditional associations with the planets accord them mysterious powers for good and evil

JEWELS

KETHER, THE SUPREME Crown of the topmost sefiroth of the cabalistic Tree of Life – studded with gems of elemental brilliance, glistering fire, shining water, sparkling air, and richly glowing earth – is the archetype of all earthly crowns that have adorned prophets, priests and kings throughout the ages. In former times, jewels were often selected for their symbolic value: the diamond for unyielding durability, the pearl for purity, the flaming ruby for the administration of justice, the topaz for nobility and regal splendour; all have formed, at sometime, an essential part of royal diadems.

Behind these more obvious attributions lay a complex scheme of occult correspondence elaborated by priests, magicians, wizards and sages. The entire mineral kingdom was involved, and even stones that were not, strictly speaking, precious stones became endowed by tradition with celestial values that exalted them to the rank of veritable jewels. Yet it was not merely the symbolic value that mattered, nor the intrinsic worth of a stone in a commercial sense; it was its peculiar occult property, that gave it a place among sacred gems.

The scheme of classifying the various stones and their properties involved the planets, whose influences were believed to be very strong in certain stones. Consequently, they were considered to be their vehicles or transmitters.

Quartz is one example. It is particularly associated with the moon, and is an important constituent of the earth's crust. It has been compared with the reproductive system because, just as gold is concealed in quartz, so is the sex factor contained within the human organism. Quartz is also supposed to possess the remarkable property of rendering opaque bodies invisible. Apollonius of Tyana, the famous 1st century mystic (see APOLLONIUS), used it for this purpose when Caesar Domitian suddenly summoned him from a great distance. The sage made himself invisible, materialized before Domitian, and subsequently dematerialized again, reappearing shortly afterwards near the distant Mt Vesuvius.

In modern times, a Viennese scientist named Pribill attempted to demonstrate this property of quartz. He claimed that the secret lay in the way in which the stone had been cut for magical purposes since time immemorial, maintaining that it was cut to a certain angle and placed in the mouth after exposure to tropical sunlight. The magician then intoned a secret incantation which, combined with the occult properties of the sun-impregnated quartz, gradually caused his body to disappear.

The Crystal Window

The moon is also associated with rock crystal, which stimulates the faculty of clairvoyance. This stone is also used in healing; the affected part is immersed in water charged with the psychic energies

Magical Use of Gems

If thou wilt know whether thy wife is chaste or no.
Take the stone which is called Magnes, in English, the lodestone, it is of sad blue colour, and it is found in the sea of India, sometimes in parts of Almanie, in the province which is called East France. Lay this stone under the head of a wife, and if she be chaste, she will embrace her husband, if she be not chaste, she will fall anon forth of the bed . . .

If thou wilt provoke sorrow, fear, terrible fantasies, and debate.
Take the stone which is called Onyx, which is of black colour. And the kind is best which is full of white veins. And it comes from India, unto Arabia, and it be hanged upon the neck, or finger, it stirs up anon sorrow or heaviness in a man, and terrors, and also debate, and this has been proved by men of late time.

If thou wilt overcome thy enemies.
Take the stone which is called Adamas, in English speech, a Diamond, and it is of shining colour, and very hard, in so much that it can not be broken, but by the blood of a goat, and it grows in Arabia, or in Cyprus. And if it be bound to the left side, it is good against enemies, madness, wild beasts, venomous beasts, and cruel men, and against chiding and brawling, and against venom, and invasion of fantasies . . .

If thou would make any man's wit sharp and quick, and augment his riches, and also prophesy things to come.
Take the stone which is called Smaragdus, in English speech, an Emerald. And it is very clear, shining through, and plain, but it that is yellow is better. It is taken out of the nests of grypes or griffons, it does both comfort and sane, and being borne, it makes a man to understand well, and gives to him a good memory, augments the riches of him that bears it, and if any man shall hold it under his tongue, he shall prophesy anon.

The Boke of Secrets of Albertus Magnus, of the vertues of herbs, stones and certayne beasts

which the crystal is thought to contain.

The best documented case of crystallomancy, or divination by the crystal, is that of the Elizabethan magicians Dr John Dee and Edward Kelley (see DEE). The crystal, or the shewstone as they called it, served as a window revealing other realms of existence. The classical scholar, Meric Casaubon, described their occult experiments, and the process by which they summoned angels to appear forms the substance of one of his treatises. This process was known as scrying. Kelley was the scryer or seer, and Dr Dee recorded the visions which his collaborator received. A complex system of magic derives from the work of these magicians which involves a weird and unearthly language called Enochian, communicated by the angels.

The pearl and the moonstone are other gems connected with the moon, the moonstone being a direct image of its namesake, while the pearl represents the purity and virginity traditionally associated with that solitary planet.

The pearl, the typical stone of the sea, is attributed to the moon owing to its influence over sea tides and women, whose monthly cycle corresponds to the lunar cycle. Its iridescent qualities link the pearl to astral visions in contrast to visions of brilliant light, which characterize solar or spiritual experiences exemplified by the topaz and diamond. This is why pearls are frequently worn during ceremonial invocations of lunar forces which involve astral activity. Another moon jewel is amber, whose positive electrical characteristics link it with animal magnetism and the voluptuousness of sensual love. It is worn while casting enchantments and is said to render its wearers, especially women, irresistibly attractive.

To Mercury are assigned chiefly the opal, the agate, and to a lesser extent, alexandrite, tourmaline and Iceland spar (a colourless, transparent stone). The opal has the power of luring its possessor into strange and unknown realms, probably because Mercury, in one of his forms, is the guide of souls that have quitted earth and wander in the kingdom of the dead.

The subtle emanations of the agate avert or offer protection against violent storms, due to the close connection between Mercury and the element of air. Thus any air movement, from breeze to tempest, falls naturally within his province. The agate is also potent against the sting of scorpions, because Mercury's activities include miracles of healing.

Tourmaline absorbs light and conducts electricity, hence its affinity with Mercury whose nature typifies the electrical phenomena of transmission. Because they polarize light alexandrite and Iceland spar are classed as Mercurial stones.

Venusian influences are concentrated in the emerald and the turquoise. In ancient Egypt the emerald stood for resurrection; it was used in the construction of talismans and amulets which symbolized the periodic return of the spirit of man (see EMERALD). The Eye of Horus which was often depicted in emerald was symbolic of reproduction and of the door to the womb through which the spirit entered to take on flesh for its reappearance on earth. The emerald was worn to achieve a favourable reincarnation; in later ages it was believed to ensure perpetual fertility.

Both the emerald and the turquoise were used in rites for inciting love and passion. Both these stones typify the transmission of vital force from one organism to another.

Venus is associated with the element of water, and therefore with the aquamarine and the beryl, both of which represent water in the mineral kingdom. Paracelsus (see PARACELSUS) claimed that a person's familiar spirit could be invoked in visible form in a mirror of beryl. Its power of facilitating intercourse with familiar spirits caused it to be worn by people wanting to know the inmost secrets of others.

Power and Radiance

The topaz, yellow diamond, cat's eye and chrysolite are particularly attributed to the Sun and, in the case of the cat's eye, to the Sun's associated sign, Leo. The glorious gold of the topaz symbolizes the Sun in the mineral kingdom. This planet, whose symbol in the animal kingdom is the lion, typifies courage, royalty and leadership, and the topaz makes its bearer fearless and wise. It is also a remedy against lunacy, because it concentrates the solar rays and neutralizes the baleful effects of the moon. The topaz also gives power over wild beasts, which, interpreted in terms of the human organism, implies the conquest of man's lower nature and its transformation into the nobility, symbolized by the king of the beasts, the lion.

The yellow diamond is attributed to the Sun for similar reasons, while the chrysolite, as its Greek name signifies, is a golden stone and also a vehicle of solar energy. It bestows the power of acquiring wealth, as do all solar stones.

If radiance is the special attribute of the Sun, fiery energy characterizes Mars. The stone ascribed to this characteristic of Nature is the ruby, which represents the spirit of violence and destruction. This stone is also associated with blood, the special vehicle of energy. Robert Fludd, the 17th century mystic and philosopher (see FLUDD), likened the ruby to the red earth, or flesh, of which Adam was formed.

There are, however, more sinister stones connected with Mars, one of which is the snake-stone, another the greenish turquoise. To both these gems are attributed certain occult powers pertaining to corruption and putrefaction; the snake-stone because of its connection with Scorpio, the zodiacal sign associated with Mars; the greenish turquoise because of its association with Venus, and its tendency to deteriorate into green. This not ouly destroys its value but suggests the outer allurement and inner corruption of Venusian attraction. These stones are connected with the infernal rites of necromancy, and the putrefying substance associated with alchemy.

To Jupiter, the father of the gods, were assigned the amethyst, the sapphire and the lapis lazuli. The deep blue of the lapis lazuli symbolizes the highest form of Jupiter, whose 'pure' colour is the uncompromising blue of heaven. In earliest times, before he became father of the gods, Jupiter had a feminine as well as a masculine aspect; and lapis lazuli is the Stone of Laz, the Arabian goddess of love. The sexual organ of Ishtar, the Assyrian Venus, was sometimes carved in this stone.

The violet amethyst is the stone traditionally associated with episcopal rank. It is the jewel of the high priest, of one who is not confused, distracted or overwhelmed by the intense fascination of external phenomena. In this sense the amethyst preserves its wearer from drunkenness. In some legends of the Holy Grail, the sacred vessel is said to have been fashioned of pure

amethyst. This jewel is also employed in magical rites to achieve political power and other types of ascendancy over the masses. In its highest aspect, however, it was believed to confer the Vision of Love, whereby Jupiter, represented by the wise ruler, governed the universe.

Jewels of Darkness

Like lapis lazuli, the sapphire also had its feminine symbolism, and in one of the ancient Indian Tantric texts the goddess Lalita is described as 'the Sapphire Devi (goddess) whose slender waist, bending beneath the burden of the ripe fruit of her breasts, swells into jewelled hips heavy with the promise of infinite maternities'. According to the 19th century occultist, Madame Blavatsky, the Buddhists ascribed to the sapphire 'a sacred magical power, which every student of psychological mesmerism will understand, for its polished and deep-blue surface produces extraordinary somnambulic phenomena'.

The star-sapphire, the onyx, the black diamond and the chalcedony are attributed to Saturn, the oldest of the gods. The star-sapphire symbolizes a void of darkness with a starry light at the heart which represents Saturn who, as the earliest, was also the sole light.

The dull and often black onyx is attributed to Saturn on account of the gloomy and leaden nature of that planet. It is used by sorcerers in works which are connected with malediction and death.

The black diamond is connected with the idea of nothingness, the starting point, the mystical void or chaos out of which all things emerged. It also typifies the pupil of the eye, and the Hebrew cabalists assigned to it the letter *Ayin*, which means an eye. The black diamond is therefore a symbol of Sight in Darkness, and of the Unseen Seer. Magicians seeking information, while remaining unseen, employed the Evil Eye; evil because feared; feared because unseen, although known to be present. The black diamond, with that curious reversal characteristic of many ancient symbols, from being an emblem of the Evil Eye, came to be regarded as a charm against it.

Chalcedony, a kind of onyx, is ascribed to Saturn because it is said to drive away

sadness; and Saturn is the epitome of melancholy and dark dread. A person who wears this stone is believed to be protected from the depressing influences symbolized by this planet.

To the ultimate God is ascribed the white diamond, the essence of brilliance. This jewel is a symbol of the True Will, of spiritual energy in its purest form.

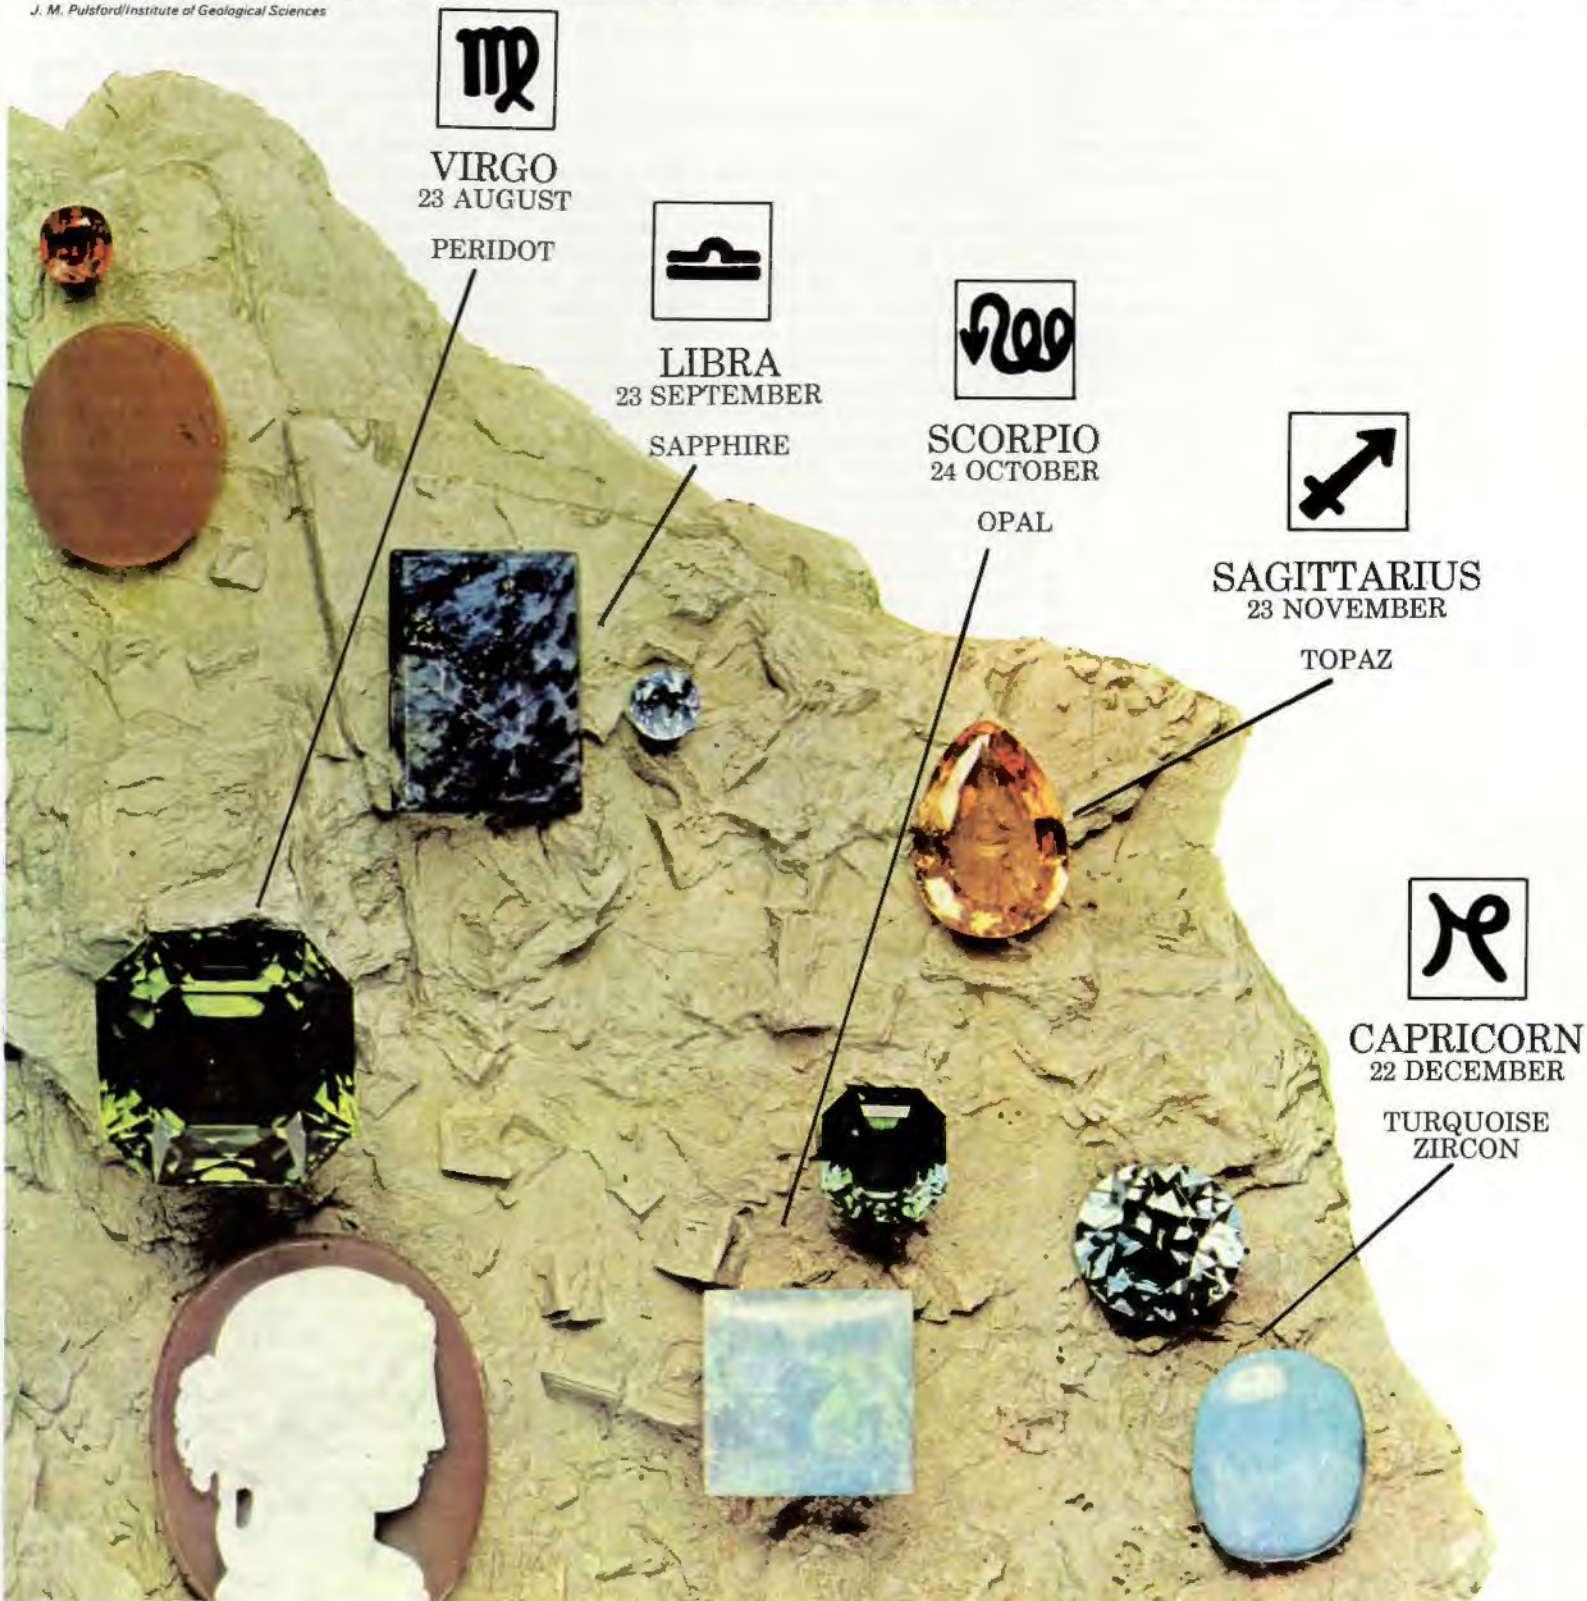
In Tantric Buddhism the diamond is likened to the *vajra*, or thunderbolt, symbolic of the Adamantine Consciousness which sustains and underlies existence. It is always coupled with the lotus, the feminine aspect of Consciousness, which acts as the objectifying agency of manifestation. The celebrated Tibetan prayer *om mani padme hum* (O, the jewel in the lotus), refers to the diamond vajra in union with its vehicle of manifestation. It is force manifesting as form; will manifesting as idea; the self manifesting as the world.

Disastrous Diamonds

In geometry, the diamond is constructed from a vesica, a pointed oval, which is formed by two intersecting circles. The vesica, like the lotus containing the vajra, also contains a diamond. The vesica was known under the name of the Evil Eye, and the talisman used to avert its baleful powers was the phallus. Thus both Eastern and Western systems of symbolism, associate the diamond with the emblem of male creative energy.

The legends surrounding such historic stones as the Regent Diamond, the Great Mogul, the Orloff Diamond, the Moon of the Mountains, the Koh-i-Noor and the Hope Diamond illustrate a totally different aspect of the diamond. The last of these has occult interest. It is said to have been stolen from an Indian temple and was sold to Louis XIV in 1668. The man who sold it was struck by various misfortunes, during which he lost all his money. He set sail for India again to make a second fortune but died during the journey. This diamond next appeared adorning the Marquise de Montespan, the beautiful and infamous mistress of Louis XIV who was involved with a group of magicians headed by the obscene Abbé Guibourg. He performed a series of Black Masses at her instance, in order that she

J. M. Pulsford/Institute of Geological Sciences



might obtain supreme power and bind the king's affections to herself alone. During the ritual, Guibourg slashed an infant's throat, the blood being consecrated over the naked body of the living altar, the Marquise herself. It was said that her sole ornament during the rite was the diamond. It was charged by the blood of repeated murders, committed to the accompaniment of diabolical profanations and blasphemies. But the evil sorceries recoiled upon the Marquise, for instead of advancing her cause in the royal household, she experienced an unobtrusive fall from favour (see BLACK MASS).

A century later the same diamond is said to have been in the possession of Marie Antoinette, and again it brought disaster for the 'Diamond Necklace Affair' was one of the incidents that led up to the French Revolution. Marie Antoinette lent the diamond to the Princesse de Lamballe. Shortly afterwards, fate overtook the Princess and she was butchered by the mob, parts of her body being displayed under the windows of the Temple where Louis XVI and his family were imprisoned.

Various other misfortunes attended successive owners of this malignant stone. It is said to have been bought for £18,000 by the London banker, Henry Thomas Hope, after whom the stone was named. In due course his descendant, Lord Francis Hope, came into possession of it, and he lost his fortune shortly afterwards. The trail of disasters continued — suicide, fatal accident, bankruptcy, disgrace — covering in all a period of two hundred years.

The Philosophers' Stone

The alchemists believed the diamond to have attained the pinnacle of beauty and perfection, equal only to that of gold among metals and the Sun among planets. Among the symbols of the alchemists was the Shameer, the strange diamond wrested from the beak of a cock, with which Moses is said to have cut the precious stones for the ephod, a Jewish priestly vestment, and which opened for King Solomon the ultimate gates of wisdom.

But of all precious stones, the star ruby is undoubtedly the most magical. It represents the creative energy of the Sun, or creator star, and symbolizes the star of magic, the pentagram. This star has been used from earliest times to conjure and control angels, demons, elementals and occult entities of all kinds.

The elusive yet far-famed Philosophers' Stone which the adept Trautmansdorf claimed to have discovered was bean-shaped and of reddish hue, emitting flashes of light when in total darkness. It is interesting to compare this with an Indian Brahmin's account of the Pentarbe, a magic stone that was exhibited before Apollonius of Tyana: 'In the night-time it glowed like fire, for it is red and emits rays; and if you look at it, it smites your eyes with a thousand gleams. And this light within it is a spirit of mysterious power, for it absorbs to itself everything in its neighbourhood.'

The Eastern version of the Philosophers' Stone seems to have been the fabled Chintamani, or wishing-gem which has the power to grant all desires. It is said to have belonged to Brahma, the creative aspect of the Hindu Triad. A *Tantra* describes the Supreme Goddess, united with her lord in a room of Chintamani stone, surrounded by a grove of heavenly trees on the island of gems, set in the ocean of ambrosia.

Of no less interest are the toadstones and corals of witchcraft: the Kaustubha jewel of Hinduism and the lightning stones of the ancient Mexicans.

Sir Walter Scott described his family's most curious possession as 'a toadstone . . . a celebrated amulet. It was sovereign for protecting new-born children and their mothers from the power of fairies, and has been repeatedly borrowed from my mother, on account of this virtue.'

The toadstone was any stone that resembled in shape or colour the toad or frog. But the most treasured kind was supposed to be found in the head of a living toad. In *As You Like It* Shakespeare speaks of 'the toad, ugly and venomous', as wearing 'a precious jewel in his head'. This stone was held to be an infallible remedy against curses and witchcraft.

The coral was believed to have similar powers. Paracelsus claimed that the wearing of red corals was a remedy against melancholy. Red corals transmit the solar influence; brown corals, on the contrary, transmit lunar vibrations. The red variety wards off evil spirits while the brown attracts them and helps them to manifest.

In Hinduism, the Kaustubha was a jewel obtained at the churning of the ocean, after Indra, the king of the gods, had been cursed by Shiva for slighting the sage Durvasas. It was a wish-granting gem worn by Krishna and Vishnu.

Lightning stones, sometimes known as thunderbolts, were created when the god of fire, in the form of lightning, flashed into sand, fusing and converting it into vitreous serpentine tubes. The ancient Mexicans revered them as the phallus of the fire god, and used them in their rituals of fertility.

During the course of centuries the tradition of the secret significance of jewels and precious stones became obscured and debased. The ascriptions of various stones to individuals, according to their date of birth, were calculated according to planetary influences operating through the Zodiac. And to the twelve zodiacal signs were allotted the stones with which tradition has familiarized us. In this way, the tradition has been passed down and become merged in the lore concerning the lucky stones and charms of modern astrology.

The Purity of the Pearl

The idea of pearly purity is inseparably linked with the name Margaret, derived from the Persian *Murwari* (pearl, or child of light) . . . The use of the word as a proper name among the early Christians was doubtless suggested by the sweet simplicity and loveliness of the pearl, and by the beautiful symbolical references to this gem in the Scriptures; and the meaning of the name has been strengthened by the pure lives and the good deeds of the many beautiful Margarets in all lands, including the virgin martyr, St Margaret of Antioch . . . who, before the fifth century, was the embodiment of feminine innocence and faith overcoming evil, and also is often represented wearing a string of pearls.

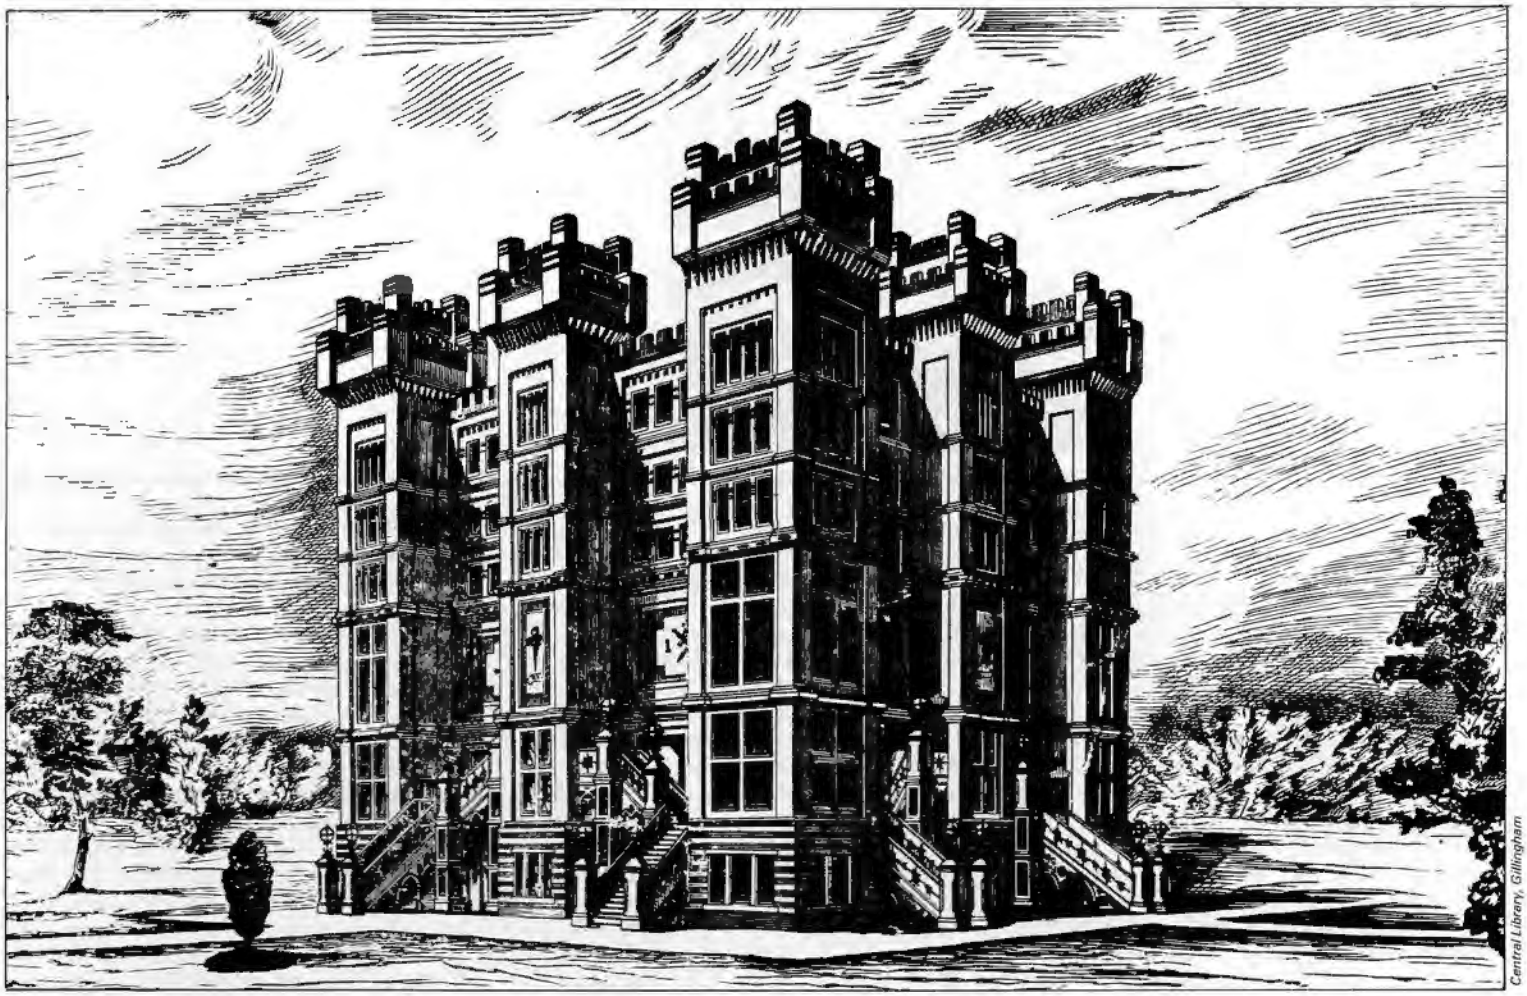
G. F. Kunz and C. H. Stevenson
The Book of the Pearl

Founded by James Jezreel, the New and Latter House of Israel preached exclusive salvation to its believers. But schism followed Jezreel's death and the massive half-built temple, a testimony to the prophet's power, fell into ruin

J. J. JEZREEL

THE NEW AND LATTER House of Israel, also known as the Jezreels or Jezreelites, were a minor religious sect of the 19th century. Until 1960 the terraced houses of Upper Gillingham in Kent were overshadowed by their headquarters, a great ruined hulk of a building. Its sides were adorned with huge plaques of carved trumpets and scrolls and local legend had it that the tower was built by the Jezreelites to reach to heaven, but the money ran out before that desirable end could be achieved. Since the followers of this sect made it a point never to cut their hair or shave, it was popularly believed by schoolboys that the Jezreelites expected God to return to earth and pull them up to heaven by their hair.

The truth is in a sense even more unlikely than the local stories. The massive tower was begun by the founder, James Jershom Jezreel, and should have served as a central preaching home for his sect. Jezreel's origins remain mysterious; he is known at one time to have served as a private in the army. He arrived in Gillingham in 1875 as James White but after getting in touch with a small religious group who believed themselves to be the elect of God, he announced himself as the messenger of the Lord and took his new name, a move which provided him with a fine apocalyptic set of initials. Jezreel's views were set down in 'the Flying Roll' which he claimed was divinely inspired and which distinguished his followers as the 144,000 (mentioned in Revelations 7.4) whom God had specially marked for salvation. It was in essence the same message preached by the 18th century prophetess Joanna Southcott (see SOUTHCOTT); and a similar exclusivity lives on in the teachings of the Jehovah's Witnesses



Central Library, Gillingham

An artist's impression of Jezreel's tower, which was intended to serve as the headquarters of the Jezreelite movement at Gillingham in Kent; according to local legend, the tower was planned to reach heaven

and of the British Israelites. Jezreel acknowledged his debt to Joanna Southcott and called himself the Sixth Trumpeter – one of a succession of people who had presented the new revelation.

He soon gathered around him a group of faithful followers and was able to move into Woodlands – a large house in Gillingham. There, he opened a school which taught a very narrow curriculum largely based upon Jezreel's own writings. He was not unaware of the importance of music and singing and this became a central part of the services which he held. In its daily conduct the sect had all the characteristics of the Protestant underworld. Like the aged retainer in Emily Bronte's *Wuthering Heights*, they 'ransacked the Bible, pulling all the promises to themselves and flinging all the curses on others.' At the same time exclusive and eclectic, the New and Latter House of Israel clung to the belief that they and they alone were chosen by God.

The school and the centre at Woodlands drew the movement together in Gillingham, and converts in other places sold up their belongings and came to join the community. They deposited their worldly wealth in the treasury and many began to run the businesses which Jezreel started to set up in connection with the society. These included printing shops to produce the tracts and copies of the Flying Roll, and general stores and cobblers to serve the Jezreelites and any others who would use them. The organization was never very large but it attracted a number of wealthy people who put their entire fortunes at the disposal of Jezreel. Soon he conceived of a great temple which would serve as the focal point for his new religious community.

The Reign of Queen Esther

Land was bought high above the Medway River and, after the builder had modified the original plans, the work was under way. Below were to have been the printing presses while above it was intended to provide a great preaching deck where the prophet could address the faithful. In 1885 the foundations had been laid and building began when disaster struck – Jezreel himself, the successor of Joanna Southcott, the Prophet of God, died and the sect was thrown into disarray. Many followers were unable to believe that God's own prophet could have died and the leadership was very much in doubt until Jezreel's widow, now named Queen Esther, by sheer persistence and imperious self-will gained control.

In contrast to Jezreel, Queen Esther was singularly lacking in tact and organizational ability, she was autocratic and proud and soon complaints of her rule became widespread. People who had given all their money to the movement demanded it back, and some claimed to have been left in appalling circumstances by the Mother of Israel as the new leader styled herself. The society was threatened with schism and the threat became a reality when one faction seceded and moved to London. Work on the temple was held up when the builders demanded their money, and finally stopped when the money was not forthcoming.

The local press was loud in its denunciation of the Jezreelites and it was in the midst of a decidedly hostile community that Esther herself died in 1888. Serious dissension broke out among the remaining followers of Jezreel and the movement split into warring groups, just as the various sects claiming descent from Joanna Southcott had split earlier. There was a short revival of fortunes when an American calling himself Prince Michael arrived to claim leadership, but his endeavours to re-establish the New and Latter House of Israel met with no lasting success.

The London secessionists carried on and up to the late 1950's bearded speakers at Hyde Park Corner were still telling of the wonders of the Flying Roll. They disclaimed any connection with the Gillingham believers who lingered on, their temple uncompleted and derelict; in 1960 the edifice was destroyed. Although the New and Latter House of Israel has ceased to exist, buses still stop at 'the Jezreels', copies of the Flying Roll can still be bought, and James Jershom Jezreel is still reckoned as the Sixth Trumpeter by the present followers of Joanna Southcott, the Panacea Society of Bedford.

J. S. GUMMER

Jihad

An Arabic word meaning a 'striving', used specifically in Islam to denote a holy war or religious crusade against unbelievers; Mohammed resorted to arms to suppress his opponents in Mecca and later Moslem rulers often proclaimed jihads: those who died fighting in such a war became martyrs and were assured of eternal bliss with Allah; in a broader sense jihad means the struggle against one's lower nature.

See ISLAM: WAR.

Sonia Halliday

JINN

JINN IS A better spelling for the common English 'genie'. According to the Koran, Jinn were created of scorching heat or of a smokeless flame, and by popular report inhahited the earth long before Adam. It was believed that they lived underground or in Mt Qaf, which is said in Arabic mythology to encircle the earth.

Jinn are frequently mentioned in the Koran. Seemingly, pagans had treated them as semi-divine, for sura 6.100 says they worshipped them alongside God and sura 37. 158 that they believed in a relationship between God and the jinn. But in general, the jinn are treated as a race parallel, though inferior in honour, to man. Solomon is said to have commanded troops of them (sura 27.17; 34.11), his power over them being popularly believed to have lain in a ring inscribed with God's greatest name.

Jinn are mortal, are believed to propagate their species and to be long-lived. God created men and jinn to serve him hut many jinn are unbelievers and will go to hell. The first part of sura 72 tells of some jinn who heard Mohammed reciting the Koran and became believers, and sura 46. 28–31 tells of jinn hearing the Koran, summoning their people to belief, and warning them God cannot be frustrated.

Pagans, says the Koran, accused prophets, such as Noah, Moses and Mohammed of being jinn-possessed, *'majnun'* (a word which is now used generally to mean mad). Such accusations were strenuously denied. In the same way, when Mohammed was called a poet, this was refuted – not on the score of poetry being held disreputable, but because Arabs believed poets were inspired by jinn. Mohammed insisted that his inspiration came from God.

Jinn are generally thought of as having a group existence, with no separate identity, but there are classes which do have an individuality. Among these is the *ifreet*, mentioned once in the Koran (sura 27.34), as offering to bring Solomon the Queen of Sheha's throne. They are dreaded for their maliciousness. Another class is the *ghul* (from which the English word ghoul is derived), said to be ugly but to be able to change its form. It lurks in desert places, lights fires to mislead travellers, and entices them to their destruction. According to tradition, Mohammed denied the existence of the ghoul, but this has not made people abandon the belief.

There is some doubt about Iblees (from Greek *diabolos*, devil), chief of the devils (in Arabic, *shayatin*, plural of *shaytan*, Satan). He is called one of the jinn (sura 18.51), and Iblees says God created him of fire (sura 7.11), which connects him with the jinn; but elsewhere he is a rebellious angel cast out of heaven because he refused to join the other angels in obeying God's command to do obeisance to Adam. The Koran speaks both of devils and jinn listening outside heaven and being driven away by a bright flame, and it is uncertain whether devil is another name for jinn, or whether they both attempt to learn heaven's secrets.

Tradition often mentions jinn. It says everyone has a partner, one from the jinn and one from the angels; the former is disposed to lead one astray, thnugh Mohammed's jinn had accepted Islam. A tradition tells of an ifreet of the jinn unsuccessfully trying to interrupt Mohammed's prayers. Another says that on the first night of Ramadan the devils and rebellious jinn are chained. One says house snakes must not be killed, for they are resident jinn; but another says one should tell the snake to go away. If it remains after a third telling it is to be killed, for it is an infidel. Warning is given to bring children inside in the evening, for jinn are about and may seize them.

An Ifreet

The caravan . . . came at last, at the fall of a certain night, to a column of black stone to which a strange being was chained, one half of whose body was visible and the other half deeply hidden in the ground. The upper half seemed to be that of some monstrous birth imprisoned there by infernal powers. It was as black and large as the trunk of an old and naked palm-tree: it had two great black wings and four hands, of which two were like the taloned feet of lions. A shaggy covering of rude onager-tail hairs moved savagely upon the terrible head, while under the roofs of the sockets flamed two red eyes, and a third shone immovably green like that of a tiger or a panther, between the twin horns of the bull-like brow.

The Thousand and One Nights
(trans by Powys Mathers)

Right **A 19th century illustration from *Sindbad the Sailor* showing an ifreet – a malicious type of jinn – being burned out of the sky**

Jinn are believed to live in trees, wells, marshes, uninhabited and even inhabited houses, and to frequent lonely roads, market places, cemeteries, privies and drains. A pillar of sand rushing across the desert is a jinn driving along, and so is a waterspout. Inter-marriage between humans and jinn is possible, but the human partner may suffer.

Fortunately there are various methods of protection from the dangers of the jinn. If one climbs a date palm the jinn can be effectively frightened by singing, so that the work can proceed without incident. Loud sounds, music, and the shrill cries of women at weddings scare them away.

Jinn fear iron and steel, so some people wear a steel ring, and others put daggers or knives in places where protection is sought. Salt is another means of protection, for jinn abhor it.

Koranic and other sacred words are the most effective protection. Written charms, bearing verses from the Koran, names of God, magic squares, a group of magical signs called the seven seals, are commonly tied on children and animals and are also worn by adults. They protect the wearer from the machinations of the jinn who, in addition to producing calamities, are notorious for causing diseases. The last sura of the Koran includes a petition for protection from the jinn.

Some modern Moslems have tried to explain away the jinn, even suggesting they were microbes. Mohammed Ali, in his commentary on the Koran, has various explanations. At times he seems to feel they were devils invisible to men, but elsewhere he suggests they were strong men, slaves employed by Solomon, or Jews who heard the Koran recited. However, the common people's belief in a race of jinn who can harm or sometimes help, is more in keeping with the original meaning.

British Museum / John Freeman

Did Joan of Arc's voices really come from God? Posterity, like her own time, has been curiously ambivalent in its attitude to the Maid of Orleans; at various times and in different quarters, she has been seen as a great warrior patriot, a deluded hysteric, a Devil-inspired witch and a stained-glass-window saint

JOAN OF ARC

THERE ARE FEW people nowadays who would dispute the spiritual stature of Joan of Arc, one of the most remarkable women who has ever lived, although over five centuries after her death there is still no common agreement as to the exact nature and source of her inspiration. The opinion of the judges at her trial in 1431, however, which led to the stake, was totally at variance with this assessment. They held that her visions were worthless, denied her the gift of prophecy, accused her of sorcery and above all censured the heretical pride which had induced her to believe that she was answerable only to God, and not to God's ministers on earth, which her judges represented.

A similar contradiction of views has persisted down the intervening centuries; defended in her own century by Thomas Basin, historian and Bishop of Lisieux, in Shakespeare's *Henry VI* Joan was represented as 'a sorceress condemned to burn', in fact, a witch (a view which was also put forward in recent times by Margaret Murray in her *Witch-Cult in Western Europe*). In the 16th century the Jesuit Father Guillaume Postel, himself known to practice magic and alchemy, defended her. In France Voltaire took the view that she was an unhappy wretch, given to hallucinations; and not long after Joan had begun to achieve the status of a national heroine, the celebrated writer Anatole France echoed this view of her as a deluded unfortunate in a biography published in 1908. Immediately, the Scottish writer Andrew Lang replied with his own biography, *The Maid of France*, maintaining that it was Anatole France himself who was deluded. In Bernard Shaw's eyes, Joan was a Protestant who insisted on the validity of her own personal vision, contrary to the view of Paul Claudel and Charles Péguy, the eminent Roman Catholic poets, who revered her as a mystic and a saint.

Voices of the Saints

The historical truth behind all these opinions is hard to establish. It has been suggested that she was the illegitimate daughter of Louis d'Orleans and Queen Isabeau, widow of Charles VI, and therefore half-sister of the Dauphin, Charles VII. Although this claim fails to stand up to close examination, it is strange, nevertheless, that the Dauphin gave her a coat of arms – an azure shield, a silver sword with a gold pommel, supporting a gold crown and flanked by two fleurs-de-lis in gold – a tremendous honour for an uneducated peasant girl. Despite this, it seems much more likely that she was the daughter of prosperous peasants from the village of Domrémy in Lorraine, close to the border of the kingdom of France, which at this time covered the region of Paris and was being sorely harrassed by the English.

The meteoric rise to fame of this illiterate country girl, her astonishing career, her miracles and her eventual martyrdom all stem from her belief in her power to deliver France from the English, a power which she was convinced had been divinely conferred on her for this purpose. As a little girl, she would often have been told how the kingdom of France had been lost by a wicked woman (Queen Isabeau, who had defected to the side of France's enemies), and that a virgin would restore it. There was another story that at the beginning of the 15th century a soothsayer named Marie d'Avignon had gone to the King and told him that the country was about to be ravaged by war, but that a maid would come who would lead France to victory. Since Joan was probably familiar with both these legends, she would not have thought it strange when 'voices', which she later identified as those of St Gabriel, St Michael, St Marguerite and St Catherine, began speaking to her one day when she was about 13 years old. Under a 'fairies' tree' close to her home, she made a vow to remain a virgin and to live a pure and godly life. At first the voices told her to go to the land of France, but later, when the news of the siege of Orleans reached Domrémy, they instructed her to rescue the city.

Despite her spirituality and growing reputation as a young visionary fallen from heaven, Joan was very much aware of practical realities, and her skill in dealing with unforeseen problems was considerable. In 1429 she asked the officer in command of her area, Robert de Baudricourt, to provide her with a horse and escort to enable her to go and see the Dauphin. After insisting that she should first be exorcized by a local priest, de Baudricourt agreed to her request. Furnished with an introduction to the Dauphin, Joan set off across occupied France to Chinon. Difficulties seemed to vanish before her; she made her way past road blocks, ambushes and sentries. When she arrived at Chinon, Charles hid himself among his courtiers, but she recognized him immediately, went up to him and whispered in his ear certain facts which were known only to him. Joan assured Charles, who had been thinking of relinquishing his throne, that he would be victorious and would reign with power and honour. She made four predictions: that she would deliver Orleans, if she were taken there with the troops; that Charles would be crowned at Rheims with Joan herself at his side; that Paris would return to French control, and that the Duke of Orleans would come back to France.

Mansell Collection

Three images of St Joan *Left* An idealized portrait of Joan as the saintly patriot *Right* Joan brought to trial as a heretic, weak against the combined might of Crown and Church: illustration from the Armagnac manuscripts *Following page* An incarnation of purity and truth, Joan leads the French troops into battle. She believed her bravery to be a gift from God, who had sent her to deliver France from the English: 19th century painting by Frank Craig

God's Field Commander

The court at Chinon was immediately mistrustful of this strange young girl who said she consorted with saints and angels, and who announced that she was sent by God; they suspected that she might be using diabolic powers. Joan had to undergo a lengthy ecclesiastical examination at Poitiers, in which she conducted herself well and impressed the clerics favourably. Later, with Charles, she declared that she would fight and that she was able to command through the grace of St Michael. Charles was convinced. Joan was sent to Tours and provided with armour and troops. She requested that a sword be brought to her from behind the altar of the church of St Catherine-de-Fierboys. On her standard, to which she was entitled by her military rank, was painted the King of Heaven holding an orb, together with the words 'Jesus Maria'. Thus equipped, she set out to join the army at Blois for the relief of Orleans.

At first, her military campaign was successful. Orleans was relieved, the English put to flight, and town after town in the Loire fell before her. On 17 July 1429 Charles was duly crowned at Rheims, as she had predicted. But victory was short-lived; on 23 May of the following year, outside the walls of Compiègne, she was taken prisoner and handed over to John of Luxembourg, the Burgundian commander, who eventually sold her to the English. Held captive in the castle of the Luxembourgs at Beaurevoir she again heard 'voices'; and obsessed with the idea of going to the help of the people of Compiègne, she leapt from the tower, suffering minor injuries. A second attempt to escape was similarly unsuccessful. Joan was then moved to Rouen, the English military centre, and imprisoned in the castle.

Her trial, on the charges of sorcery and heresy, began early in 1431. The English, for political reasons, were determined that Joan should be convicted, in the hope

Was Joan a Witch?

This intriguing theory of Joan's death has been rejected by most scholars

The witch-cult being a survival of an ancient religion, many of the beliefs and rites of these early religions are to be found in it. Of these the principal are: the voluntary substitute, the temporary transference of power to the substitute, and the self-devotion to death. As times changod and the ceremonies could no longer be performed openly, the sacrifices took on other forms . . . when the time came for the God or his substitute to be sacrificed, recourse was had to methods which hid the real meaning of the ceremony; and the sacrifice of the incarnate deity, though taking place in public, was consummated at the hands of the public executioner . . .

Read in the light of this theory much of the mystery which surrounds the fate of Joan of Arc is explained. She was put to death as a witch, and the conduct of her associates during her military career, as well as the evidence at her trial, bear out the fact that she belonged to the ancient religion, not to the Christian . . .

The belief that Joan was God Incarnate will account, as nothing else can, for the extraordinary supineness of the French, who never lifted a finger to ransom or rescue Joan from the hands of either the Burgundians or the English. As God himself or his voluntary substitute she was doomed to suffer as the sacrifice for the people, and no one of those people could attempt to save her . . .

An intensive study of this period might reveal the witch organisation at the royal Court and possibly even the Grand-master to whom Joan owed allegiance, the 'God' who sent her. Giac, the King's favourite, was executed as a witch, and Joan's *beau duc*, the Duke d'Alençon, was also of the fraternity.

Margaret Murray *The Witch-Cult in Western Europe*

Private collection, London

that this would discredit Charles and so improve their failing fortunes. Joan was handed over to Pierre Cauchon, a dispossessed anglophile Bishop who had applied for the office of judge in the hope of personal preferment; to this end he selected a tribunal likely to favour and achieve a conviction.

Trial and Judgement

The lynchpin of Joan's trial was to resolve whether it was God or the Devil who guided her. The theologians of the Church, the clerics and masters of the University of Paris were agreed that Joan had used witchcraft. It was claimed that the judges had proof that she was a 'magician, a heretic, a schismatic'. It was alleged that her 'voices' were the result of mandrake, a plant containing a narcotic juice which causes delirium and to which many magical properties were ascribed, including the power of speech; it was said that Joan had kept a root of this plant in her bodice. Her judges insisted that her apparitions were in fact infernal spirits, that her voices were satanic interventions, that her premonitions were witchcraft, and that her battles were diabolic crimes.

The indictment held that she was 'superstitious, a soothsayer, an idolator, an invoker of devils, a blasphemer against God and his saints'. It enumerated her 'detestable and wicked crimes and sins' as fruits of her 'proud spirit'. The Inquisition refused to believe that the saints had visited her. Charles VII's coronation had been 'a work of hell', because she had invoked evil spirits. It was further maintained that she was 'perfidious, cruel, tainted with human blood'. The University of Paris, whose opinion had been sought, affirmed that Joan was 'a woman of Belial, Satan and Behemoth'. On these grounds the accused was found guilty of heresy, and liable to the extreme penalty unless she submitted. Confused and appalled at her imminent fate, Joan recanted and was taken back to prison. Abjuring her recantation, she was handed over to the secular arm and on 30 May 1431 was burned as a relapsed heretic.

Seen to Exhale a Dove

After the fire had consumed her, there were some who doubted whether she had actually suffered this fate, so the executioner was ordered to separate the ashes and show the people that her remains really were there, as it was thought that her witchcraft had caused her to disappear, just at the crucial moment. The believers wept and crossed themselves; they thought that they had burned a saint, and it was murmured that as she breathed her final breath, she was seen to exhale a dove, the symbol of the Holy Ghost. The executioner cut open her pathetic remains, and destroyed what was left of her entrails. He was ordered to throw the heart and the ashes into the Loire lest any miracle-working relics should remain.

At Joan's trial, the most highly esteemed judges, jurists, prelates and the Dominican Inquisitor had affirmed her diabolism, her heretical and schismatic condition; only Jean Gerson, Master of the University, had defended her in the first place and declared her innocence when the clerics united against her. Some years later, however, in 1456, other equally eminent judges with similar assurance proclaimed the iniquity of her first trial, asserted her orthodoxy and admirable merits, and annulled the judgement of 1431. Nearly five centuries later, in 1909, Joan was beatified and in 1920, canonized by the Roman Catholic Church. On the latter occasion, one saw the curious spectacle of her being acclaimed at the same time by the Royalists and by the Communists, who saw her as a daughter of the revolutionary people, by the anti-clerical faction who saw her as an opponent of the priests, by the militant atheists and by the occultists. More recently still – and perhaps still more curious – Joan of Arc, whose effigy with its sword and banner may be seen in many cathedrals, was described by the eminent Jesuit, Cardinal Danielou, as 'a model of lay saintliness'.

Thus the Church, which had first sent her to her death and centuries later canonized her, has now placed her on the fringe of its holy community and regards her as a laywoman, as if she were not recognized among its saints.

How can innocent suffering be reconciled with the image of a just God? This is the central theme of the book of Job

JOB

PROBABLY THE MOST significant book in the Hebrew Bible, the book of Job expresses in dramatic form a great crisis that had gradually built up in Hebrew religion, and it represents a noble but unsuccessful attempt to solve that crisis.

Ancient Hebrew religion was essentially ethnic in character. It centred on the relation between God, Yahweh (see YAHWEH) and his chosen people, Israel. In this relationship, the individual counted only in so far as he promoted or hindered the nation's service to its god. He had no ultimate significance; when he died, his shade descended into the gloomy depths of Sheol, beyond the care or interest of Yahweh. The only hope was that his pious service to Yahweh would be rewarded by a long and prosperous life, and that his children would succeed him within the holy community of Israel.

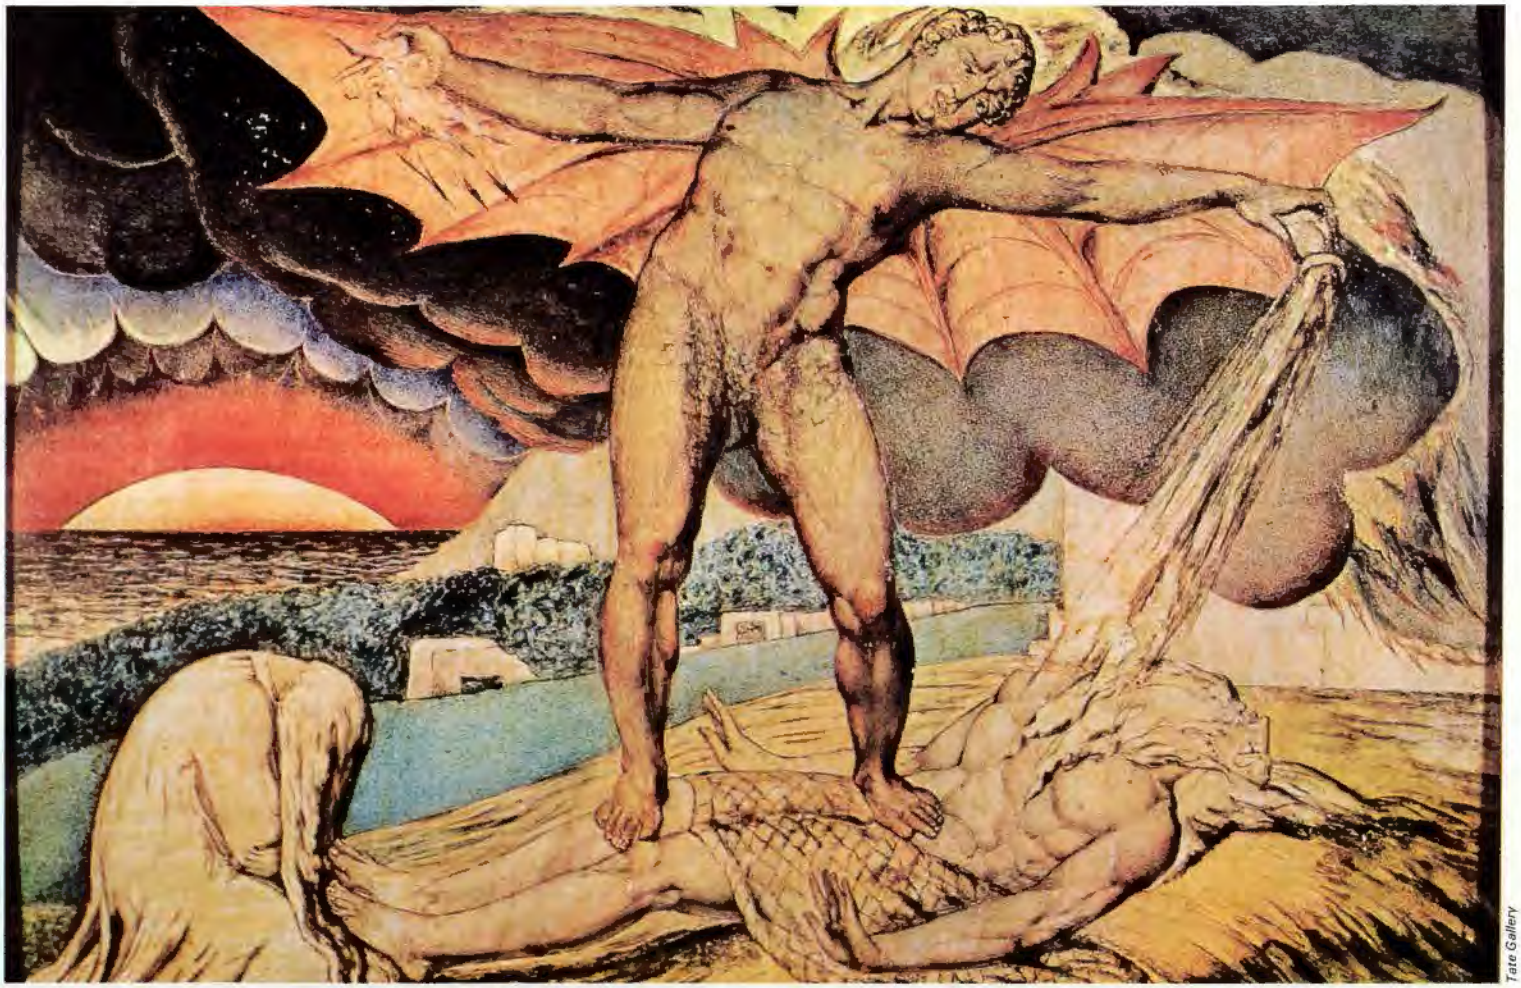
Hebrew religion in its early form, therefore, held no promise of a happy life after death. Many Israelites found consolation in in the mortuary cults of Canaan, which presupposed that the dead lived on in their tombs; but such practices were fiercely condemned by the Yahwist prophets. In time, however, a sense of individuality began to emerge, and it coincided with a significant development in the conception of Yahweh. The prophets increasingly emphasized both Yahweh's omnipotence and his moral character. This changing conception inevitably raised a difficult problem about the fate of the individual and Yahweh's attitude to him. Experience often showed how specious was the Yahwist doctrine of man; for frequently it was not the pious but the wicked who lived long and prosperously. How was this fate to be reconciled with the idea of Yahweh as a just god? For there was no hope of restitution in the grim pit of Sheol. This problem was felt most keenly by those who wished to believe in the justice of Yahweh, but could not close their minds to the facts of experience. Such a one was the anonymous author of the book of Job who sought to answer this challenge to his faith in Yahweh.

Satan Challenges Job

The book of Job contains a multitude of literary problems for which no certain solution has been found. Scholars date the book between 700 and 200 BC. They are generally agreed that the prose prologue and epilogue were originally distinct from the main poetical dialogue, and that the speech of Elihu (Joh 32–37) was a later interpolation. Of Job himself nothing is otherwise known although there are a few brief references to him in the Bible.

The prologue (Job 1–2) sets the scene for the ensuing drama. It starts by representing Job as a rich sheikh, dwelling in the land of Uz (possibly the neighbourhood of Edom or the Hauran, east of the Dead Sea). He is described as 'blameless and upright, one that feared God, and turned away from evil'. The scene then changes to the court of Yahweh, where the 'Sons of God' assemble, and among them comes Satan. At this stage in Hebrew thought Satan was not yet the Devil, but a cynical observer of mankind. When Yahweh praises the rectitude of Job, Satan answers that Job fears God because God has blessed him with success and happiness. And he goes on to suggest that if misfortune befell Job, he would renounce God. The challenge is accepted, and God allows Satan to afflict Job.

In the subsequent series of personal disasters Job loses all his wealth and his children are killed. But his faith in God is not shaken. Satan, however, is not impressed, and suggests that Job's integrity would not stand up to the test of physical suffering. Yahweh again allows Satan to try the unfortunate Job. He is tormented by boils; in his misery 'he took a potsherd with which to scrape himself, and sat among the ashes'. His wife exhorts him to renounce God and die; but he remains steadfast in his allegiance. Then Job's so-called 'comforters', Eliphaz, Bildad and Zophar, visit him. They do not come to comfort him, but to endeavour to explain Job's misfortune in terms of the traditional Yahwist view of life. With their arrival the prologue ends. The stage is now



Tate Gallery

Challenging his faith, Satan smites Job with boils: from the series illustrating the book of Job by William Blake

set for the series of dialogues in which Job and his 'comforters' debate the cause of his unhappy lot.

Job's problem is that of reconciling innocent suffering with belief in a just and omnipotent God. The poignancy of Job's dilemma lies in his acceptance of the orthodox Yahwist creed that man did not survive death. This belief is presented with vivid imagery (Job 14.7–12):

> For there is hope of a tree,
> if it be cut down, that it will sprout again . . .
> But man dies, and is laid low;
> Man breathes his last, and where is he?
> As waters fail from a lake,
> And a river wastes away and dries up,
> So man lies down and rises not again,
> Till the heavens are no more he will not awake,
> Or be roused out of his sleep.

The theme of the 'comforters' is that misfortune is the inevitable penalty of misdoings (4. 7–9):

> Think now, who that was innocent ever perished?
> Or where were the upright cut off?
> As I have seen, those who plough iniquity, and sow trouble reap the same.
> By the breath of God they perish,
> and by the blast of his anger they are consumed.

But Job knows that he has not merited such punishment, and he rejects their shallow philosophy. As the dialogue proceeds, Job turns more to interrogating God than answering his 'comforters'. In the depth of his despair, he implores the Almighty to cease from tormenting him. But he cannot leave the problem of the seeming injustice of God, and finally he calls on God to justify himself.

God's answer is to overwhelm Job by a parade of his cosmic activity, so that Job's personal problem is dwarfed into insignificance, and he is made to abhor himself in dust and ashes (chapters 38–41). This was the only solution that the author could offer for the problem of innocent suffering. In the prose epilogue that follows, an even more unsatisfactory ending is offered. God rebukes Eliphaz and his friends, and endows Job with greater prosperity than he had before, thus endorsing the orthodox view that God rewards the just with material blessing (Job 41. 7–17).

The book of Job, or at least the poetical part of it, is thus a noble failure. Its author had agonized over the problem of innocent suffering, but had failed to find a really adequate moral answer. The tension was only eased finally in the 2nd century BC, when Hebrew religion accepted belief in a resurrection of the dead and a post-mortem judgement (see JUDGEMENT OF THE DEAD).

An ancient Mesopotamian writing that is sometimes called 'The Babylonian Job' contains a long complaint from a just man overwhelmed by undeserved misfortune. But the purpose of the writing seems rather to be that of commemorating the ultimate saving intervention of the god Marduk than of discussing the problem of innocent suffering in relation to the gods.

S. G. F. BRANDON

The Splendour of God

Then the Lord answered Job out of the whirlwind:
Gird up your loins like a man;
I will question you, and you declare to me.
Will you even put me in the wrong?
Will you condemn me that you may be justified?
Have you an arm like God,
and can you thunder with a voice like his?
Deck yourself with majesty and dignity;
clothe yourself with glory and splendour.
Pour forth the overflowings of your anger,
and look on every one that is proud, and abase him.
Look on every one that is proud, and bring him low;
and tread down the wicked where they stand.
Hide them all in the dust together;
bind their faces in the world below.
Then will I also acknowledge to you,
that your own right hand can give you victory.

Job, chapter 40

The teaching of St John of the Cross, contained in his beautiful mystical poems and commentaries, reveals how the soul becomes purified in its development towards a perfect union with God

JOHN OF THE CROSS

THIS GREAT SPANISH mystic was the third son of Gonzalo de Yepes, a Castilian silk-merchant. When Gonzalo died, less than three years after John was born, the family fell into great poverty and the mother and the eldest child, Francisco had to work to support them. John himself, as he grew up, was apprenticed to various trades but was able to attend the Jesuit grammar school at Medina. At the age of 21 he entered the Carmelite monastery in the same town, taking the name of John of St Matthias. He then went to study at the University of Salamanca and in 1567, at the age of 25, he was ordained priest, after which he returned to Salamanca for a final year of study. He had already formed a wish to enter into a stricter way of life and had contemplated joining the austere Carthusian Order, when a meeting with Teresa of Avila brought a realization of his true vocation. Teresa had already begun her great work of Carmelite reform and had been instructed to found two monasteries for Carmelite friars who wished to practise the primitive rule (see TERESA OF AVILA).

John met Teresa immediately after his ordination and when he had finished his studies, along with two others he entered the reformed house at Duruelo, and changed his name to that of John of the Cross. For some years all went well, but in 1575 a violent reaction set in against the whole movement for reform and John was imprisoned at Toledo by a Carmelite community of the mitigated rule, who were opposed to reform. He was placed in a small, badly-lit cell, where he was inadequately fed and harshly treated in an attempt to persuade him to give up his adherence to the reform. His spirit remained unbroken and after some eight or nine months he escaped from Toledo to southern Spain. For the remaining 13 years of his life he acted as confessor and spiritual adviser to many nuns of the reform, in addition to holding various administrative positions in the Order. He died in 1591, at the age of 49.

Journey of the Soul

Apart from his letters of spiritual advice, John's systematic treatment of mystical theology is contained in a number of poems, which he subsequently explained in a series of commentaries. *The Spiritual Canticle* is a long dialogue between the soul, the Bride, and her Beloved, clearly inspired by the Song of Solomon in the Old Testament. The greater part of this poem was composed during his imprisonment in Toledo, the commentary having been written in 1584 and later revised. The Bride complains of her Lover's absence and tells of her longing for him. He is all in all to her, yet he eludes her. But this is the testing, purifying process, to prepare her for the raptures of final union.

Ascent of Mount Carmel is a study of the process by which the soul reaches the heights of mystical contemplation. It is cast in the form of a commentary on a poem, *The Dark Night* (composed between 1579–81), though there is another commentary on the same poem, written apparently at much the same time as *The Ascent*. A later poem, *Living Flame of Love*, was composed at some date between 1582–85, with a subsequent commentary. It is universally recognized that John's poetry is of the highest quality, although his prose style is of a lower level of inspiration.

Two other works should also be mentioned: John's remarkable drawing of Christ crucified, the result of a vision, and his sketch-plan of the Ascent of Mount Carmel, which summarizes his teaching on the subject of spiritual and mystical progress.

The basis of the teaching of John of the Cross, drawn largely from his own experience, is that the human person is, in St Augustine's words, 'made for God' and can only be fulfilled, perfected, become fully itself 'in God'. He describes the process by

which this absorption into God is achieved and the state of the soul when thus absorbed. John's teaching is addressed primarily to the enclosed, 'contemplative' religious, though it has its value for all Christians. Whilst he sketches out an ideal, typical journey of the soul towards God, he is the first to insist that no two souls are alike and that each man's way of coming to God will be peculiar to him and will not necessarily be helpful to another. Yet there is little doubt that what John has to say has been, and will be, of practical value for all who are seriously interested in the mystical way.

Night of the Senses

The soul moves towards God in two stages, which are really complementary aspects of one conditioning. That conditioning is the stripping away of all the obstacles that come between the creature and its Creator. The obstacles may be divided into what may roughly be called moral and what may be described as psychological. The moral obstacles are the desires which spring from selfishness or any form of self-regarding feelings. These must be purged away in the 'night of the senses'. All stirring of desire, even for innocent pleasure, must be 'mortified', put to death, annihilated. This purification is the work of normal asceticism, the ordinary acts of self-denial, self-discipline, the refusal of all enjoyment, the training of the will to an actual preference for the harder, more distasteful, more painful. Thus, he says: 'Strive not after that which is most easy, but after that which is most difficult . . . not after that which is most pleasant, but after that which is most unpleasant. . . Strive not to desire anything but rather nothing.'

'The night of sense is common and the lot of many; these are the beginners. The night of the spirit is the portion of the very few. The night of sense is of ordinary occurrence. Recollected persons enter the dark night sooner than others after they have begun their spiritual course. In general there lapses no great length of time after they have begun, before they enter the night of sense, and most of them do enter it, for they suffer aridities' (a feeling of distaste for prayer and that sense of the absence of God, which are the special suffering of those whose lives are, by dedication, God-centred and prayer-centred).

'During the aridities of the night of sense, God is drawing the soul out of the way of sense into that of spirit, from meditation to contemplation . . . God is leading them by the way of contemplation, which knows no imagination or reasoning . . . All they have to do is to keep their souls unembarrassed and at rest from all thoughts and all knowledge, contenting themselves with directing their attention simply and calmly towards God. . .'

The second stage of this purifying process is the 'Night of the Soul' or 'the Spirit', a night more terrible still, in which the soul, passive under the influence of God, finds memory, imagination, intellect, and will itself emptied of everything that is familiar and normal. This is because the normal objects of

Glasgow Art Gallery and Museum

memory and imagination, of intellect and will are necessarily finite and therefore, compared with the infinity that is God, can only betray and falsify the ultimate truth. If the powers of the soul are to be made fit for the vision of God they must be stretched beyond their normal capacity. So long as they are concerned with what is less than the pure being of the Infinite, they will be unable to rise above their own limitations. Nor can the soul achieve this purification by any effort of its own. God takes charge and does the work in and for the very centre and core of its being.

A Positive Purgation

All this sounds, and could be interpreted as being, so negative and destructive as to be totally inhuman, Yet, in principle, there is no difference between the demands of John of the Cross and the obligation that the poet John Milton felt himself to be under, '. . . to scorn delights and live laborious days'. For the doctrine, however starkly and forbiddingly stated, is essentially positive and constructive. The purgation is, and must be seen to be, no more than a means to an end, an end that is one of total fulfilment, perfection, sheer bliss. Certainly it should not be interpreted as suggesting that any created reality is in itself tainted, corrupt, sinful. Not only would this be contrary to the whole Christian belief in the creative activity of God and in the Incarnation which implies the involvement of God in his own creation; it is also contrary to John's own attitude. His poetry is filled with a sense of the beauty of creation, which would be impossible in a man who had stripped himself of all appreciation of natural reality:

> Of flowers and emeralds fine
> Gathered when dawn's dews gleam,
> Gay garlands we shall twine.
> Fragrant with your love's tender breath,
> Bound with one hair of mine.

John's doctrine is essentially one of balance. In God is found the fullness of all perfection, of beauty, of happiness, of wisdom. To arrive at union with that source of all that is worth while it will be necessary to pass through a preparatory stage in which experiences of everyday life seem to disappear. But the more completely the soul gives itself up to this process of purification, the more rapidly and completely will it find again all that it had thought lost, all that and so much more. Yet, if the surrender is not total, if the ascetic is in effect giving up *in order to* profit more completely, this is no true purgation. It is simply an act of selfishness. So the surrender must be absolute with no thought of recompense.

Again, as is the way of mystical writers, the final union of the soul with God is pictured in language drawn from the analogy of human love-making:

> O, burning, burning sweet!
> O wound, O welcome blow!
> O gentle hand, O touch that soothes and thrills,
> Filling with life complete,
> Cancelling all I owe:
> Love's sword revives even as it kills.

By contrast, John's prose commentary, couched in the language of scholastic metaphysics, loses something of this passion. 'The end I have in view is the divine Embracing, the union of the soul with the divine substance. In this loving, obscure knowledge God unites himself with the soul eminently and divinely.

'This knowledge consists in a certain contact of the soul with the Divinity, and it is God himself who is then felt and tasted . . . This touch of knowledge and of sweetness is so deep and profound that it penetrates into the inmost substance of the soul . . . The soul prays to see the Face of God, which is the essential communication of his divinity to the soul, without any intervening medium, by a certain knowledge thereof in the Divinity. This is something beyond sense and divested of accidents, inasmuch as it is the contact of pure substances, that is of the soul and of the Divinity . . .'

Although much of John's teaching is concerned with the process of purification, and he insists on the need for self-denial, the 'self' here is not the true personality, but represents all those tendencies and limitations in our nature which impede our true self-development. In the end, our happiness is seen to lie in the perfection of love, which transforms, as only love can, through union with the beloved. 'At the end of life it is on love that we shall be judged.'

Giraudon/Bibliothèque de Moulin

The book of Jonah is important not only because of its descriptions of the adventures of Jonah, but because it carries a warning from God against Jewish religious exclusiveness

JONAH

IN POPULAR THOUGHT Jonah is inevitably linked with the 'whale' that swallowed and regurgitated him. It is unfortunate that attention is concentrated so excessively on this intriguing incident, for it means that the real significance of Jonah's story is missed.

According to a brief reference in 2 Kings 14.25, Jonah, the son of Amittai, was a native of Gath-hepher and renowned as a prophet; he seems to have lived in the 8th century BC. The book of Jonah, which records his adventures, was written much later and probably dates between 400 and 200 BC. Its author is unknown.

The book of Jonah can be classified

For Christians, the story of Jonah has come to be linked with the Resurrection, for Christ likened Jonah's experience in the belly of the whale to his own three days 'in the heart of the earth' *Left* Illustration from the 12th century *Bible de Souvigny* showing Jonah being cast from the boat into the jaws of the whale, to abate the storm *Right* Jonah disappears into the body of the whale; detail from a mural by Giotto in the Scrovegni Chapel, Padua

as a *midrash*, a Jewish moral tale, destined to correct the Jewish disposition to believe that God was concerned only with the Jews, and not with the Gentiles also. Jonah typifies Jewish exclusiveness, and his story is intended to show how God sought to persuade him to take a wider view of human needs and divine providence.

The story opens with Yahweh (see YAHWEH) commanding Jonah: 'Arise, go to Nineveh, that great city, and cry against it; for their wickedness has come up before me.' Jonah tries to avoid the mission, but not from fear as it later transpires. He takes a ship from Joppa to Tarshish, which was probably a Phoenician port in the western Mediterranean; its remoteness from Palestine indicates Jonah's desire to get as far away as possible from the God of Israel. But Yahweh was not to be thus circumvented. He sends a storm that almost wrecks the ship. And the sailors said: 'Come, let us cast lots, that we may know on whose account this evil has come upon us.' The lot falls on Jonah. Realizing he is the cause of impending disaster, Jonah tells the Phoenician crew: 'Take me up and throw me into the sea; then the sea will quiet down for you; . . . it is because of me that this great tempest has come upon you.' When they do so, Yahweh 'appointed a great fish to swallow up Jonah; and Jonah was in the belly of the fish three days and three nights'. It should be noted, incidentally, that the Hebrew *dagh gadhol* means 'great fish', not necessarily a whale; it is in the reference to the story in the gospel of Matthew (12.40) that the English translation presents the monster as a 'whale'.

At Yahweh's instruction, the great fish 'vomited out Jonah upon the dry land'. Having learned his lesson, Jonah proceeds to Nineveh and proclaims Yahweh's message. What Jonah had originally feared then happens. The Ninevites repent and Yahweh forgives them. To Jonah this was intolerable, for the Ninevites were the pre-eminent enemies of his people. In his anger, he reproves Yahweh for not punishing the hateful nation. He has to be taught a further lesson. It is very hot, and Yahweh causes a gourd to grow up miraculously and shade Jonah. But as Jonah is rejoicing in the shade, Yahweh destroys the gourd, and as Jonah faints

Scala

After three days and three nights in the belly of the whale, Jonah is thrown up onto dry land: 19th century German print

Ted Binet

under the hot wind, the divine lesson is finally driven home. Jonah is reproved by Yahweh for lamenting the destruction of the gourd, while desiring that Nineveh and its inhabitants should all perish.

The historical significance of the book of Jonah thus lies in its being a Jewish protest against the racial exclusivism of the Jews. But in Christianity it acquired another significance: 'the sign of Jonah' became a prototype of the Resurrection of Jesus. Jesus is recorded to have said: 'For as Jonah was three days and three nights in the belly of the whale, so will the Son of man be three days and three nights in the heart of the earth (Matthew 12.40). The symbolism caught the imagination of the early Christians, and depictions of Jonah being cast to the sea monster (shown as a kind of dragon) and resting under the shade of the gourd often appear in the iconography of the catacombs and the sculptured sarcophagi of the 4th and 5th centuries. The use of 'Jonah' as a synonym for one who brings or attracts misfortune derives from the predicament in which the Phoenician sailors found themselves.

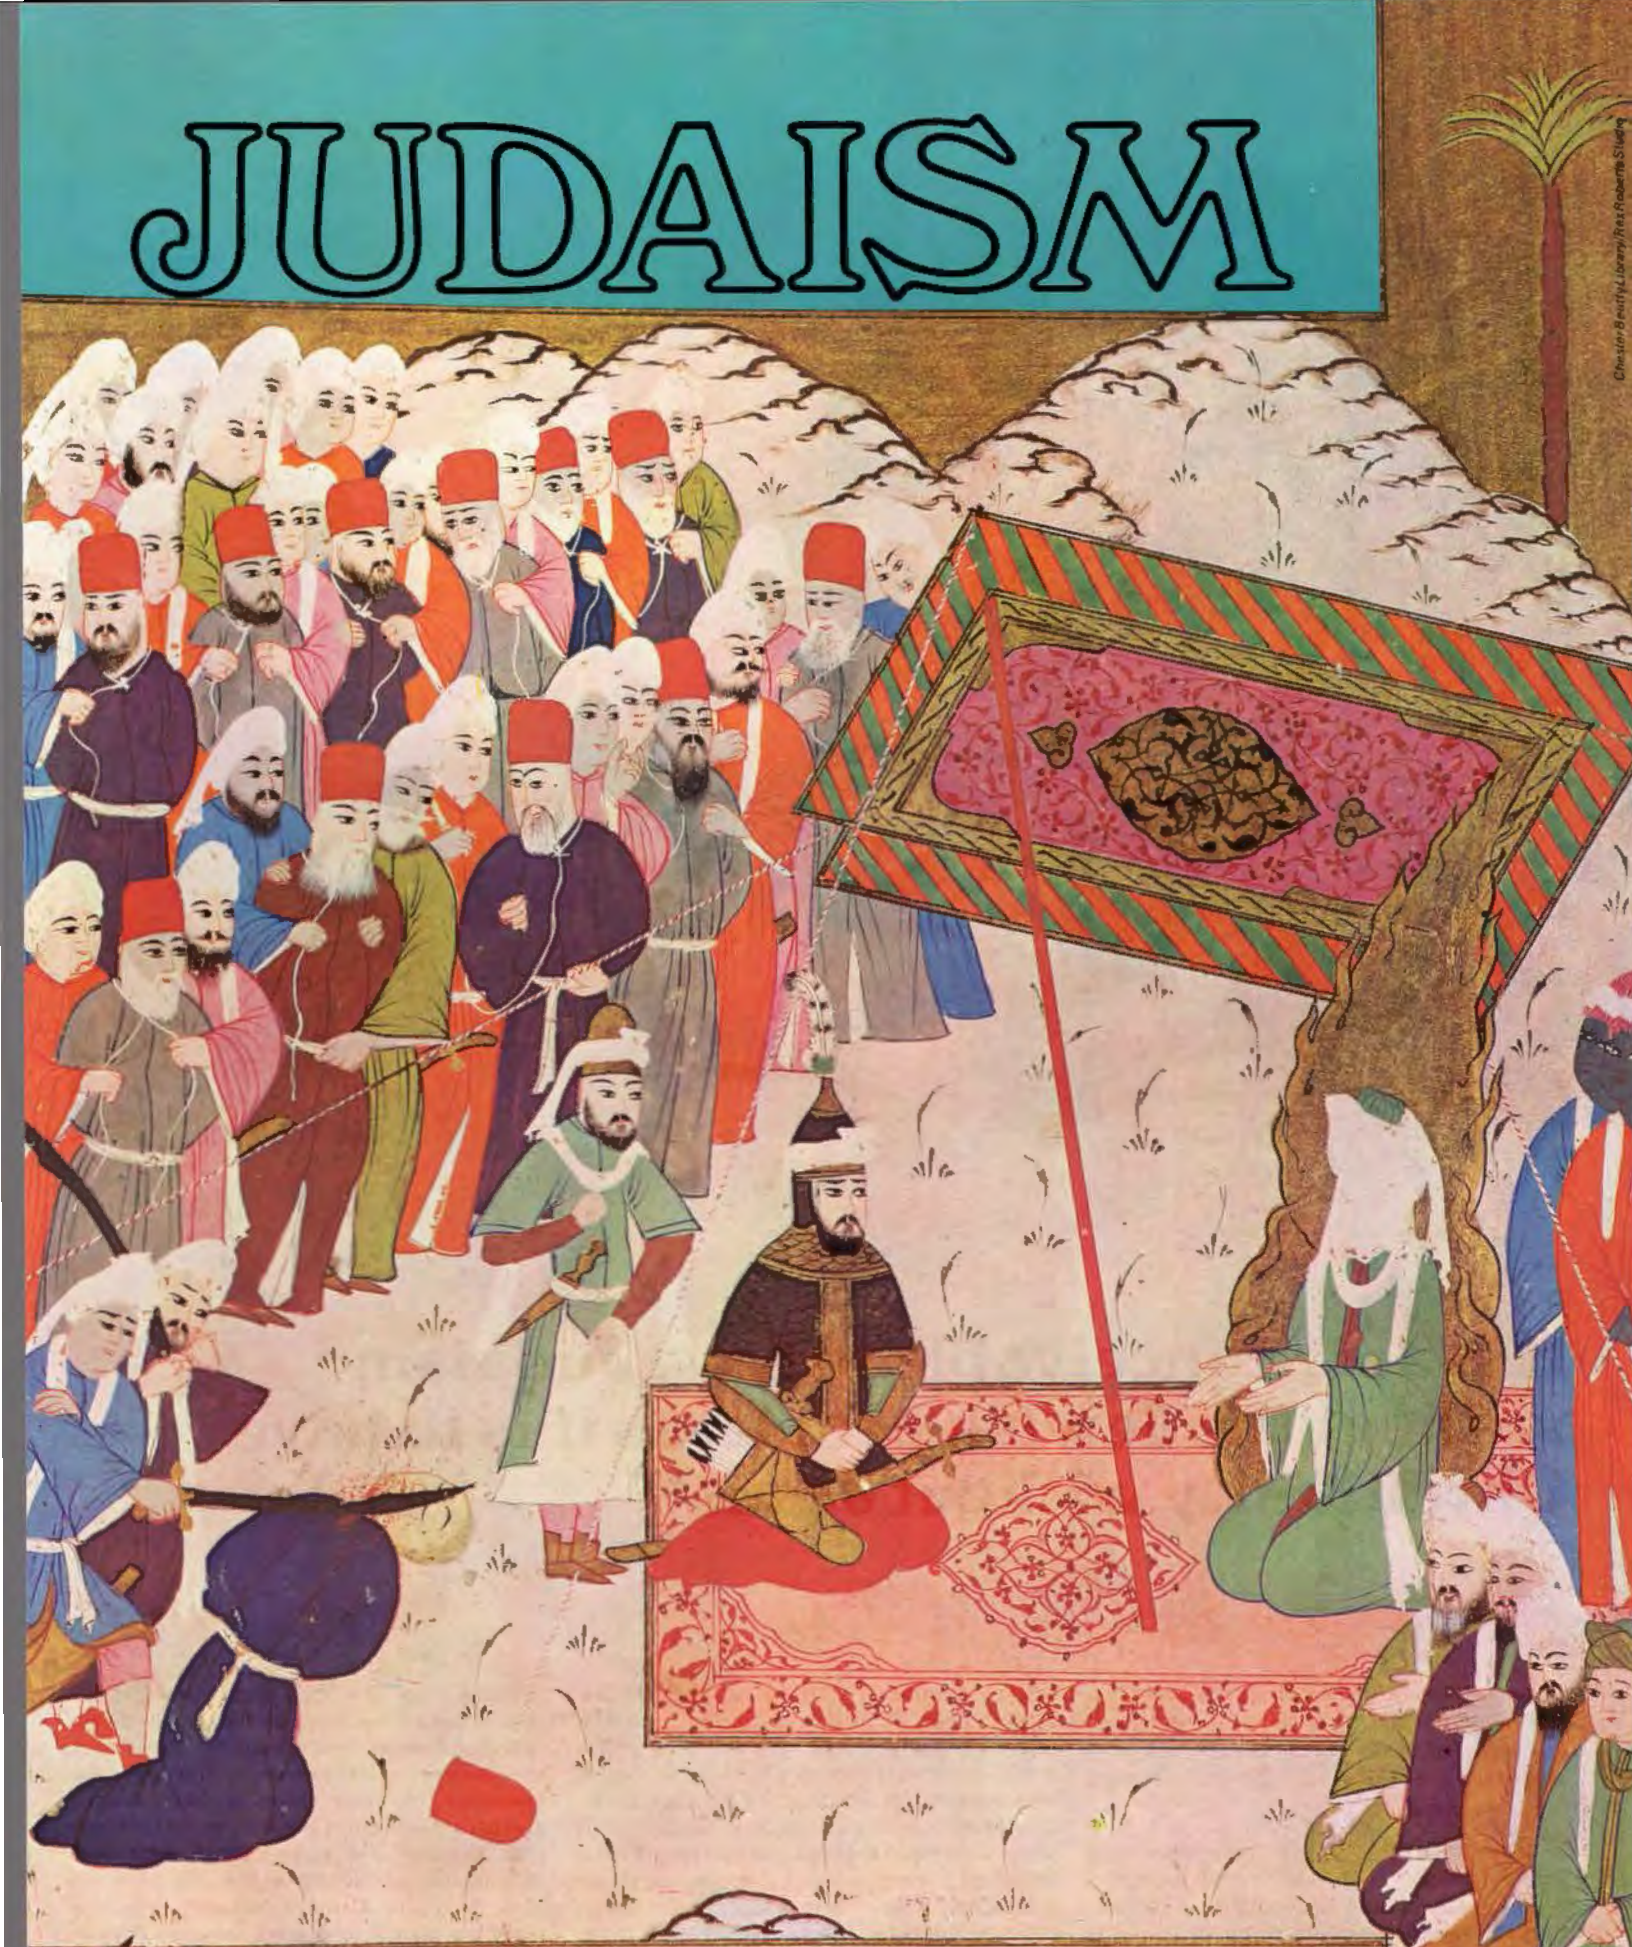
JUDAISM



دیدی هر یکی مسلمان برجهودی ولد دلر ابن هشام ایدر اول تاجرکم
محیصه سلم شدی انی اول کون ولد ردی قرنداش حویصه اول کونک

Samuel H. Kress Collection, of Arizona Art Gallery

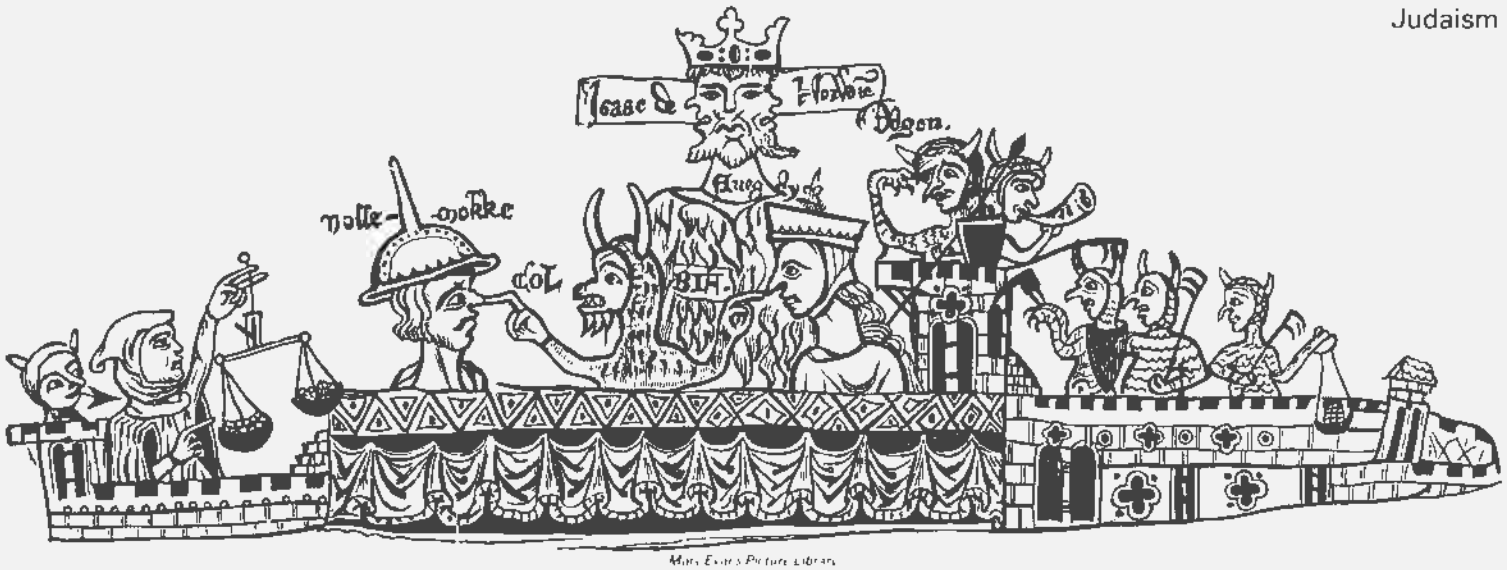
It is as inconceivable to have Judaism without the Jewish people, as it is to have Christianity without Jesus

The progenitor of all subsequent monotheistic religions, Judaism is based on the belief that there is only one God. Unlike other faiths, Judaism is centred not on a prophet or saviour but on the idea of a chosen people

A SIGNIFICANT FACTOR in the understanding of Judaism is that it centres around a people, rather than an individual. Important though Moses or Abraham or Isaiah is for Judaism it is quite possible to imagine the Jewish faith without any of these. But it is as inconceivable to have Judaism without the Jewish people as it is to have Christianity without Jesus, Buddhism without Buddha or Islam without Mohammed.

In 1981, it was estimated that there were about 14½ million Jews throughout the world, around 6 million in the United States, over 3 million in Israel, and the remainder distributed over the rest of the world. Some of these have no religious belief whatsoever, but the majority do subscribe to the faith known as Judaism, though with many differing emphases in matters of both belief and observance. One large division (an ethnic rather than a doctrinal one) is between Oriental Jews together with those hailing from Spain and Portugal, and Jews from other parts of Europe. The former are known as Sefardim (from the Hebrew name for Spain, *Sefarad*) and the latter as Ashkenazim (from the Hebrew name for Germany, *Ashkenaz*). The differences between these two groupings are in minor liturgical rites, customs and popular foods.

Previous page The idea of the Jews as the chosen people has been partly responsible for the persecution and hostility they have encountered: Mohammed ordering the execution of Jews, from a 16th century Turkish manuscript *Above* In accordance with Levitical law, every Jewish male must be circumcised on the eighth day after his birth. Originally a rite of initiation, it is now practised mainly for health reasons: *Circumcision of the Children of Israel,* by the 18th century Italian painter G. B. Tiepolo *Above right* Satirical drawing of the Jews of Norwich which appeared in the Jews' Roll, a list of tax payments in Henry III's reign; antisemitic feeling ran high in medieval Europe and in England Jews were afforded protection only on payment of exorbitant taxes



Another division is between Zionists, who see the main future for Jews in the State of Israel and who tend to look upon the Jews as a nation, like the English or the French, and the non-Zionists, who see Judaism purely as a religion, and in non-nationalistic terms. This does not rule out the existence of many religious Zionists and there are even a few anti-Zionists. Still another significant division is between Orthodoxy and Reform; the main difference between these two groups concerns the nature of revelation and the permanent binding character of the ceremonial law.

The Crown of the Torah

The Jewish place of worship is the synagogue, from a Greek word meaning simply 'place of assembly'. Some Reform synagogues are called 'temples', chiefly because Reform Jews, unlike the Orthodox, do not believe that the Temple in Jerusalem will be rebuilt in the days of the Messiah and animal sacrifices again offered there, so that the synagogue has now taken the place of the ancient Temple. In the modern synagogue the rabbi and the cantor – the reader of the prayers to music – officiate at the services, but there is nothing in Jewish teaching to prevent any Jew from officiating at any service, including the marriage service. The rabbi is not a priest. The word rabbi means 'teacher' or 'master' and his chief function is to be an expounder of the Jewish religion. There is, in fact, no priesthood nowadays in Judaism, except for vestigial remains of a very peripheral order. Jews claiming descent from the Temple priesthood, who frequently have the name Cohen, from the old Hebrew name for 'priest', recite the priestly blessing 'May the Lord bless you and keep you' in Orthodox synagogues on the great occasions of the year, but otherwise very little is left in present-day Judaism of the hereditary priesthood.

In fact, until the 14th century there were no professional rabbis, the Jewish teachers earning their living by practising such crafts as that of physician while teaching Judaism without fee in their spare time. The rabbis of an earlier period were drawn from every walk of life. Some of them were businessmen, others smiths or cobblers. The sole qualification was proficiency in the Torah. This word, meaning 'teaching', refers in the first instance to the Pentateuch, the Five Books of Moses, but then, by extension, to the whole range of Jewish teaching.

There is to be observed in Jewish history a definite substitution of an aristocracy of learning for the older aristocracy of the priesthood. This received its most dramatic expression in two sayings dating from as early as the 2nd century: that only the son of a king can be a prince and only the son of a priest can be a priest, but the crown of the Torah lies in a corner and anyone capable of so doing can don it; and that a bastard learned in the Torah takes precedence over an ignorant High Priest. Love of learning and respect for things of the mind has been a distinguishing feature of Judaism so that a non-believing Jew like Freud could still feel himself strongly attached to Judaism for this reason.

The Thirteen Principles

The most obvious way of describing a religion is to state the beliefs it expects from its adherents. There are, however, notorious difficulties when one tries to describe Judaism in this way. There has never been in Judaism any proper machinery for the formulation of dogmas, no synod or body of representative Jewish teachers to decide authoritatively and categorically what it is that a Jew must believe in order to be a Jew. This has resulted in an extremely wide range of diverse views among Jewish theologians.

It would be wrong to conclude, as many 19th century scholars were in the habit of doing, that Judaism has no dogmas, that a Jew can believe what he likes and still remain an adherent of Judaism. This is clearly an absurd position to adopt: as Solomon Schechter (d.1915) pointed out, it would make the central idea of Judaism the dogma of having no dogma. What does emerge from a study of the classical sources of Judaism – the Bible, the Talmudic literature produced in Palestine and Babylon during the first five centuries AD, and the medieval Jewish writings – is a kind of consensus of opinion among believers as to the distinguishing features of Jewish belief but with much room for individual interpretation and the possibilities of strong but legitimate differences in some matters.

With these reservations the 13 principles of the Jewish faith can be examined as formulated by the greatest Jew of the Middle Ages, Moses Maimonides (1135–1204). These are the nearest thing to a Jewish catechism. They have been printed in many prayer books and are recited daily by the pious. But many modern Jews do not accept them without considerable qualifications and there are other beliefs, such as that of the divine election of Israel, for example, which are not included among the 13 but which many Jews would consider to be basic. Maimonides's principles are: belief in the existence of God; in his unity; his incorporeality; his eternity; and that God alone is to be worshipped; belief in the prophets; that Moses is the greatest of the prophets; that the Torah is from heaven; that it is unchanging; belief that God knows the deeds of men; that he rewards the good and punishes the wicked; belief in the coming of the Messiah; and in the resurrection of the dead.

The first five principles have to do with the nature of God. Maimonides's choice of principles was chiefly in response to the particular challenges of his day and the second, third and fifth principles are fairly obviously directed against Christianity. While in the Middle Ages and later there were to be found Jewish teachers of note who were prepared to acknowledge that the Christian doctrine is not tritheism and that Christianity is not 'idolatry', Jews have been unanimous in declaring the doctrine of the Trinity, and especially the doctrine of the Incarnation, in which Jesus of Nazareth is the Second Person in the Trinity, to be a breach of pure monotheism and therefore incompatible with Jewish belief. The Jewish declaration of faith is the *Shema*, 'Hear, O Israel; the Lord our God, the Lord is One' (Deuteronomy 6.4). The Jewish child is taught to recite the verse as soon as he can speak. The devout Jew recites it daily, in the morning and at night. The dying repeat it as life's last affirmation.

Beyond Time and Space

There has been a wide spectrum of belief regarding the nature of God, from the negative theologians who wax eloquent in declaring how little one can say of God as he is in himself (some of these observe that one cannot, strictly speaking, say that God exists, since 'existence' is a term too heavily laden with human associations) to the Jew of simple faith who is not bothered

Justification for Living

Western civilization professes one God and lives in polytheism. We Jews are connected to this civilization with thousands of strands, but if we share in its dualism of life and profession of faith, we shall forfeit our justification for living. If we were only one nation among others, we should long ago have perished from the earth. Paradoxically, we exist only because we dared to be serious about the unity of God and his undivided, absolute sovereignty. If we give up God, he will give us up. And we do give him up when we profess him in the synagogue and deny him when we come together for discussion, when we do his commands in our personal life, and set up other norms for the life of the group we belong to. What is wrong for the individual cannot be right for the community, for if it were, then God, the God of Sinai, would no longer be the Lord of peoples, but only of individuals. If we really are Jews, we believe that God gives his commands to men to observe throughout their whole life, and that whether or not life has a meaning depends on the fulfilment of those commands. And if we consult our deep inner knowledge about God's command to mankind, we shall not hesitate an instant to say that it is peace. There are many among us who think this command is intended for some more propitious future; for the present, we must participate in the universal war, in order to escape destruction. But it is only if we do participate in this war that we shall be destroyed; for as far as we are concerned, there is only one possible kind of destruction: God letting us slip out of his hand.

The Writings of Martin Buber (ed W. Herberg)

at all by the problem of anthropomorphism. Even the belief that God can, if he so chooses, assume a bodily form (as in the legend, when he appeared on the altar in the Temple to consume the sacrifices in the form of a lion of fire) is not, according to some theologians, sufficient to cause those who hold it to be excluded from Judaism. Maimonides does, indeed, declare such persons to be heretics and his third principle states this emphatically but some of Maimonides's critics, while themselves rejecting any belief in God's corporeality, feel that the anthropomorphisms in Scripture encourage this belief so that although the sophisticated understood these in a non-literal sense the more naive believers cannot be condemned for holding opinions which, for them, have the full sanction of holy writ.

God is beyond time and space (the fourth principle) and the universe is subordinate to him. He is both transcendent and immanent. He is apart from the world and yet involved in it. Judaism rejects both deism, which denies God's immanence in the universe, and pantheism, which denies his transcendence and identifies God with the universe.

Prayer and worship are to be offered to God alone (the fifth principle). Even prayer to God through an intermediary is forbidden. In the hasidic movement (see HASIDISM) which arose in the 18th century one does, however, find the idea of prayer through an intermediary, the hasidic saint or master. This was one of the reasons why the movement met in its early stages with such vehement rabbinic nppositiun. But the prayers are never offered *to* the holy man. It is rather that he prays on behalf of others who present their petitions to him; the hasidic movement believed that the prayers of the holy teacher can accomplish that which sinful men are incapable of achieving by themselves.

The sixth to the ninth principles (belief in the prophets of whom Moses is the greatest, and in the heavenly origin and unchanging character of the Torah) are concerned with revelation. The seventh and ninth principles appear to have been particularly stressed by Maimonides as a response to the claims of both Christianity and Islam that a greater prophet than Moses had arisen and that Judaism, though once valid, had been superseded. Until modern times, with very few exceptions, Jewish teachers held that the books of the Hebrew Bible (the 'Old Testament') were divinely revealed to man, albeit in differing degrees. The Pentateuch (the Torah proper) was thought of as being divinely dictated by God to Moses. The manner of the divine communication was, to be sure, variously understood in the Middle Ages (Maimonides himself held that all the people heard was an inarticulate sound which Moses put into words) but the content was conceived of as the very words of God. The prophetic books of the Bible (and this includes the historical books with the exception of Ezra, Nehemiah and Chronicles) were written by the prophets under the impact of prophecy (a lesser degree than the inspiration vouchsafed to Moses) while the books of the Hagiographa (including Psalms and Proverbs) were thought of as conveyed by the still lesser degree of inspiration known as the holy spirit. This is expressed in Jewiah practice by forbidding the placing of the books of the Hagiographa on top of the prophetic books and the prophetic books on top of copies of the Pentateuch. The Torah was seen as twofold: firstly the written Torah, or the Pentateuch and the other hooks of the Bible, and secondly, the oral Torah or the teachings held to have been conveyed by God to Moses by word of mouth, together with those elaborations and applications now found in the rabbinic works produced during the first five centuries AD, the most important of which is the Talmud. There are two Talmuds; the Palestinian edited around the year 400, and the more authoritative Babylonian edited around the year 500.

Orthodoxy and Reform

Orthodoxy holds fast to the position that the present text of the Pentateuch is the word of God, infallible, sublime, created before the world came into being. Both the written and the oral Torah are from God in a direct sense with the corollary that the precepts of the Torah in their rabbinic interpretation are eternally binding upon Jews and immutable. In the Orthodox view all biblical criticism, whether 'higher' or 'lower' (that is, literary criticism and textual criticism) is heresy because it expresses doubts as to the correctness of the present text and because it sees the Pentateuch itself as a composite work produced at different intervals and with contradictions between the Codes of Law found therein.

Reform Judaism, on the other hand, accepts the new picture of the Pentateuch and the rest of the Bible which has emerged as the result of modern historical investigation and criticism. Reform holds the view that a radical re-interpretation of what revelation means is now called for and abandons the idea of an immutable law. A compromise position between Orthodoxy and Reform is represented chiefly in the United States by Conservative Judaism, to which the precepts are binding not because they were given by God in the direct sense in whicb Orthodoxy understands it but because God is seen, as it were, in the process as a whole. The real source of authority is the tradition of the Jewish community of believers, just as the Church in Catholicism is for Christians.

To illustrate the differences an example can be given from the dietary laws, such as abstinence from eating pork and shell-fish. Orthodoxy insists on the observance of these laws as God-given ordinances. Reform leaves such observances to the individual conscience but holds in any event that it is the moral rather than the ritual and ceremonial law which is permanently binding. Conservative Judaism believes that the binding character of these laws derives not so much from any kind of direct divine communication but because the laws have evolved through the historical experiences of the Jewish people and are therefore part of the divine-human encounter in human history and can serve in the present, as they have done in the past, in furthering the ideal of holiness in daily living. With regard to the ethical law there is complete unanimity among all sections of Jewry that this has binding force for all time.

The tenth and eleventh principles (that God knows the deeds of men and rewards or punishes them accordingly) are accepted in outline by all religious Jews, although there is considerable difference of opinion as to the exact nature of divine Providence and as to how reward and punishment are to be understood. Does the doctrine mean that God rewards directly in this life those who keep his laws and punisbes those who do not, or does it mean that virtue brings its

own rewards and vice its own punishments? Does it mean that there is reward and punishment in the afterlife and if it does, what is the nature of heaven and hell? Is there a hell at all and, if there is, is it a place or a state of remoteness from God? Is punishment in hell eternal or only for a period? On these questions there are still differing answers among Jews.

The Beginning of Redemption

The twelfth principle refers to the belief mentioned frequently in the Bible that the day will come when this world will be perfected, when war and hatred will be banished from the earth, and when the Kingdom of God will be established and all men will recognize him as their Maker. The Orthodox belief is in a personal Messiah (a word meaning 'the anointed one', in reference to the practice of anointing kings with oil), a human being of great renown but in no way divine who will be a descendant of King David and who will be sent by God for this purpose. Non-Orthodox opinion since the last century has tended to place all the stress on the

Judaism does not believe that salvation is only possible for Jews but that the righteous of all peoples have a share in the world to come

dawning of the messianic age and to reject the doctrine of a personal Messiah as savouring too much of the magical. The basic idea is that God will eventually intervene in human affairs so as to bring about the perfect society envisaged.

In the last century many Jews tended to interpret the doctrine in purely naturalistic terms, that better education and social reforms in the Western world will themselves bring about the millennium. The horrors of this century have made such a belief in automatic human progress towards the desired goal remote and even ludicrous, though this theory is by no means dead. It has been related by many to the events which led up to the establishment of the State of Israel. The fact of the holocaust in Europe in which 6 million Jews died and the setting up of the State of Israel have both encouraged religious Jews to see the new State as having messianic dimensions. A number of religious Jews today tend to look upon Israel as 'the beginning of redemption', believing that the first steps have been taken towards the realization of the age-old messianic vision. At the same time they believe that the world still needs redemption and that the full realization, in which the perfect society under God will be established for all mankind, is still awaited and will only be achieved when God himself intervenes. It should be noted that the messianic belief concerns events here on earth. Whatever the Jewish views on the afterlife, Judaism believes that God will not permanently abandon this world to chaos and that one day mankind here on earth will find its complete redemption.

Immortality of the Soul

The last principle, relating to the resurrection of the dead has also been variously interpreted. Originally the doctrine of the resurrection referred to the dead rising from their graves and living again here on earth. It was closely connected with the messianic hope. After the advent of the Messiah the resurrection would take place on earth. As its name implies, the doctrine means that death is really death and resurrection a new birth of the body. In the course of time, however, the doctrine of the immortality of the soul came into Judaism. There may be traces here and there in the Bible of the doctrine that the soul lives on after death but these are few and vague. When the two doctrines – of the resurrection and the immortality of the soul – were fused, as eventually happened, the official view became that when a person dies his soul lives on in another realm until the resurrection, when it is reunited with the body on earth.

Maimonides seems to have been embarrassed by the whole idea of the body living on and, indeed, by the basic notion of the resurrection. In his earlier writings he is very indefinite about the idea and towards the end of his life he put forward the view that the resurrection is only for a time and that it is the soul alone which inhabits eternity. The ultimate bliss for the righteous is, in the words of the rabbis, to bask forever in the radiance of the divine presence. The references in the classical sources, of which there are many in the post-biblical period, to the world to come are both to the soul's fate in the afterlife and to the resurrection.

Reform Judaism, and for that matter even some Orthodox interpreters, prefer to think, as Maimonides seems to have done, of the doctrine of the immortality of the soul as the really significant part of this principle. Many modern Jewish thinkers accept this with the proviso that it does not refer to the mere survival of a nebulous 'soul' but to the continuing existence of the total human personality which, it is claimed, is really what is implied in the doctrine of the resurrection. It must also be appreciated that Judaism is not a religion of salvation, in other words, Judaism sees this life as good in itself, and not only as a means of acquiring eternal life. Life would be worth living even if this world were all man can hope to have. The paradox inherent in Judaism as a religion that is both this-worldly and other-worldly was finely expressed by the 2nd century teacher who said: 'Better one hour of good deeds and repentance in this world than the whole life of the world to come but better one hour of spiritual bliss in the world to come than all the life of this world.'

Judaism is a people-centred religion but it is not an exclusive religion. Converts are accepted although they are required to show clear evidence of sincerity. Moreover Judaism does not believe that salvation is only possible for Jews but that the righteous of all peoples have a share in the world to come. The idea that the religion depends on the peoplehood of Israel is frequently expressed, in the Biblical idiom, by saying that God has chosen Israel. This notion presents difficulties all of its own and is liable to misconceptions. There is nothing racialist about the doctrine that Israel has been chosen to serve God and all mankind. The convert to Judaism, whatever the colour of his skin and whatever his background, becomes a full member of the Jewish community.

Yet tensions inevitably exist between the universalism taught by Judaism – God as the Father of all mankind – and the particularism inseparable from the idea of divine election. Some modern Jewish thinkers, notably Mordecai Kaplan in the United States, have found the doctrine so open to misrepresentation that they have suggested it be dispensed with entirely. But the majority of religious Jews prefer to live with the tensions, trying to further the richness of the idea of Israel as God's covenant people without losing sight of the fact that, as Judaism itself repeatedly stresses, God loves all men.

That this is no idle dream can be seen from the contribution Judaism has made in the past to civilization. Judaism's daughter religions, Christianity and Islam, have received many of their most significant beliefs and institutions from Judaism: the doctrine of the one God, the patterns of worship in church and mosque, the reading of the Scriptures, the teachings of the prophets. The stories of the book of Genesis, for instance, with their strong moral sense have been a powerful aid in the moral education of children of both Jewish and other faiths. Movements of social reform and freedom from tyranny have found inspiration in the Old Testament passion for justice and the narrative of the deliverance from Egyptian bondage. Words like *Hallelujah* and *Amen* have become part of the vocabulary of worship for millions. The rhythm and concreteness of Hebrew prose and its powerful idioms have influenced, through biblical translation, all the European languages.

Festivals and Rites

Jewish practices are of two kinds, the ceremonial and the ethical. On the ceremonial side there are colourful rituals both in the home and the synagogue. The sabbath and festivals are celebrated with joy. These

When asked if a Jew might hunt animals for sport, an 18th century rabbi replied that he could not imagine a Jew wishing to do so

always begin at nightfall and end at nightfall. On the eve of the sabbath two candles are lit as a symbol of peace in the home and increased spiritual light. The master of the house recites a benediction over a cup of wine in which he praises God for creating the world and giving his people sabbath rest. Tuneful table hymns are sung during the meal, the whole family joining in. The sabbath is a day of rest and of spiritual refreshment.

Orthodoxy adheres strictly to the laws prohibiting all kinds of creative activity on the sabbath in acknowledgement of God as Creator and giver of life's blessings. Some Orthodox Jews refrain even from switching on electric lights on the sabbath. Orthodox Jews do not ride on the sabbath, do not write, engage in business, smoke or carry anything in the street. Reform Judaism has relaxed many of these laws but has not lost sight of the ideal of the sabbath as a day devoted to spiritual pursuits.

During the sabbath service in the synagogue a scroll of the Pentateuch is taken from its place in the Ark at the eastern end of the synagogue and carried in procession around the building while the congregation stand. The scroll must be written by hand and there are detailed traditional rules which the scribe must observe while carrying out his sacred task. It is adorned with silver ornaments, especially bells which tinkle while it is being paraded. A portion is read from it each week; this portion is divided up and members of the congregation are given in turn the honour of reading from the scroll (or, since many cannot read the Hebrew nowadays, of having it read for them by a competent reader). In this way the whole of the Pentateuch is read each year. The reading of the complete scroll is concluded in the autumn of the year. On this occasion no sooner is the reading complete than it begins again. The persons given the great honour of reading the last portion and the first of the new cycle are called respectively: 'Bridegroom of the Torah' and 'Bridegroom of Genesis'. These two invite the rest of the congregation to festivities to mark the event.

The Jewish calendar is rich in festivals. The three pilgrim festivals (so called because in Temple times people would ascend to Jerusalem, then in joyous pilgrimage to the Temple) are the Passover in the spring, Pentecost seven weeks later, and Tabernacles in the autumn. Passover is in celebration of the Exodus from Egypt, when God led the enslaved people out of Egyptian bondage; in their haste to depart they had not time to bake their bread properly, so that they were obliged to eat unleavened bread. On Passover eve, in a delightful home ceremony, the family partake of unleavened cakes and they eat bitter herbs as a reminder of the bitterness of slavery, and they drink wine, in joy at the new-found freedom. At this meal the *Haggadah* (literally 'the telling') is recited. This is a dramatic presentation of the Exodus culled from biblical and other sources, in the course of which the youngest child present asks four questions regarding the unusual ceremonies he sees and the father and the rest of the company reply. Pious Jews refrain from eating leavened bread during the whole eight days' duration of the festival.

Pentecost is a celebration of the giving of the Torah, that is, of the revelation on Mt Sinai, as told in the book of Exodus. During the synagogue service of the day the portion from Exodus describing this tremendous event and containing the Ten Commandments is read from the scroll. Tabernacles celebrates the dwelling of the Israelites in 'booths' in the wilderness after they had gone out of Egypt. Many Jews build a booth in their gardens, the roof of which is open to the sky but lightly covered with foliage or straw, in which they eat all their meals for the seven days of the festival. On this festival a palm branch and other plants are taken in the hand during the recitation of Psalms in the synagogue in thanksgiving for God's bounty.

Historically considered, the three pilgrim festivals were originally agricultural feasts pure and simple but the genius of Judaism transformed them into festivals celebrating historical events. Some Jewish thinkers today see this as part of a long process in which religion was gradually freed from subservience to place. Unlike many pagan gods the true God is not bound to single spots on the earth's surface and he manifests himself through human history.

The Day of Atonement

The New Year festival in the autumn is a solemn occasion, the major portion of the day being spent in prayer. In the home on the eve of the festival an apple is dipped in honey and eaten at the festive meal, while prayers are offered to God to grant a sweet and good year. The central feature of the synagogue service on this day is the blowing of the ram's horn, the oldest musical instrument known to man. Many ideas have been read into this ceremony, the best-known of which is that the piercing sound of the horn affords a shrill warning to man to awaken himself to his duties and responsibilities in the year ahead. Another explanation is that trumpets are blown at the coronation of a king and at the beginning of the New Year God is hailed as king of the universe.

On the tenth day after the New Year festival there falls the great fast of Yom Kippur, the Day of Atonement. Devout Jews fast for 24 hours, partaking of no food or drink whatsoever and spending the better part of the day in prayer. The Day of Atonement is a day of pardon. Jews confess their sins and throw themselves on the divine mercy. But solemn though the day is, it is in a way a joyous occasion because on it man is reconciled to his God and to his fellows. The name 'Black Fast', which is sometimes given to it by non-Jews, is a misnomer. In fact, the readers of the services and many members of the congregation dress in long white robes symbolizing purity and divine compassion.

Obligations of the Faithful

Two minor feasts are Purim (literally 'lots'), celebrating the deliverance of Jewry from the machinations of Haman as recounted in the book of Esther, and Hanukkah (literally 'dedication') celebrating the deliverance of the people in the days of Antiochus and the re-dedication of the altar, as told in the books of the Maccabees. On Purim the book of Esther is read amid jollification. On each of the eight days of Hanukkah candles are kindled in the Menorah (candelabrum), one on the first day, two on the second and so on (see CANDLE). Legend has it that when the soldiers of Antiochus profaned the Temple there was only one small jar of pure oil left uncontaminated. This was used for kindling the Temple Menorah and although there was only sufficient for one night it burned by a miracle for eight days. The miracle of the oil became symbolic of the victory of the spirit which is the main theme of the Hanukkah festival.

The most vivid description of what

Telaviv Museum/A.P.A.G.P. Paris

Jew with the Torah, **a painting by Chagall; the persons having the honour of reading the first and last portions of the Pentateuch each year are called respectively 'Bridegroom of the Torah' and 'Bridegroom of Genesis'**

Judaism demands of its adherents is found in the book of Deuteronomy (6. 4–9):

> Hear O Israel: The Lord our God is One Lord; and you shall love the Lord your God with all your heart, and with all your soul, and with all your might. And these words, which I command you this day, shall be upon your heart; and you shall teach them diligently to your children, and shall talk of them when you sit in your house, and when you walk by the way, and when you lie down, and when you rise. And you shall bind them as a sign upon your hand, and they shall be as frontlets between your eyes. And you shall write them upon the posts of your house, and on your gates.

The passage is repeated in slightly different words in Deuteronomy, chapter 11. At an early period in Jewish history the last verses were taken literally so that to this day the devout Jew has these two passages inscribed on parchment and fixed in a little case (the *mezuzah*, 'doorpost') to the doorpost of his house, reminding himself of God's law whenever he enters and leaves his house. Similarly, the passages, together with two others, inscribed on parchment, are placed into little boxes known as *tefillin*, meaning 'attachments' or 'phylacteries'. They are affixed with leather straps to the left arm, opposite the heart, and to the head and worn during prayer; they symbolize the Jew's dedication of mind, heart and hand to God's service.

Ritual observances, important though they are in the scheme of Judaism, are far from being the main features of the Jewish faith. At the heart of Judaism is an ethical affirmation. This is that man can imitate God by practising justice, righteousness and holiness and by showing compassion. This is the way to be God-like. It is for this reason that those biblical passages which breathe the spirit of passionate concern for the downtrodden and which speak in the most urgent terms of the pursuit of justice have always been favourite Jewish texts; such as those enjoining concern for the poor and needy, for the hired servant and for the stranger; the spirit of neighbourliness, and just and upright dealings. There are innumerable examples of this constant demand for sound ethical conduct as the basis of human life and such teachings were not seen by the Jewish teachers as mere preachment but as divine imperatives. The rabbis, the post-biblical teachers, elaborated on these precepts, discussing in great detail, for example, the question of fair prices and fair and unfair competition in business, of the laws against overcharging and having false weights and measures, of the prohibition of misleading others and the need for a community to take adequate care of its poor and needy, of regulations between employers and employees, masters and servants, parents and children. Even animals have their rights and have to be treated with kindness. A distinguished 18th century rabbi when asked if it is permitted for a Jew to hunt animals for sport replied that he could not imagine a Jew wishing to do any such thing.

Jewish ethical teaching is not confined to laws and deeds alone. Character formation is of the utmost significance. There has grown over the centuries a vast moralistic literature produced by Jewish teachers and studied by Jews regularly, inculcating the formation of good character traits and the rejection of vicious tendencies. Hatred of one's neighbour, sloth, pride, lust, anger, spite, envy and jealousy, are to be fought against, while compassion, kindliness, benevolence, the love of learning and of one's fellow-men are to be pursued vigorously. In the words of an 11th century Jewish moralist, Judaism certainly knows of 'duties of the limbs' but, even more important are the 'duties of the heart'. It was in this spirit that the Talmud contains a passage in which it is said that there are three distinguishing marks of the Jewish people: they are compassionate, they are bashful, and they are benevolent. In another Talmudic passage it is said that it is the heart of man that God wants.

The conflict in man's soul between his higher and lower nature is described by the Talmudic rabbis as a conflict between the 'evil inclination' and the 'good inclination'. By the evil inclination they mean man's ambitions and his bodily instincts. These, though called 'evil' because they can lead

The Star of David (in Hebrew 'Shield of David', *Magen David*) as a symbol of Jewry was adopted as the emblem of the Zionist organization in 1897 and is now part of the flag of the State of Israel

to such, are essential to life and provide it with its driving power. With some exceptions Judaism is not an ascetic faith but it holds strongly to the need for self-control. Its ideal is neither life's denial nor its exploitation but its sanctification. In a rabbinic homily the Torah, the law of God, is compared to a plaster on a wound. While the healing plaster is on the wound the wounded man can eat and drink safely and freely and the wound will not fester. As Judaism sees it, man should not try to live as a hermit or a recluse. He should live in society and be of constant help to his fellows, he should marry and have children, he should enjoy life as a precious gift from God, but he should always be aware of the call to higher things and see himself, in the marvellous imagery of Jacob's dream in Genesis, as a ladder with its feet firmly planted on earth but with its head reaching to the heavens.

This short survey of the Jewish faith can be fittingly concluded with a Talmudic tale about the great teacher Hillel who lived 2000 years ago. A prospective convert to Judaism came to Hillel and asked the sage to teach him the whole Torah while he stood on one leg. Hillel replied: 'That which is hateful unto thee do not do unto thy neighbour. This is the whole of the Torah. The rest is commentary. Go and learn!'

JUDAS

THE MOST FAMOUS traitor of history, Judas Iscariot has naturally not fared well in subsequent remembrance. In the lowest circle of Dante's hell, the Devil as 'Emperor of all the realms of woe', encased to his chest in ice, chews three arch-sinners in his three monstrous mouths. One mouth gnaws on the head of Judas, and in the other two are mangled the bodies of Brutus and Cassius, the treacherous assassins of Julius Caesar. At one point in the story of St Brendan's voyage (see BRENDAN), the saint sees the unhappy Judas sitting naked on a rock, buffeted by the waves. He explains that he is allowed out of hell to squat forlornly on this rock on Sundays and Christian feast days. There were other stories that when Christ harrowed hell and released the souls of the dead, Judas, Cain and Herod were left behind there.

The meaning of 'Iscariot' is uncertain. It may simply indicate the village from which Judas came (*Ish Kerioth*, 'man of Kerioth'). Or it may be derived from Latin *Sicarius* ('assassin'), which would mean that Judas was one of the fanatical Jewish patriots called Zealots (see JESUS; ZEALOTS). In that case, it may be that Judas's real motive in betraying Jesus was his bitter disappointment at the latter's failure to take political action.

The gospels, however, imply that Judas acted as he did out of sheer greed. Mark (chapter 14) says that Judas went to the chief priests and agreed to betray Jesus to them for money. At the Last Supper, Jesus predicted that one of the disciples would betray him, and each of them said sorrowfully, 'Is it I?' Jesus said, 'It is one of the twelve. . .' Later, knowing that Jesus was in the garden of Gethsemane, Judas led there a party with swords and clubs, sent by the chief priests, and identified Jesus by kissing him and calling him 'Master'.

Matthew (chapter 26) adds that the amount of money involved was 30 pieces of silver. When Jesus predicted the coming betrayal, Judas said, 'Is it I, Master?' and Jesus answered, 'You have said so.' Luke (chapter 22) says that Satan entered into Judas and caused his treachery, and makes it clear that the point of the betrayal was to give away Jesus's whereabouts at night, so that he could be arrested quietly without creating disturbance among the crowds assembled in Jerusalem for the Passover.

12th century stone carving from Old Sarum depicting Judas in the mouth of hell

Michael Holford

The traitor's kiss took a strong hold on the imagination of later generations, and so did the scene at the Last Supper. In medieval representations of it, Jesus and the rest of the disciples are frequently shown sitting at one side of the table with the traitor alone at the other. On the table there is often a plate containing a fish, and this fish and the seat of Judas have a role in the Grail legends (see GRAIL).

There are two different accounts of what happened to Judas afterwards. One (Matthew, chapter 27) is that when he saw that Jesus was condemned, Judas repented of what he had done and tried to return the money to the authorities but they took no notice. So he threw the pieces of silver down in the Temple, 'and he went and hanged himself.' But Acts (chapter 1) says that he used the money to buy a field, 'and falling headlong he burst open in the middle and all his bowels gushed out.'

Later it was generally accepted that Judas had hanged himself on a tree, and various different trees were associated with the deed. One of them *Cercis siliquastrum*, is called the Judas-tree.

JUDGEMENT OF THE DEAD

Museo di Santa Croce

Virgil's account of the underworld as a place of retribution, where demons and writhing snakes plague sinners, greatly influenced the medieval concept of hell: in Orcagna's *Inferno*, the wicked are their own tormentors

The idea that the final destination of the individual in the life to come depends on his conduct in this world is common to many religions; the manner in which the final judgement is reached varies from faith to faith

THAT THE FATE of the dead is decided at a post-mortem judgement is an idea which is very ancient and widespread. It naturally involves belief that the dead survive death, that they remember their past lives and are conscious that they are now dead, and that they can experience the pain of punishment and the joy of reward. Where death is regarded as the virtual extinction of personality, as it was for example in ancient Mesopotamian and Homeric religion, there is no basis for belief in a post-mortem judgement – the shades of the dead, good and bad, are doomed to virtual non-existence.

The earliest known evidence of belief that the dead would be judged for their conduct in this life occurs in Egyptian records dating c 2400 BC. The belief was obviously already well established by that date, and its origins doubtless lie back in a more remote past. In the Pyramid Texts inscribed on the interior walls of certain pyramids at Sakkara near Memphis (see BOOK OF THE DEAD) two different conceptions of this judgement were apparently current. One is of an unsophisticated kind, and it was probably inspired by contemporary juridical practice. It finds expression in a series of anticipatory declarations of innocence made by the deceased in respect of various crimes. The idea behind these declarations seems to be that in the next life complaints might be brought against the dead as they were brought against the living in this world. As, in the primitive courts of Egypt, the accused would vehemently reject the charges and protest his innocence, so it was apparently thought well to anticipate such charges in the afterlife by prior solemn declarations of guiltlessness. In these passages, however, no reference is made to a judge of the dead.

The other conception was of a much more

Medieval representations of the judgement emphasize the horrors of hell. Dante's *Inferno* describes ten divisions of hell in which the punishment is suited to the crime *Above left* Dante is shown a frozen lake where icy figures symbolize the extinction of all feeling *Above* Tyrants boil in a river of blood *Right* Detail from a 12th century mosaic in Torcello Cathedral: angels thrust the damned into the flames while the Devil sits with Antichrist in his lap

involved kind. In one Text it is said of the dead pharaoh: 'He desires that he may be justified *(maa kheru)* through that which he has done'. The words *maa kheru* meant literally 'true of voice', and they acquired a specific significance through the legend of Osiris (see OSIRIS). The ancient Egyptians believed that the case of the divine hero Osiris, after his resurrection from death, had been brought before a tribunal of the gods of Heliopolis. Osiris was there adjudged *maa kheru*, 'justified', and his murderer Seth was condemned. Since the dead king, in the Pyramid Texts, was ritually identified with Osiris in order to participate in his resurrection, this identification also caused him to acquire Osiris's title in the state after death of *maa kheru*. The Pyramid Texts thus reveal the origin of an idea which later came to dominate the Egyptian conception of the judgement of the dead.

Warning from the Tomb

Certain tomb inscriptions of about the same period, or slightly later, reveal an important development in this idea of a posthumous judgement. At that time the royal government of Egypt was weakening, with much resultant social disorder. Tombs were being either robbed of their funerary equipment or taken over by others for their own mortuary use. To the law-abiding, such happenings were most terrible, for they threatened their hopes of a blissful afterlife. Some Egyptians sought to meet the danger by threatening inscriptions on their tombs. Thus Herkhuf, an Aswan noble, warns any would-be robber: 'As for any man who shall enter into this tomb as his mortuary possession, I will seize him like a wild fowl; he shall be judged for it by the Great God.'

The 'Great God' whom Herkhuf here invokes was doubtless the sun god Re, who was regarded as the upholder of *maat*, the principle of cosmic order. In other words, Herkhuf not only claims that, though dead, he was able to attack any who might rob his tomb; he confidently asserts that Re himself would punish so vile a crime. But the thought of the divine judgement that would fall on the robber apparently led Herkhuf to think about his own situation. For he goes on in his inscription to declare: 'I was one saying good things and repeating what was loved. Never did I say aught evil, to a powerful one against any people, for I desired that it might be well with me in the Great God's presence.'

In other words, this ancient Egyptian not only threatened any would-be violator of his tomb with divine judgement; he was mindful that he had himself to undergo such judgement.

No hint is given in this earliest evidence of how the judgement after death was imagined. Some kind of tribunal was evidently envisaged. Herkhuf seems to imply that Re was the judge, but he makes no reference to the way in which the verdict was reached. A clearer picture emerges from the next document that mentions the post-mortem judgement. It is known as the Instruction for King Meri-ka-re, and dates from c 2100 BC. The dead are depicted as being tried by a panel of judges with Thoth, the god of wisdom, acting as prosecutor. Their deeds are set before them in two heaps, presumably of the good and the bad. This imagery, however, did not establish itself and the Coffin Texts of the Middle Kingdom period (c 2160–1580 BC) reveal a fluidity of concept about the judgement.

During this period, however, a new idea emerged that was to dominate the later conception of the judgement. References occur in the Coffin Texts to weighing on balances as the mode of assessment. How this weighing was done is obscure: in one passage the balance is actually personified as 'this god of mysterious form, whose two eyebrows are the two arms of the balance, who casts his lasso over the wicked (to hale them to) his block, who annihilates the souls, in that day when evil is assessed, in the presence of the Master of all.'

The motive that inspired the idea that the dead would be assessed by weighing is an interesting subject for speculation. On the available evidence, it would seem

Scala

that the ancient Egyptians sought for an image that would express the absolute impartiality of the judgement after death. Doubtless their experience of legal chicanery caused them to avoid the imagery of earthly tribunals. The earlier idea of assessing the dead by the witness of their good and evil deeds set out in heaps had invoked the practice of the market place; but, though a vivid image, it was evidently found inadequate. The process of weighing must obviously have been deemed a better conception, and by the New Kingdom (c 1580–1090 BC) it was developed into one of the most impressive scenes in the religious iconography of the ancient world.

Weighed Against the Truth

The best representation of the scene, beautifully drawn and coloured, is in the Papyrus of Ani, now in the British Museum. The scene depicts the dead scribe Ani and his wife watching apprehensively the weighing of Ani's heart in the Hall of the Two Truths. The great balance occupies the centre of the scene. In one scale-pan the hieroglyph symbol of the heart is represented, and in the other the feather symbol of *Maat*, truth. The heart of Ani is being weighed against truth. In ancient Egyptian psychology the heart was regarded as a kind of independent censor or witness within each person and in most copies of the Book of the Dead the heart is implored not to witness against the deceased at this decisively critical moment.

The fateful balance is attended by the jackal-headed mortuary god Anubis, who adjusts its plummet, while the text above him exhorts him to be exact. To the right of the balance stands Thoth, the ibis-headed god of wisdom, who records the verdict of the weighing on his scribe's tablet. The adjacent text gives the report which Thoth makes to the divine assessors seated above. Ani is acquitted: 'His soul *(ba)* has stood in witness thereof. His case is exact on the Great Balance. No crime has been found in what he has done.' In turn, the divine tribunal is represented as replying to Thoth: 'Confirmed is that which comes forth from your mouth. Just *(maa)* and righteous is Osiris (namely) the scribe Ani. He is justified . . . Entrance into the presence of Osiris shall be granted to him.'

The scene ominously indicates the fate which awaited the guilty. Behind Thoth is depicted the fantastic monster Am-mut, the 'eater of the dead'.

This judgement scene is followed by another representing the god Horus (see HORUS) leading the justified Ani into the presence of Osiris, who sits enthroned and attended by the goddesses Isis and Nephthys. Subsequent vignettes in the Papyrus show Ani and his wife enjoying the delights of the otherworld, over which Osiris ruled. In most other depictions of the judgement scene Osiris is represented as presiding in person over the transaction.

The presentation of the judgement in the Book of the Dead is complicated by chapter 125, which is entitled: 'Words spoken when one enters the Hall of the Two Truths. To separate N from his sins, and to see the face of all the gods.' Then follow two lists of what are often called 'negative confessions', but which are more correctly designated 'declarations of innocence'. The first, and shorter, is addressed to Osiris; the second to 42 other deities. The sins, of which the deceased declares that he is innocent, range widely and include moral offences, such as murder and unnatural sexual relations, and ritual offences like hindering the procession of a god. The conception of the judgement implied in this chapter is quite different from that presented by the weighing of the heart. The discrepancy is probably to be explained by the conservatism of the Egyptian mind. For these 'declarations of innocence' doubtless derive from the primitive asseverations of guiltlessness from specific sins that appear in the Pyramid Texts. Never willing to discard ancient traditions, the Egyptians retained this one even when the idea of the weighing of the heart had become the dominant theme of the judgement. They apparently reconciled the differing conceptions by representing the 'Declarations' as being made first by the deceased on arrival at the Hall of the Two Truths. The subsequent weighing of his heart against the symbol of truth proved whether his protestation of innocence could be accepted as truly justified.

This Egyptian conception of the judgement after death is unique in the ancient world. It remained an effective belief in Egypt until the Christian era; it is only in Christianity that the idea achieved a like importance and such dramatic presentation.

Until the 2nd century BC Hebrew religion did not provide the necessary basis for belief in a judgement after death. According to its view of human nature, man was a psycho-physical organism which death irreparably shattered. The shade that survived this dissolution descended to Sheol, conceived as a deep pit far below the foundations of the world, where all the shades of the dead dwelt in dust and gloom, with no distinction between the just and the unjust. However, about the time of the Maccabaean Wars, a change took place. Belief in a resurrection of the dead suddenly made its appearance, together with the idea of a judgement of the dead. The earliest evidence is the following brief statement in the book of Daniel (12.2): 'And many of those who sleep in the dust of the earth shall awake . . . some to everlasting life, and some to shame and everlasting contempt.' The statement is admittedly obscure, particularly in its limitation of resurrection to an undefined 'many'. However, this first problematic evidence of the belief is soon supported in Jewish literature by an abundance of references to, and descriptions of, a future judgement of the dead. In turn, the conception of Sheol changes from the place where all the dead dwell, undifferentiated by their moral character, to a place of punishment for the wicked.

The Jewish conception of the judgement of the dead was essentially conditioned by the strong nationalist factor in Judaism. It had long been believed that there would be a 'Day of Yahweh' when the god of Israel would signally punish the oppressors of his people. In later Jewish apocalyptic literature, owing to the deterioration of Israel's political position, this belief was gradually changed into an intense conviction that Yahweh would soon intervene dramatically in the existing world situation. The 'Day of Yahweh' was, in consequence, transformed into a Last Judgement, coincident with the catastrophic end of the world. The following passage from the apocalyptic writing known as II(IV) *Esdras* (chapter 6) vividly presents this Last Judgement at which the god of Israel would pronounce the doom of the Gentile Nations, who had afflicted his people:

> And the earth shall restore those that are asleep in her, and so shall the dust those that dwell in silence, and the secret places shall deliver those souls that are committed unto them. And the Most High shall be revealed on the seat of judgement, and compassion shall pass away, and longsuffering shall be withdrawn: but judgement only shall remain. . . And the pit of torment shall appear, and over against it shall be the place of rest: and the furnace of hell shall be shewed, and over against it the paradise of delight. And then shall the Most High say to the nations that are raised from the dead, see and understand whom ye have denied, or whom ye have not served, or whose commandment ye have despised. Look on this side and that: here is delight and rest, and there fire and torments. Thus shall he speak unto them in the day of judgement.

In Jewish apocalyptic belief the Last Judgement was primarily an 'Assize of Nations', at which the Gentiles would be punished for their oppression of Israel. It was to be preceded by a general resurrection of the dead, and accompanied by cosmic cataclysm. In some versions of the belief the Messiah, instead of God (Yahweh), would be the judge. This idea of a Last Judgement was taken over by Christianity, and profoundly influenced its doctrine concerning the 'last things'.

Punishment in Hades

Neither the Greek nor the Roman religion offered hope of a significant afterlife, and therefore no ground existed for belief in a post-mortem judgement. The description of the dead given in Homer's *Odyssey* (book 11) set the pattern for what might be called the classical view of human destiny. At death the *psyche*, a wraith-like image of the living person, descended to the gloomy realm of Hades. There it joined the other dead, who dwelt there bereft of consciousness. The logic of this situation negated belief in a judgement after death.

The idea of Hades as a place of retribution, thus implying a judgement, gradually developed, chiefly through the influence of Orphism (see ORPHEUS) and Neo-Pythagoreanism. The fate of the dead turned on whether they had been initiated or not into the Mystery cults concerned (see MYSTERY RELIGIONS). However, the post-mortem judgement gradually came to be thought of as a moral test. A vivid description of Hades as a place of retributive punishment for sins is given by Virgil in the *Aeneid* (book 6). In the underworld, his hero Aeneas comes to a parting of ways: one leads to Elysium; the other to Dis, a great fortress-like place, encircled by a flaming river. Here Rhadamanthys 'holds his iron sway; he chastises, and hears the tale of guilt, exacting confessions of crimes, whenever in the world above any man rejoicing in vain deceit, has put off atonement for sin until death's late hour'. Awful demons, with writhing snakes, torment these sinners. This horrific depiction greatly influenced Dante as his *Inferno* shows, and it is reflected in many medieval descriptions of hell.

Bridge of the Separator

The teaching of Zarathustra, the ancient Iranian prophet (c 628–551 BC) faced every man with the fateful decision of aligning himself on the side either of the principle of Good or of Evil, which struggled unceasingly for mastery of the universe (see ZOROASTRIANISM). In the *Gathas*, in which Zarathustra's teaching is preserved, there are enigmatic references to the consequences in the afterlife of each person's decision. Mention is made of retributive punishment by molten metal; but more notable is his reference to the *Cinvato paratu* or 'Bridge of the Separator'. The crossing of this bridge appears to constitute a post-mortem ordeal for the dead – the wicked would fall from it to some awful doom below. In the later literature of Zoroastrianism the crossing of this fateful bridge is elaborated into a definite act of judgement. A deity named 'just Rashnu' weighs the deeds of the dead with the strictest precision. Those adjudged just pass with ease across the bridge to eternal bliss, while the wicked, unmasked by Rashnu, are seized by the demon Vizarsh. This judgement apparently took place shortly

Michael Halford

Judgement in Black and White

O nobly born (so-and-so), listen. That thou art suffering so cometh from thine own *karma*; it is not due to any one else's; it is by thine own *karma*. Accordingly, pray earnestly to the Precious Trinity; that will protect thee. If thou neither prayest nor knowest how to meditate upon the Great Symbol nor upon any tutelary deity, the Good Genius who was born simultaneously with thee, will come now and count out thy good deeds (with) white pebbles, and the Evil Genius who was born simultaneously with thee, will come and count out thy evil deeds (with) black pebbles. Thereupon, thou wilt be greatly frightened, awed, and terrified, and wilt tremble; and thou wilt attempt to tell lies, saying 'I have not committed any evil deed'. Then the Lord of Death will say, 'I will consult the Mirror of *Karma*'.

So saying, he will look in the Mirror, wherein every good and evil act is vividly reflected. Lying will be of no avail.

The (one of the Executive Furies of) the Lord of Death will place round thy neck a rope and drag thee along; he will cut off thy head, extract thy heart, pull out thy intestines, lick up thy brain, drink thy blood, eat thy flesh, and gnaw thy bones; but thou wilt be incapable of dying. Although thy body be hacked to pieces, it will revive again. The repeated hacking will cause intense pain and torture. Even at the time that the pebbles are being counted out, be not frightened, nor terrified; tell no lies; and fear not the Lord of Death.

Thy body being a mental body is incapable of dying even though beheaded and quartered. In reality thy body is of the nature of voidness; thou needest not be afraid. The Lords of Death are thine own hallucinations. Thy desire-body is a body of propensities, and void.

W. Y. Evans-Wentz ed
The Tibetan Book of the Dead

after the death of the individual; but Zoroastrian doctrine also included a final judgement. In the classic description of it in the *Bundahisn*, at the ultimate rehabilitation, the dead would be resurrected and all mankind assembled for judgement. They become aware of their good and evil deeds, and the good go to heaven and the wicked are cast into hell. How this ultimate judgement was related to the immediate judgement after death is not clear; a similar problem exists in Christian doctrine.

The Last Trump

Christianity originated in Judaea as a Jewish messianic movement. Its outlook was thus conditioned by current apocalyptic belief. Jesus was identified with the Messiah and, after his crucifixion, it was believed that he would soon return with supernatural power to complete his messianic task. This belief finds dramatic expression in the gospel of Matthew (25.31–33), where he presides at the Last Judgement: 'when the Son of man shall come in his glory, and all the angels with him, then shall he sit on the throne of his glory: and before him shall be gathered all the nations, and he will separate them one from another as a shepherd separates the sheep from the goats, and he will place the sheep at his right hand, but the goats at the left.' Although the passage at this point suddenly changes from envisaging an Assize of Nations, according to Jewish apocalyptic, into a trial of individual persons, the judgement is the traditional Last Judgement at the end of the world. The most graphic presentation of this Judgement in the New Testament is given in the Revelation of John (20.11–13); it conforms to the traditional apocalyptic pattern by including the resurrection of the dead: 'Then I saw a great white throne and him who sat upon it; from his presence earth and sky fled away, and no place was found for them. And I saw the dead, great and small, standing before the throne, and books were opened. Also another book was opened, which is the book of life. And the dead were judged by what was written in the books, by what they had done. And the sea gave up the dead in it, Death and Hades gave up the dead in them, and all were judged by what they had done.'

The first Christians believed that the return of Christ and the Last Judgement would happen within their own lifetime. But the non-fulfilment of this expectation gradually caused a change of outlook. Although belief in an apocalyptic Last Judgement was never abandoned, subsequent generations of Christians had to adapt their faith to the fact that they would doubtless die before Christ returned. The question inevitably arose, therefore, of the situation of the dead until the Last Judgement determined their eternal fate. A solution was found in the idea of a judgement immediately after death, which was implied by Christ's parable of Dives and Lazarus (Luke, chapter 16). Hence emerged the concept of two post-mortem judgements in Christianity: an immediate or particular judgement and a final judgement. And with it developed the doctrine of purgatory. It was taught that immediately after death the soul would be judged and sent to purgatory, unless its sins were such that it was already damned beyond redemption. In purgatory expiation was made for past sins, in the hope of ultimate acquittal at the Last Judgement, when the purified soul would be admitted to the beatific vision.

A distinction was drawn between the torments of purgatory and those of hell. In purgatory the souls of the dead were disembodied; hence their sufferings were not physical as they would be in hell, where the damned sulfered in their resurrected bodies. Further, the souls in purgatory suffered in the hope of ultimate deliverance; but the pains of hell were eternal. However, despite these theological distinctions, it would appear from medieval art and literature that the torments of purgatory were imagined just as realistically as those of hell.

The prospect of immediate judgement and purgatory did not lessen concern about the judgement to come. From about the 12th century the representation of the Last Judgement became a major theme of Christian art in both the Eastern and Western Church. These medieval depictions are generally composed of three registers of scenes. At the top Christ appears as the awful Judge; he shows the wounds of Crucifixion, and attendant angels bear the symbols of his Passion. On either side the Virgin Mary and St John kneel, supplicating the stern Christ to spare sinful humanity. In the bottom register the dead rise from their graves at the sound of the Last Trump. It is in the central register, however, that the crucial drama is enacted. Generally, the Archangel Michael is represented weighing the souls of men, and repelling the attempts of the Devil to interfere with the verdict. This *psychostasia* or weighing of souls was derived from ancient Egypt, by way of Coptic Christianity; its adoption into the medieval Doom constitutes a fascinating instance of the transference of ideas.

In this painting by St John of Climax, judgement takes place on a ladder, symbolizing the link between heaven and earth: the blessed mount towards God and his angels, while the wicl are dragged off to their doom below

In the Doom (the name by which representations of the Last Judgement are known in England, where they often appear on the chancel arch of a church), the weighing of souls divided the two groups of the redeemed and the damned; the division was obviously intended to denote its decisive nature. The redeemed are usually represented as being carried by angels to Abraham's bosom (Luke 16.22). Abraham is quaintly depicted as seated, with a crowd of diminutive souls looking complacently out from the bosom of his robe. The damned, on the other side, are herded by demons, horrible and relentless, towards the mouth of hell or cast into the cauldron of hell. The medieval Doom vividly testifies to the importance of the idea of the Last Judgement in medieval Christianity. Although the depiction of it virtually ceased after the Reformation, the idea continued to haunt Christians and it was a basic theme of both Catholic and Protestant teaching until the 19th century.

In Islam the final judgement was a foremost topic of Mohammed's teaching, and reflects Judaeo-Christian concepts. The idea of a post-mortem judgement occurs also in popular Buddhism, where it has been adapted to the idea of the transmigration of the soul and the doctrine of *karma*.

Roger Wood

JULIAN OF NORWICH

JULIAN OF NORWICH was one of a number of women who have made their mark on Christian mysticism, although very little is known of her life. Dame Julian, as she was known, belongs to the small band of 14th century English mystics, among whom her affinities are with Richard Rolle rather than with the author of the *Cloud of Unknowing* (see CLOUD OF UNKNOWING) and Walter Hilton (see HILTON), though she seems to have been influenced by both; like Teresa of Avila, she describes her own experiences instead of offering a treatise on the theory of mysticism. In her own day, her works appear to have been nothing like as popular as Walter Hilton's or the *Cloud of Unknowing*; there are around 50 extant manuscripts of Hilton's *Scale of Perfection*, for instance, while there are only five of Julian of Norwich's writings.

The copyist of one of Julian's earlier manuscripts speaks of her as 'a devout woman whose name is Julian . . . a recluse at Norwich'. She herself tells us that she was 'thirty and a half' years old in May 1373; this places the date of her birth towards the end of 1342 and it is known from references in wills that she was still living in 1416. Margery Kempe of Lynn in her spiritual autobiography, *The Book of Margery Kempe*, tells how she was 'bidden by our Lord to go to an anchoress in the same city (Norwich) named Dame Jelyan . . . for the anchoress was expert in such things and good counsel could give'. Dame Julian refers to herself as 'a simple creature unlettered', though her writings by no means give the impression that she was uneducated. She could certainly read and wrote her own language in a vigorous style. She was well acquainted with the English Bible for her works are full of biblical quotations and allusions.

Julian was an anchoress or recluse enclosed in a cell attached to St Julian's church, Norwich. There she followed a way of life that was not uncommon in the Middle Ages and which was carefully regulated by the Church. Some of the hermitages or cells contained more than one room, like a modern flat, while others had a small garden where the occupant could cultivate vegetables and take the air. A servant of some sort was needed to buy food and ensure essential relations with the outside world. References to two of Julian's servants have been found; she herself tells us that at one time she had a servant named Alice.

Julian's book, her only known work, is *The Revelation of Divine Love*, of which two versions exist. The first, which is the oldest and shortest of the manuscripts, may well preserve a description of Julian's experiences as a result of a severe illness, in the course of which she received the last sacrament, as it was written soon after their occurrence in May 1373. The longer version was the result of her pondering on the meaning of the visions which she had experienced at that time, the subject of which absorbed her attention for almost 20 years. During this time she received, she says, 'teaching inwardly' to help her to understand their full meaning.

Like Teresa of Avila (see TERESA), Julian had a keen mind, a fund of common sense and an attractive style, but does not write as a theologian. Like all the mystics, too, she finds great difficulty in conveying in ordinary language what she had been 'shown' in her visions. They took place before she became a recluse, probably when she was living at home, since she mentions the presence of her mother, and also the parish priest.

She tells us how on 8 May 1373 she experienced a series of visions of the Passion of Christ, and indeed her book has been likened to a prolonged meditation on that subject. She plunges straight into her story. 'I desired three graces by the gift of God: the first was to have the mind of Christ's passion; the second was bodily sickness, the third the wound of wilful longing for God.' There follows the account of her experience which was to furnish her inspiration for the rest of her life. But she took no credit for what she had seen: 'Because of the showing I am not good, but only if I love God the better . . . I saw it for the profit of many others. For truly it was not showed to me for that God loves me better than the least soul in grace . . . For if I look singularly to myself, I am right naught.'

From visions of the Passion of Christ she goes on to what she calls the 'ghostly sight', that is, the spiritual perception of various matters of her faith. Thus she sees more clearly and understands more vividly God's care for all creation, his infinite goodness and immanence in all things and the malice of the Devil. After a time of trial and temptation to disbelief in her visions she comes to final reassurance in a vision of the indwelling of God: 'Know it well: it was no raving you saw today. But take it and believe it, and keep thereto, and you shall not be overcome. He said not, "You shall not be tempested, you shall not be travailled, you shall not be distressed", but he said, "You shall not be overcome."'

The longer version, which is the better known, was completed at least 20 years after the visions. It is based of course on the shorter version but is about three times as long. A good deal of revision and addition, a certain elaboration, indeed, has taken place; the doctrinal implications are brought out and there is much inherent advice about prayer and the spiritual life, together with allusions and references to the writings of the Fathers of the Church. There is an obvious Neoplatonist influence which can be accounted for perhaps from Julian's reading of the *Cloud of Unknowing* and the works of Walter Hilton.

Visions, revelations, 'shewings' as Julian called them, of their very nature raise all sorts of difficulties. Opinions regarding the authenticity of Julian's experience may well differ; some indeed would regard it as purely subjective, deriving wholly from her own mind, while others, admitting a subjective element, would regard it as of supernatural origin. But what is impressive in Julian's case is the balanced nature of her writings and her sound religious sense; despite the deep emotion there is no hint of emotional instability.

The southeast wall of St Julian's church in Norwich showed clearly where the anchoress's cell once stood with its window on to the high altar; the wall was destroyed in an air raid in 1942 and the site has now been made into a chapel adjacent to the restored main building.

JUNG

THE MOST INFLUENTIAL psychiatrist, after Freud, of the 20th century has been Carl Gustav Jung (1875–1961). He was born at Kesswil, a Swiss hamlet near the falls of the Rhine. His grandfather, a Rosicrucian freethinker, was reputed to have been an illegitimate son of Goethe; exiled from Germany, he moved to Switzerland, and became professor of surgery at Basle. Jung's father was a rather rigid pastor, whose hobby was philology. Jung took a medical degree at the University of Basle and then, like Freud before him, went to Paris to study psychological medicine. On his return he was appointed lecturer in the Psychiatric Clinic of Zurich University. His first important publication was a systematic report of a series of experimental studies, carried out by means of Galton's 'word association test' (during which the subject replies in turn to a disconnected series of words read out to him with the first word which comes into his mind). This led him to formulate the notion of a 'complex' – a cluster of emotionally toned ideas and memories all associated with some central theme and largely, if not wholly, unconscious.

In 1907 he met Freud, and for long remained his foremost disciple. However, his own psychiatric work soon led him to question some of Freud's fundamental principles. Freud, he believed, laid far too much stress on repressed sexual tendencies in the production of nervous disorders. Instead of seeking the main causes in forgotten infantile experiences, greater importance should be attached to the effects of emotional conflicts, and to the strains and stresses of the patient at the time of his breakdown. Jung's concept of the 'libido', which in Freud's usage meant the energy of the sexual instincts, was that of a kind of general emotional energy, with sex, fear, anger, and the like as merely some of its specialized forms. His book on *The Psychology of the Unconscious* (1912) included criticisms too drastic for Freud to brook. This led to a final rupture a year later. Thereafter Jung preferred to call his theories and therapeutic methods 'analytical

psychology', leaving the older description 'psychoanalysis' to Freud and his more faithful followers.

Temperamental Types

Freud's aim was to develop a dynamical theory of mental structure and mental processes which would be universally applicable. Jung, on the other hand, largely as a result of his early experimental studies, became profoundly impressed by the influence of innate individual differences. These he sought to classify in terms of temperamental types. His first and best known distinction was between the 'extravert' and the 'introvert'. The 'extravert' is one whose interests and emotions are directed predominantly towards the external world of Nature and other persons; the 'introvert', one whose interests and emotions are directed predominantly towards the inner world of the self and his own private thoughts and feelings. Later he proposed to subdivide mental processes into four primary activities – sensing, feeling, intuiting and thinking. According as one or other of these activities tended to dominate the life of the extravert or the introvert, he was thus led to distinguish eight 'psychological types'. The contrast between the extravert and the introvert has since been abundantly confirmed by experimental and statistical research except that, instead of clear-cut 'types', most present-day psychologists prefer to talk of 'tendencies', varying in degree.

Perhaps the most characteristic feature in Jung's conception of the structure of the mind is his belief that below the 'personal unconscious' consisting of the half-forgotten relics of the individual's past experiences from infancy onwards, there is the deeper layer of the 'collective unconscious', which contains the persistent after-effects of the primitive experiences of the human race during the earlier phases of its evolution. Thus it includes not only what are commonly called instincts – the impulses of sex, fear, aggression, parental love, and the like – but also certain 'primordial images' or ways of thinking, which Jung termed 'archetypes'. These he described as 'inherited complexes'. They may be discerned most clearly in the analysis of dreams; but they tend to mould all our attempts to interpret the universe as a whole – mythology, religion, philosophy and even science.

One of the commonest archetypes is the so-called 'father-figure', often pictured as a wise and masterful old man, the representative of authority and power. Another is that of the Great Mother, the embodiment both of fertility and of benevolent protection. The serpent or dragon commonly stands as a symbol of evil. As in heraldry, various animals – the lion or leopard, the sheep or lamb, the eagle and the raven – occur again and again as emblems of certain quasi-human characteristics. Some of the archetypal conceptions, however, are relatively abstract,

Bats and owls swarm over the head of a dreaming man; a painting by Goya. It is in the analysis of dreams that Jung's concept of 'primordial images', patterns of thinking, or archetypes may be most clearly discerned

for instance the polar opposites of male and female, hate and love, repulsion and attraction, which so often appear in both popular and scientific thought.

When Jung first developed his concept of innate archetypes, it was widely believed that acquired habits and ideas might eventually become hereditary, so that recurrent experiences of primitive man might be transmitted as part of our common racial inheritance. Today almost every biologist rejects the theory that characteristics acquired by the individual can so affect the germ-plasm that they reappear in the offspring. There is no doubt about the frequent emergence of these symbolic concepts in the folklore, superstitions and religions of widely separated races. Nevertheless, most contemporary anthropologists regard them as due, not to inheritance, but rather to the early diffusion of primitive culture. Jung, in his later replies to biological critics, contended that his own theory of archetypes did not necessarily entail the direct inheritance of experience as such, and suggested that they might be an indirect effect of natural selection, operating during man's prehistoric evolution: as a result 'all human brains would to some extent be similarly differentiated'.

Secret of the Golden Flower

In the course of his therapeutic work Jung discovered that one of the commonest causes of nervous breakdown was 'loss of religious faith'. For this, the strictly materialistic and fatalistic outlook of Freud and his followers seemed to provide no cure. To combat this growing materialism Jung's main interest began to turn (as he expressed it) 'from therapy to the art of living'. Most of his later studies were concerned, not with psychiatry, but with topics that his colleagnes and critics dismissed as 'antiquated superstition, unworthy of a genuine scientist's interest or attention' – alchemy, astrology, spiritualism and popular folklore. Even if wholly false, so he maintained, the reasons for their widespread prevalence called for psychological investigation.

As a pastor's son, he had always been both interested in, and critical of, the traditional religion in which he had been reared. Quite early in life his curiosity had been aroused by the accounts brought back by missionaries and others of the religions of the ancient East, particularly by the Chinese 'meditation school' and by Indian yoga, wondering whether they might be adapted for psychiatric treatment. In 1928 he published, jointly with Richard Wilhelm (an authority on Chinese philosophy), a book called *The Secret of the Golden Flower*. The 'secret' was the familiar conception that (in Jung's words) 'man is a cosmos in miniature, and is not divided from the Great Cosmos by any fixed limits; Tao, the Undivided, all-embracing ONE, gives 'rise to two opposite reality-principles – Darkness and Light, Yin and Yang'. The 'Golden Flower' is a form of meditation aiming at their reconciliation. This suggested to him the idea of 'individuation' as an aim both for psychotherapy and 'the conduct of life'. 'Individuation' is his term for integrating the personality 'so that the person becomes in the true sense an "individual"'.

Syndication International

Most of Jung's later studies were concerned, not with psychiatry, but with alchemy, astrology, spiritualism and folklore: in certain esoteric teachings he discerned 'a profound philosophy which is nothing if not practical . . .'

But there seems to have been a more intimate reason for this radical change in the direction of his investigations. In his autobiography *Memories, Dreams, and Reflections* (1963), he describes a quasi-mystical experience of his own during a serious illness at the beginning of 1944. When, according to his physician, he was actually at death's door, he felt himself caught up out of his body in a state of ecstasy into the remoter part of the heavens, and seemed on the point of entering an illuminated temple. 'The whole phantasmagoria of terrestrial existence was stripped from me; I became a historical fragment'. He wondered what would happen next and felt that as soon as he entered the temple he would receive the answer. At that moment he heard his doctor's voice recalling him to earth. From the time of this experience he dated what he described as 'the second and most fruitful half of my long life'.

In the same book he related how he himself was apparently endowed with paranormal powers – telepathy, precognition and even psychokinesis (psychic control over inanimate objects – see PSYCHOKINESIS). Among other instances he recalls a discussion on parapsychology with Freud, who in those days rejected such ideas as nonsensical, though later he accepted them. On this occasion Jung twice demonstrated his powers to Freud; and an extant letter from Freud himself attests the 'poltergeist phenomenon' so produced. It was, he says, to gain a better understanding of his own mystical and paranormal experiences that he was driven to search for historical parallels. Suggestive explanations and examples he thought might be discovered in the writings of the early alchemists, such as 'the visions of Zosimos' (an Egyptian of the 4th century), and particularly the cryptic disquisitions of his own compatriot, Paracelsus (see PARACELSUS). 'Here', says Jung in his *Paracelsica*, 'seems to be the bridge that has led from early gnosticism to the modern psychology of the unconscious'.

The Alchemical Heritage

'Alchemy', he observes, 'has been called a dream of primitive medicine'; and, like ordinary dreams, he argued, its superficial or 'manifest content' might at once conceal and symbolize a deeper 'latent content'. It was by no means a mere bogus science practised by mercenary charlatans. Philosophers like St Thomas Aquinas, physicians like Sir Thomas Browne, scientists like Sir Isaac Newton had studied it. Like gnosticism, alchemy appears to have originated in the Hellenistic culture of Alexandria in Egypt. The Egyptian metallurgists possessed the trade secrets of extracting and purifying the 'nobler metals', gold and silver, for the wealthy, and cheaper imitations for those who could not afford the ornaments of the rich. The operations carried out in the laboratory were interpreted in terms of Aristotelian physics and Alexandrian Neoplatonism (which also influenced early Christian doctrines). A leading conception was that the microcosm – the world of man – mirrored the macrocosm – the universe as a whole, with the heavenly bodies. Mesopotamian astrology thus became closely linked with alchemy. Each metal had its celestial counterpart: gold was associated with the sun, silver with the moon, quicksilver with mercury, and so on. To effect the 'great work' of transmutation, 12 successive laboratory processes, associated with the 12 signs of the zodiac, were necessary. And the astronomical symbols were borrowed to represent the chief chemical substances and processes.

As Jung points out, the explanatory theories, like those of the modern scientist, were often suggested by more or less fanciful analogies. Later alchemists were frequently physicians, and consequently thought of the chemical processes as analogous to those of human physiology and medicine. Just as lowlier animals had to be sacrificed, cleansed and burned before they could live again as part of the human body, so the humbler metals had to be 'killed, washed, and fired' before re-emerging as nobler metals. Ideas were introduced from Chinese alchemists who regarded the transmutation of baser metals into silver and gold as of secondary importance; their own aim was rather to supplement the use of herbal medicines, which served to cure minor ailments, by a pill or elixir prepared from minerals and

metals, which might confer immortality.

All these ideas reappear in the writings of Paracelsus. Jung maintained that Paracelsus should be regarded, not only as the founder of iatrochemistry (the application of chemistry to medical theory), but also of psychological medicine, since he professed to cure not only physical but psychical disorders as well. In its psychological aspect, he believed, Paracelsan alchemy is 'a path of salvation for the soul'. Jung was one of the first to emphasize the fact, which present-day historians of chemistry now fully recognize, that alchemy had both an exoteric or popular aspect and an esoteric or secret one. Exoteric alchemy was largely centred on the preparation of the Philosophers' Stone – a magical substance capable of converting lead, tin and copper, not into a compound or alloy, but into 'purified' metals such as silver and gold (see PHILOSOPHERS' STONE); esoteric or mystical alchemy regarded these mundane transmutations as symbolic of a devotional system by which sinful man could be transformed into a perfect and immortal being.

Expressing the Inexpressible

Underlying the teaching of the esoteric school, so Jung contended, we can thus discern 'a profound philosophy, which is nothing if not practical, and therefore a religion rather than a science or a metaphysic'. The symbolism of the Judaeo-Christian religion was that of a sheep-rearing and agricultural community; and its symbols and rituals – bread and wine, the blood of the lamb, the sacrifice on the altar – seemed inappropriate to the bolder thinkers of the early Renaissance. They therefore sought to express their religion and their conception of the universe and man's destiny in what they took to be a more up-to-date and scientific symbolism. The reason why symbolism was necessary was not merely that the religious doctrines

themselves would have been condemned as heretical, but because 'the inexpressible can only be expressed in terms of symbol and myth, parable and allegory'.

Jung made a couple of brief statistical studies to check predictions drawn from astrological horoscopes, and believed that on the whole the results confirmed them; but he fully recognized that his methods were too simple to carry conviction. Partly to explain the way in which celestial phenomena might affect human life, he put forward what he called the 'principle of synchronicity'. Natural science has commonly treated causation as the supreme explanatory principle; and causation implies temporal succession. However, events that are not successive but simultaneous may, he maintained, also be connected in a manner which appears intuitively meaningful. This supplementary principle would furnish an explanation of such paranormal phenomena as telepathy and clairvoyance – examples of which he quotes, not only from the literature of psychical research, but also from his own experience.

In several of his writings he discusses the possibility of the survival of the individual mind or personality after death and of its pre-existence in an earlier incarnation. On both these topics, he declares, he has no evidence of his own to offer. He thought it quite conceivable that the phenomena cited in support of such doctrines might really be no more than 'projections of the unconscious'. The most we can safely assert, he says, is summed up in a dictum of the American psychologist, William James: 'Whatever it may be on the *further* side, the 'more' with which we seem to feel connected in religious and mystical experiences is on its *hither* side essentially a subconscious continuation of our own conscious life'.

Juno

In Roman mythology, the wife and sister of Jupiter, identified with the Greek goddess Hera; she was the queen of heaven and protectress of females; she was particularly associated with childbirth and with the month of June, which was considered a favourable month in which to marry: at Roman weddings the bride's girdle was consecrated to Juno.

See HERA.

Michael Holford, National Gallery

The elaborate and curious prohibitions which the special priest of Jupiter had to observe attest to the overriding importance of the father of the gods to the Romans; similarly, in astrology, those influenced by the planet Jupiter are likely to be dominant characters and leaders of men

JUPITER

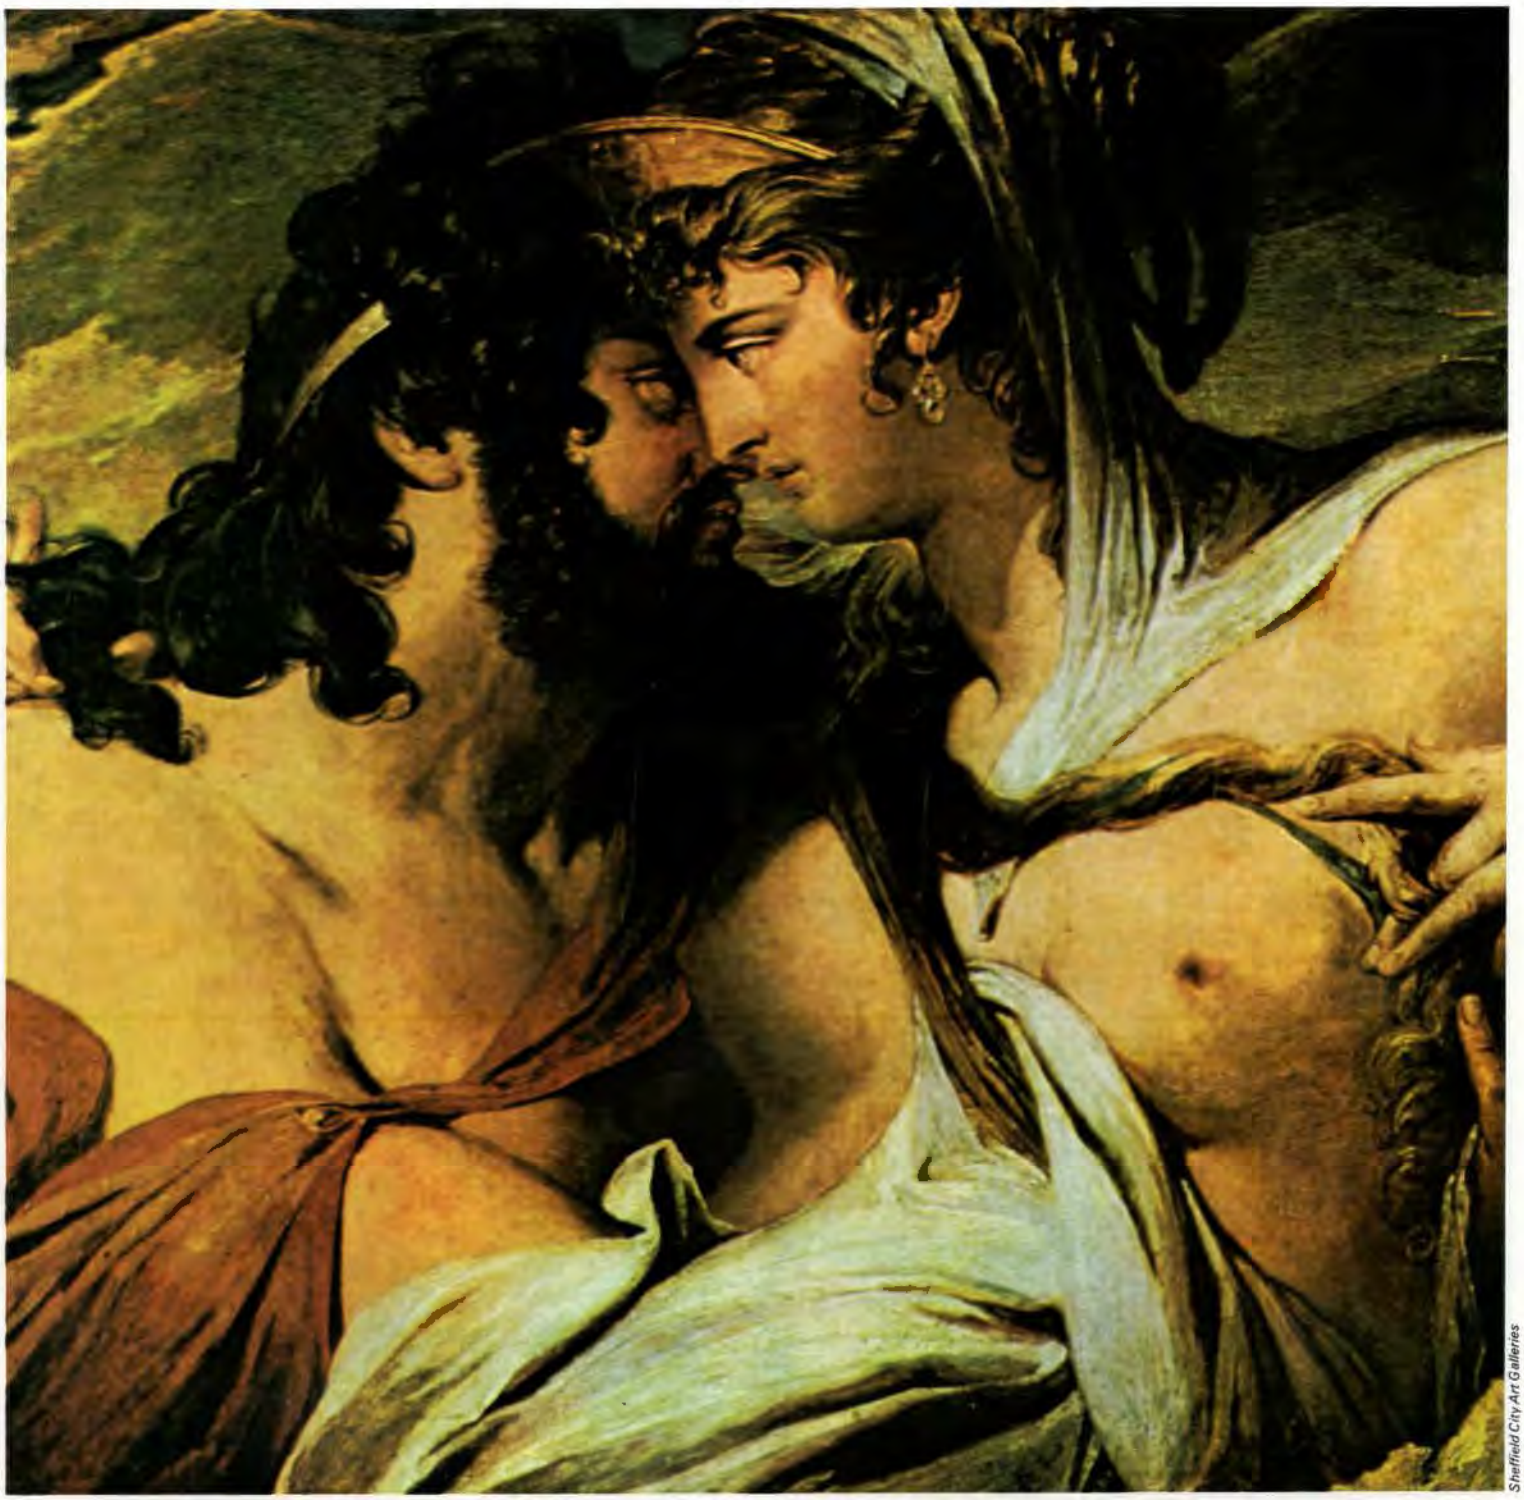
ROME'S MOST IMPORTANT and powerful god. Jupiter came to Italy with the migrations of Indo-European speaking people. His name's first element, giving us 'Jove', is related to the Greek Zeus and to the Latin and Germanic words for 'day'. Its second element is simply 'father', bestowed on him and a few other Roman gods, just as Zeus was often so addressed. In their own literature the Romans transferred the many tales of Zeus to his Latin counterpart. Jupiter's cult was found in most parts of Italy and his functions readily became fused with those of Etruscan, oriental and north European gods of like character.

In Italy Jupiter was revered as lord of sky and daylight. Rain and its consequences were owed to him. Thunder and lightning were sent by this god whom the Romans majestically represented with the thunderbolt and eagle which otherwise adorned every military standard. Because the ancient Italians trusted to natural phenomena in ascertaining the divine will, both thunder and lightning, together with the flights of certain birds were scrupulously observed as sent from Jupiter. All important public business could be validly transacted only if and when such heavenly signs were propitious. The Romans developed the interpretation of the signs into a fine art, the 'auspices' (see AUGURY). Official consultation of Jupiter probably led the Romans to accord him pride of place among the political gods of the state religion. Since Zeus, too, enjoyed a comparable position in many Greek city states, the Romans and others may have imported into Italy the idea of the god as a defender of the people.

Jupiter's religion exhibits a number of cult practices. On the Aventine Hill, for instance, Jupiter Elicius had an altar, or a mere stone, by which the Romans could summon heaven's gift of rain. Smaller stones might be employed to solemnize oaths, for Jupiter also stood as guarantor of man's good faith. This aspect of his worship strengthened Roman political reliance on Jupiter because he sanctified the many treaties which played a fundamental part in ancient warfare and diplomacy. Besides stones, some trees such as the beech and certain oaks were sacred to Jupiter; this attachment apparently arose from their relative susceptibility to his lightning. Thanks to his control of the rain, the god was beneficial to Mediterranean farming, and one of Jupiter's many festivals concerned successful grape harvesting.

Not only Rome's chief magistrates but also a priest and his priestess wife, the *flamen Dialis* and *flaminica*, ministered to Jupiter. No priesthood supplies a better index to the primitive quality which marks Rome's old religion. The flamen was compelled by law to observe and eschew many practices to which no other priest was bound, with the object of protecting him from pollution. Jupiter's flamen was forbidden to mount a horse, gaze upon the army, swear an oath, touch a corpse or enter a sepulchre; he must not wear a ring unless perforated and without a stone, lend fire from his hearth unless for prescribed rites, knot his clothing or hair, or walk under grape bowers; he was not permitted to touch or speak of female goats, uncooked meat, ivy or beans, or to eat leavened bread, or to uncover himself out-of-doors where he was seen by his god. On the other hand, he was required to have his hair trimmed only by a free-born barber, and the hair trimmings and nail parings were buried under a fruitful tree; to sleep on a bedstead whose legs were smeared with clay; to sleep no more than three nights away from home; to allow no one to sleep in his bed and to keep sacrificial cakes at its foot; and at all times to wear his special white pointed cap *(apex)*. By an outmoded ceremony he wed only a lady of his patrician caste whom he might not divorce; if she died, he quit the priesthood.

His priestess wife, the flaminica, was bound by her husband's restrictions and by a few of her own. For instance, she wore specially dyed clothing, kept a twig from a fruitful tree in her elaborate head-dress, and did not ascend a ladder beyond the third rung. On certain days, she might not comb or arrange her hair although she



Sheffield City Art Galleries

Jupiter was the chief god of the Romans and like the Greek Zeus had many loves; despite his unfaithfulness, Juno was a determined wife and made frequent attempts to win back her husband: *Jupiter beguiled by Juno,* by Barry

apparently still wore the head-dress. Some of these restrictions obviously belong to the priest of a sky god; others are simple taboos against flatulence or corruption by the dead. It is little wonder that towards 200 BC the flamen botched a sacrifice, thereby forfeiting his office and that thereafter eligible candidates for the priesthood rarely came forward. Ceremonial limitations left many priestly functions to the chief magistrates, the consuls.

Gorgeous Spectacles

In matters of war and government the Romans ever looked to Jupiter for help and advice. His major shrine on the Capitol gave him the name *Capitolinus* although the official style was *optimus maximus* 'best and greatest'. This temple had three chambers, one each for Jupiter, Juno and Minerva. In the central chamber stood his statue garbed like a triumphant general in resplendent toga. Every fifth year the statue's complexion was reddened with lead paint. The god, as well as his triumphant model, had once been smeared with the blood of a fallen foeman. Founded by Rome's last Etruscan king, its liturgy was partly inspired by the Etruscans although the temple was dedicated by the new republican government in 509 BC. The god's puissance among the Romans encouraged them frequently to convene voting assemblies in its precinct. On the same height was situated the small temple of Jupiter Feretrius, a god of oaths. On its walls hung three sets of armour taken by Roman chief magistrates from enemy chieftains whom they had slain in battle with their own hands.

Jupiter enjoyed cult through public games that began as religious ceremonies and developed into those gorgeous spectacles for which the Romans were renowned. Feretrius's games included boxing matches and foot races held on oiled animal skins. Others comprised chariot races and, later, stage-plays produced under Etruscan and Greek influence. Like the triumphal games to

which they are related, Jupiter's festivals were preceded by a lavishly-mounted parade of statues of almost every deity installed at Rome, of state priests and the magistrates. The statues were borne upon platforms which also held paintings and religious paraphernalia. His games fell in September, October and November and at one time totalled 29 days. On 13 September, he received a banquet in return for the rain which had made possible the harvest.

Of equal historical importance was the festival of Jupiter Latiaris on the Alban Mount. Since time immemorial the Latins foregathered to offer annual sacrifice under a rotating presidency from the several constituent peoples of Latin stock. In later republican times the sovereign Roman consuls presided over this religious remnant of a Latin league. A truce of the god secured the sharing of the meat of sacrificial victims by the assembled Latins or, later, by their representatives. From an imperial point of view the Roman consul could no more omit this ceremony than he could fail to greet Capitoline Jupiter before and after his military expeditions.

While in late pagan times Jupiter's divinity attracted astrological and philosophical speculation and quickened religious syncretism (or intermingling), his Roman cult retained the savour of its simple beginnings and propagated veneration of the Empire's greatness. From first to last the Romans acknowledged him as their patron and lord.

R. E. A. PALMER

The Kindest Planet

Ever since the development of astrology as a study in itself in the 7th century BC, Jupiter, the largest of the planets, has been supposed by astrologers to be the most kindly-disposed of them, and for that reason is often spoken of in astrological literature as 'the greater benefic', the lesser being Venus, which is smaller. The zodiacal sign ruled by Jupiter, even when he was still the father of the gods and not yet a planet, appears always to have been Sagittarius.

Jupiter as a planet is constantly associated with wealth, high position, getting one's own way, promotion, prosperity, and all forms of status. Anyone who wants to choose a time to begin an undertaking, to make sure that it shall not go wrong, would be advised by an astrologer to pick a time when the Moon is going to be in a strong 'good aspect' of Jupiter. Similarly, if he chooses a time when Jupiter is fortified (that is to say, when he is in a favourable position), there should be no financial difficulties.

Although the chief association of Jupiter is with money matters, he is also concerned with social position, so that any question connected with snobbery can always be answered by examining the aspects of Jupiter. He is also 'the greater benefic' in an entirely general way, and signifies success of any kind, including the recovery of health. Success is always thought to be indicated by the influence of a favourable planet, so even if one were setting out to commit a burglary, say, or any other crime, it would be prudent to try to have Jupiter on one's side. Even if this precaution did not lead to financial gain, it might bring luck to one's illegal enterprise by causing a policeman to look in the other direction at the critical moment.

The signs ruled by Jupiter are Sagittarius, the Archer, which is regarded as positive and masculine, and Pisces, the Fishes, which has been described as negative and feminine, though the sexes symbolically allotted to these two signs should not be taken too seriously. Both signs have a touch of that happy-go-lucky optimism which is one of the most characteristic gifts of Jupiter to his natives.

Typically, a person born under Jupiter will be good-looking, if not handsome; like those born under Leo, although to a lesser extent, he will have the dignity of a natural ruler. He knows what is due to him and expects to receive respect accordingly. He will probably have an impressive manner and in consequence is likely to be elected to official positions in clubs and other organizations. Such men are often successful businessmen or heads of companies, for they like making money. They usually uphold the established order and their dress is conventionally respectable.

People whose horoscope is dominated by Jupiter in his less favourable position spend their lives betting but are unlikely to meet with much success. Looking on the bright side, however, they may well win a competition, be promoted unexpectedly, or meet with some other kind of unforeseen good fortune.

Until a century ago, travellers in lonely parts of India ran the risk of being ritually strangled in honour of Kali, the black-faced, vampire-fanged goddess who represented the terrifying aspect of the Earth Mother

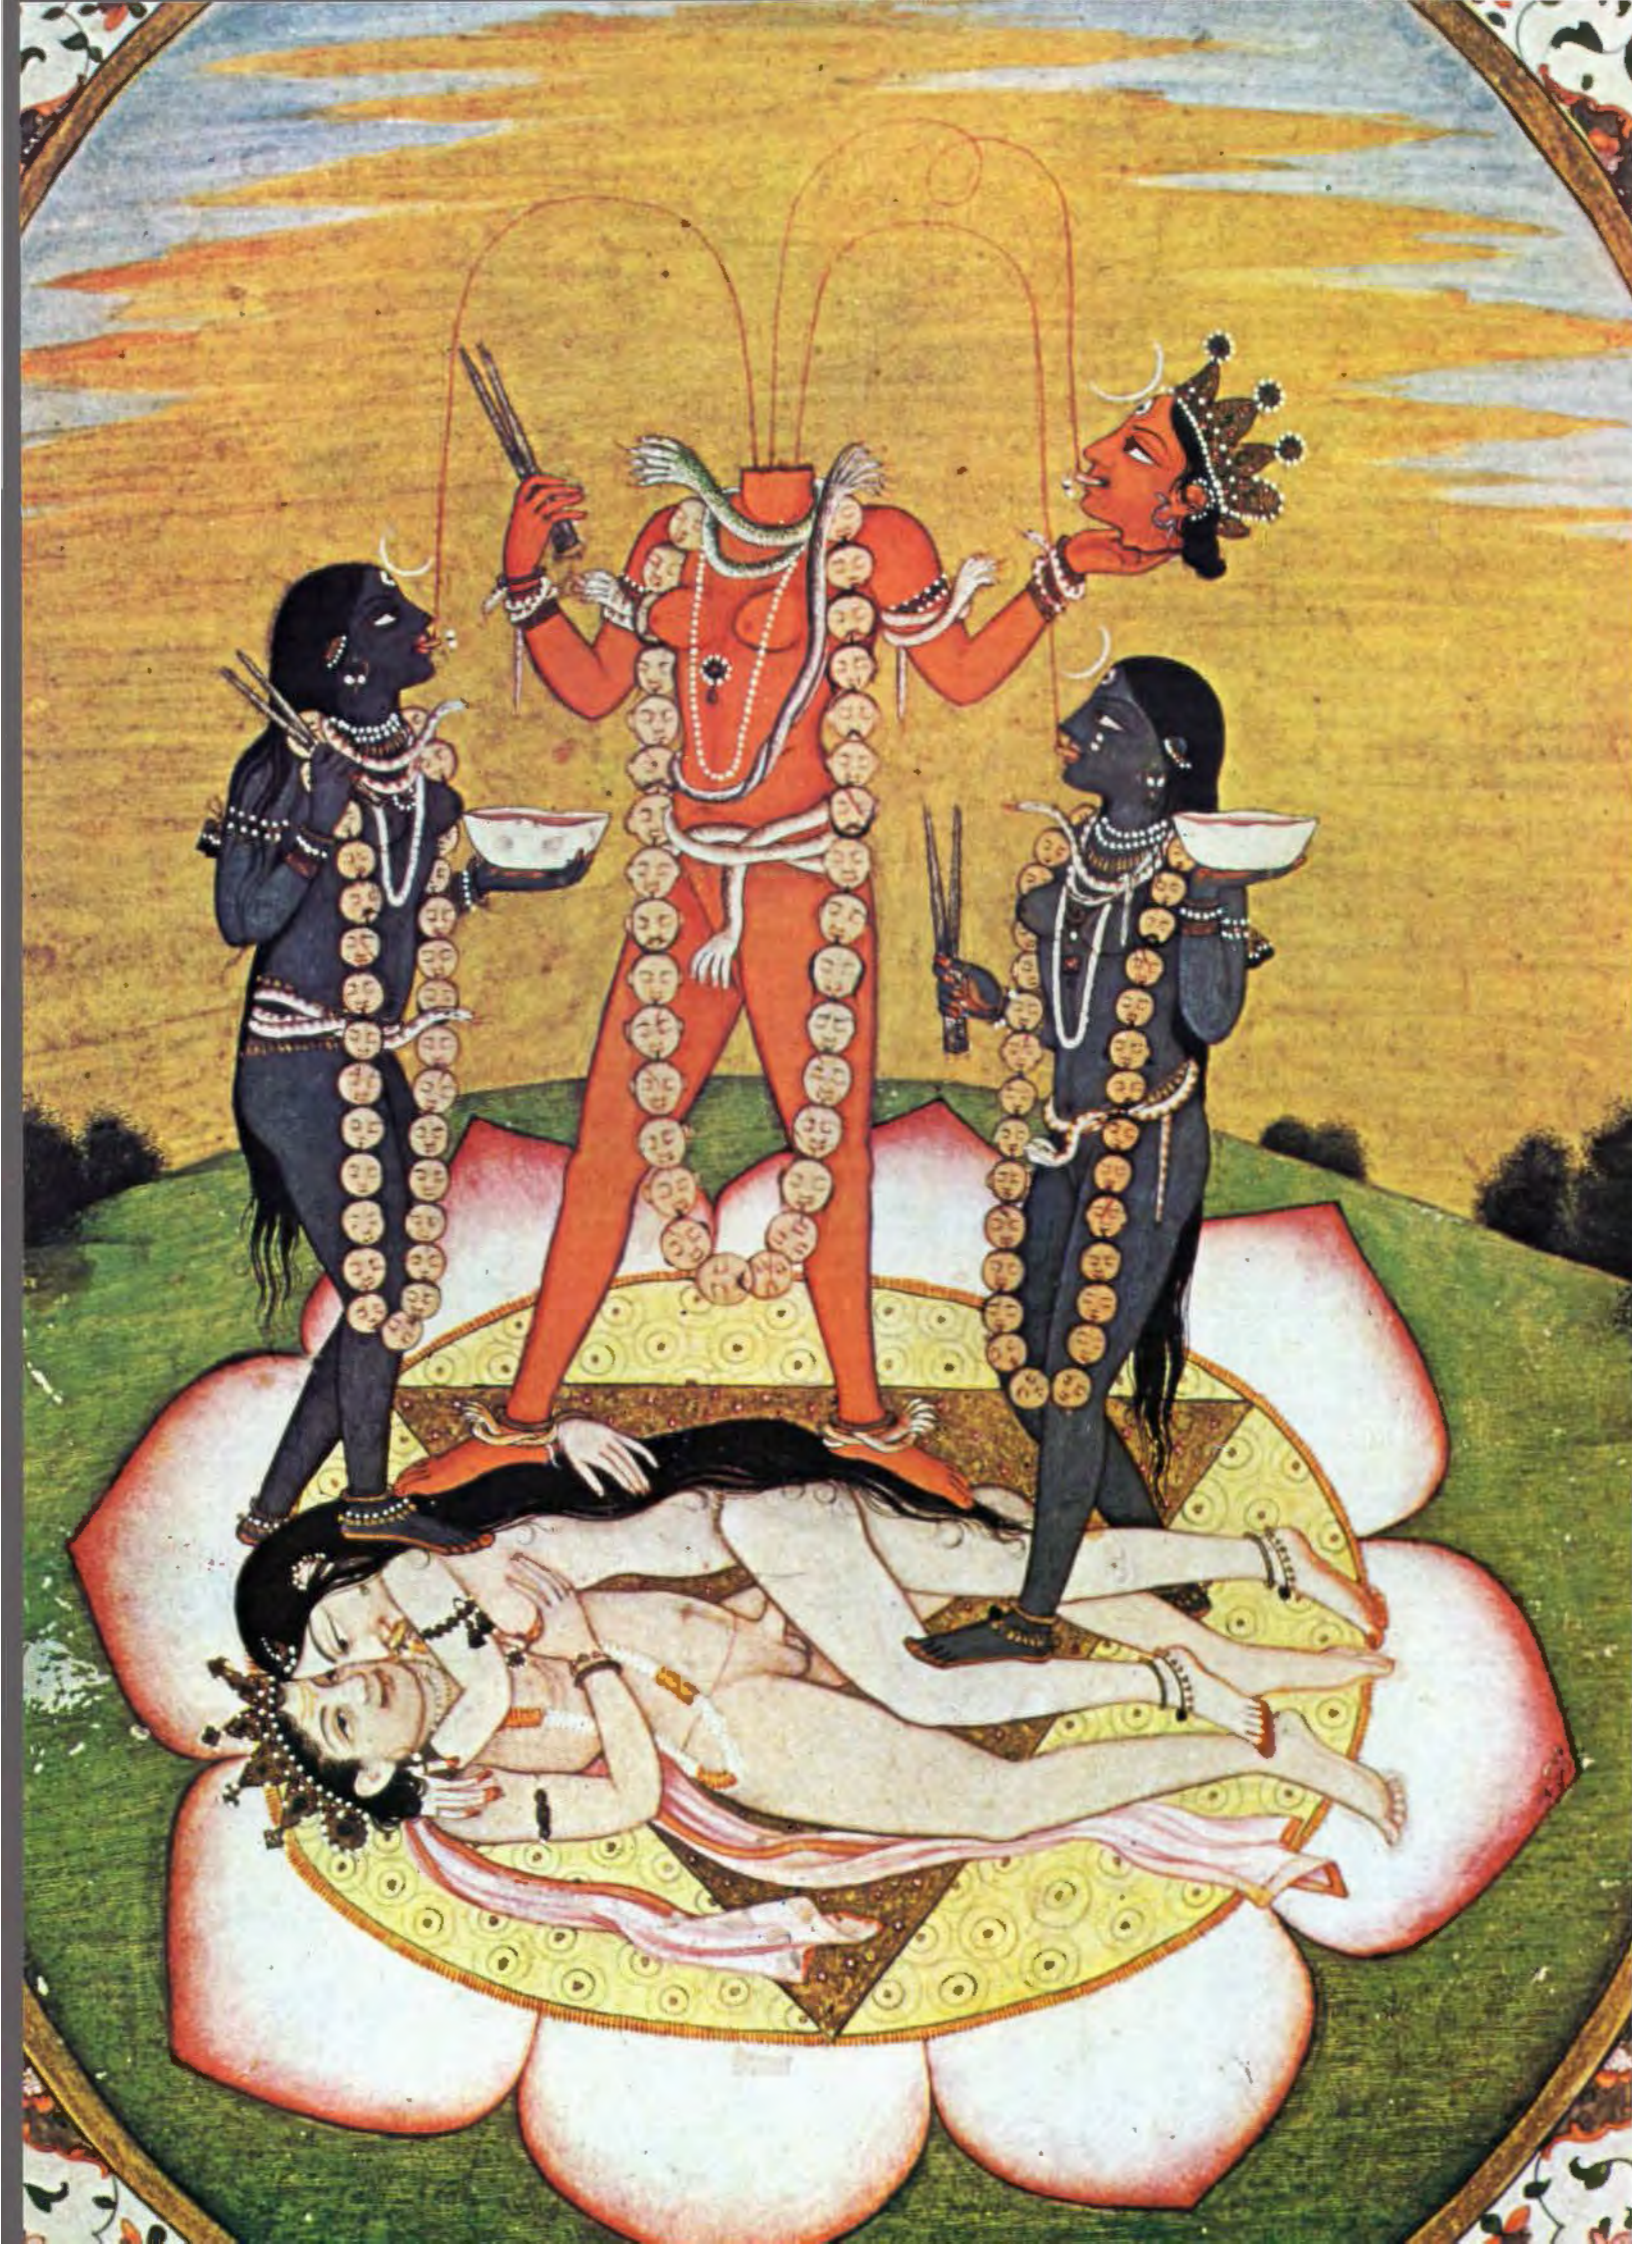
KALI

THE CREATIVE DEITY of the universe was regarded in a number of religious systems from earliest times as a Great Mother, a fertility goddess, carved or modelled with generous breasts and ample haunches, giving promise of the full measure of the earth's abundance. Through the ages this mother goddess developed several subsidiary aspects besides the nourishing and maternal being who was the universal provider. These aspects became separately personified and were worshipped as varying manifestations of the great deity. Frequently she was a sex goddess, a courtesan or divine harlot. Sometimes she was the goddess of illicit love; sometimes the devoted spouse, or the spotless virgin.

But there was yet another face, an awe-inspiring image typifying the deep-seated dread aroused by the unpredictable hazards of man's existence. This dire concept of woman recurs in mythologies the world over. The benign mother-protectress then emerges as a goddess of warfare, of the chase, of pestilence, of blood sacrifice and death, and the other manifold terror-shapes which invest the primordial and mysterious Female in man's mind. As such she stands for the cruel, unpitying, avenging side of the cosmic process. In classical myth these qualities manifest as the child-stealing Lamia, the Harpy, the Gorgon and the Fury; in Tibetan Buddhism as the wrathful and destructive female demons. Hinduism has a host of such deities, but in none are these attributes more forcefully conceived than in the figure of the goddess Kali.

The name Kali means 'black'. She may be

An 18th century painting of Chinnamasta, a manifestation of the bloodthirsty Kali; the goddess represents the terror side of cosmic female potency and is shown standing on the love god Kama-deva in union with his wife Rati



called the Indian counterpart of black deities who appear in the pantheons of several old religions. Ancient Egypt had a Black Isis; Rome had a Black Venus, and a Demeter *Melaina*, 'Black Demeter', was the Greek version of the dark-visaged goddess.

But Kali probably takes precedence in the hierarchy of black-hued deities because although her blackness may ultimately be due to her tropical, aboriginal inheritance, she is in essence Blackness personified, ruling over all the dark elements of Nature.

Black Strangler

In Hinduism the mother goddess assumes a variety of forms, several of whom are the wives of the god Shiva, each symbolizing an aspect of his being. These aspects, taken collectively, represent the female cosmic principle, known as Shakti. Shiva's power is effective and can operate only through his Shakti, an all-pervading female potency that suffuses the universe like a vast web in which the manifest world is enmeshed and on which the sequence of the human puppet-drama is played out. Kali represents the terror side of this Shakti principle. Her presence gives not only shape and reality but also a fierce vital energy to the things that exist. She is the dynamism of the cosmos.

Traditionally Kali is portrayed as an emaciated hag with a very dark complexion. Often she is shown with bulging bloodshot eyes and matted hair. She wears a necklace of human skulls and a girdle of human teeth. Between protruding fangs her long pendulous tongue drips gore. Human entrails are her especial delight. In the bony fingers of one hand she holds a human head, and in the other the blood-stained sword with which she has severed it. Her two other hands are raised to encourage or bless her devotees. Occasionally she is shown holding a rope to strangle her victims, and an iron hook to impale and drag them to their doom.

Closely linked with Kali and frequently identified with her, particularly in Bengal, is the goddess Durga, commonly depicted riding on a lion or tiger and accompanied by eight female demons who gnaw at the bones that remain after she has feasted.

Kali is held responsible for smallpox, plague, cholera and other pestilences that beset mankind, and for the high fevers that rage before death. Regular blood sacrifices are therefore performed to propitiate her wrath and gain her favour, and until the middle of the last century these not infrequently included the immolation of human beings. On one occasion, in 1830, a rajah sacrificed 25 adult males in her honour, and in various scattered communities her followers offered her a human victim or two when occasion demanded and opportunity offered. In the shrine of Danteshwari (dedicated to the 'Fanged Deity') in Bastar, Central India, human heads were regularly presented at her altar.

Most other gods of India today are satisfied with simple offerings of flowers, coconuts, rice and fruit, but Kali remains the chief goddess to whom blood sacrifices continue to be made, though owing to the restrictions imposed by enlightened legislation the victim is now usually a goat.

Demons Born from Blood

Certainly the most ardent and extreme of Kali's worshippers were the members of the once widespread secret society called Thugs. Their name comes from a Sanskrit word meaning 'conceal', and they had good reason to be secretive about their cult, for they were professional stranglers who terrorized the Indian highways for centuries, waylaying and garrotting unwary travellers as a pious act of devotion to their goddess (see THUGS).

The legend goes that Kali once had an encounter with a demon and decapitated him. But to her dismay she saw that from every drop of his blood there sprang another demon equally ferocious, and as each was slain other demons arose from the spilt blood. The goddess finally tore off the border of her garment, twisted it into a rope and used it to strangle her demon adversaries. She then applied her vampire fangs to their throats and drained their blood.

In commemoration of this event Kali summoned a few select devotees and ordained that they should henceforth strangle human victims in her honour. On a clay dummy she taught them the art of doing this correctly with a *rumal* (handkerchief) and presented them, as an emblem of their religion, with one of her curved fangs, which the Thugs worshipped as their sacred pickaxe. The practice of *thuggee* remained an accepted part of the dangers of travel in India into the 19th century.

Kali has been the subject of innumerable legends, songs and sculptural representations throughout India's long history. What is perhaps her earliest prototype can be seen in the Indus Valley civilization which flourished between 2500 and 1000 BC, where one of the seals shows a mother goddess standing under a fig-tree awaiting the sacrifice of a goat which a worshipper is bringing to slay before her. She appears in the *Mahabharata*, the great epic of India, exulting in flesh and animal sacrifice. In subsequent literature she is the exterminator of demons, but also *Kali Ma*, 'Mother Kali', the great protectress, the granter of boons. Kali personifies the Permanent Reality of the Tantric texts, those medieval writings devoted to the Shakti creed. Reformist societies in India today still revere her as the Mother who nourishes but also punishes, and submit to her dread judgement both in this world and the next. The worship of Kali remains widely prevalent in Bengal among all classes of the population, and the biggest temple raised in her honour is that of Kalighata; Calcutta, which was built in the environs of a small village where the temple stands, is an anglicized version of this name.

Kali reigns supreme as the goddess of fatality who determines the destiny of things. The Greeks believed that retribution follows *hubris* or inordinate pride against the gods; but Kali is *nemesis* or retribution, which is undeserved. She expresses the terror that underlies every activity. Her influence is felt wherever fear and worry are present. In terms of modern psychology she represents the shadow side of the psyche; the sombre archetype of the *anima*, the female element that is the permanent guest within ourselves. Outside ourselves she is the looming menace behind Nature; ever present in what we believe is meant to nurture and mother us. Within us or without, she reveals her power in the dark flame that flickers like a panic band in the spectrum of existence. A frightening paradox: Kali Ma, the Dread Mother.

Kama

The Hindu concept of Desire, personified as the god of love and depicted as a beautiful youth riding a bird or elephant, armed with a bow made of sugar-cane; his chief festival, *Madanotsava*, was celebrated by dancing and singing, culminating in sexual union: it is recounted that Desire was the first thing that stirred at the dawn of creation, Kama's power over humanity henceforth ensuring the continuing creation of the world.

KAMIKAZE

'EVERYONE TALKS about fighting to the last man and the last round,' General Slim remarked during the war in Burma, 'but only the Japanese actually do it.' Among the most dramatic examples of the Japanese conviction that death is preferable to the dishonour of surrender were the attacks made by *kamikaze* pilots on American and Allied warships in the Pacific during the Second World War. The pilots were told that in their heroic efforts to save their Emperor and country from defeat, at the cost of their own lives, they would become gods. They attempted to crash their planes, which were loaded with bombs, onto enemy ships. Many of them were shot down before reaching their objectives but they sometimes caused sinkings and heavy damage. For instance, during the American assault on the Philippines, the *Nashville*, flagship of a task-force sailing by Surigao Strait to Mindoro, was struck by a kamikaze plane which crashed into the superstructure. The ship was put out of action, 131 men were killed and 158 wounded.

The original kamikaze, or 'divine winds', were the storms which dispersed Mongol invasion fleets in 1274 and 1281, and which were believed to have been sent by the gods of Japan. The belief that death is the honourable and desirable objective of the fighting man also goes back to medieval Japan, to the code of behaviour of the *samurai* warrior caste, which was later called *bushido* and survived the abolition of the caste itself. Bushido involved an ideal of utter loyalty and obedience which put a warrior's life totally at the disposal of his superior officer. The warrior regarded himself not so much as a man but as a weapon, a tool in the hands of his master, and his honour required that if he was ordered to die, he obeyed. Early in the Second World War the Japanese Prime Minister, General Tojo, enshrined this principle in the instruction that a soldier should be ashamed to surrender, however hopeless the circumstances. He should fight on until he was killed, or else kill himself.

Kamikaze pilots deliberately crashed their planes onto enemy ships, believing they would become gods by dying for their country

The law of cosmic requital for one's good and bad deeds, known as karma, is a central concept of all Hindu and Buddhist sects, the chief aim of which is the acquittal of the soul of its debts; this is achieved by successive rebirth until the slate is wiped clean

KARMA

REWARD FOR the virtuous: punishment for the wicked. In one form or another this principle of elementary justice underlies every social and religious attitude. Throughout the world every society, however primitive or however far advanced, gives its prizes and its penalties according to a predetermined law. Worldly esteem, high estate, honour and a place in heaven after death, on the one side; disgrace, jail, failure, and the fires of hell on the other. This is the law in its simplest form.

It is fundamental to the Greek concept of *heimarmene* or destiny, the inescapable chain of cause and effect which arises from the pressure of impersonal forces upon personal behaviour, and which draws down reward or retribution. We get what we deserve. 'Heaven,' says Plato, 'is guiltless.' It is the rigid framework upon which the heroes of the great Greek tragedies were racked, for their own deeds, or for events played out at a distance by other protagonists, the repercussions of which were reflected in their own tragic fates.

It permeates the logic of the Hebrews as expressed in the book of Job (chapter 4) by Eliphaz the Temanite: '"Who that was innocent ever perished? Or where were the upright cut off? . . . those who plough iniquity and sow trouble reap the same."'

But in no religious system has the law of cosmic requital been more profoundly explored and become more deeply rooted than in Hinduism. In Hindu philosophy the term embracing the idea is *karma*. The word is derived from a Sanskrit root which signifies action, as implicit in every form of human activity, thought and feeling.

Deeds and thoughts are seeds. If what is sown is good, the fruit is good. If the seed is bad, the fruit is bad. The only significant contribution of a man's life consists in the sum total of his actions as they relate to his karma. Even so, the impact of karma may not be immediately evident on the physical plane; its final impress is stamped upon the invisible sphere and remains unseen. Like the hero of Oscar Wilde's *Portrait of Dorian Gray* we may live out our lives oblivious of the consequences of our actions, but like the portrait in the attic the soul is all the time undergoing a slow transmutation, reflecting in each line of its features the mounting consequences of every single deed and thought.

Logically considered, the karma doctrine is not without its beauty. It extends the principle of causation to the sphere of human conduct and commits a man to the obligations of a truly moral life. The precise accounting of human behaviour falls into an exactly balanced scheme, which seems to fulfil the requirements of a perfectly ordered and just universe. It provides an explanation for the existence of evil, inequality and injustice. It answers the problem of suffering with a reasonable explanation.

Victoria & Albert Museum

'Every action, every thought, every passing wish is a link in the chain that tethers man more firmly to the wheel of birth-death-rebirth'; he must continue to return to earth until all karma, a basic concept in Buddhism and Hinduism, is expended *Above* and *Right* Two Tibetan examples of the 'wheel of life', to which all men are shackled

Karma determines our condition both in the next world and in the next life on earth. In a very literal sense we fashion our own fate. The doctrine's precepts might be called a metaphysical elaboration of the popular wisdom enshrined in such notions as that of a man being captain of his soul; or sowing a thought and reaping a destiny; or of the battle being lost for a horseshoe nail.

The Divine Essence

Hindu and Buddhist doctrines concerning what occurs after death vary to some extent with different theologians. How the soul is judged, and by which roads it travels via the moon, sun, stars and celestial abodes of the ancestors and the gods is not always consistently stated in the texts on the subject. Most agree that a judgement takes place in the Hall of Yama, situated in the underworld, where the record-keeper Chitragupta reads out the balance sheet of our deeds.

Those who in this life were so far advanced in purity and truth as to have totally avoided any evil thought or act, and who therefore have no entry in the adverse side of their ledgers, are translated immediately to the heavenly realms and enter the state of everlasting beatitude. In other words, those who have attained the highest degree of the soul's evolution have no residue of karma left, and they do not, like lesser mortals, have to repeat the earthly pilgrimage. For them ultimate emancipation is assured. They are merged with the Divine Essence.

All the rest, the innumerably vast majority of mankind, are predestined to return. The very good who fall short of perfection, the moderately good, the bad and the supremely wicked, must all come back. They must try again.

But before re-entering the physical plane each one receives his share of reward or punishment according to the way he has lived. For the virtuous the reward after death, according to some scriptures, is a period of joy in paradise. They taste the delights of bliss in the abode of the gods. The wicked, on the other hand, are visited with punishment in one of several hells appropriate to their transgressions. They suffer the pangs of thirst or physical torment. They are drowned in mire, prodded by fiends, suspended from the spiked branches of poisonous trees, or suffer in lakes of fire.

This interim punishment or pleasure does not, as one might suppose, liquidate the debt. Heaven and hell are mere interludes, a reminder, as it were, of what awaits them after their next birth. Having met his

just deserts in the next world, man's account is not balanced yet. For the heavens or hells provide no permanent means of reparation or absolution. It is only on earth that imperfect acts can be wiped out. Earth is therefore known as *karma-bhumi*, 'karma-place'. Only here, in man's material condition, are actions generated; only here are evils expiated; only here is righteousness rewarded.

The vast majority of men are therefore fated to come back to earth, and to continue to return until all karma is expended. Relentlessly and remorselessly the wheel turns. Every action, every thought, every passing wish is a link in the chain that tethers man more firmly to the wheel of birth-death-rebirth. And bound in this way he returns and keeps returning until the balance sheet is clean.

This recurrent cycle of coming and going of the human soul to the scene of its actions is known as *samsara*, or transmigration: the soul's journey to the otherworld after the death of the body which has marked it with its stains; and then a pleasant or painful interval in the next sphere, followed by the inexorable return to earth reincarnated in a higher or lower scale of life according to the soul's merits. The sinner can try again and make amends. The impure and imperfect are given another chance and allowed another term to learn and cultivate the redeeming virtues that perfect the soul. Until then the soul must continue to reinhabit body after body for repeated trials and probations until the stage is reached when it is completely purified.

Karma is inseparably linked with the idea of reincarnation. No karma, no rebirth. The soul comes back because of karma, and the bodily form it occupies depends on the way it has acquitted itself in its previous life. Today, these forms, as described in the law-books of Hinduism, often have a bizarre ring, for they reflect the social background prevailing in early and medieval Indian communities. The last section of the compilation of laws by the great Hindu lawgiver Manu (500 BC) is concerned with the 'fruits of karma'. Says Manu: 'The individual soul enters a womb in this life as a result of what it has done in a previous birth.' The slayer of a Brahmin enters

Victoria & Albert Museum

the womb of a sow or she-ass; a priest who drinks intoxicating liquor will be reborn as a bird that lives on excrement; the thief who steals gold will become a lizard. Men who delight in doing hurt will become carnivorous animals; those who associate with outcasts become cannibals. He who steals grain will be reborn as a rat.

The consideration of what does and what does not constitute accountable action, the foundation of karma, is an intricate one, and has been the source of a great deal of metaphysical speculation. Some philosophers have held that the power of karma operates solely in clearly intentioned acts. Only willed or desired activity, with a clearly defined motive and a distinct end can be called accountable action, meriting the full impact of the laws of karma. Secular legislation prescribes severe and well-deserved punishment for the perpetrator of such acts of transgression, and religious law is no less clear-cut on the issue. But, to use legal jargon, if wilful murder is karma-carrying, does manslaughter, an accidental slaying without premeditation or intent, also have a karma content? Is motive the sole factor that determines the operations of karma? Strictly speaking, the teachings of the karma doctrine leave no room for this kind of distinction. The action is clear, hence the consequences are clear. An accidental killing is still a killing.

And what of actions that redeem, or at least lighten the burden of karma-bearing? Does obedience to scripture, ritual observance, 'doing good' as ordained by the *dharma* or law, mitigate man's imperfections? Is it possible to escape wrong action by non-activity? By renouncing the flesh and spurning its pleasures? By asceticism, self-denial and self-chastisement? The law is adamant. The whole field of human endeavour falls within the domain of karma. To live is to act, and all action is inherently liable to produce karma.

Nothing is exempt. Everything counts. Not only behaviour deliberately intended and directed towards evil; not only the consequences resulting from accidental misdeeds; not only activity meant to counter wrongful activity; but man's very emotions. Self-seeking, covetousness, jealousy, wrath, ambition, lust and hatred, even if not translated into physical action, are still karma-generating.

What then of unconscious thoughts, innocent ruminations, harmless fantasies? St Augustine, aware that his dreams could not bear close inspection, thanked God that he was not responsible for them. But the law of karma does not exclude dreams from its scope. Although they seem to come unbidden, they come to the dreamer, and each dreamer must account for them.

Enmeshed in His Own Web

Karma grinds down and measures the tiniest shreds of each man's hidden personality. Everything that constitutes even an atomic fragment of what might be regarded as his self is put into the scales. Otherwise the rigid law of justice would not be properly served. And it would seem that exponents of the doctrine have the support of psychoanalysis, for there is, according to Freudians, a hidden wish behind dreams, inadvertencies and apparent whims, behind casual errors and mistakes.

Man is entirely enmeshed in a web spun by himself. His own nature entraps him. As long as he lives on earth he is subject to the inexorable law of karma, and he can do nothing but submit to it. This doctrine has been called the 'nightmare' of Hindu and Buddhist thought. Birth-death-rebirth is the lot in perpetuity of almost every mortal soul. Unless a person possesses the exceptional, indeed almost superhuman, qualities needed to achieve the required state of enlightenment, he faces the prospect of a recurrent sojourn on earth till the end of time. All Hindu and Buddhist sects have as their chief aim, the release of the soul from the shackles of karma.

A new idea was introduced into the concept of karma some time in the early centuries of the present era, the idea of the grace of God, known in Sanskrit as *bhakti*. Although there are some tenuous references to bhakti in the early Hindu scriptures the concept first began to be systematically developed sometime after the advent of Christianity in India, and gained ground in the areas where Christianity was first established in the country. To some extent the new religion may have influenced the growth of the bhakti cult. The term 'bhakti' means variously: faith, grace, charity, love, devotion (see HINDUISM; KRISHNA). And the idea behind it is that it is possible through bhakti to obtain release from the cycle of reincarnation.

No matter if man, struggling towards the mirage of perfection falls short of the glory of God; or if, feverishly striving for enlightenment by asceticism, self-mortification and penance he still remains sinful; or if he continues backsliding despite his most frantic exertions: there is no need to despair. The heavy debit entries marked on the balance-sheet of the soul's accounting can be more than offset by simple faith in the saving power of God. And bhakti demands no exertion. Not even an act of will. Rather, the abandonment of the will; the relinquishment of effort. It merely requires surrender.

Nor does bhakti need understanding. It renounces knowledge, for the chief obstacle between man and God is not ignorance but unbelief. It does not insist on the need for good deeds, since this would suggest the efficacy of man's works, and so diminish the area for the operation of God's superabundant grace.

How far must man go in his faith? According to one school of thought, man must be like the baby monkey and cling to God, as the monkey clings to its mother; he has nothing to fear. But another school regards this 'monkey-hold' theory as requiring too much effort on man's part and therefore lacking in faith. Man does not even have to cling. He must lie prostrate and helpless like a kitten. And just as the mother cat takes hold of her kitten and carries it off to a place of safety, so does God with the man of faith. No clinging is required on his part, no effort whatsoever; only complete abandon and trust.

Bhakti is total, all-consuming and all-sufficing. With one sweep of God's grace the ill effects of every action are permanently effaced and the soul emancipated from the dread bondage of eternal return.

Karma is divine justice. Bhakti is divine mercy. And for men of faith God's mercy is greater than God's justice.

Key

An important symbol in magic, religion and folklore because it provides and prevents access to some sought after place or spiritual condition: associated with entrance to the Mysteries, and to degrees of initiation; in many religions the key has the power to open heaven and hell; freedom of a city is symbolically granted by being given the keys, and a decorative key is presented on 21st birthdays to 'unlock the door' of adult status.

See SYMBOLISM.

Before committing the acts against white colonists which so horrified the Western world, the Mau Mau warrior of the Kikuyu took a solemn oath, the breaking of which was believed to have terrible consequences; magic pervades every aspect of Kikuyu life and is especially potent in oath-taking

KIKUYU

THE LARGEST of the 48 tribes living in Kenya, the Kikuyu, number some $1\frac{1}{2}$ million people. They came to the attention of the outside world in the 1950s because of their membership of the Mau Mau, a terrorist organization whose avowed aim was to drive the white man out of Kenya. The Mau Mau tactics consisted largely of ritual murders which, under the terms of an oath, required the killer to cut off the victim's head and drink the liquid of his eyeballs.

The Mau Mau, however, were not representative of the majority of the Kikuyu who usually prefer diplomacy to open warfare with their neighbours. They belong to the great Bantu-speaking group of Negroes and are predominantly agriculturists and goatherders. Traditionally, they live in family homesteads protected by a stockade which encloses a collection of huts, one for each wife and her children.

The Kikuyu religion is fundamentally pagan and animistic, as religion has always been throughout Black Africa. The Kikuyu have a chief god who inhabits the sky and the peaks of high mountains. He is called Ngai and was probably originally a sun god, for the Kikuyu pray to him at first light when the sun comes over the horizon.

But Ngai is a rather vague deity, and much more meaningful are the ghosts of the ancestors and the spirits of the earth. All these gods and ghosts have to be continually placated with sacrifices, for they are ever-present, loitering around the hut and particularly the hearthstone, extremely interested in the affairs of the family and frequently intervening in them.

As a result, religion animates every aspect of Kikuyu life. No public or private act can

John Moss

Mount Kenya is sacred to the Kikuyu, who believe that it is the earthly dwelling-place of the Creator god

John Moss

be performed without the approval, if possible, of the family gods. For if that approval is not obtained, if the spirits are displeased, misfortunes are bound to follow – sickness, barrenness, and death itself.

The spirits of the earth must also be heeded. They inhabit many inanimate objects, trees, waterfalls, and rocks. The Kikuyu believe so profoundly in their existence that when clearing a forest they always leave the largest tree as a refuge and home for the sylvan godling. Sacrifices are offered at the bole of these sacred trees, and the area round about is considered so holy that fugitives are permitted to take refuge there.

Closely bound up with these religious beliefs and rituals are the tribal magicians, both those concerned with black magic and those concerned with white. White magicians, or medicine-men, have always had an honourable place in African societies, though their function has been greatly misunderstood by Western observers. The medicine-man's job is primarily to diagnose and treat diseases, sometimes by the use of herbs, sometimes by magic (a method of healing which has much in common with psychotherapy) and often by a combination of both. He is also a soothsayer, priest, counsellor, and stern opponent of witches and wizards. The medicine-man, in short, is a public servant who works in the open and in daylight.

In contrast, the black magician is a creature of the night whose hold over other men is based on the psychology of fear. The wizard has no need to make himself known to his victim. Creeping up to a hut by night, he will place gazelle horns by the door and wait for his enemy to lie down and voluntarily 'give up the ghost'. On the other hand, if the wizard is 'smelt out' by the genuine medicine-man, his death is terrible. The Kikuyu peg him to the ground and leave him to die of starvation and exposure. Those unfortunate people who are born with the 'Evil Eye', however, are not regarded as witches, provided they observe proper etiquette. They must not, for instance, look anybody directly in the face, or praise anything or anybody too highly.

So magic, it is seen, pervades many aspects of Kikuyu life, and it is especially potent in oaths and oath-taking, which have a far more profound mystical significance to tribal people than they do to Western man. In fact, oath-taking is such a solemn, elaborate and even dangerous proceeding that it is only undertaken as a last resort. This is the oath which the Mau Mau warriors swore at the time of their war against the white colonists:

> I swear that if I am ordered to kill, I will kill, no matter who it is. In the event of my killing anyone, I will cut off their head, extract their eyeballs, and drink the liquid from them. When I go to kill someone, I must take with me a strangling rope, a small knife to extract the victim's eyes, and a handkerchief to cover my hands against fingerprints.

The most important thing about this oath was not the wording, but the ritual by which it was sanctified. For the ritual involved powerful magic in the form of the so-called 'oath-stone'. This was usually a boulder pierced with seven holes to represent seven orifices of the male human body – two ears, two nostrils, a mouth, anus and penis. The medicine-man and the chief elders would poke sticks into these holes as the oath was being sworn, in order to ensure that the vow could not escape.

The climax was reached when the swearer called upon the oath-stone to bring about his death and the death of all his clan if he was guilty of perjury or false evidence. Further, all the parties involved, both the principals and their relatives, were debarred from sexual activity for seven planting seasons, a prohibition that also applied to their male animals which therefore either had to be castrated or sent away. In other words, a Kikuyu oath is so binding and so severe that parties to a dispute will do everything in their power to avoid having to swear it.

Naturally, the solemnity of an oath varies with the gravity of the dispute or the accusation. For instance, a man accused of homicide who pleads innocence must take the oath while sacrificing a sheep whose apertures, including the eyes have been closed up. The accused is required to carry this animal around the circle of the elders while swearing his innocence and then to throw the sheep into a fire for ritual burning. For the next year neither the accused nor any of his kin are permitted to have sexual intercourse. And if he or any of his relatives on

The main concern of the women of the Kikuyu tribe is their status, and at one time all young girls had to undergo rites such as clitoridectomy and abdominal cicatrization, both of which were presided over by the old women of the tribe, to prepare themselves for their future roles as wives and mothers *Left* Women performing a ritual dance *Right* Kikuyu woman in the kind of colourful costume that was worn during Kenya's Independence celebrations

his father's side die during the year, he is declared guilty.

Such an oath is considered so powerful that the Kikuyu are convinced that it could kill all the members of a homicide's clan and therefore prove his guilt and that even relatives as much as 100 miles away, without any knowledge of the crime, would die. For this very reason, the aged and sick are deliberately excluded from the effects of the oath, to make sure that there is no coincidence in the working of the magic.

It follows that some wrong-doers will refuse to take such a dangerous oath, preferring to pay a fine assessed by the elders. If a guilty man then refuses to pay the fine, the tribe has further means of punishing him. They use the sanction of total ostracism, which extends to his wife and children whom nobody will help or even speak to. Very few men whose lives are so dependent upon a small rural community can withstand such social pressure for long and, in any case, his wife or wives would very soon see to it that he paid his fine in order to be 'cleansed' of his wrong-doing.

A related form of oath-swearing is uttering curses which, provided they are spoken or acted out in the open, are regarded as legitimate weapons of attack and defence, particularly for women. When a woman's first child is born, the amniotic fluid is usually cursed in order to preserve the secrets of the mother's private life.

Women's Secret Meetings

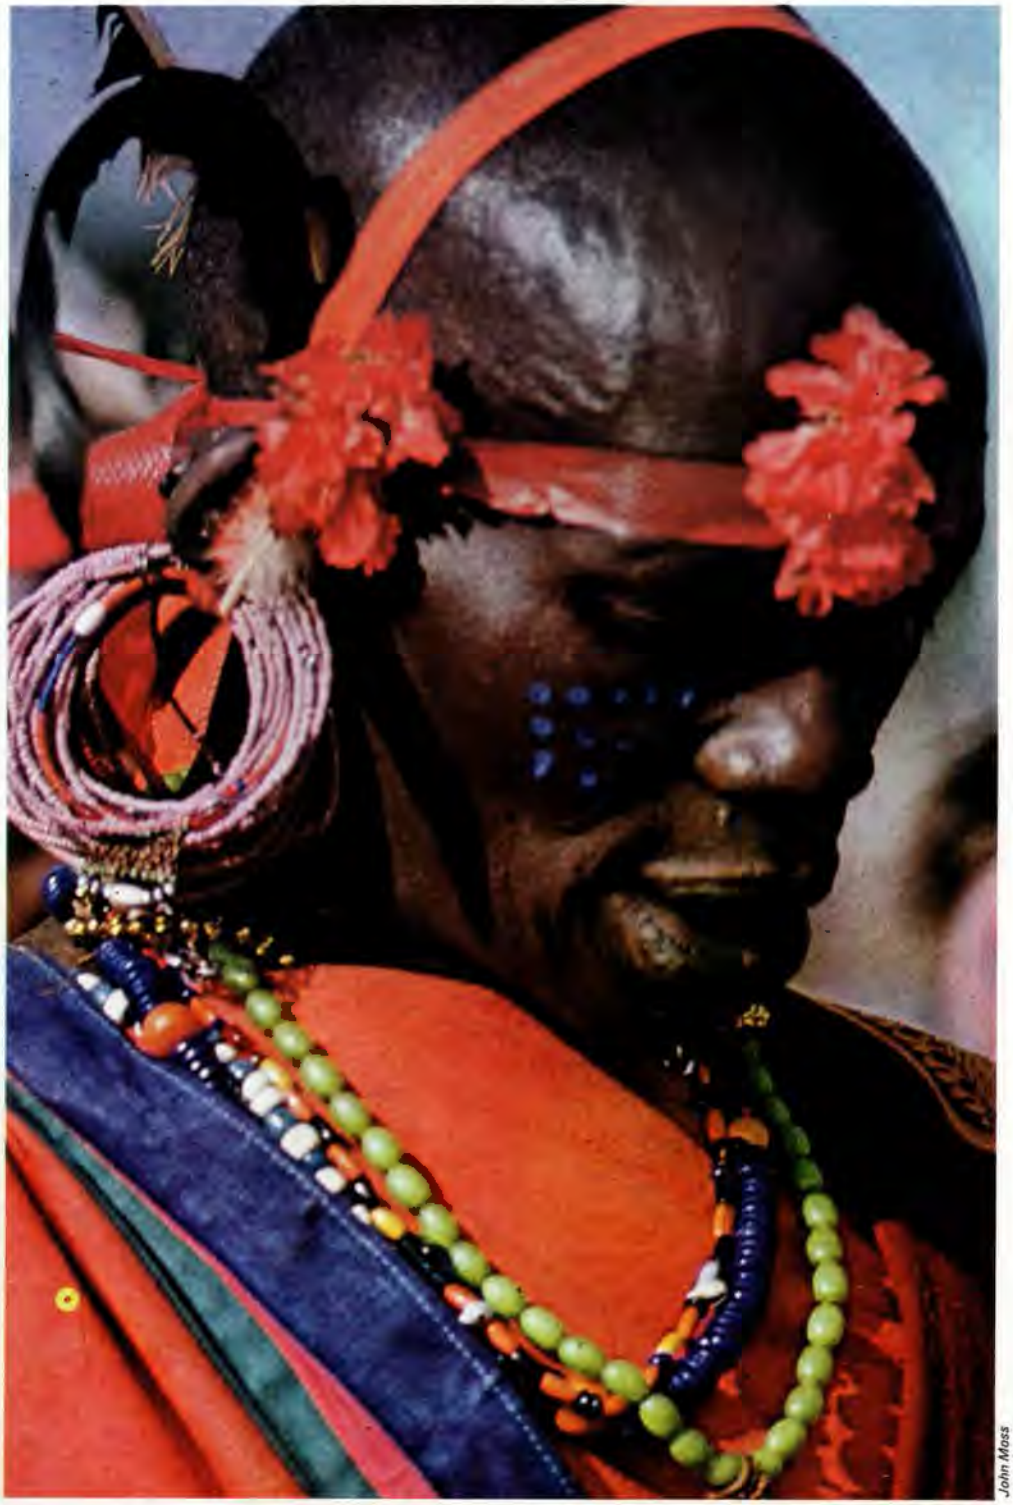
A very common form of threat used by women is to exhibit their private parts with appropriate gestures. For instance, if two wives quarrel about the boundaries of their gardens, one may uncover herself in the presence of the other and then make obscene gestures towards the ground, which consequently is cursed. Such symbolic 'cursing' is not unknown in Western societies.

An even more solemn variation is the procedure whereby the women of a village will demonstrate their stern disapproval of another group, male or female, by lining up, removing their undergarments, bending forward with their buttocks directed towards the offenders, then, at a signal from their leader, lifting up their skirts over their backs. The spectacle of some score or more women in this position is considered horrific enough to make even the most blasé offender mend his ways.

It is by such means that women make their wills and wishes felt in a strictly masculine society, though their actual organizations are so secret that few white men or, for that matter, the Kikuyu males themselves, know what they are. The natives usually refer to 'secret meetings of the dames', but usually take good care not to get involved.

Obviously the main concern of the women is their status – as potential wives and mothers. This involves a number of rites and ceremonies which are presided over by the older women, who supervise the clitoridectomy of the young girls and the abdominal cicatrization. The former operation, like the circumcision of the boys, has some sort of ancient religious significance. The abdominal scars resulting from the cicatrization of the belly are supposed to cause sickness in illicit male lovers and hence ensure the good behaviour of a wife. Both practices are frowned upon by Christian missionaries, and the Kikuyu themselves were persuaded in 1932 to pass an order limiting the operation of female circumcision to an incision of sufficient depth for the removal of the *glans clitoridis* only.

A basic concept of the Kikuyu religion is a belief in the spiritual uncleanness of anybody who has broken one of the tribal laws or taboos, whether deliberately or involuntarily. He must then be purified by an elaborate ritual in case he contaminates other members of the community. In other words, the Kikuyu regard crime or misbehaviour as a physical sickness, like measles, and they treat the 'patient' accordingly. Proof of their conviction that spiritual uncleanness is a disease is provided by the fact that a malefactor will often show all the symptoms of sickness – persistent headaches, aching joints, vomiting,



John Moss

debility, and so forth. He needs, therefore, to undergo a cure. The cure, or cleansing, always entails the sacrifice of a goat or lamb; the drinking of a potion containing the undigested food in the animal's stomach; the smearing of the patient with the entrails; and the relevant incantations. All such ritual has to take place in public, otherwise black magic would be suspected.

The concept of cleansing or purification underlies many of the initiation ceremonies which mark every stage of Kikuyu life. Initiation proceeds by age groups, and begins just before puberty with the circumcision of both boys and girls. This operation, which is always dangerous in view of the primitive instruments employed, takes place soon after the harvest, between February and April.

Marriage Insurance

Circumcision is followed by a curious ceremony called *kuihaka muunya*, which requires the 'rape' of a woman who is a stranger and for this purpose, the boys roam through the countryside on the look-out for such a woman, and in theory every member of the band must have sexual intercourse with her in order to cleanse himself. It seems that in practice some of the boys complete the rite by masturbating in the woman's presence. Barbarous though this custom seems, it is none the less so deeply rooted in the Kikuyu culture that no man can marry until he has purified himself in this way.

Girls, too, had to be cleansed before marriage by full intercourse with a strange man, not an easy procedure since no man would want to risk being 'tainted' in this manner. Consequently girls often sought out immature boys for their purpose, since children were not considered subject to the 'taint'. The anthropologist can recognize in this ancient custom the strong taboo concerning blood.

After initiation, both boys and girls belong to their appropriate groups, the boys to a regiment of warriors, the girls to a club. The boys now go hunting and fighting; the girls learn personal hygiene, the use of ornaments, and the rules of the limited sex-play permitted by custom between unmarried young people of the same age group.

It is time now for a Kikuyu male to think about marrying, which is described as 'bride purchase' by some Western observers and 'marriage insurance' by others. In either

Left **A modest version of a traditional cursing procedure in which the women of a village showed their disapproval of another group by removing their undergarments, directing their buttocks towards the offenders, and lifting their skirts up over their backs *Above* Formalized make-up is worn by young men taking part in the Muchungwa, a dance in which girls are also allowed to participate**

case, the procedure is always much the same. A Kikuyu will choose a wife from among the girls who grew up in his set and were his dancing partners during the important social occasions which were connected with the initiation rites.

The bride-price, which involves a great deal of haggling between the parents, is assessed in terms of goats, cattle, and land; the basic price for a desirable bride used to be three heifers and two bulls. This custom means that the wife has a certain insurance if the marriage breaks down because of the husband's inadequacy. The payment and acceptance of cattle and land, therefore, go a long way to ensuring a good marriage and to avoiding the complication of divorce, which the Kikuyu strongly oppose.

Polygamy is permitted, as it is throughout pagan Africa. The second and subsequent wives are usually chosen by the first, or senior, wife, who naturally often selects a friend who, for some reason or the other, has not obtained a husband. In addition, there exists the curious custom called *kuheero*, which permits a single woman to look around for a married man she considers would make a good husband and then to take steps to attach herself to him. To do this, she will enter his hut after he has gone to bed and offer herself to him. If the man accepts her and allows her to remain, he is obliged to make her his legal wife.

Although such customs appear to be arbitrary and highly permissive, there is neither prostitution nor illegitimacy in traditional Kikuyu society, nor are there unwilling spinsters. It was inevitable that the early missionaries should condemn the custom of kuheera and, in any case, conditions in big cities like Nairobi, where husbands and wives are not separate and independent each in their own hut, have tended to undermine the custom.

The attitude of the Kikuyu towards sex and procreation has always been simple, since there was no guilt-complex attached to either. In the case of childbearing, it was taboo for a woman to have another baby until the child at her breast was weaned, which did not take place until the infant was two or even three years old. The limitation to one child every three years was not the result of abstinence, but of birth control by the use of herbal contraception.

Once a Kikuyu child was able to walk, his education began and continued all through his life. The stage after childhood was that of junior warrior, then senior warrior, then married man, junior elder, senior elder, magistrate, and so on. The whole object of this training was to make the Kikuyu a good citizen, which meant a gradual process of learning tribal law and religious ceremonies, so that the older a man or woman grew, the more he or she was valued by the community.

Most of the customs described here are changing rapidly as the Kikuyu, along with other African tribes, turn their faces towards the modern world. Western methods of exploiting Nature tend to undermine their traditional reverence for forests, rivers, waterfalls and mountains, once the haven of spirits, now the source of new wealth. Christian missionaries have taught the young Kikuyu that polygamy and premarital sex-play are wicked and, in any case, urban living does not permit the old customs of kuihaka muunya and kuheera. Medicine-men have been discredited; and the old people, who were once the most respected members of the tribe, are becoming a burden on the young, as they are in Western society.

All these developments during the years since 1963, when Kenya became an independent state, have led some observers to fear that the traditional religious beliefs and social customs are being discarded too rapidly, with no positive standards to take their place. This, however, is the general effect of progress and Westernization throughout Black Africa.

KING

'Kingship, like the gods, has for most people at most times had an appeal far profounder than its purely practical and political significance would explain': in many parts of the world kings have been reverenced as being sacred, or even divine

FOR ALL PEOPLES who regard the king and the gods as vitally important for their welfare, kingship inevitably has a sacred aspect, since the regulation of the realm under the king is an integral part of a divine regulation of the world. The association of human and divine authority in the person of the king is thus well known in modern as in ancient history, and the European debate about the divine right of kings was a sophisticated, legalistic expression, in special historical and theological circumstances, of a universal concern for harmonizing secular and sacred powers in a single cosmic order.

So it would be to misrepresent modern studies in social anthropology to suggest that a specifically *primitive* form of divine kingship could be usefully isolated for study. In so far as the word 'primitive' means anything in this connection (and in social anthropology it comes to mean less and less in any context) all sacral kingship might be said to be primitive, in that it seems to draw upon sentiments and symbols which lie very deep in human experience.

Nevertheless 'divine kingship' as a quasi-technical term in anthropological writings has a particular history which has given it a particular meaning. It was first introduced as a central theme in Sir James Frazer's *The Golden Bough* (1890), and thereafter captured the imagination of a most varied public. For professional anthropologists as for general readers, the study of 'divine kingship' starts with that vast work.

At the very beginning of *The Golden Bough*, Frazer introduces a form of kingship reported from the ancient Mediterranean world as the source of his interest in the immense survey of beliefs and superstitions that follows. In the poetical prose which has carried so many readers along with him, he conjures up a scene of the long distant past from a woodland lake at Nemi outside Rome. By this lake – '"Diana's Mirror", as it was called by the ancients . . . lapped in a green hollow of the Alban Hills' – was the sacred grove of Diana of the Wood. There, Frazer writes:

> . . . grew a certain tree round which at any time of day, and probably far into the night, a grim figure might be seen to prowl. In his hand he carried a drawn sword, and he kept peering warily about him as if at every instant he expected to be set upon by an enemy. He was a priest and a murderer; and the man he looked for was sooner or later to murder him and hold the priesthood in his stead. Such was the rule of the sanctuary. A candidate for the priesthood could only succeed to office by slaying the priest, and having slain him, he retained office until he himself was slain by a stronger or a craftier. The post which he held by this precarious tenure carried with it the title of king. .

Frazer's sources for the story are references in Greek and Latin classics, whence also comes the information that this king was known as 'King of the Wood'.

By piecing together fragments of classical literature Frazer began to form the idea of a type of king, who was also both magician and priest, who represented a stage in the early evolution of kingship and more widely, a stage in human intellectual development from magical to religious, and eventually to scientific thought.

But why should this king be killed by a more vigorous successor when his strength began to fail? The clue lay in his title. As King of the Wood he was king of the trees, and as king of the trees he was the incarnation of the spirit of all vegetation. He was thus the source and cause of natural abundance and fertility, and if his vital energies were allowed to decline, those of Nature itself would decline with them.

Beliefs bearing a certain resemblance to these are reported from many times and places, as Frazer himself shows in his encyclopedic survey of ethnographic and historical literature. But perhaps the most anthropologically authoritative confirmation of his views came from two distinguished professional scholars in his own field, Professor C. G. and Mrs B. Z. Seligman. Unlike Frazer they travelled widely to make their own first-hand observations, and during visits to the southern Sudan from 1910 onwards they found there among the Shilluk nation a kingship resembling the divine kingship already familiar to them from *The Golden Bough*.

The Seligmans' report, finally published in *Pagan Tribes of the Nilotic Sudan* (1932) but available much earlier, has become a standard source for students of divine kingship, and Frazer himself cited it in later editions of *The Golden Bough* as a striking empirical confirmation of his interpretation.

Though it contains much new and valuable ethnographic material, and is hedged with doubts about some of the more essential details, its generalizations sometimes follow those of Frazer so closely that they raise questions of how far his persuasiveness as an anthropological visionary and personal repute as a scholar actually predisposed other students to cast their material in his mould. Take for example the Seligmans' account of night-time in the Shilluk court. The King (for some reason not explained) then without his bodyguard: '. . . was represented as passing the night in constant watchfulness, prowling fully-armed, peering into the shadows or standing silent and watchful in some dark corner. Then, when at last his rival appeared, the fight would take place in grim silence, broken only by the clash of spear and shield, for it was said to be a point of honour for the *reth* (king) not to call for help.'

At the present state of our knowledge we cannot deny the possibility of such a scene, nor that (as the Seligmans say) 'many commoners will give some such account (though) there is no reason to suppose that the above represents what really happened during the recent period. . .' But even so it seems strange that African commoners in the 20th century should appear to express themselves in language so like that which Frazer used to describe an Italian priesthood of remote antiquity.

Human and Divine

This mutual confirmation of ideas by three outstanding anthropologists nevertheless established with an authority not readily challenged the broad outlines of a definition of divine kingship. Only much later did experienced scholars of similar standing question not so much the basic principles of divine kingship posited by Frazer and the Seligmans (that the king, as the source of natural abundance, must always be intellectually and physically fertile himself),

Michael Halford Library

In ancient Egypt the pharaoh was believed to be divine, the child of the sun god Re; he was also thought to be an incarnation of the god Horus who had been given the throne of Egypt by divine decree after the death of his father Osiris. The pharaoh became an Osiris when he died, and his son and successor was Horus: wall painting from the tomb of Amenophis II showing the king with Osiris

but the sense of proportion with which the earlier writers presented those principles.

For sacral kingships, it is clear, have their practical, political aspects too. To concentrate only on the ritual drama and mystical beliefs which they involve, appealing as these are to the imagination, is to leave out those features of kingship which are human as well as divine. So E. E. Evans-Pritchard in *The Divine Kingship of the Shilluk of the Nilotic Sudan* (the Frazer Lecture for 1948) and himself the foremost expert on Nilotic peoples, concluded from an examination of all the literature that the reasons for the premature deaths of Shilluk kings were political rather than religious. Other princes raised rebellions against kings who had become unpopular, and times of national misfortune (such as failure of the harvest) were the most likely times at which such unpopularity would be incurred. And A. I. Richards in *Keeping the King Divine* (the Henry Myers Lecture, 1968) gives us a small insight into the rational component in divine kingship which an earlier tradition of writings on the subject (though often maintained by anthropologists who were agnostics themselves) tended to play down. Of the divine king of the Bemba of Rhodesia, in 1957, she writes: 'When told by his religious advisers that lions were becoming more and more common owing to his failure to do the purification rites, he replied, "I shall just ask the District Commissioners for an extra gun licence and more bullets."'

And with respect to the relationship between kingship and divinity, and the symbolic thought and action surrounding it, the Frazerian account must now appear too limited, intellectualized and materialistic. A large symposium entitled *The Sacral Kingship* (1959) draws together information from most of the world to show that some

Coronation of the Pharaoh

No connected account of an Egyptian coronation has survived and at best the reliefs give us only a selection of the more significant items, and even the exact order of the ceremonies is uncertain. It is evident, however, that to the Egyptian the death of a king meant the temporary disruption of the Two Lands, and that one of the main purposes of the coronation was to restore that unity and to ensure that the new king became a god. The first ceremony was a purification, the Baptism of the Pharaoh as it has been called: the king was purified by the gods of the cardinal points. The purification was not by water alone: the reliefs frequently depict the symbols of life and power or dominion as issuing from the vases, and it would appear that the ceremony was intended to transfer to the new king the powers of the gods of the cardinal points. The king was then led into the Dual Shrines, or the Per-wer and Per-neser, and crowned by the gods, in theory being invested with each individual crown. This was followed by investiture with crook and flail and the presentation of the little casket containing the title-deeds or testament. It was probably at this juncture that the symbolic ceremony of Uniting the Two Lands was performed and it was apparently at this point that Thoth or the Immutef-priest proclaimed the god's decree declaring that the newly crowned king was his legitimate successor, and the Ennead gave their endorsement. The king was then led towards the god, Thoth proclaimed his full titulary, and Thoth and Seshat, goddess of writings and annals, inscribed his years and life-span on the leaves of the sacred persea tree. Finally, apparently after presentation of a scimitar and perhaps investiture with other regalia, the king was led into the presence of the god who formally adjusted the crown as the king knelt before him . . .

H. W. Fairman, 'The Kingship Rituals of Egypt' (in S. H. Hooke ed *Myth, Ritual, and Kingship*)

fusion of ideas of the king and the god is and has been widely characteristic of the human imagination. Accounts of it come from the Americas, the Far East, India, Iran, Christian and pre-Christian Europe, as well as Israel, Greece and Rome, and of course ancient Egypt where it is at the centre of a complex theology and literature.

But the contributions to that symposium show also that the actual killing of the king in the belief that the natural world will be thereby rejuvenated is but one among many beliefs about sacral kingship, from among which different combinations emerge in different faiths and societies. In such a highly developed religious kingship as that of ancient Egypt, where theocratic interests were so conspicuously dominant, the aging king was not killed. Instead, through a subtle and elaborate theology and mythology, his natural death was represented as a spiritual transfiguration and resurrection. The kings, father and son, Osiris and Horus, followed each other in an endless cycle of spiritual and social regeneration. We have some faint echo of that theme in the saying 'The king is dead; long live the king.'

And among peoples who have believed that their kings must not be allowed to decline through sickness and senility to an enfeebled death, the means of appearing to forestall that death are various. Frazer himself cites examples from several different regions where the king's death, far from being a 'murder', is a voluntary suicide, even a self-immolation, accepted in the belief that through it his people will receive new vitality. This is certainly so among the Nilotic Dinka, whose most important leaders, custodians of sacred ancestral spears, asked their people to release them when their lives became a burden, and towards their end were placed in chambered graves, whence they continued to the last to admonish and bless the tribe.

Students of comparative religion have always sensed an analogy between the sacred king who dies for his people and the sacrifice of Christ, himself both priest-king and man-god. The intense interest aroused by anthropological studies of divine kingship may well be partly explained by their wider religious implications. For rationalists, they seem to demonstrate that cardinal tenets of Christianity are paralleled among many whom the Victorians would have described as savages, while for believers the ubiquity of the divine king appears to confirm that their own faith is grounded in profound psychological and theological truth.

The Centre of Order

The re-creation of natural and social life out of the king's death, and the sense of human involvement through the king in a cosmic order to which man can make some contribution, are basic features of divine kingship. But there are many others which anthropologists interested in more precise and systematic classification have attempted to use. Tor Irstam (*The King of Ganda*, 1941) considered over 30 associated criteria, of which quite a large number are found sufficiently widely distributed to require some mention. Among them are that there should be special modes of election and installation; that the king is hedged round by prohibitions against eating in public, touching the bare earth, or being physically disfigured; that there are sacred regal insignia and an organization of the royal court designed to sustain the majesty of the king; and that the king himself may be regarded as partaking of the nature of the gods and as an incarnation of divine powers. Thus the king is placed at the centre of the social and natural orders. The births and deaths of kings are then often connected with exceptional natural phenomena such as falling stars or violent storms, as when the murder of Duncan in Shakespeare's *Macbeth* is associated with other unnatural events.

A. M. Hocart (*Kings and Councillors*, 1936) pointed to the way in which the king is believed to be the source and symbol of life and order, and draws attention to the frequent use of imagery relating the king to the light-giving and life-giving sun, in maintaining the ordered rhythm of the world. Hocart also emphasizes the dual nature of kingship which others have elaborated upon since his time. On the one hand the king is the spiritual leader, the priestly, even god-like, guide and peacemaker. On the other hand he is the giver of victory, the vanquisher of his people's enemies. Sometimes these spiritual and temporal qualities are represented in the person of a single leader, the king. Sometimes this dual nature of power and leadership gives rise to dual personal leadership. Among the Winnebago Indians for example, the spiritual chief, concerned with peace and harmony, was drawn from a family in one division of the tribe, while the temporal chief concerned with justice and discipline was drawn from a family in another. Hindu doctrines of kingship also represent a separation of the priestly from the warlike attributes of kingship, their functions in ensuring the welfare of the state being ideally complementary. It has commonly been found that though kings are accredited with both spiritual and secular superiority, in fact their executive powers are far smaller than the deference shown them would suggest, and the old European maxim that 'the king reigns rather than governs' has become a commonplace in anthropological work on the subject.

So to modern anthropologists 'divine kingship' suggests a whole complex of beliefs, rituals and ceremonies surrounding the idea of sovereignty, rather than the dramatic and exotic institution which captured the imagination of their predecessors. Certainly these beliefs and the rich imagery in which they are expressed indicate that kingship, like the gods, has for most people at most times had an appeal far profounder than its purely practical and political significance would explain. The king actually reigning at any given time symbolizes the kingship, and the kingship symbolizes the order of the world in which it reigns. Hence it may be imagined that while that order flourishes, individual kings die in one way or another but *the* king never dies. The myth which generated Frazer's study of kingship in *The Golden Bough* is one among many ways in which peoples have expressed their sense of this immortality, in which they see an image of their own constant social regeneration.

GODFREY LIENHARDT

The King in the Ancient World

The term 'divine kingship' is generally used with reference to those forms of monarchy in which the leader of the community is at the same time king and priest. In some cases the king is also thought to be descended from the gods or to share divine qualities in some way or other. Some feel that the term 'divine kingship' should be confined to these cases and would like to use 'sacral kingship' as a broader term, denoting all forms of kingship in which the king has religious functions without being considered divine.

The sacred king who dies for his people in the belief that they will receive new vitality through his death is characteristic of various different cultures: scholars of comparative religion have always sensed an analogy between this tradition and the 'sacrifice of Christ, himself both priest-man and man-god': Christ carrying the cross; painting by El Greco in the Prado Museum, Madrid

Michael Holford

In *The Golden Bough* Frazer regarded sacral kingship as a development of primitive chieftainship, the chieftain of a tribe being at the same time its chief magician. He also placed special emphasis on the king's close connection with the dying and rising god of fertility (see also DYING GOD). A. M. Hocart in his monograph *Kingship* (1927) developed the theory that the belief in the divinity of kings was the primitive religion of mankind. On the basis of material from various parts of the world, he tried to reconstruct a common pattern, especially for the rites of coronation. S. H. Hooke and his collaborators in the collection of essays called *Myth and Ritual* (1933) concentrated their attention on what they considered as a common 'myth and ritual pattern' in the ancient Near East, one conspicuous feature of which was the way in which the king played the role of the chief god in the cult-drama of the New Year Festival in order to ensure fertility and success for the year to come. Scandinavian scholars, such as G. Widengren and I. Engnell, carried these viewpoints further, applying them also to biblical religion and Messianism.

According to Hocart's analysis, as modified by Widengren in his *The World of Religion* (in Swedish, 1953), the almost universal pattern of coronation includes the following characteristic points: a sham fight or ritual combat from which the king emerges victorious; the king is proclaimed the master of the world; the king is asked to reign with justice, and promises to do so; the king is invested with a symbolic garment and receives other regalia, such as a sword, a sceptre, a ring; the king is given food and drink, supposed to give immortality, and he is baptized in water and anointed with oil; the king is proclaimed the son of the god; the king is seated on a throne and receives one or several throne names; the king celebrates the sacred marriage. The aim of all these is obviously to transform the king into a new being, endowed with divine power and divine authority.

From other points of view, it is obvious that there are different types of kingship according to the various degree of close connection with the divine. C. J. Bleeker, at the International Congress in Rome in 1955 entirely devoted to the institution of sacral kingship, suggested the following types: the king's authority rests on his supernatural or divine qualities; or the king is regarded as the son of the deity, thus representing the god on earth; or the king reigns by divine election; or the king has come to be regarded as divine because of his outstanding qualities. It must be admitted, however, that these types are rarely pure and there is considerable overlapping.

Strictly speaking, the institution of divine kingship belongs to the type of society in which sacred and profane order coincide, as in ancient Egypt or the ancient Near East. In Greece and Rome the monarchical constitution was abandoned and the priest took over the king's religious functions; the same is true of the high priest of Israel after the Exile. A different development occurred in the Byzantine Empire and in many European monarchies, in which the king had no religious or cultic functions but was thought to have authority from God.

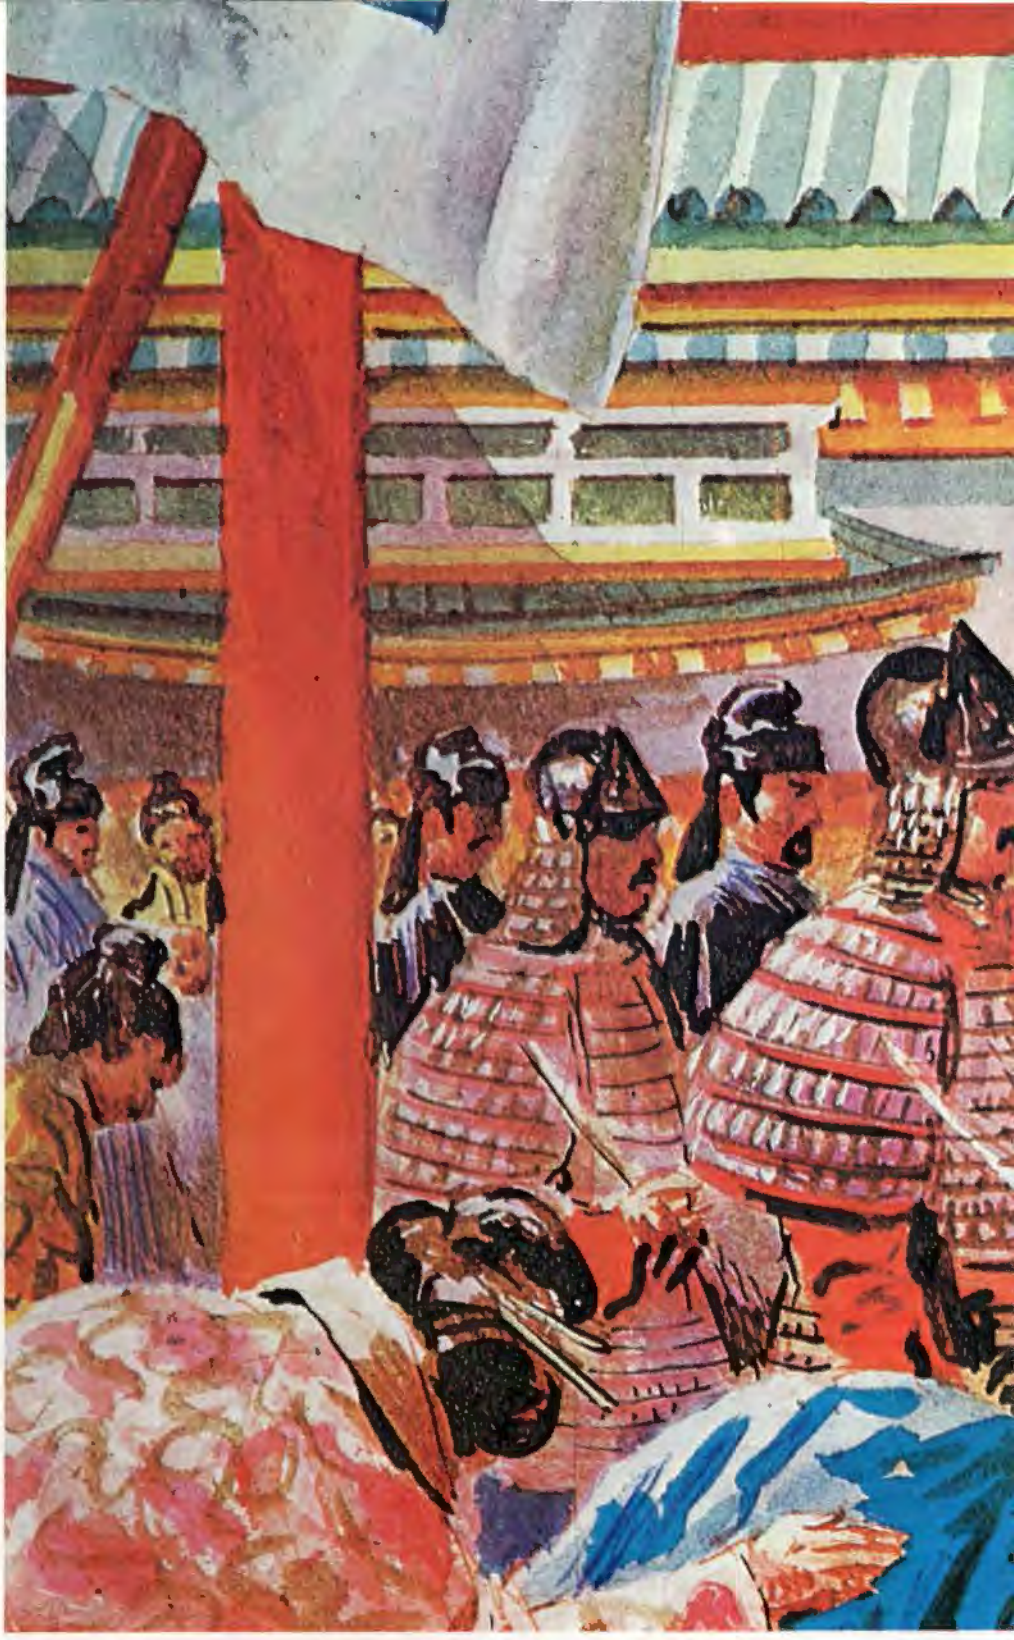
In ancient Egypt, the pharaoh was regarded as divine, one of his titles being 'Son of Re'. This emphasized his divine origin in so far as his birth was believed to be the result of divine intervention. Inscriptions tell us that the sun god took the shape of the reigning pharaoh and begot the royal child. But the king is also the incarnation of the god Horus. Since it was believed that Horus was the son of Osiris and was by divine decree given the throne after the death of his father, this accentuated his position as a rightful sovereign. On his death the king became an Osiris, while his son and successor was Horus. At the same time the deceased king was thought to become united with his divine father, the sun god.

As a ruler the pharaoh exercised divine functions. He represents the god who creates order in the world; he is responsible for *maat*, a concept which comprises both cosmic and social order. It is characteristic that the same verb is used for the official appearance of the king at his accession or at a cultic festival as for the appearance of the sun god at creation and in every sunrise. Just as the sun god put an end to chaos and created the world and its order, the king's accession to the throne meant a renewal of creation and his rule the maintenance of its order.

The king is the shepherd of his people, and as a symbol of this he carries the shepherd's crook as his sceptre. He is to maintain justice in the land, and to care for the livelihood of his people. Like the god, he is equipped with the authoritative word and with wisdom: 'He knows everything that happens in the land.' Thus his commands are wise and are carried out accordingly. He is also responsible for the inundation of the Nile, the normal course of the seasons and the growth of crops. His cultic activity is necessary for maintaining the fertility of the soil. It is also his duty to vanquish the enemies of the country who threaten order and balance. In theory he was often thought to win his victories alone, without his army, thus repeating the events of creation when the primeval god, being alone, defeated the forces of chaos and brought maat into being.

As intermediary between gods and men, the pharaoh was the head of the state cult.

The king is often believed to be the source and symbol of life and order, and imagery associated with the sovereign frequently relates him to the sun which gives light and life: in Japan the emperor was thought to be descended from the sun goddess Amaterasu; known as 'the ruler of heaven' or 'the sun of heaven', he was worshipped as a god by his people



In theory, it was he who had to fight Seth, the murderer of Osiris, every year to maintain life and prosperity in the land. In practice, however, these tasks were mostly delegated to the priests.

In ancient Mesopotamia the divinity of kings was not as strongly accentuated as in Egypt. Some of the Sumerian kings claimed divinity by adding the sign for 'god' to their names, and hymns were written to them exalting their divine qualities. But as a rule the kings of Babylonia and Assyria were only regarded as the sons of deities. In some cases, however, there are legends about the miraculous birth of kings. Of Sargon of Akkad (c 2350 BC), it is told that he was born of unknown parents and exposed in a basket made of reeds in the Euphrates, where he was found by a water-bearer who brought him up. It is interesting that similar stories are told of Moses, the Persian king Cyrus, and Romulus and Remus; obviously the aim of this legend is to emphasize the divine protection of the royal child.

Kingship as an institution was thought 'to have come down from heaven' from the gods. The king was chosen for his task even before his birth, he was 'called' by the god and 'sent' on his mission. His ascending to the throne was praised as the beginning of a new era of happiness and prosperity for the country. 'The harvests become plentiful, the blind have their eyes opened, the lame walk and those who were in captivity are set free.' As the representative of the gods the king claimed dominion of the whole world. There is an intimate relationship between the king and certain symbols of life and fertility, such as 'the plant of life' and the water of life. In the New Year Festival the king acts out the myth of creation, thus representing the creator god and ensuring the order of the world and a good year for his country.

The Anointed of Yahweh

On the other hand, the king represents his people before the gods and is responsible to them. In the New Year Festival at Babylon the king had to kneel before the high priest of Marduk and was deprived of his royal insignia until he had recited a negative confession, saying that he had not broken the rules of the gods. When some evil was thought to threaten the country, sometimes a substitute king was chosen and ultimately put to death, thus bearing the responsibility of the real king.

In Israel kingship was introduced by Saul, and was developed by David and his son Solomon. The model of Israelite kingship was that of Canaan which obviously had great similarity with Egyptian and, above all, Babylonian kingship. Thus, in the so-called royal Psalms, the Israelite king is addressed by Yahweh as his son (Psalm 2, for instance) the implication being that he is adopted by Yahweh (the formula is 'today I have begotten you'). The king is chosen and appointed by Yahweh (Psalms 2 and 89). He is consecrated by anointment with oil, which at the same time implies that he is equipped with God's spirit (1 Samuel, 10.6). Consequently his title is the Anointed of Yahweh (*meshiakh Yahweh*, from which our word Messiah is derived). Though Israel was a small country, her king, in theory, claimed world dominion: 'he shall reign from sea to sea and from the river (Euphrates) to the ends of the earth' (Psalm 72). He was thought to reign on God's behalf and defeat his enemies with God's help (Psalms 72, 89, 110). His great domestic responsibility is for the maintenance of *sedaqah* or 'righteousness' in the country, assisting the weak and supporting the needy; as a consequence, rain will fall and the crops will grow abundantly (Psalm 72).

It is clear that the king was responsible for the Temple and its cult. Once he is referred to as a priest, 'after the order of Melchizedek' (Psalm 110) but there is little clear evidence of his functioning in this

capacity. However, David performed cultic ceremonies at the transfer of the Ark to Jerusalem (2 Samuel, chapter 7), Solomon dedicated the Temple (1 Kings, chapter 8), and Hezekiah and Josiah worked for the reform of the cult. It is possible that certain functions of the high priest (for example, on the Day of Atonement – Leviticus, chapter 16) were originally royal prerogatives. It has also been argued, on the basis of certain Psalms (18, 22, 88, 89, 116 and 118), that the king was ritually humiliated at a night-time ceremony in the New Year's Festival and restored in the morning. This theory, however, has not been definitely proved.

The royal ideology of ancient Israel is of great historical significance, since out of it grew the expectations of a coming ideal king who was to save Israel from all evil, the Messiah. It is these expectations that the writers of the New Testament regard as being fulfilled in Christ.

Burning Like Fire

Moving farther eastwards, we find sacral kingship in ancient Iran. Here the king enjoys the special protection of Mithras, and is often regarded as the incarnation of that god. He should be born like Mithras in a cave from the descending star as a saviour of mankind. His birth marks the beginning of a new golden age. He is praised as a divine being and greeted with prostration like a god. He is called the brother of the sun and the moon. His real nature is fire, for he has descended from heaven as lightning in a column of fire. Therefore he is also surrounded by a nimbus of fire or radiance, called *khvarenah*, a word which also denotes the king's fortune, or luck.

The king is the ruler of all the world, the champion of justice, the protector of the poor and the defenceless. In his person he unites the three social classes (priests, warriors and peasants) which he shows by dressing in the colours of the different classes on certain occasions. He is also a cosmic ruler, whose power is symbolized by his star-studded mantle, representing the sky and the universe.

The Persian king often functioned as a priest, offering sacrifices and, above all, performing the acts of fire-worship. There

Being divine the king should not be seen by ordinary people, nor should he touch the ground with his feet

Crown Copyright/H.M. Stationery Office

The custom of consecrating the sovereign by anointing him with oil is part of an almost universal pattern of coronation: ampulla and anointing spoon used at the coronation of British monarchs

are several indications that in ancient times he also performed the role of the mythical dragon-slayer in the annual festival.

In India the king was in ancient times considered as a *deva*, or divine being. However, in later theory, it is kingship and not the king that is really divine. According to the Law of Manu the king was created from eternal and essential particles of the eight devas (gods) who are called the guardians of the world and who are believed to protect the eight main points of the universe. The king thus has something of these gods in him and is the protector not only of his people but of the whole universe. The king should be burning and dispel the beings of darkness like the sun; he should be gentle like the moon and promote vegetation and fruitfulness; he is the judge, like Yama; he is the master of wealth, like Kubera, the god of the north; his anger destroys like Agni, the fire; he is the lord of *dharma* (law and order) like Varuna; he controls the powers of fertility and causes rain, welfare and the growth of crops, like Indra; he is free like the wind; and he is the protector of all, like Vishnu, and gains control over the universe by taking the three strides of that god.

Being divine the king should not be seen by ordinary people, nor should he touch the ground with his feet. His insignia represent his sovereign authority and connect him symbolically with various gods. The royal throne is a representation of the sovereign seat of the god; it is often compared with the altar, also the support of a sacred being. The king is believed to incarnate various gods, especially Indra: 'May the king, the slayer of Vritra (the dragon) be our king and defeat the enemy.'

A further development of these ideas is found in the Buddhist concept of *cakravartin* or 'wheel king'. This is a legendary, universal ruler with conspicuous features of a solar hero.

In the Far East both China and Japan have known a well-developed sacral kingship. The Chinese emperor was regarded as the Son of Heaven. He thus held a unique position as God's representative and it was very important that he should have the divine mandate. He was to interpret the will of heaven, and as long as he properly took care of his office he was regarded as the guarantor of harmony in Nature and society. It was he who performed the most important sacrifices of the state. After death he attained divine rank.

The emperor of Japan was regarded as the descendant of the sun goddess Amaterasu and was called *tenno*, the ruler of heaven, or *tenshishama*, the sun of heaven. The term *mikado* 'the sublime gate', was used only in poetry.

The Manifest God

In Greece and Rome there was a peculiar development of kingship. At an early date monarchy was abandoned but the title of king (*basileus*, *rex*) was retained for a priest who exercised some of the king's sacral functions.

With the coming of Alexander the Great there was a change in the Greek outlook. Apparently under the influence of oriental ideas, the Hellenistic rulers began to claim divine prerogatives. They were given divine titles, such as *Soter*, 'saviour', and *Epiphanes*, 'manifest (deity)'. They were represented with a radiant crown, symbolizing their divine nature. In many cases they even received worship, at least after death. In philosophical writings the king was described as a representative of the godhead on earth, his duty being to imitate in his reign the divine rule of the universe. A true king is 'a living law', the very embodiment of universal order. Of rather theoretical interest is the idea that a good king has to suffer and be humiliated, the model being Hercules who was the son of Zeus but nevertheless had to humble himself and suffer.

Roman emperor worship was in many respects a continuation of the Hellenistic sovereign cult, but was probably also linked with ancient Roman ideas. Initiated through Julius Caesar and Augustus, it was originally concerned with the emperor's *genius*, and only after his death was he raised to the sphere of the gods (*apotheosis*). But gradually, beginning in the provinces, the emperor was acclaimed 'saviour' and 'god', and given divine epithets. Thus as time went on, a 'sacral emperor ideology' developed.

The emperor was thought to be the son of a god (Jupiter, Apollo) or the manifestation of a god on earth. Legends about the divine parentage of the emperor are found in the cases of Augustus and Nero. The emperor was Jupiter's deputy and image, and consequently the ruler of the world. The globe of the world belonged to his insignia – this is the prototype of the royal orb. Some emperors also claimed influence on the progress of the year and the order of Nature. The emperor's ascent to the throne was thought to inaugurate a new golden era, the effects of which extended to Nature and fertility. According to Seneca, the prince is to fulfil the functions of the gods on earth. So in his rule he should imitate the gods. He is the soul of society and its unifying force, the vital spirit of mankind.

With the introduction of Christianity as the official religion of the Empire much of this ideology became impossible. But many traits of it lived on, with a different interpretation. The emperor was regarded as God's and Christ's representative and deputy, and as the defender of the Church. The Empire became a dominion 'by the grace of God'. Much of this continued down through the ages and formed the background of medieval and even later theories of kingship. The symbolism of the royal insignia can be understood only against this background. There are even instances in England and France of the belief that the king can cure diseases (see KING'S EVIL).

KING'S EVIL

THE HEALING POWER of touch has been recorded throughout history among communities at all stages of social development as a faculty peculiar to specially endowed individuals including kings and magicians. Many of the healing miracles of Christ were effected by this means, and among anointed kings who were long believed to possess this quasi-divine power, were the emperors of Rome. Vespasian is said to have cured the maimed hand of one of his subjects by a single touch of the royal foot. The kings of France also practised healing by touch, traditionally instigated by Clovis in the 5th century, and in common with the kings of England they possessed the art of curing the King's Evil, or scrofula, a disease characterized by the enlargement and degeneration of the lymphatic glands. In 1686, on Easter Sunday, Louis XIV is said to have touched 1600 people.

According to William of Malmesbury, an English historian who lived in the 12th century, the first English monarch to exercise this art was Edward the Confessor (d. 1066) who was encouraged to do so by a woman to whom it had been revealed in a dream that the King could restore her health by the power of touch. Touching to cure the King's Evil became one of the minor functions of the English monarch, and this power was bequeathed as a royal heritage to successive kings, although records of subsequent cures do not in fact commence until the reign of Henry II in the 12th century.

The Tudor monarchs seem to have practised the rite extensively, usually at the behest of the parish priest who issued the necessary authority, but it was Henry VII who in the late 15th century established a definite touching ceremony for the first time. This consisted of the laying on of hands followed by the presentation of a small piece of gold. Henry VIII made a gratuity of 7s. 6d. to each of those he touched. Andrew Boorde, his physician, referred to the art in his *Breviarie of Health* (1547) as a power given by the grace of God to the anointed king. According to William Tookes, a 16th century authority on the subject, the reign of Queen Elizabeth I was characterized by innumerable cures among individuals of all social ranks. James I, who succeeded her, attempted to dispense with the rite altogether, although he finally consented to retain it for reasons of public policy.

A Corpse's Touch

During Charles I's impoverished regime in the 17th century silver was often substituted for the gift of gold, although occasionally no present whatsoever was made. The Restoration of the Stuarts saw the ceremony at its peak with vast hordes of the sick and suffering clamooring for the touch of the royal hand, and it is on record that Charles II touched 92,107 persons during his reign. Specially designed touch-pieces were introduced at this time showing the archangel Michael and a dragon on one side, and on the other a ship. This medallion, which was usually made of

Michael Halford/British Museum

University Library Cambridge

gold, was known as an 'angel'. A special prayer was included in the ceremony from 1684 until 1715.

James II continued the custom, which was referred to in the diary of Bishop Cartwright in his entry for 27 August 1687. 'I was at his Majesty's levee from which at 9 o'clock I attended him into the closet where he healed 350 persons.' The sceptical William III never performed the ceremony and is on record as having addressed one who sought his touch in the following terms: 'God give you better health and more sense.' Queen Anne was the last of the English sovereigns to touch for the King's Evil, one of her patients being the infant Samuel Johnson who was presented with his piece of gold in 1712, when he was less than three years old.

This royal rite finally became extinct in England during the Hanoverian succession, although even after its official discontinuance a lay 'toucher' named Tunis was apparently curing the King's Evil in Scotland by rubbing the affected spot with his hands. He claimed no special powers of his own but declared that 'it is God that cures'. Lay practitioners of the art were usually seventh sons of seventh sons, one of the more eminent of whom was Valentine Greatrakes, a Civil War veteran, who acquired national fame for curing the King's Evil and a multitude of other maladies, all of which he attributed to evil spirits. Yet another healer, James Leverett, claimed to have cured more than 600 people simply by touching them.

A Kirlian photograph of a steel ball bearing showing the characteristic light discharge

KIRLIAN PHOTOGRAPHY

KIRLIAN PHOTOGRAPHY is a way of photographing an object by exposing it to a high energy electric field. An effect like the miniature lightning storm shown in the illustration is typical. The object (in this case a steel ball bearing) appears surrounded by discharges of light. Kirlian photography is the result of an accidental discovery made in 1939 by a Russian electrical repair man, Semyon Kirlian, and developed over the next 30 years with his wife, Valentina.

Kirlian photography does not use a camera. The object to be studied is simply placed in a darkened room between a high energy electric field and a photographic plate. The flares and flashes are then recorded on the plate. In the case of inanimate objects, the colours of the energy discharges are constant. In the case of organic subjects, the flashes fluctuate and change colour.

It was originally believed that Kirlian images reflected the aura or energy field surrounding living matter, and that this made possible a new way of diagnosing illness from the condition of the aura. It is now thought that the radiant colour effects are the result of the process itself.

There is some indication that variations occur when do seem to relate to the state of the individual's physical and emotional health. So far, however, there is no trustworthy and controlled system of using the process as a therapeutic tool. Research into Kirlian photographic methods is continuing, and scientists are still hoping to develop new ways of using it.

ERIC MAPLE

Kiss

Gesture of love, respect, worship; the Greeks and Romans kissed images of the gods: visitors to the pope customarily kiss his ring or foot: the kissing of sacred objects such as the altar, pictures of the saints, and relics is common in Roman Catholic countries and to kiss the Bible is to confirm an oath taken; at the sabbath, witches were said to kiss the Devil 'under his tail'. See SABBATH.

Radio Times Hulton Picture Library

Kite-Flying

A popular pastime in many parts of the world, it is also a significant feature of many Eastern religious customs and festivals; kites, often in the shape of birds, men, fish and dragons, were flown over houses at night to keep evil spirits at bay, and in Siam large paper kites were flown in the hope that their fluttering would attract the seasonal winds.

Picturepoint London

KNIGHTS TEMPLAR

British Museum

IDEALISM, CHIVALRY and religious fervour inspired the Order of the Temple, founded c 1188 by Hugh de Payens of Champagne, and eight companions. This militant fellowship of knights dedicated their lives and wealth to the defence of pilgrims and the routes to the Holy Land; with such idealistic aims, they could not have foreseen that 250 years later the Templars' honour and renown would be destroyed by charges of heresy, unnatural vice and Devil-worship, levelled by a greedy and unscrupulous monarch, implemented by a timorous pope, and put to trial by the torturing hands of the Inquisition.

Within ten years of its inception the Order's white mantles (later emblazoned with a crimson cross), and black and white standard with its legend 'Non Nobis Domine' so fired popular enthusiasm that the noblest Europeans sought to join, while others endowed it with riches, lands and produce.

The Templars cut off their hair, let their beards grow long, and took monastic vows. The vow of poverty related only to personal property, each knight owning only the clothes, weapons and domestic utensils granted at his initiation, but the Order itself grew rich from gifts and benefits, which later aroused envy and antipathy.

Chastity was rigidly enforced, and the knights slept fully clothed in lighted chambers. They were forbidden to kiss even their mothers, or attend any gathering which might inspire longings for family life. This total avoidance of female company resulted in imputations of homosexuality. Such unnatural practices horrified the common people because of their heretical associations; many gnostic heresies, for instance, shunned normal sex because of its connection with birth.

The vow of humility required total submission to superior officers. No possessions might be locked away, and every personal letter had to be read aloud before the Grand Master. If captured, a knight could not expect to be ransomed, for that would incur the dissipation of the Order's funds on one individual.

Each group was organized as precisely as the Cistercian Order on which their rule was based, and every contingency governed by 62 rules set down by St Bernard, the ecclesiastical reformer who made the Cistercians into a world power. The Grand Master alone stood above these laws giving flexibility to an otherwise rigid code, and also making the Master the supreme ruler to whom every Templar owed total allegiance. As well as the cadre of knights there were lower categories composed of priests, soldiers and servants, all bound by equally strict rules, and associate members who flocked to the Order to secure religious benefits and indulgences.

Two factors distinguished the Templars from other monastic orders: their devotion to fighting, and the total secrecy surrounding all chapters, ceremonies and initiations. This secrecy eventually damned them for wild rumour fed on mystery, yet it is understandable that security such as this would be necessary in any military group. Despite differing language and nationality, the Templars became a closely-knit organization with branches throughout Europe. Only later did individual kings and prelates recognize and fear the potential danger from this independent and strong body, whose worldly power in time corrupted their former humility.

Their laudable aims and strict vows won the Templars papal acclaim, and the Order was showered with every religious privilege and immunity; they were exempted from taxes and secular laws, and became answerable only to the pope who threatened to

excommunicate anyone hindering or harming a Templar.

As soldiers, the Templars won an honourable name, even though the Crusades were a failure. With its immensely strong castles and enormous wealth the Order took on the role of financier. During truces it transacted business with the enemy, and undoubtedly absorbed some of the infidel's culture. So much confidence was placed in their complex of fortified estates like the Temples of London and Paris, that kings deposited their riches there for safekeeping.

The last years of the 13th century witnessed the inglorious finale of the Crusades. The Templars were the last to leave the Holy Land, and their famous Castle Pilgrim between Haifa and Arsuf was the final Christian stronghold to fall. Meanwhile the Church contented itself with promises of a fifth Crusade, which never took place, and a fiery resolve to hunt down the heretics in its midst, rather than to drive the infidel out of the Holy Land.

The Templars' career did not come to an end with the collapse of the Crusades and Cyprus became the new headquarters of the Order. Yet the power it possessed had subtly altered both the Templars' role and their reputation. Hatred and envy was stamped on the other side of the coin of admiration, for people dislike their creditors. The high-born resented the privileged knights who barely needed to pay homage to any monarch. The lowly resented that because of special tax exemptions the Templars undersold wine and wool from their estates. The Order's reputation for avarice grew alarmingly as the knights seized domains they considered rightfully to belong to them.

Individual members often played important parts in European affairs, having high positions in royal courts, and acting as special papal emissaries. The Order's coffers advanced money to kings for wars and dowries, and Templars hired themselves out as mercenaries.

It was for their wealth that the Templars were eventually destroyed. Philip IV of France, despite a devout reputation, had a devious, shifty character. He was eager to raise as much money as possible to finance his wars, and taxed his people unmercifully, while scheming to gain ascendancy over the papacy. From the outset this monarch desired the Templars' ruin in order to acquire their wealth, cancel his own debts to them, and curtail their power. He even tried, unsuccessfully, to join the Order. While showing ostentatious friendship to the Templars he sent his capable and cunning minister Guillaume de Nogaret to collect evidence against the Order.

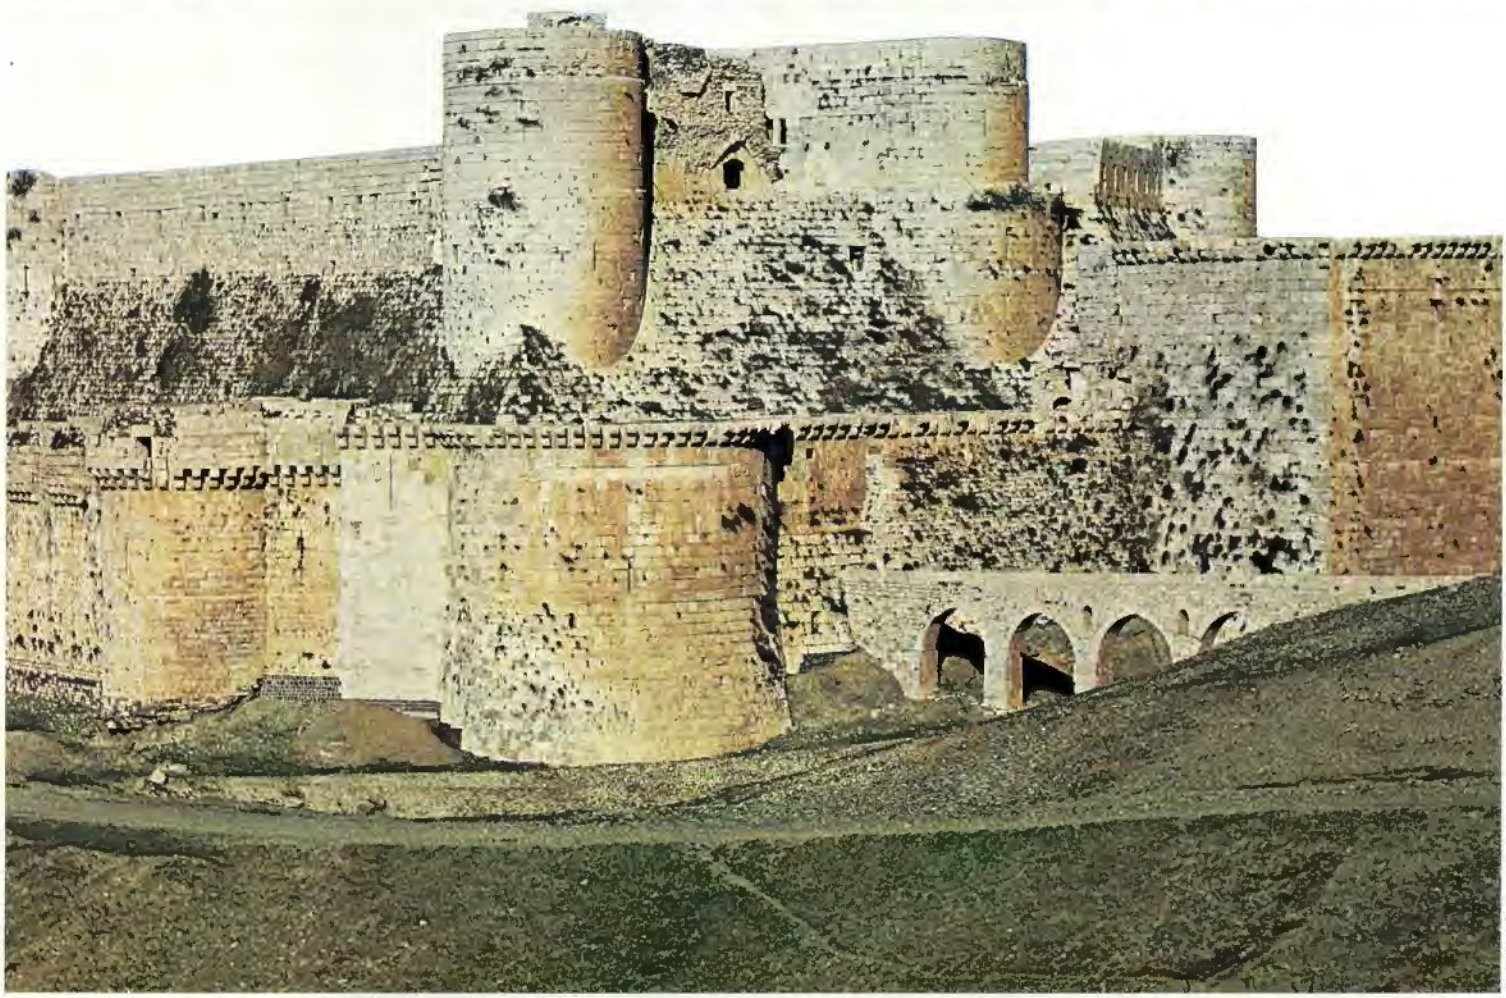
Heresy was the safest accusation to bring, for the Inquisition was bound to act on it, and it was almost impossible to get free from its clutches. For the Order's possessions to be confiscated in France it had to be dispossessed throughout Europe, and to do this Philip required Pope Clement's co-operation. The threats and exchanges between the two were dubious and dishonourable to say the least.

Worship of Baphomet

At daybreak on 13 October 1307 140 Templars and their Grand Master Jacques de Molay were arrested by de Nogaret in the Paris Temple, and their wealth was impounded, while all over France other members were seized. The atmosphere buzzed with rumours about the knights' vile deeds, and Philip encouraged popular hatred by announcing that the Templars' exemption from taxation had bled the country white, and that if the Order were dissolved debts would not have to be paid.

Torture was used to extract confessions; when these were retracted even grimmer measures were employed to punish the relapse. It is not surprising that in most cases the victims admitted their guilt. Briefly the charges were as follows: the knights put their Order before every other principle, swearing to enrich it by any means; at initiation a neophyte was required to spit or urinate on the cross and renounce Christ; indecent kisses were

The first aim of the Order of the Knights Templar had been to protect the pilgrim routes to Jerusalem and other holy places; later they became enormously rich and were destroyed for this reason by Philip IV of France who, greedy for their wealth, accused them of heresy *Left* Philip IV attends the execution of Jacques de Molay and other members of the Order: illustration from a 15th century Flemish manuscript *Below* Krak des Chevaliers in Syria; one of the Templar strongholds



A. F. Kersting

exchanged, and unnatural sex commonly practised and encouraged within the Order; they worshipped Baphomet (see BAPHOMET), sometimes said to be a stuffed human head, sometimes a head with three faces, and at other times described as a human skull, and the cord they wore over their shirts was hallowed by being wrapped about it, while an ointment made from murdered babies was used to anoint this grisly object. It was also said that they had betrayed the Crusades, and that their priests did not consecrate the host during Mass; that the Templars had worshipped the Devil in the form of a black cat, which they kissed beneath its tail. The life of anyone who confessed was to be spared, but refusal to confess meant death. However, the confessions were an odd assortment, and none of the charges was conclusively proved.

An element of truth probably exists among the accusations. The contact with the East had inclined some Templars towards Oriental attitudes; they may well have adopted some of the gnostic theories underlying Mediterranean civilization, and a few probably practised ritual magic. In such a closed society homosexuality is not unusual. With regard to the charge of the infamous kiss, the crude horseplay of the age may have produced a ceremony in which nobly-born knights forced underlings to show their subservience by kissing the preceptor's backside, while the alleged denial of faith could in fact have been a test of absolute obedience.

On 22 November 1307 Clement was more or less forced by Philip to issue a Bull ordering all sovereigns to arrest the Templars and seize their property. At this juncture monarch and Pope had both gone too far to risk the Templars ever being freed to join with friends in order to wreak vengeance on their oppressors.

Holy Relics from the Ashes

In several European countries the Order was not rigorously persecuted and there were no general confessions; Clement had to issue another Bull to force Edward II of England to use torture on English Templars. In France the Inquisition attempted to force the truth from the Templars for nearly three years. Many died from their ordeals. In 1310 a number of knights came forward to defend the Order, and Philip, unwilling to risk doubt being thrown on the proceedings, had 54 Templars burned to death. All refused to confess.

In 1312, the unhappy Clement, author of so many disgraceful Bulls, had to admit that there was not enough evidence to prove definite heresy. But the Templars' reputation was irretrievably damaged, and he dissolved the Order, stipulating that its funds should be transferred to the Hospitallers, a rival crusading order. Templars who had not perished by fire or in jail were allowed to join another order or to revert to the secular state.

Philip held on to the Order's property, enjoying its revenues during his lifetime, and finding various pretexts for making the Hospitallers pay over large sums, since the six-year inquiry into the Templars' misdeeds was said to have cost the state a fortune. With similar excuses Edward II, who had never very zealously attacked the Templars, retained their possessions, and squandered them on his favourites. In Spain, Portugal and Germany, where the Order had suffered least, and had in fact received royal protection, its estates and members were absorbed by existing orders, or diverted to found new ones.

On 19 March 1314 the final scene of the tragedy was enacted. After nearly seven years of captivity, Jacques de Molay was taken from prison to make a public confession after which he was to be imprisoned for life. To the consternation of the authorities de Molay declared himself guilty of only one offence: that of allowing torture to force him to lie, and declared the Order to be pure and innocent.

At sunset on the Ile de Palais in the Seine, de Molay slowly burned to death, protesting his innocence and winning admiration from the watching crowds, some of whom collected his ashes as holy relics. It was rumoured that de Molay's last words were to summon the Pope and the King to meet him before God's throne within a year. Strangely enough both Philip and Clement died within that time.

Chris Barker

'In the ocean many things are hidden': the kraken is said to be the largest of many gigantic sea monsters that reputedly lurk in the ocean depths

KRAKEN

'AMONGST THE MANY things which are in the ocean and concealed from our eyes or only presented to our view for a few minutes is the Kraken. . .' The sea monster described here by Erik Pontoppidan, Bishop of Bergen, in his *Natural History of Norway* (1752), was reputed to be the largest in the world. Also known as the kraxen, krabben or sea korven, it was so elusive as to be dismissed by ancient and modern sceptics as nothing more than a sailor's myth.

Throughout history, however, a few writers have mentioned a giant sea creature with characteristics similar to those of the kraken. Pliny wrote of a monster in the Straits of Gibraltar which blocked the entrance to ships; other experts on sea life referred to a mammoth starfish that had been found in the waters around Sicily.

It seems likely that the kraken was a kind of giant polyp or cuttle-fish, perhaps a survival of some almost extinct prehistoric sea creature. Bishop Pontoppidan, who wrote quite extensively about this inhabitant of Norwegian waters, had a theory that the floating islands which suddenly appeared or disappeared in Northern seas, were in fact kraken; and also that the medusa or jelly-fish might be its ovum.

Another bishop, cited by Pontoppidan as a reliable witness, claimed that in 1680 the remains of a young kraken were found putrefying when the creature got wedged among some rocks in a fiord. Apparently, the monster was not particularly dangerous, except because of its size. Any ship, even one as large as a man-of-war, that was caught up in the swell of a submerging or surfacing kraken would be wrecked.

The creature only appeared on hot summer days when the sea was calm. Norwegian fishermen, who rowed out several miles to where they reckoned the sea should be at least 480 to 600 feet deep, would suddenly find a depth of only 120 to 150 feet, and the water teeming with shoals of cod and ling. This they took to be a sign that a kraken was present. If the water began growing shallower they stopped fishing immediately, and rowed some distance away, for it meant that the monster was about to emerge.

Owing to its enormous size, the whole body was never visible; an entire kraken could be observed only when it was young. The back of a fully grown monster was estimated to be $1\frac{1}{2}$ miles in circumference, and at first sight the creature looked like a number of small bumpy islands, surrounded by fronds of floating seaweed, with fish leaping about the shallows. After a time, huge tentacles were said to appear, with which the kraken propelled itself along, and gathered food.

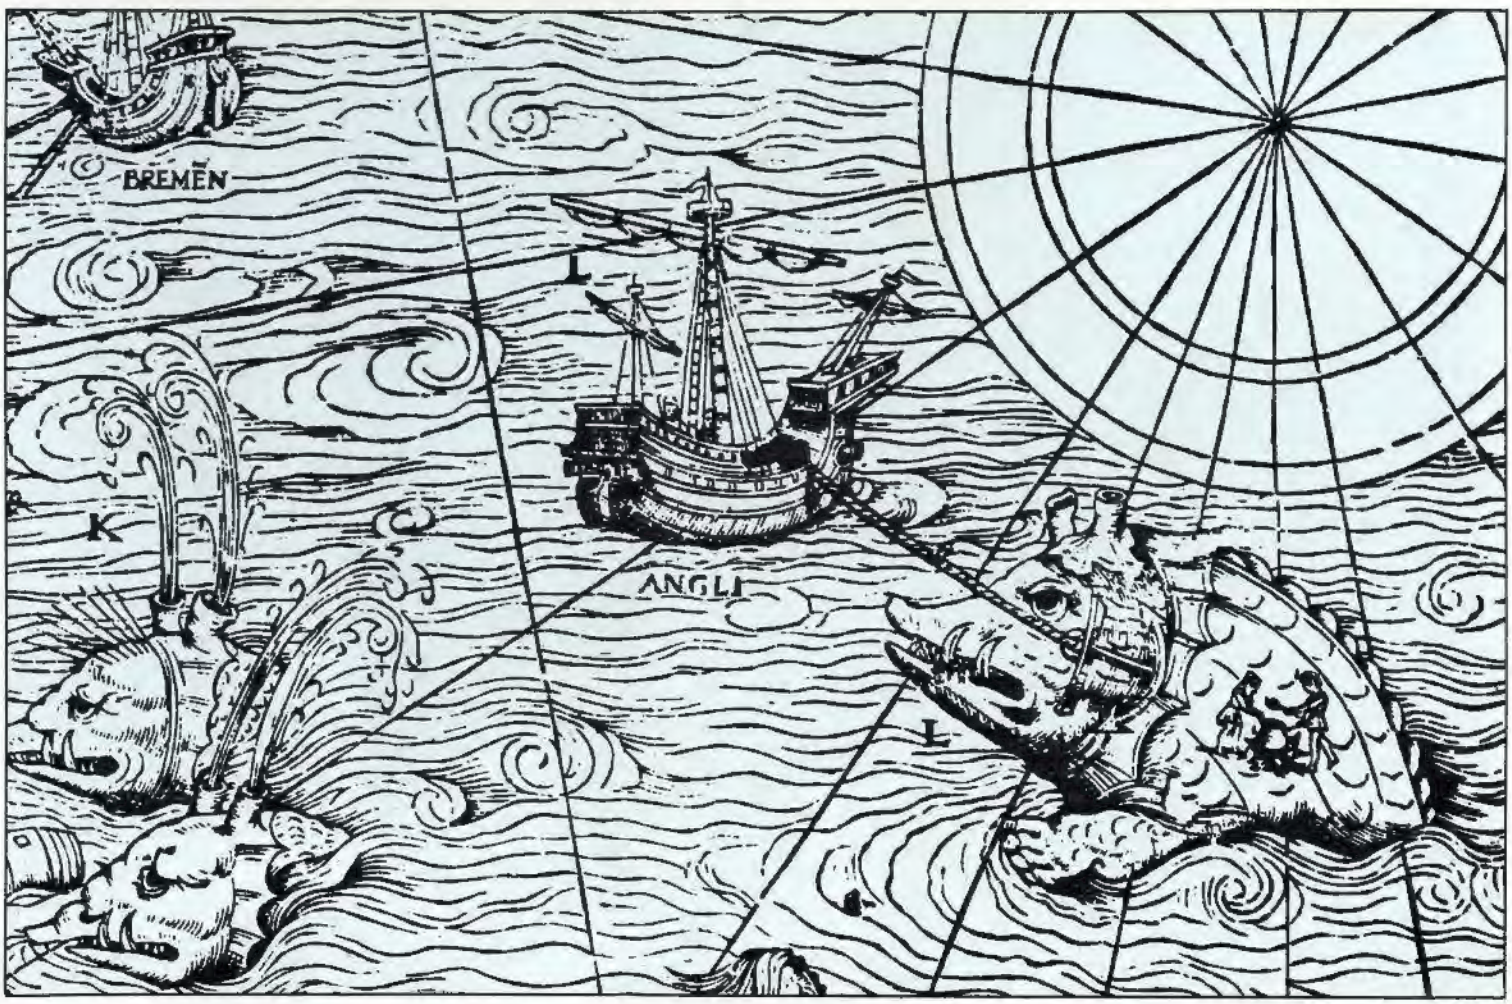
The kraken only remained on the surface for a short while. Its descent into the ocean was a treacherous time, for it churned the waters around it into a whirlpool and drew everything into its depths.

A Pungent Sea

The creature lived according to a definite rhythm. For some months it was seen only to eat, and at others solely to excrete. During the latter period the sea's surface became thick and disturbed and gave off a pungent aroma. The smell and muddiness attracted the shoals which gathered to feed, and the kraken then opened up its tentacles and drew in all the fish, which were converted into bait for the creature's next feeding period.

Whether the kraken was merely a legendary sea monster, or the remains of some primeval sea creature, or the over-dramatized account given by lonely sailors of an extremely large cuttle-fish, Bishop Pontoppidan's own words seem particularly apt in describing all those monsters which the modern world has not glimpsed: 'In the ocean many things are hidden.'

(See also FISH.)



The kraken was said to surface only on summer days when the sea was calm, and because of its enormous size its entire body was never visible; at first sight the monster could be mistaken for an island, or a group of islands surrounded by fronds of floating seaweed with fish leaping about in the shallows: 16th century *Carta Marina*, a map of the North Sea showing a ship anchored to one of these gigantic creatures; two sailors have disembarked and are cooking a meal on the monster's back

KRISHNA

Indians have believed that Krishna was a god for more than 2000 years, and from him they have derived inspiration and guidance in ultimate matters

Believed by some scholars to be based an a historical figure, Krishna had many endearing human characteristics and was regarded as the fount of all sacred and profane love; to the devout Hindu he is the eighth incarnation of the great god Vishnu

LITERALLY 'the dark-coloured one', Krishna is one of the major gods of Hinduism, and has been the centre of a richly varied system of religious beliefs for more than 2000 years. Although his importance has been obscured to some extent by his association with the god Vishnu, of whom he is generally said to be the eighth incarnation, it is likely that Vishnuism has been enriched by the devotion and meditation inspired by Krishnaism, its seemingly subordinate branch.

Even in the oldest texts Krishna is represented as a god, or more often as God. In the *Mahabharata*, the voluminous Indian epic that tells of the war between two related royal families, Krishna is the divine charioteer, cousin and friend of Arjuna one of the protagonists. Arjuna seeks Krishna's guidance on the eve of battle, and the god's reply constitutes the text of the *Bhagavad Gita*, an immensely influential and much-admired work (see BHAGAVAD GITA). Krishna reveals himself as God the Absolute, and Arjuna wins the battle with the help of the god.

The *Mahabharata* deals with the war and there is no consistent characterization of Krishna. This vacuum is filled by a group of texts known as *Puranas*, literally 'old traditions', whose origins date back to the last few centuries BC. Myths, legends, fairy tales and stories about Krishna were collected for about 1000 years, and were summarized in an extensive 'biography' in the *Bhagavata-Purana* which, according to some scholars, was written in the 10th century AD.

Dallying with Milkmaids

According to this text, the goddess Earth asked Vishnu to free her from the many demons that oppressed her, and the god decided to 'descend from heaven to earth' (a phrase that gave rise to the concept 'avatar', 'one who has descended') to be born as Krishna and kill the demons.

It had been prophesied that a demon king Kamsa, who reigned over Mathura in northern India, would be killed by the eighth child of Vasudeva, a relative of his. He therefore had Vasudeva's first seven children murdered but the eighth, Krishna Vasudeva, was exchanged, while still an embryo, for the daughter of Yashoda, the wife of a herdsman called Nana. Saved from Kamsa's persecution, Krishna was born among cowherds in the lovely country of Gokula near the river Yamuna, now known as the Jumna. Many legends tell of the miraculous deeds he performed during his childhood and youth, protecting the lives of the herdsmen from demonic attacks. As an adolescent boy, being extremely handsome and skilful at playing the flute, he won the love of all girls and women in Gokula, referred to in literature as *gopis*, 'milkmaids', and spent his time in amorous dalliance. But he had to continue his mission against the demons, and eventually left Gokula and his mistresses, never to return.

He went first to Mathura where he killed Kamsa and gained his kingdom; further stories tell of battles with other demons, and of one instance when Krishna and his people, forced to flee, moved to the legendary city of Dvaraka. He continued to further his mission against the demons in the war described in the *Mahabharata*, as a result of which many more oppressors were killed. Krishna's stay on earth came to an end when, cursed by a hermit, his sons and relatives killed one another while drunk. He himself was shot in the foot – his only vulnerable spot – by a hunter who mistook him for a deer, and returned to his heavenly abode.

There are certain gaps in this synopsis of the life of Krishna and scholars have tried to solve the problems raised by separating different layers and milieus in the mythical accounts, in an attempt to trace an original Krishna figure. It has been said that he was originally a herdsmen's god, or a fertility god, and that another Krishna was a shrewd politician, or the teacher of a religion which later deified him. But Indians have believed that Krishna was a god for more than 2000 years, and from him they have derived inspiration and guidance in ultimate matters.

Oversimplification of the god's character to single aspects cannot do justice to Krishnaism as a religious movement. No scholarly analysis can further understanding unless it centres around Krishna as the god who has become part of Indian religious consciousness. Research by W. Kirfel and W. Ruben throws new light on his background. Their investigation of relevant texts reveals that Krishna was a tribal king or chieftain involved in warfare and possessed of predominantly human characteristics, who was possibly a historical figure. This theory facilitates understanding of Krishna: mythical tradition has faithfully preserved his historicity while transforming him into the universal protector and lover.

The 'dark-coloured one', Krishna is the most celebrated of all Hindu gods; it is said that the goddess Earth asked Vishnu to free her from the demons that oppressed her, and the god decided to be born as Krishna and kill the evil-doers *Previous page* A monk approaches Krishna in a grove *Right* The god destroys the demon Nikumbha: both illustrations are from the Victoria and Albert Museum

Krishna's historical origin gives a richness to Vishnu's appearance on earth that no imaginary account could have given, an astonishing human richness justified by tradition, that inspired philosophical discussions of immense spiritual fertility. For example, Krishna's love-affairs with the wives of cowherds in Gokula are contrary to all moral standards. An idealized legend with no historical basis would have eliminated this stumbling-block; but the tradition of Krishna's humanity inspired not only lengthy theological discussions but also gave new insights into the essence of love and, in marginal religious circles, motivated certain religious sexual practices.

The two elements in Krishna, the human and the divine, were fused in a process that is viewed differently by scholars and by Hindu believers. The former regard it as a process of deification that took many years, in which essential characteristics were abstracted from a historical person and interpreted in the form of myth, fairy tale and legend until Krishna finally became a god and was identified with Vishnu. To the Hindu the process is one of 'incarnation': the god Vishnu decided to he born among men as Krishna.

Krishna was God to a large group of Hindus over a long period of time, and accounts of his life inspired not only philosophical and theological reactions

Hamlyn Group

The divine, that which saves and heals, the means through which man may obtain release from the endless cycle of rebirth, is embodied in Krishna

but also affected religious practices and the patterns of thought on which they were based. A few examples of these reactions, which took many different forms and which appeared all over India, are given here, and show how the believer understood and interpreted the concept of Krishna, ignored by, or even in the face of, official doctrines.

The many, complex responses to Krishna are summarized by the term *bhakti* which can be roughly translated as 'devoted loving attachment'. Basically this concept refers back to human relationships such as those between king and vassal, husband and wife, and so on. The *Mahabharata* contains examples of this relationship: between Krishna and his wife Satyabhama, or between the god and Arjuna. Transformed into religious love the relational aspect is retained as being essential, in contrast to the other religious ideal, to become one with the Absolute, which is found especially in the *Vedanta* and schools of Shivaism.

Bhakti has many shades and nuances and makes use of various levels of the human personality. The most archaic expression of religious response to Krishna could be described as 'materialism'; but this word has various undertones and associations. The term 'substantialism' is preferable; this is the concept that the divine, that which saves and heals, the means through which man may obtain release from the endless cycle of rebirth, is embodied in Krishna. This divine is transmitted to anyone in contact with Krishna, either through his physical touch or through the thought of him, for to think of Krishna is in a way to be filled with that 'substance' – even if the person concerned has no moral, positive or negative, attitude towards the god. There are stories of demons and rascals who were saved through contact with Krishna when he killed them. Though only Krishna's contemporaries could benefit from his touch, all were able to think of him. This idea is now archaic but it is still reflected in certain practices; a man may, for instance, achieve salvation by constantly murmuring the name of Krishna.

Much more important than this archaic belief was a form of religious response that can be roughly described as 'emotionalism'. Certain elements in the Krishna myth gave ample scope for light-hearted enjoyment, his jokes as a child, for instance, or his love-affairs with the milkmaids. The devotee of Krishna creates a relationship between himself and his god by filling his soul with the wonders and pleasures of Krishna's earthly life, and not through rational thought or as a result of performing impersonal rites.

The origin of this emotional bhakti is still obscure, but it seems to have started in southern India where it flourished from the middle of the first millennium. A group of ecstatic men and women known as *Alvars*, 'the immersed ones', wandered around this region preaching, and worshipping Vishnu and Krishna through songs, dances and music. It is likely that the *Bhagavata-Purana*, which presented the Krishna life

Krishna was regarded as the fount of all love, sacred and profane *Left* The god was said to have had many mistresses and wives, but his special beloved was a cowgirl called Radha, and the theme of their love for each other became the focus of medieval Krishnaism: Krishna and Radha, 17th century miniature *Right* The god rides through the air on a symbolic elephant made from young women

C. M. Dixon/Victoria & Albert Museum

While still an embryo Krishna was exchanged for the daughter of Yashoda, the wife of a herdsman, in order to escape death at the hands of the demon king Kamsa; he spent his early years among the cowherds of Gokula: sandstone carving of Krishna with a bull

as a series of wonders, full of emotional flavour, was closely related to this movement. From the start this form of devotion was closely associated with the arts; the music and dancing of the Alvars, and the beauty of the language in the *Bhagavata*. This continued throughout the history of Krishna bhakti, and even today a great deal of Indian music is based on the Krishna legends.

Universal Fount of Love

The most attractive theme for this emotional devotion was naturally Krishna's colourful adventures as a lover. Radha, a special beloved of his, is introduced into texts from about 500 AD onwards (but not into the *Bhagavata-Purana*) and the Radha-Krishna theme became the focus of Krishnaism in medieval India. A host of documents of all kinds, geographical, cultural and above all religious, reflects the immense appeal of this motif for the Indians.

The poet Jayadeva (12th century AD) retold the story of the love between Radha and Krishna in the form of a series of love songs, using the elaborate rules of Sanskrit poetry; the seemingly profane character of these creates for the devotee an intense erotic atmosphere, which he can release into the fount and origin of all love, the divine lover Krishna.

The key concept of the Indian theory of poetry was *rasa*, 'flavour', which denoted an aesthetic sensation suggested through the emotive quality of the words of a poem, and this concept was transferred to religious experience: the person of Krishna and the incidents in his life could evoke a religious rasa, and in a religious context even secular poetry could give rise to the same sensation. These ideas were eventually incorporated in an elaborate system of religious poetics by the Bengali philosopher and poet Rupa Gosvami (16th century AD), a pupil of the mystic Chaitanya.

Chaitanya took from the Radha-Krishna theme the aspect of Radha's final separation from Krishna when he left her, never to return, and used this theme to express his own mystical experiences as unfulfilled longing for Krishna; in other words, he looked upon himself as participating in the very suffering of Radha.

It is interesting that one group of devotees, the Sahajiya sect, made use of the imagery of the Radha-Krishna theme but transferred it from a mythical to a psychosomatic level: Radha and Krishna are two essential elements in every human personality and through their union, which is brought about by physical acts, final salvation may be achieved.

It can be seen that a rich and varied world of religious beliefs and responses has developed around the figure of Krishna, the human god who presents always new, and sometimes shocking, aspects to his followers. While the theologians, believing that the beliefs and practices of the Krishna sects should be acceptable to orthodoxy, worked ceaselessly through the mass of Hindu philosophical and theological speculation and tried to incorporate Krishna and Krishna bhakti in a universal system of thought, the mystics repeatedly broke the accepted social distinctions, stressing that in the presence of Krishna and his grace social status was not essential.

In the West, Krishna is famous mainly as the teacher of the *Bhagavad Gita*, and it is tempting to see him as the founder of a new religion, a point of view that is in a way justified by the enormous influence he has exerted through the *Gita*; but this work may well be an early theological reflection on Krishna, put into his own mouth. The richness of Krishnaism can probably be best understood if it is seen as a basic force that produced many different expressions, inspired by the intense bhakti relationship between devotee and Krishna, and the former's intense meditation on the person of the god.

Diagram of the major chakras situated along a shaft from the base of the spine to the top of the head. When awakened, the kundalini rises through these centres of psychic energy releasing potent forces

KUNDALINI

Within every man, according to Hindu mystics, sleeps a tiny coiled serpent, a potential source of immense power but extremely dangerous if aroused without due care and preparation

KUNDALINI

THE KUNDALINI might be described briefly as 'the fiery serpent-power within', if one is not too exacting about definitions. Such a symbolic description would be in accordance with that given in Hindu texts on the subject. The kundalini forms part of what is called the 'subtle body', an interesting concept of esoteric physiology, and one that has been minutely investigated by exponents of yoga (see YOGA). In many occult systems it is believed that apart from the muscles, veins, arteries and nerves that are known to regular anatomy, there exists in man an intricate network of invisible ganglia radiating out through his whole body like a spider's web. The strands come together at certain points, not only among themselves but also where they connect with the physical body. In yoga these junctures where the physical and subtle bodies meet and interact are known as *chakras*, or 'wheels'.

The chakras, great or small, are thought to be psychic dynamos, centres of superphysical energy. They have no physiological existence, because although the corresponding points of their contact with the physical body are known to occultists, such as the point near the solar plexus, an examination of that area in the physical body will not disclose its presence. It remains invisible, intangible and 'subtle'. And no part of the subtle body can be subjected to laboratory analysis or studied under the microscope.

What the chakras are in reality presents another problem. For while the anatomical description of the heart, liver and lungs in two different textbooks will be identical, the description of the astral body and the chakras may not necessarily be the same, the reason being that our information about the subtle body is based entirely on subjective or interior knowledge. The chakras cannot be laid out on a dissecting table like pieces of tissue; they can only be known through meditative experience.

The actual juncture-points between the subtle and the physical bodies are said to be numbered in hundreds. But these have relevance largely to a system of healing by 'pressure-points', such as is used in Chinese therapy by acupuncture, where healing is effected by pricking the body at these points with a needle (see ACUPUNCTURE). Only the major chakras need to be taken into account when considering the kundalini. They are arranged along a shaft of the subtle body that is believed to pass through the human frame from the base of the spine to the top of the head. This shaft, called the Rod of Brahma, is located within the spinal column, and within it again there run three channels, a central one (the *sushumna*), one on the left of it (the *ida*) and one on the right (the *pingala*). The central channel is normally closed.

The major chakras are said to be seven in number, situated approximately as follows: one is at the base of the spine, near the tail bone (called the *muladhara*); the next is in the region of the sex organs; the third in the region of the solar plexus; the fourth at the level of the heart; the fifth at the base of the throat; the sixth behind the meeting-point of the eyebrows; and the seventh just above the crown of the head (called the *sahasrara*).

Hindu occultists visualize the kundalini as a small serpent lying in a spiral of three and a half coils at the base of the spine, near the coccyx and between the anal and genital regions. It is frequently personified as a goddess, whose spouse Shiva resides in the sahasrara. Although an invisible and 'astral' element, the kundalini is the central nucleus of vital energy, and a repository of material, physical and sexual force.

In the astral body of the average person the kundalini lies asleep, with its head blocking the central channel, the sushumna of the Rod of Brahma, the 'gateway of ascent'; the man is left undisturbed by its presence and indeed unaware of its existence. This is all to the good. For the ordinary man it is important that the serpent should remain dormant, since it has a tremendous power when aroused. If disturbed, accidentally or by recourse to techniques ignorantly applied to awaken it, this force can prove very dangerous. Then the kundalini raises its head and begins to move about in a disorganized manner, raging unrestrained through the lower chakras and causing an abnormal excitation of the baser instincts and passions.

The correct method of arousing the coiled potency is extremely complex, being concerned with the controlled direction of the released force by certain definite stages upward through the chakras till its contact with the highest centre, the sahasrara, is achieved. Those who wish to further their knowledge of the kundalini by practical experience, or who desire to achieve the powers that the aroused kudalini engenders, have to submit to a long period of preparation, for the ability to control the released force takes many years of arduous training to acquire.

Long Discipline

Awakening the kundalini is the climax of a long discipline involving practically every major technique of yoga. It calls for a combination of bodily posture *(asana)*, hand gesture *(mudra)*, mystic syllables *(mantra)*, breath control *(pranayama)*, eye-focusing *(trataka)*, symbolic diagrams *(yantra)* and super-concentration *(dharana)*. The practitioner seats himself on the floor in the classical cross-legged squatting position, with hands on knees, thumb-tips touching finger-tips. He then 'focuses' his eyes on an imaginary spot at the top of the head, or on his forehead just above the meeting point of the eyebrows, or on the tip of the nose.

Breath control plays a part of great importance in the kundalini technique, and without its proper application the conditions for awakening the serpent can never be successfully fulfilled. Breathing must be co-ordinated with certain 'interior' exercises, which in themselves can prove to be dangerous if not correctly done: for they can upset the natural working of the breathing apparatus so that one is unable to breathe normally and automatically, but is forced to do so like an asthmatic, gasping for air and forcing the ribs to open and close until the regular rhythm is restored. Expert guidance is absolutely essential.

The first step in breath control is to establish a pattern. A common ratio adopted is 3-2-3: three units for drawing the breath in, two for retaining it and three for expelling it. The unit, known as the *matra*, may be one second or other fraction of a minute, but is usually calculated by the time it takes to stroke the knee with a circular motion three times and then snap the finger and thumb once.

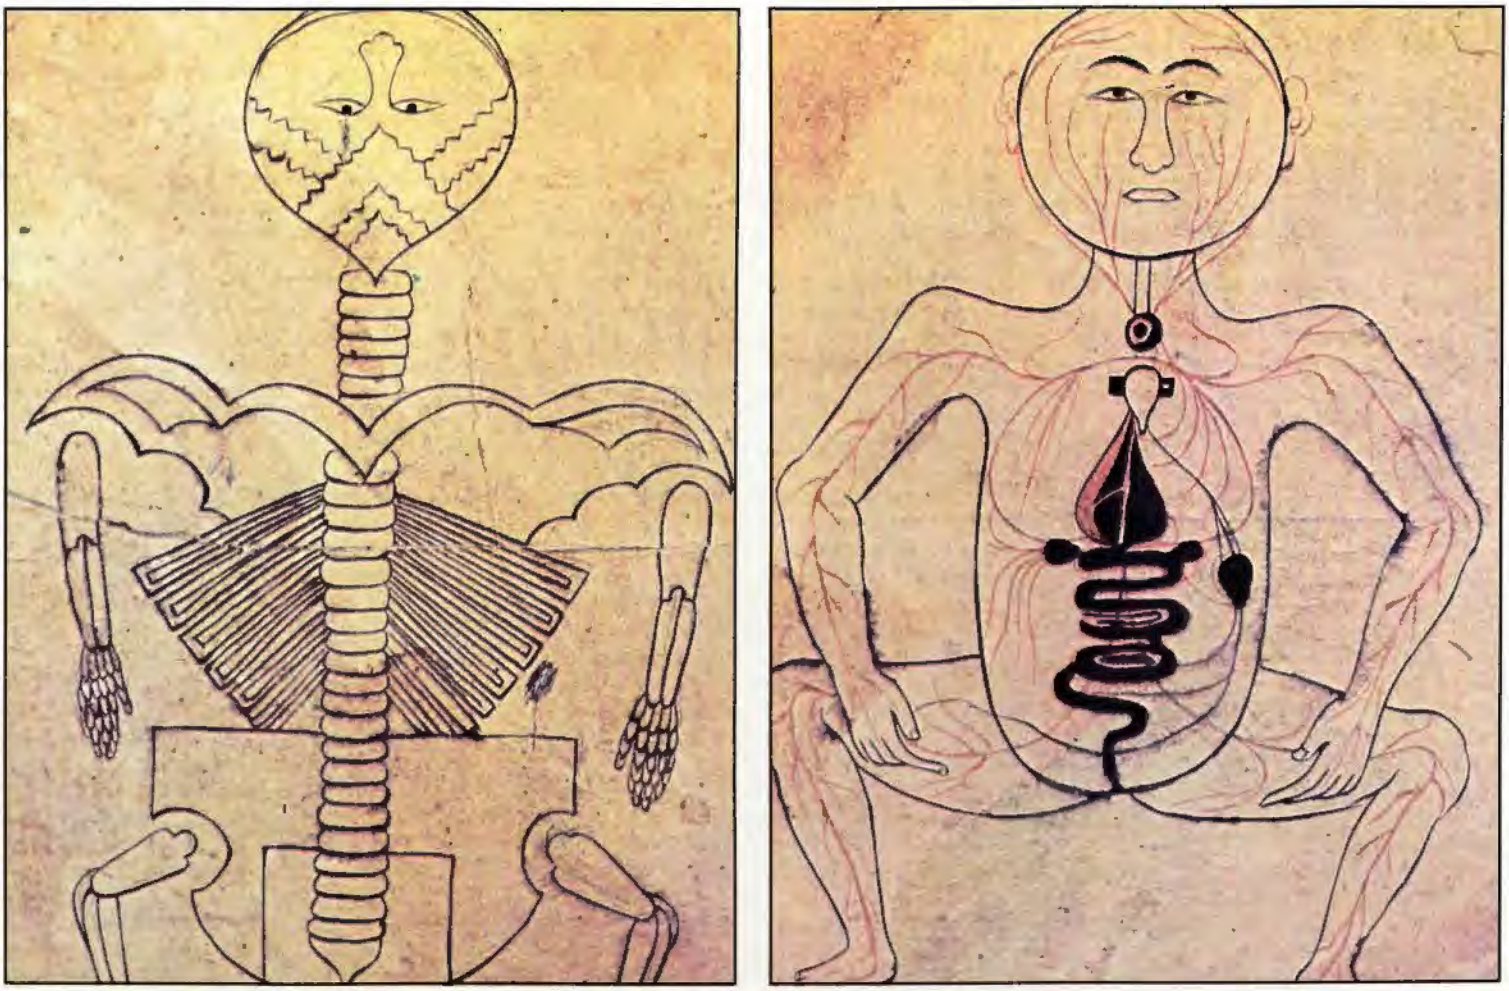
The breathing is then diffused into two streams of subtle breath *(prana)*: an upward moving breath from below, and a downward moving breath, both breaths being directed towards the diaphragm to be collected there as if charging a battery. At a certain moment, which may be internally triggered or may be signalled by the guru (the teacher), the two breaths are conjoined. Breathing is instantly stopped, the two breaths are suddenly impacted and directed down towards the kundalini. The two lateral columns within the Rod of Brahma are blocked and the central column, the sushumna, is opened and the kundalini awakened.

Body Filled with Fire

In the figurative wording of the Hindu texts the kundalini first stretches itself, the three and a half coils uncurl and the tiny serpent begins to tremble. A sensation of warmth is one of the earliest symptoms of the kundalini's awakening. The feeling starts from the muladhara, the basal chakra at the lower end of the spine. The temperature rises from warm to hot, followed by a sensation of burning heat that may spread through the whole body. From the tips of the toes to the top of the skull there seems to be a sense of flaming power. By this time the serpent is upreared, ready for its journey.

Once kindled the serpent-fire must be carefully directed, otherwise it will become a destructive force. The proper progression of the kundalini lies through the secret gateway of ascent and then upward through the various stations of the chakras in order. And here the long years of preparatory discipline must be brought to bear in mastering the fierce energy that has been aroused. In the uninitiated experimenter its awakening can create a sense of acute distress mounting to a feeling of uncontrollable panic, because he has no means of checking the rampaging creature unless it be in prolonged and agonizing bouts of sensual indulgence to afford some measure of relief.

Under the tutor's guidance, the acquired techniques are now brought into operation. The normal ratio of inbreathing, retention and outbreathing has to be changed once more, and this change must be co-ordinated with the intonation of specific mantras. A mantra is a mystic formula, which often



In yoga, the kundalini, when aroused, rises along a shaft called the Rod of Brahma. This is located within the spinal column *(left)* and within it again there are three channels. Normally the kundalini serpent *(right)* lies coiled asleep with its head blocking the central channel, the *sushumna*, but can be induced to awaken by the application of certain yogic disciplines. Two anatomical drawings of the 1st century AD

consists of a single syllable (see MANTRA). Although meanings have been ascribed to them their main purpose is to create a particular 'vibration' within the subtle body and urge the kundalini along the stations of Brahma's Rod, directing it from chakra to chakra until it reaches the sahasrara at the top of the head. As it moves up the column it either touches or pierces the chakras one after the other. Each chakra is compared to an inverted flowerbud pointing downwards; as it is pierced it folds in upon itself, closes into a tight ball and then blossoms out, its petals unfurled and facing upward.

As the kundalini rises it becomes progressively filtered and sublimated. Each chakra pierced and opened brings a new power, a new experience and a new vision. The opening of the basal chakra confers regenerative power; the solar plexus gives control over the internal processes; the heart plexus controls the subtle winds; the throat chakra the etheric elements; the eye chakra rules elemental beings; and the sahasrara brings ultimate understanding of Nature's mysteries.

Among the many phenomena accompanying the activated kundalini are strange auditory experiences. These sounds are not externally heard. Their sequence begins with a high shrill, like the chirping of crickets, and the novice may be deluded into interpreting the sounds as 'voices'. In such cases the attempt should be discontinued, for he is not yet sufficiently adept to carry on. If all goes well, however, the shrill sound begins to change. It is lowered in pitch and becomes like the buzzing of a bee, then a dull drone, the sound of a flute, a bell, a deeper boom, and then the roar of a distant ocean.

At some time during the auditory stage physical symptoms also begin to manifest themselves. The practitioner suffers from a sense of dizziness accompanied by nausea. His balance is disturbed and his body sways as he sits. Foamy saliva fills his mouth and he is beset with a feeling of suffocation and dread.

The Voice of the Inner Silence

In this welter of sensations he gradually becomes conscious of a pinpoint of silence. He must concentrate his attention on that point but should not seek to enlarge it. It will expand on its own, like the ripples of water when a stone is thrown into a pool. He will become aware of a growing space of absolutely 'colourless' sound, soundlessness which is more than a mere absence of sound. This phenomenon is known as the voice of the inner silence. It is the field of the potentiality of sound; the abstract region where no sound dwells but where Sound emanates.

To the inner perception there is simultaneously presented a vision of light, which passes from a bright glow to a heaven full of brilliant dots, like stars; then flaming tongues of fire, geometrical radiances and coloured shapes. All this is apprehended as if just behind the eyes or the meeting point of the eyebrows. There follows a sudden suffusion of shining whiteness that is no longer beheld as an 'optical' experience, but is an awareness of the supreme Radiance itself.

If the basal chakra be the negative pole of the subtle body, the sahasrara is the positive, and when the two polarities are linked the experience is described in language reminiscent of the sublimest raptures of the mystical spirit. Within the subtle body of the yogi the God and Goddess, Shiva and Shakti, meet in close embrace. All normal mental processes are suspended; the traffic of the senses is brought to a standstill; the ego is extinguished. All things become one; differences vanish and the oneness of the self and the Infinite is apprehended in the highest dimensions. This is Union, Absorption, Identity. The whole psyche is illuminated and the yogi, merged with the Resplendent Void, achieves the transcendent state of Being-Consciousness-Bliss. (See also DEATH.)

BENJAMIN WALKER

ALICE KYTELER

THE FIRST, and the most famous, witch trial in Ireland was that of Dame Alice Kyteler of Kilkenny, in 1324. She was a member of an Anglo-Norman family long established in Kilkenny, and a woman of considerable wealth and influence. At the time of the trial, she was the wife of Sir John le Poer, but she had been married three times before. Her first husband was William Outlawe, a banker of Kilkenny, by whom she had a son, also named William Outlawe. Her second and third husbands were Adam le Blund, of Callan, and Richard de Valle. All these men in their turn had bequeathed the bulk of their property to her, or to her son William, thereby impoverishing their other children. The latter suspected, and were later to declare in formal charges against her, that she had enchanted their fathers in order to make them dispose of their wealth in this manner, and that she had subsequently murdered them, either by poison or by sorcery. When her fourth husband, Sir John le Poer, began to suffer from a curious wasting disease which reduced him to a state of extreme emaciation and weakness, and caused his hair and his nails to fall off, she was suspected of bewitching him also.

Sir John himself seems to have thought his illness was natural until a maidservant in his house warned him that it was more probably due to spells cast upon him by his wife. He then commanded Dame Alice to give him her keys, and when she refused, he took them by force. Inside some locked chests, he found certain magical powders and ointments, and other things indicative of sorcery. In his *Chronicle of Ireland* (1587), Holinshed says that these included 'a wafer of sacramental bread, having the devil's name stamped thereon instead of Jesus Christ, and a pipe of ointment wherewith she greased a staff, upon which she ambled and galloped through thick and thin, when and in what manner she listed' (see BROOMSTICK). These two items are not, however, mentioned in the contemporary records, and it is possible that they are later additions to the story. Sir John gave all his alarming finds to two trusted friars, who carried them, on his instructions, to the Bishop of Ossory.

The Bishop at that time was Richard de Ledrede, an Englishman who had been trained in France. This was a period when the notion of witchcraft as a singularly evil form of heresy was gaining ground in Europe, and the Bishop already believed that he had found evidence of 'a certain new and pestilential sect' in his own diocese. He ordered a close investigation to be made into the affair of Dame Alice and subsequently charged her, and ten others, her alleged followers or accomplices, with practically every kind of heretical wrongdoing mentioned in the later witch trials of the 16th and 17th centuries. Apart from the murder of her first three husbands and the bewitching of Sir John, Dame Alice was accused of denying Christ and abstaining from Christian worship, offering sacrifice to demons, consorting carnally with a familiar spirit called Robin *filius Artis*, or Robin Artisson (see FAMILIARS), and a variety of other abominations.

This Robin Artisson was curiously described as *ex pauperioribus inferni*, one of the poorer folk of hell. He appeared sometimes as a cat or a shaggy black dog, and sometimes as a black man of low stature, accompanied by two others similar to, but taller than himself. From him, Dame Alice had acquired all her wealth; since she had actually inherited it, this probably meant that he taught her how to enchant her husbands so that they left it to her. She and her followers had offered to him cocks and other living creatures which they tore to pieces at the crossroads, afterwards using the entrails to make ointments and powders for purposes of evil magic. The other ingredients of these horrible compounds were herbs of various kinds, spiders, black worms, the flesh of serpents, hair and nails taken from dead bodies, and the brains and wrappings of an unbaptized child, all boiled together in the skull of a decapitated felon over a fire of oak-logs. In addition they sought advice and responses from demons by means of lots; and they had used blasphemous mock rites of excommunication against Dame Alice's husbands, cursing them in every part from the crowns of their heads to the soles of their feet and, at the end of the ceremony, solemnly extinguishing the candles by which it had been lighted.

When the long indictment had been drawn up, the Bishop wrote to the Chancellor, Roger Outlawe (who was related to William), asking for the immediate arrest of Dame Alice and her confederates. He was soon to learn that the affair could not be handled quite so easily. It is possible that he was not very popular in his diocese. The Bishop's subsequent history soggests that he was hot-tempered and overbearing by nature, and a heresy-hunter of a type not previously known in Ireland. He was also an Englishman, which would not endear him to his Irish associates. In the course of several heated disputes with Sir Arnold le Poer, the Seneschal of Kilkenny and probably related to Dame Alice's fourth husband, the latter referred to him as 'an English foreigner' and 'that good-for-nothing rustic runaway from England'. What is certain is that he underestimated Dame Alice's strong local influence and family connections. William Outlawe sprang to the defence of his mother, sheltered her in his house and appealed to the Chancellor and to the Seneschal. The Chancellor refused, or delayed, the necessary warrant on legal grounds, whereupon the Bishop excommunicated Dame Alice and summoned her, on his own authority, to appear before him. She ignored the summons and withdrew into hiding.

The Bishop then cited William Outlawe for heresy. When he refused to withdraw this charge, Sir Arnold le Poer threw him into prison and kept him there until the date named in the citation was past. Nothing daunted, the Bishop placed the whole diocese under an interdict and cited William Outlawe again. Twice he presented himself, in the full splendour of episcopal robes and mitre, at the Seneschal's court, to state his case and demand the arrest of the accused persons, and on both occasions he was refused entry.

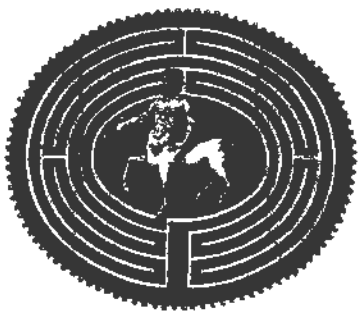
Meanwhile, even in concealment, Dame Alice still had sufficient influence to cause him to be summoned to Dublin to explain the serious matter of the interdict and her own excommunication. Then, at long last, the tide turned in his favour. After some further trouble William Outlawe was forced to submit and was imprisoned for nine weeks. A hollow (and as it turned out, impermanent) reconciliation took place between Sir Arnold and the Bishop; and Dame Alice was cited to appear at Kilkenny and answer the charges against her. She escaped, however, and fled to England, taking with her Sarah de Meath, one of her followers. Although she was subsequently condemned in her absence as a witch and a heretic, nothing more is certainly known about her. She is usually supposed to have remained in England, untroubled and in safety, for the rest of her life.

First Irish Witch-Burning

The other accused witches were not so fortunate. Robert of Bristol, John, Ellen and Syssok Galrussyn, William Payn de Boly, Alice Faber, Annota Lange, Eva de Drownestown and Petronilla de Midia (or Meath) were all arrested, convicted and sentenced to various punishments. The unhappy Petronilla seems to have been pursued with peculiar venom by the Bishop, perhaps because she had been the personal servant and close friend of Dame Alice and so became a kind of substitute for the latter in his mind. She was flogged six times by his orders, excommunicated and finally burnt. She confessed that she had taken part in most of the crimes of her mistress. She had denied the Christian faith, sacrificed to Robin Artisson, consulted with demons and caused goat horns to grow, or seem to grow, upon the heads of certain women. She said that in all this, and much else, she had been led and instructed by Dame Alice, who was a witch of far greater power and knowledge than the rest. She also attempted to implicate William Outlawe, declaring that he knew all about his mother's sorceries, and had himself worn the Devil's girdle a year and a day.

She was burnt on 3 November 1324, the first person to suffer death by fire for this cause in Ireland. Of the others, some are said to have been burnt also, some whipped, some marked with a cross upon their garments, some banished. There is, however, no official record of what happened to them, and only Petronilla's fate is certain. It is an interesting fact that, after her time, witch trials were relatively few in Ireland. The Irish believed in the existence of witches, like other people, but they remained singularly free from the witch-mania which afflicted so many other lands. Some trials there were, particularly after 1586, when the Irish Parliament passed a statute corresponding to the English Witchcraft Act of 1563, but there were never more than a few throughout the whole of the period between the 14th and the 18th century.

CHRISTINA HOLE



Labyrinth

Or maze, a complex arrangement of buildings or intricate network of enclosed paths, from whose centre it is difficult to find a way out: to penetrate it and then return symbolized spiritual death and resurrection: to the ancients the labyrinth was linked with the idea of a sacred centre of ritual, reserved only for the initiated; the famous Labyrinth of Cnossus, was said to have been built by Daedalus on the orders of King Minos of Crete, to hide the Minotaur.

See MAZE.

British Museum

Ladder

A symbol of spiritual ascension; because it gives access to a higher level, the ladder was seen as a connecting link between heaven and earth, providing a stairway to the otherworld: in ancient Egyptian belief the dead king climbed up to the sky on a ladder, and in his dream Jacob saw a ladder set up between heaven and earth, on which angels were ascending and descending: the superstition that it is unlucky to walk under a ladder is very widespread.

See STEPS AND LADDERS.

At the head of Tibetan Buddhism, officially suppressed since the Chinese invasion, stands the Dalai Lama; now in exile, he has established a small kingdom at Dharmasala in Northern India to preserve the religion. This article deals with the sacred office of the lamas before the occupation, whose succession is traditionally by reincarnation.

LAMAS

IN TIBET the principle of reincarnation determined the succession to high ecclesiastical office for at least 500 years. The religion of the country was Lamaism, a development of Mahayana Buddhism, first introduced into Tibet from India in the 7th century AD. Before the Chinese invasion in 1950 the lamas (abbots of the Tibetan monasteries, though the term is also used for all fully ordained Tibetan Buddhist monks) enjoyed immense power and prestige.

The belief in reincarnation or the transmigration of souls, though an essential element of Buddhist ideology, is adopted from Hinduism. Hindus believe that by living in accordance with the rules of their caste, they can attain a rebirth in a higher form of existence, either on this earth or in the realm of the gods. The Buddhist also believes that a soul may be reborn in any of six spheres, and that those who have attained highest merit may achieve supreme enlightenment (Nirvana) and enter into the paradise of the Buddha. But according to the Mahayana Buddhist doctrine, saintly men entitled to this supreme bliss may after death voluntarily forego final liberation from the cycle of rebirths and choose to be reborn into this world as teachers and saviours in order to help suffering humanity. A lama choosing this fate is known as a *Bodhisattva*: a manifestation of Buddhahood, he descends as a saviour to the human world in order to direct the spiritual destinies of its inhabitants. As the task of salvation cannot be achieved in the course of one human lifetime the spirit of a Bodhisattva enters one body after another.

Memory of an Earlier Life

The Tibetans describe such reincarnations as *tulku* (emanation bodies). The earliest documented case of such a reincarnation is that of the first Dalai Lama of the Gelugpa Church, the most important of the Tibetan Buddhist sects. After his death in 1475 he was reborn, according to contemporary belief, in a child identified by oracular signs, and this boy was duly installed as the second Dalai Lama. The heads of the Gelugpa sect, who after 1640 were also the secular rulers of Tibet, were subsequently chosen on the basis of the belief that the deceased priest-king was reborn in an infant, recognizable by his ability to identify various objects associated with his previous life. This manner of establishing an uncontested succession to major ecclesiastical posts soon spread throughout Tibet, and countless reincarnate lamas functioned as the heads of monastic institutions.

The practice of succession by reincarnation was based on the belief that those who voluntarily chose rebirth remembered their previous existences, and by doing so attained a level of accumulated wisdom such as could not be acquired in the course of one single life.

The methods of discovering a reincarnation relied mainly on a child's memory of his earlier life, and only to a lesser extent on oracles, dreams or visions. A saintly lama expecting to die sometimes gave his disciples certain hints as to where he would be reborn, or one of his followers might have a dream indicating where the new incarnation should be sought. More frequently a young boy might announce his status as the reincarnation of a deceased lama or demand to be taken to a certain monastery which he described as his real home. Such requests were likely to be ignored at first, but if the boy insisted the parents might take notice and consult some local lamas. Provided the boy's claim appeared reasonable, he would be taken to the monastery of the late lama and be subjected to a test. He would be confronted with a collection of objects, among which there were some of the possessions of the late lama. If the boy was a genuine reincarnation

he chose without hesitation the articles formerly owned and used by the lama whose reincarnation he claimed to be. The ability to identify the correct articles was taken as proof of his status as a reincarnation of the previous owner.

Caretaker Monks

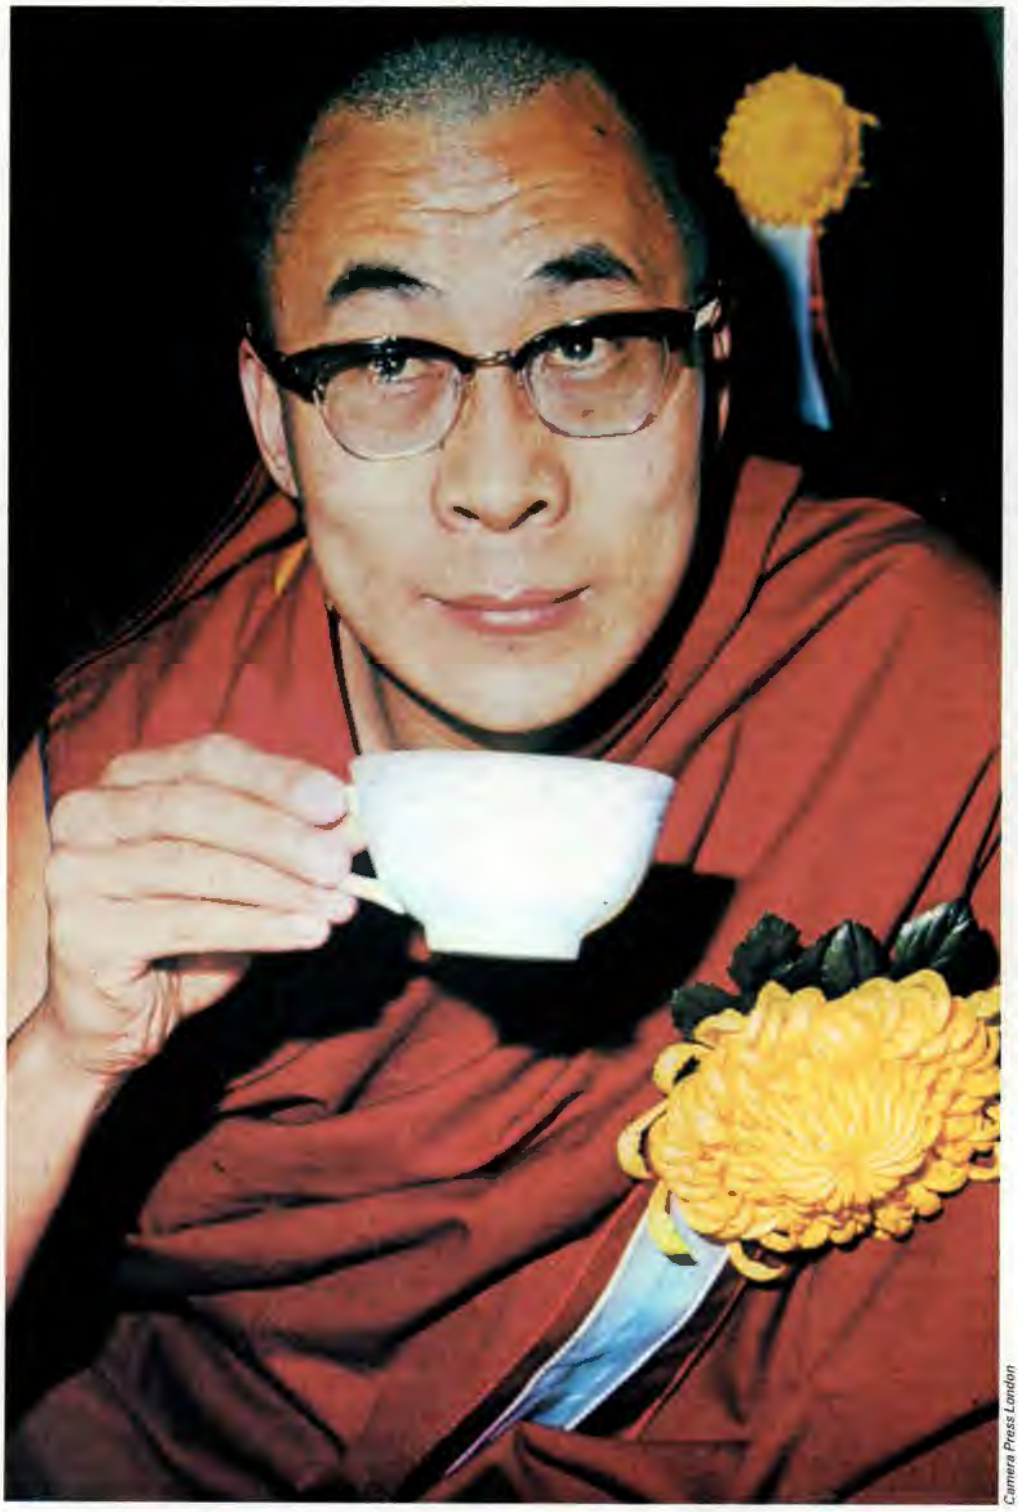
Sometimes there were several claimants for recognition as the reincarnation of a prominent lama, and more than one might be genuine. For according to Tibetan belief every personality was made up of body, voice and heart, and the theory was that these three components could be reincarnated separately. If no double or triple reincarnation was suspected the names of the claimants might be submitted to an oracle for selection of the one to be recognized as genuine tulku.

A boy accepted as the reincarnation of an abbot assumed his religious role as soon as his identity was verified and sanctioned by the competent authorities. But being a small child he required education and training, and these he received at the hands of the most learned monks of the monastery. During the infancy of the reincarnated abbot his secular duties were discharged by a senior monk acting as caretaker, but on reaching maturity, usually at the age of 16 to 18, the young abbot assumed his position as head of the monastery, and even the most senior monks were required to submit to his authority.

However, a reincarnation, once selected and installed, was not under an inescapable obligation to lead a monastic life. He could renounce his priestly role or take up purely secular duties while his position in the monastery was taken by another monk. Provided he had not led a scandalous life and brought dishonour upon his monastery he might even be reincarnated after his death and once more assume the function of abbot.

Reincarnations were not confined to the abbots of monasteries. Lamas and nuns of less exalted status might be reborn in children who recalled some experiences of their past life. Nor were reincarnations always within the same sex. Even laymen without special claim to sanctity were sometimes reincarnated in children conscious of their previous life. Such reincarnations, however, were of little practical importance. A reincarnate abbot took over the personal property as well as the official position of his predecessors, but the reincarnation of a layman had no claim to the property owned in his previous life. Whereas the reincarnations of laymen were unusual and unforeseen events, the disciples and kinsmen of a lama of learning and reputation for holiness sometimes expected him to be reborn and waited for the appropriate signs.

The Dalai Lama, photographed in Tokyo; he is regarded as a reincarnation of all his predecessors and as a manifestation of the national god of Tibet. The child in whom a dead lama chose to be reborn could be recognized by his ability to identify objects associated with his previous existence on earth



Camera Press London

The Dalai Lama

As a political phenomenon the system of succession by reincarnation played an important role in the shaping of the power structure of Tibet. The abbots of the great Gelugpa monasteries of the holy city of Lhasa were almost exclusively reincarnated lamas, and they exercised an important influence on the government of the country and the selection of the Dalai Lama, the Panchen Lama and the regents ruling Tibet during the infancy of the Dalai Lama. At the peak of the hierarchy stood the Dalai Lama and the Panchen Lama. The Dalai Lama was regarded as a reincarnation of all his predecessors in the exalted position of head of the Gelugpa Church and, like them, a manifestation of the Bodhisattva Avalokitesvara, the national god of Tibet. The Panchen Lama was regarded as a manifestation of Amitabha 'Unlimited Light', one of the five Buddhas of Contemplation and father of the Bodhisattva Avalokitesvara.

Under them were the other tulku lamas. Each one was a saviour in his own right by reason of birth and discovery and not because he had received ordination from above. The ecclesiastical organization was based on these manifestations of the Buddhahood, and the process of reincarnation assured a stable and orderly succession, which by reason of the celibacy of the lamas could not be hereditary through descent from father to son.

Lamb

Often the victim of sacrifice in early times because it stood for unblemished purity and innocence: in Christian tradition it is a symbol of Christ, who is referred to in the Bible as the Lamb of God; Van Eyck's painting, the *Adoration of the Lamb*, is one of many examples of this concept in art: the term 'flock' is used to denote the members of the Church, when Christ is seen as the Good Shepherd.

See SHEEP.

Two rival families of disreputable Lancashire peasants, each headed by an aged hag, were implicated in the sensational witch trial of 1612; wild accusations and counter-accusations, and the testimony of a nine-year-old girl, brought ten people to the gallows

LANCASHIRE WITCHES

IN THE EARLY YEARS of the 17th century Lancashire lay under a religious despotism, with an overwhelmingly Roman Catholic population dominated by a hostile and punitive Protestant government. If the parish churches were well attended it was only because absence from the service incurred a heavy fine, for the cure of souls lay almost entirely in the hands of Jesuit priests who were harried from priest-hole to priest-hole under threat of the most cruel punishments. The fires of the Reformation had as yet failed to cleanse this rebellious countryside of its so-called Popish superstitions. The prevalence of witches must also have strongly occupied the minds of the magistrates, for the Elizabethan Witchcraft Act of 1563 had been reinforced in 1604 by a further Act of Parliament and the air was alive with rumours of magic, white and black.

There were at this time two rival families living in the Pendle Forest in East Lancashire, who were widely reputed to have sold their souls to the Devil. They were an unkempt woodland folk, beggars and poachers in the main, and regarded with apprehension by the countryfolk for miles around. At the head of each family was an old crone, spiteful and hideous in appearance: Elizaheth Sowthern, an 80-year-old blind beggar, known locally as Old Demdike, and Anne Whittle, equally ancient and decrepit, known as Old Chattox. Both of them looked the very picture of a witch.

Brampton Studio

Brampton Studio

Two woodcuts depict exploits of the witches of Pendle Forest in Lancashire, who achieved great notoriety as a result of a chapbook published after their trial and execution in 1612 *Above right* Witches fly through the air to the sabbath *Right* A witches' revel: reports of the meeting held at Malking Tower by the Demdike and Chattox families, at which it was decided to blow up Lancaster Castle, provided a factual basis for such scenes

Right Children offered to the Devil. The murder of children by witchcraft was one of the charges brought forward at the Lancaster witch trial of 1612 *Far right* 'The witch of the woodlands' with her familiar spirit. Old Demdike claimed to have as her a familiar a diabolical dog named Tibb, while other canine familiars belonged to her daughter Elizabeth Device and her rival Old Chattox

There is reason to believe that each woman had attempted to exploit her reputation for casting lethal spells, in order to boost her trade in simples. The result was that they had both come under strong suspicion of causing most, if not all, of the unexplained deaths in the district.

The First Interrogations

The story begins in the early months of 1612 with a theft carried out by Elizabeth Whittle, daughter of Chattox, at the home of Old Demdike, as the result of which Elizabeth was sent to prison in Lancaster Castle. She had in the meantime branded her accuser, the 11-year-old Alizon Device, Demdike's granddaughter, as a witch. The latter, in attempting to defend herself, revealed that her grandmother had in fact tried to initiate her into witchcraft. At this point it is fairly certain that nothing more coercive than words was employed to extract a series of confessions in which each individual was led into the betrayal of the other, until finally both families were compromised up to the hilt.

Shortly after this young Alizon had the misfortune to quarrel with a pedlar, whom she roundly cursed. To her horror the man collapsed within minutes, complaining that he had been pierced with knives and sickles. Once again Alizon found herself under interrogation by a local magistrate, Roger Nowell, together with her mother and simple-minded brother James. Between them they blackened not only the reputations of each other but also those of Old Demdike and Old Chattox who, early in April, were summoned for interrogation. Demdike appears to have admitted freely that she was a witch. Many years earlier she had been approached by an evil spirit dressed in a brown and black coat and having the appearance of a boy. This demon, who bore the name of Tibb, negotiated with her for her soul, promising that in return she could have her heart's desire. Tibb manifested himself at a later date as a brown dog, in which shape he sucked blood from beneath her left arm and aided her in killing by witchcraft the child of Richard Baldwyn. Baldwyn had previously threatened to have both Demdike and her granddaughter, Alizon Device, executed as witches and whores, in the following terms: 'Get out of my ground, whores and witches. I will burn the one of you and hang the other.'

Chattox, in her feverish struggle to extricate herself from her difficulties, attempted to cast the blame for her initiation into witchcraft upon Demdike. Only because of Demdike's wicked persuasions had she ever consented to become a witch and acquired her familiar, which in the likeness of a spotted bitch 'promised her worldly wealth'. To make certain of Demdike's downfall she accused her of murdering by sorcery Robert Nutter, a local landowner. At the same time she implicated several others.

Plot to Blow up the Castle

The magistrate, now satisfied that these confessions supplied all the evidence needed for a conviction, dispatched Alizon, Old Demdike and Old Chattox to Lancaster Castle together with a fourth prisoner, Anne Redfearne, the daughter of Chattox, who was apparently also involved in the death of Robert Nutter. The families of the imprisoned women were reduced by their mutual calamity to a state of utter consternation but, setting aside their hostility for once, they called a conference at Malking Tower, the house of Demdike's daughter Elizabeth Device. It took place on Good Friday, 10 April, exactly eight days after the arrests. Those present consisted of about 20 persons, of whom only two were men. From subsequent confessions it would appear that the gathering, while feasting on stolen mutton, considered for a time the possibility of blowing up Lancaster Castle and killing the jailer in an attempt to rescue their kinsfolk. They also utilized the occasion to plan various murders and even attempted to summon up an evil spirit, the familiar of Alizon, for the purpose of giving it a name.

Present also on this occasion was Jennet Preston, a Yorkshire witch who had attended the conference in order to secure the aid of her fellow hags for the destruction of one who had caused her to be prosecuted for witchcraft at York. Finally the assembly adjourned for a twelvemonth, agreeing to meet again on Good Friday 1613 if there was no occasion for an earlier meeting. This would suggest that by the time the banquet had reached its conclusion the revellers were far too overcome by liquor to remember either the purpose for which the conference had been convened or the hopeless situation of their relatives imprisoned in Lancaster Castle.

Once apprised of this latest threat to public order Nowell struck again. He arrested a number of the former revellers, including Elizabeth Device, the convener of the meeting, her son James Device, the simple-minded labourer, and his nine-year-old sister Jennet, although many others appear to have escaped the net. Despite suggestions to the contrary there is no reason to believe that those in authority regarded the events at Malking Tower as a witches' sabbath, for even in the official report of the trial the assembly was described as a 'special meeting' of 'children and friends'.

The fresh batch of prisoners was interrogated and sent to join their fellows in the dismal, airless cells of Lancaster Castle, together with eight other suspects from Salmesbury who had been charged with bewitching a farmer's daughter to death. The examination of the Pendle suspects produced the anticipated crop of bizarre revelations, extracted by the skilled questioning of Roger Nowell and a fellow

magistrate, Nicholas Banister. Elizabeth Device confessed to murdering three persons by witchcraft and making a clay image at the instigation of her familiar, a dog named Ball, but she strenuously denied the existence of any plot to blow up Lancaster Castle. It was unfortunate for her, however, that she should have been cursed with a personal defect that longstanding superstition had decreed to be the hallmark of the witch: for she had one eye looking down and the other up, a feature then regarded as an infallible sign of the Evil Eye.

The trial of the Pendle witches at the summer assizes of 1612 was preceded by the death in jail of Old Demdike, a not unexpected occurrence in the insanitary and noisome holes in which the 17th century prisoner was left to rot. It was interrupted by the trial of the witches of Salmesbury who, after satisfying the court that they were the victims of a Jesuit plot, were found not guilty and discharged.

Found Guilty

The court with its judge, Sir Edward Bromley, then considered the evidence against the prisoners, the bulk of which consisted of written confessions and mutual denunciations made before the Justices of the Peace during the preliminary examinations. Those from Pendle who were brought to trial at Lancaster Castle were 11 in number and consisted of: Anne Whittle, (Old Chattox) and her daughter, Anne Redfearne; Old Demdike's daughter, Elizabeth Device, and her son and daughter, Alizon and James Device; Katherine Hewit, alias Mould-heels; John and Jane Bulcock, Isabel Robey, Margaret Pearson and Alice Nutter (described as a gentlewoman). Jennet Preston was tried at York, where she was found guilty and hanged.

The prisoners were foredoomed by their own admissions and severely prejudiced by the evidence given against them by James Device's nine-year-old sister Jennet, who also incriminated her own mother Elizabeth Device. Anne Redfearne was found not guilty of bewitching Robert Nutter to death but the court then declared her guilty of the murder by witchcraft of his father, Christopher Nutter, who had died railing against witches. Her old mother, the equally doomed Chattox, pleaded upon her knees in vain for her daughter's life. James Device was far too ill even to stand; now in open court he withdrew the confessions he had made to the magistrates and entered a plea of not guilty, but was sentenced to death.

Alizon Device was indicted for bewitching John Law, the pedlar who had become crippled after her quarrel with him. 'Transformed beyond the course of Nature', the pedlar was led into court while the accused girl with guilty tears begged forgiveness for a crime for which she obviously believed herself responsible. The cripple, it was said, 'had the left side lamed all save his eye', which suggests that he must have suffered a stroke.

John and Jane Bulcock, despite a plea of not guilty, were sentenced to death for 'bewitching to madness' Jennet Deane; the evidence against them was given by James, Elizabeth and Jennet Device. Katherine Hewit, alias Mould-heels, who had also been betrayed by the Devices, was charged with being present at the Malking Tower meeting and with bewitching to death Anne Foulds, described as 'a child of Colne'.

One of the unsolved mysteries of the Lancashire witch trials was the indictment of Alice Nutter, a wealthy property owner and the mother of the fatally bewitched Robert Nutter, for the murder by witchcraft of Henry Mitton. She had been named by Jennet Device as having attended the Good Friday meeting and despite her plea of innocence was sentenced to death. Isabel Robey pleaded not guilty to bewitching Jane Wilkinson and Peter Chaddock. The latter had become 'sore pained' in his bones and for this he held Isabel responsible, while Jane Wilkinson complained of being 'suddenly pinched in her thigh'. For these crimes the accused was sentenced to death.

All but one of the prisoners died on the gallows on 20 August 1612. The exception was Margaret Pearson, accused of killing a mare by witchcraft, who was sentenced to stand in the pillory at Clitheroe, Paddiham, Whalley and Lancaster on four market days with a paper describing her offence upon her head, and then to remain in prison for a year; this in itself was almost the equivalent of a death sentence. The child Jennet Device did not escape the odium of witchcraft, for 22 years later she was one of the accused in the second great trial of Lancashire witches in 1634.

From the records which were carefully noted by Thomas Potts, a lawyer, and subsequently approved by Sir Edward Bromley and published as a chapbook in 1613, under the title of *The Wonderful Discovery of Witches in the County of Lancaster*, it is evident that in the fury of the witch-hunts the unsupported testimonies of children, of senile women and of a half-witted labourer were considered to be sufficient evidence for a sentence of death. In this part of Lancashire the suspicion lingered on for many years that the rich Alice Nutter had been implicated in the case by those who stood to gain possession of her property in the event of her being executed.

Popish Charms

The story of the Lancashire witches provides valuable insight into some of the more eccentric beliefs that dominated the minds of rich and poor alike when the witch-mania was at its height. In the records of the trial we read of familiar spirits in the forms of human beings and diabolical dogs, and of a mysterious 'thing like a hare' which begged sacramental bread from James Device; we also hear of the cries of witches in a night made hideous by 'a foul yelling like unto a great number of cats'. It is obvious from the nature of some of the 'popish charms' referred to in court that the accused had remained quite unaffected by the Reformation and had continued to employ Roman Catholic terminology, which was of itself

highly suspicious to Protestant ears. An example is the following charm used by Elizabeth Device for the cure of one bewitched, which began:

> Upon Good Friday I will fast while I may
> Until I hear them knell
> Our Lord's own bell

and concluded:

> Lord I am beset with stick and stake
> That I can neither sleep nor wake
> Rise up Gabriel and go with me.
> The stick nor the stake shall never hurt thee
> Sweet Jesus our Lord, Amen.

From this it would be logical to infer that the accused must have practised a kind of benevolent 'white' witchcraft. Further evidence in support of this conclusion appears in the form of a charm to be used over bewitched milk, which was included in the confession of Old Chattox. This refers to the 'ill Eye' and 'ill Tongue' which has caused the bewitchment and offers as a remedy 'Five Paternosters, five Aves and a Creed, in worship of five wounds of our Lord'. We learn also that to be in 'hanck' meant in the language of Lancashire witchcraft to be caught in the grip of a witch; and that butter could be manufactured magically without the milk being the least reduced in quantity. Of the more grisly charms we have the revelation by James Device that Old Chattox took 'three scalps (skulls) from Pendle Churchyard', the teeth of which were extracted and then buried with a clay image of the intended victim.

There are still families in the Pendle witch country who claim descent from the Lancashire witches, sometimes with a degree of pride, while the more commercially minded commemorate the dark events of 1612 with organized tours which include the homes of Alice Nutter and other principal characters in this old tragedy.

Left **Scenes from a French MS showing: the birth of Lancelot; Lancelot with his mother and the Lady of the Lake; his knighting at Arthur's court; and his vision of the Holy Grail *Right* In company with other great medieval lovers, Lancelot (third from the left) pays homage to Venus, goddess of love: early 15th century Italian tray**

LANCELOT

'NO KNIGHT was ever born of man and woman, and no knight ever sat in a saddle, who was the equal of this man.' The earliest surviving romance of Lancelot of the Lake, greatest and most tragic of the heroes of the Round Table, is the *Lancelot* (or *Le Chevalier de la Charrette* – the Knight of the Cart) of Chrétien de Troyes (see ARTHUR). It tells how Queen Guinevere was kidnapped by the wicked Meleagant, son of the king of an enchanted land from which no prisoner could escape. Lancelot, who was passionately in love with Guinevere, and she with him, drove his way through all dangers, obstacles and enemies to rescue her, so breaking the enchantment and setting free all the other prisoners held captive there.

Chrétien may have been the first author to exploit the theme of the love of Lancelot and Guinevere, which plays such a crucial role in the later Arthurian legends. It is significant that the poem, which exalts the lovers' passion almost to the level of religious rapture, gives them an excuse by showing Arthur himself as a weakling and coward who is taunted and defied by the evil Meleagant.

The story that Guinevere was kidnapped, however, is older than Chrétien. The famous carving at Modena Cathedral apparently shows her being rescued from an enemy castle, and Caradoc of Llancarfan's *Vita Gildae* (possibly c 1100) says that Melwas, the king of the Summer Country, carried Guinevere off to his stronghold at Glastonbury and Arthur had to come to her rescue.

Lancelot himself is also older than Chrétien. In the Welsh tale of *Culhwch and Olwen* he is Llenlleawc the Irishman, who may originally have been the Irish god Lug. Later, he has strong ties with Brittany (see BRITTANY). He takes his title 'of the Lake' from the tradition that he was brought up by a lake fairy. Chrétien mentions that he owned a magic ring which freed anyone who gazed on it from the power of enchantment, given him by the fairy. In the late 12th century German *Lanzelet* the infant Lancelot is stolen from his mother by a fairy who takes him to her castle on a crystal mountain, in a magic island of 10,000 maidens where flowers and trees bloom all the year round. When he grows up, she sends him to Arthur's court to be knighted.

In the French prose tale of *Lancelot* (early 13th century, part of what is called the Prose *Lancelot* or Vulgate cycle) the fairy is called the Lady of the Lake. Before sending Lancelot to Arthur's court, she gives him arms and the magic ring, and instructs him in the duties of chivalry and the importance of protecting the weak and defending the Church. He becomes the best knight in the world, the indomitable hero of innumerable battles, jousts and quests. As Malory puts it, 'in all tournaments and jousts and deeds of arms, both for life and death, he passed all other knights, and at no time he was ever overcome but it were by treason or enchantment.' But Lancelot and Guinevere fall helplessly in love and because of their sinful liaison Lancelot fails in some of his adventures. He is told that a better knight will appear and will win the Grail. This proves to be Galahad (see GALAHAD) who is Lancelot's own son, begotten on the daughter of the keeper of the Grail castle while

Lancelot is under an enchantment and thinks himself in the arms of Guinevere.

In the next work in the cycle, the *Queste del Saint Graal*, Lancelot fails in the Grail quest because he is a sinner. He has always kept sternly silent about his affair with his royal mistress but now, bitterly disappointed, he breaks down and confesses to a hermit: 'I have sinned unto death with my lady, she whom I have loved all my life, Queen Guinevere, the wife of King Arthur... For her love alone I accomplished the exploits with which the whole world rings. She it is who raised me from poverty to riches and from hardship to the sum of earthly bliss. But I know full well that this bond is the sin that has earned me Our Lord's dire wrath. . .' He promises to renounce her and because of his repentance he eventually reaches the Grail castle and is granted a partial and passing experience of the Grail.

The search for the Grail has destroyed the old fellowship of the Round Table by devaluing its aims and standards, and the last work in the cycle, the *Mort Artu*, relates the final tragedy. Malory used these French tales with consummate skill in the *Morte D'Arthur*. After the winning of the Grail by Galahad, Lancelot returned to Arthur's court and renewed his adulterous relationship with the Queen, haunted by his failure in the Grail quest and by the irreconcilable conflict between his passion for Guinevere and his loyalty and affection for Arthur. Guinevere was abducted by Sir Meliagrance and rescued by Lancelot. The court gossiped about the lovers and eventually they were openly denounced.

There followed the final disruption of the Round Table in civil war, the treachery of Mordred and the fatal wounding of Arthur. Heavy with guilt and grief, Lancelot hurried to England, said his last farewell to Guinevere, and became a hermit. Seven years later, Guinevere died and Lancelot left his hermitage to bury her at Glastonbury. He himself died soon after, broken-hearted, and one who was with him saw in a dream how the angels carried him up to heaven and the gates of heaven opened for him. Malory's words about Guinevere apply equally to him, 'that while she lived she was a true lover, and therefore she had a good end.'

LANDSCAPE SYMBOLISM

St Anselm in the 12th century considered it spiritually dangerous to sit in a garden because it is so pleasant to the senses

The river of death, the city of God, the valley of humiliation, the garden of paradise, the deserts and mountains of revelation, the tower of strength – vividly evocative images drawn from landscape run all through the Western tradition of symbolism

ALMOST EVERYTHING the human eye has rested on has been used by someone somewhere as a symbol and landscape, which constitutes most of what we see around us, is no exception. It is an old and widespread tendency to discern in Nature a powerful element of the divine, to make the earth a goddess and the sky a god, to people with a multitude of spirits 'every rock and hill, every tree and flower, every brook and river' (see ANIMISM). And in literature, art and dreams, landscapes or particular features of landscape frequently stand for ideas, beliefs, moods, things not fully expressible in plain language.

All consideration of symbolism is bedevilled by the fact that a symbol will have different meanings for different minds, or for the same mind in different moods, and still more by the fact that since symbols are attempts to express what is otherwise unexpressible, they can hardly be satisfactorily elucidated in words. Although a few symbols have a clear and definite significance – the sealed fountain or the closed gate as images of the virginity of the Virgin Mary, for instance – most have meanings which are necessarily large and vague, and often inherently contradictory.

The resolution of contradictions is the theme of one of the finest of the many examples of landscape symbolism in the Old Testament. 'In the wilderness prepare the way of the Lord, make straight in the desert a highway for our God. Every valley shall be lifted up, and every mountain and hill be made low; the uneven ground shall become level, and the rough places a plain. And the glory of the Lord shall be revealed, and all flesh shall see it together' (Isaiah, chapter 40). Here flatness of landscape stands for the destruction of all height and depth, all opposites and distinctions, all surface appearances, when they are transcended in the last days in the glory of God. But equally, a landscape of hills and valleys can also convey the essential unity of all things in the existence and love of God, as in Bellini's famous picture of *St Francis in Ecstasy* (see FRANCIS OF ASSISI) of which Kenneth Clark says: 'No other great painting, perhaps, contains such a quantity of natural details, observed and rendered with incredible patience: for no other painter has been able to give to such an accumulation the unity which is only achieved by love.'

Left **The Fall of Adam and Eve and their expulsion from the garden of Eden: from the *Très Riches Heures du Duc de Berry*. The paradise garden appears as an enclosed place with pleasant trees and lawns, while the dangers and discomforts of the outside world are symbolized by a line of barren mountains in the foreground. A place set apart, where Nature is tamed and beauty cultivated, the garden became a symbol of perfection, earthly and divine** ***Following page*** **The vast emptiness of the wilderness can be a symbol of unchanging eternity and infinity: in Salvador Dalí's painting *The Persistence of Memory* a dreamlike, timeless landscape is the background to the foetal creature and the limp clock faces**

Giraudon

Deserts of Vast Eternity

The desert or wilderness is a particularly rich and ambivalent symbol. It may stand for 'the undifferentiated', the unity behind surface appearances, the level plain of Isaiah, for 'the realm of abstraction', for the negation of landscape, the vast eternity of emptiness which is outside the normal scenery of human and animal life. From this point of view, it is the place in which to find God, to receive divine revelation. St Anthony and other early Christian hermits went into the desert to find solitude, silence and God. The Israelites escaped from their bondage in the corrupt land of Egypt and fled into the wilderness, where God made his covenant with them, before leading them on to the Promised Land.

But on the other hand, the desert is also a symbol of spiritual sterility, of the absence of God, of the demonic. St Anthony and the desert hermits were famous for the attacks which devils launched against them. That the desert was the home of evil spirits was a commonplace of Jewish belief and the scapegoat loaded with the sins of the people was driven out into the wilderness, to the demon Azazel.

So the desert combines the idea of spiritual fecundity and the presence of God with the opposite idea of the barren waste from which God is absent (and can stand for the sterile worldly life of men, far from God). After his baptism Jesus retreated into the wilderness where he experienced the assaults of the Devil but also found comfort and strength.

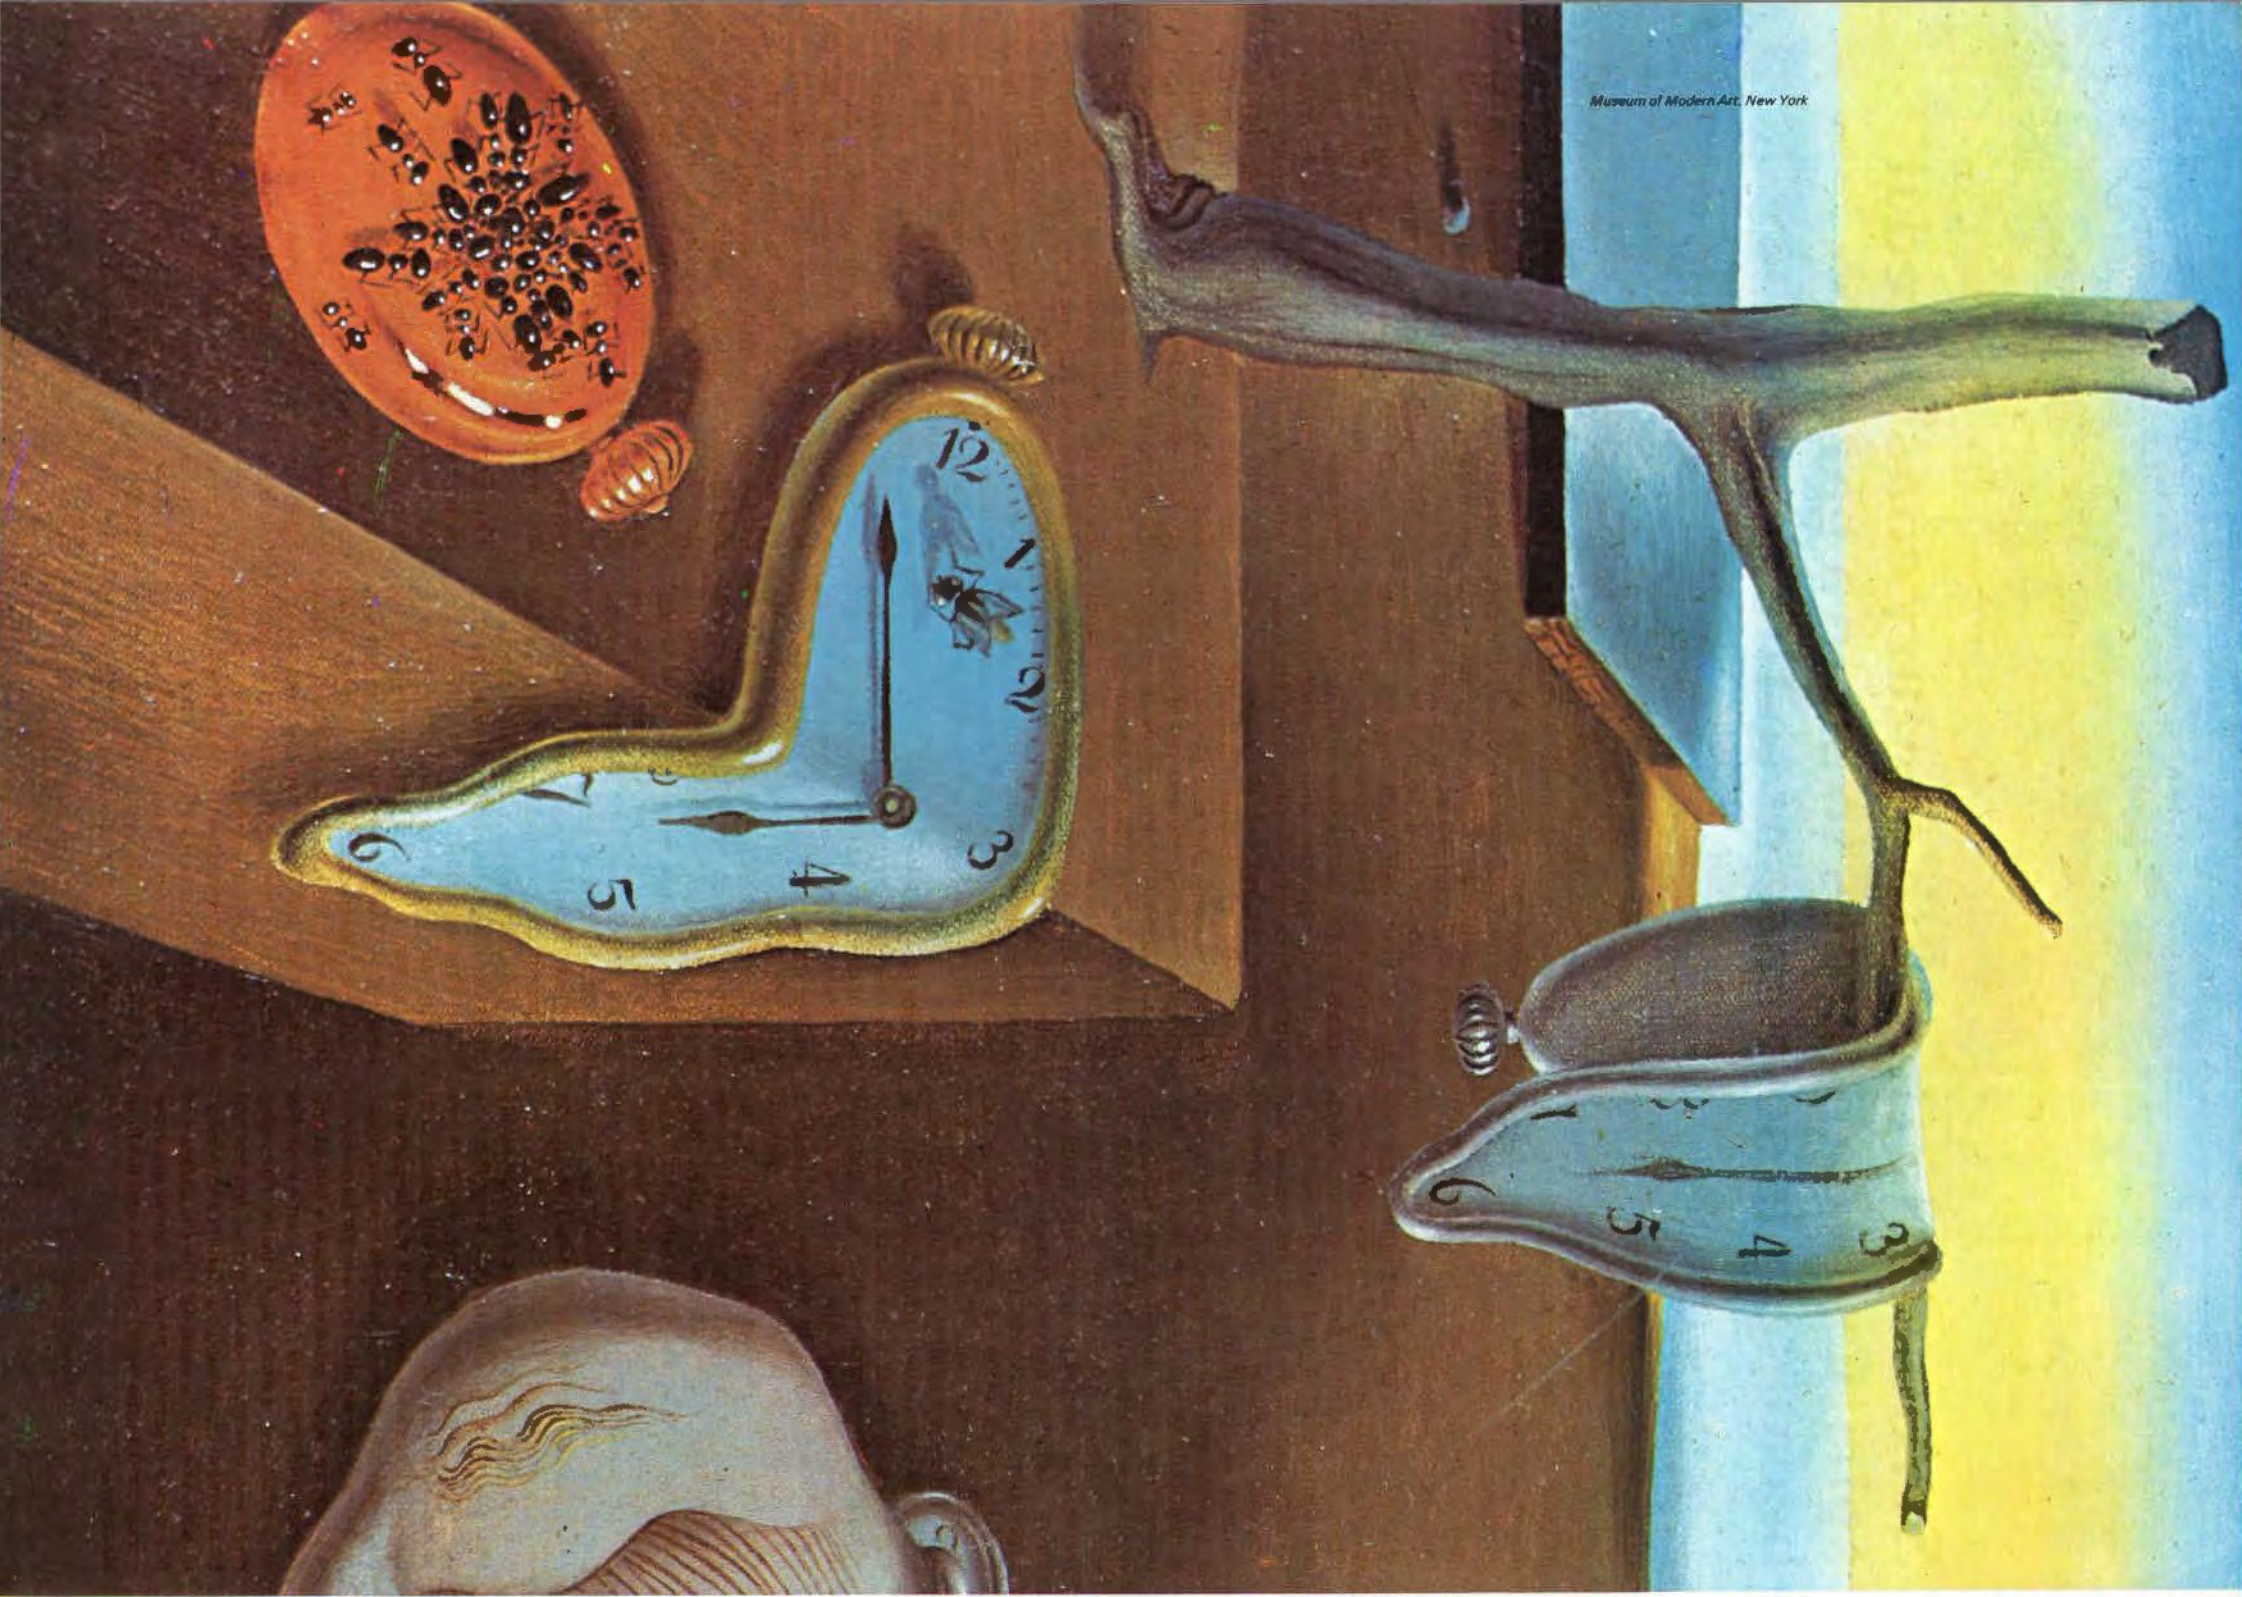
The pitiless dearth of the wilderness is the drought of asceticism, in which the body is parched for the saving of the soul. The desert is the domain of the sun, of the pure and blinding light which is the realization of truth. Since the wilderness is naturally barren, its spiritual fecundity is due solely to God, to the saving light of God's grace. In Bosch's magnificent painting of *The Seven Deadly Sins* (see BOSCH) the dead rise from their graves in the desert to face the withering and punishing blast or the saving, gracious illumination of Christ in Judgement. The landscape contrasts with the equally sterile but unclean, citified scenery of hell in the opposite corner of the painting.

The garden is also set apart from the normal world but, unlike the desert, it is a place where Nature is tamed and beauty cultivated. St Anselm in the 12th century considered it spiritually dangerous to sit in a garden because it is so pleasant to the senses. But in other parts of the world and in Europe in the later Middle Ages the garden was a symbol of perfection, earthly and divine: 'a flowery meadow cut off from the world of fierce accidents,' to quote Kenneth Clark again, 'where love, human and divine, could find fulfilment.' God planted the garden of Eden for Adam and Eve, and in it, according to legend, the animals lived before the Fall as peaceable as snowdrops and primroses.

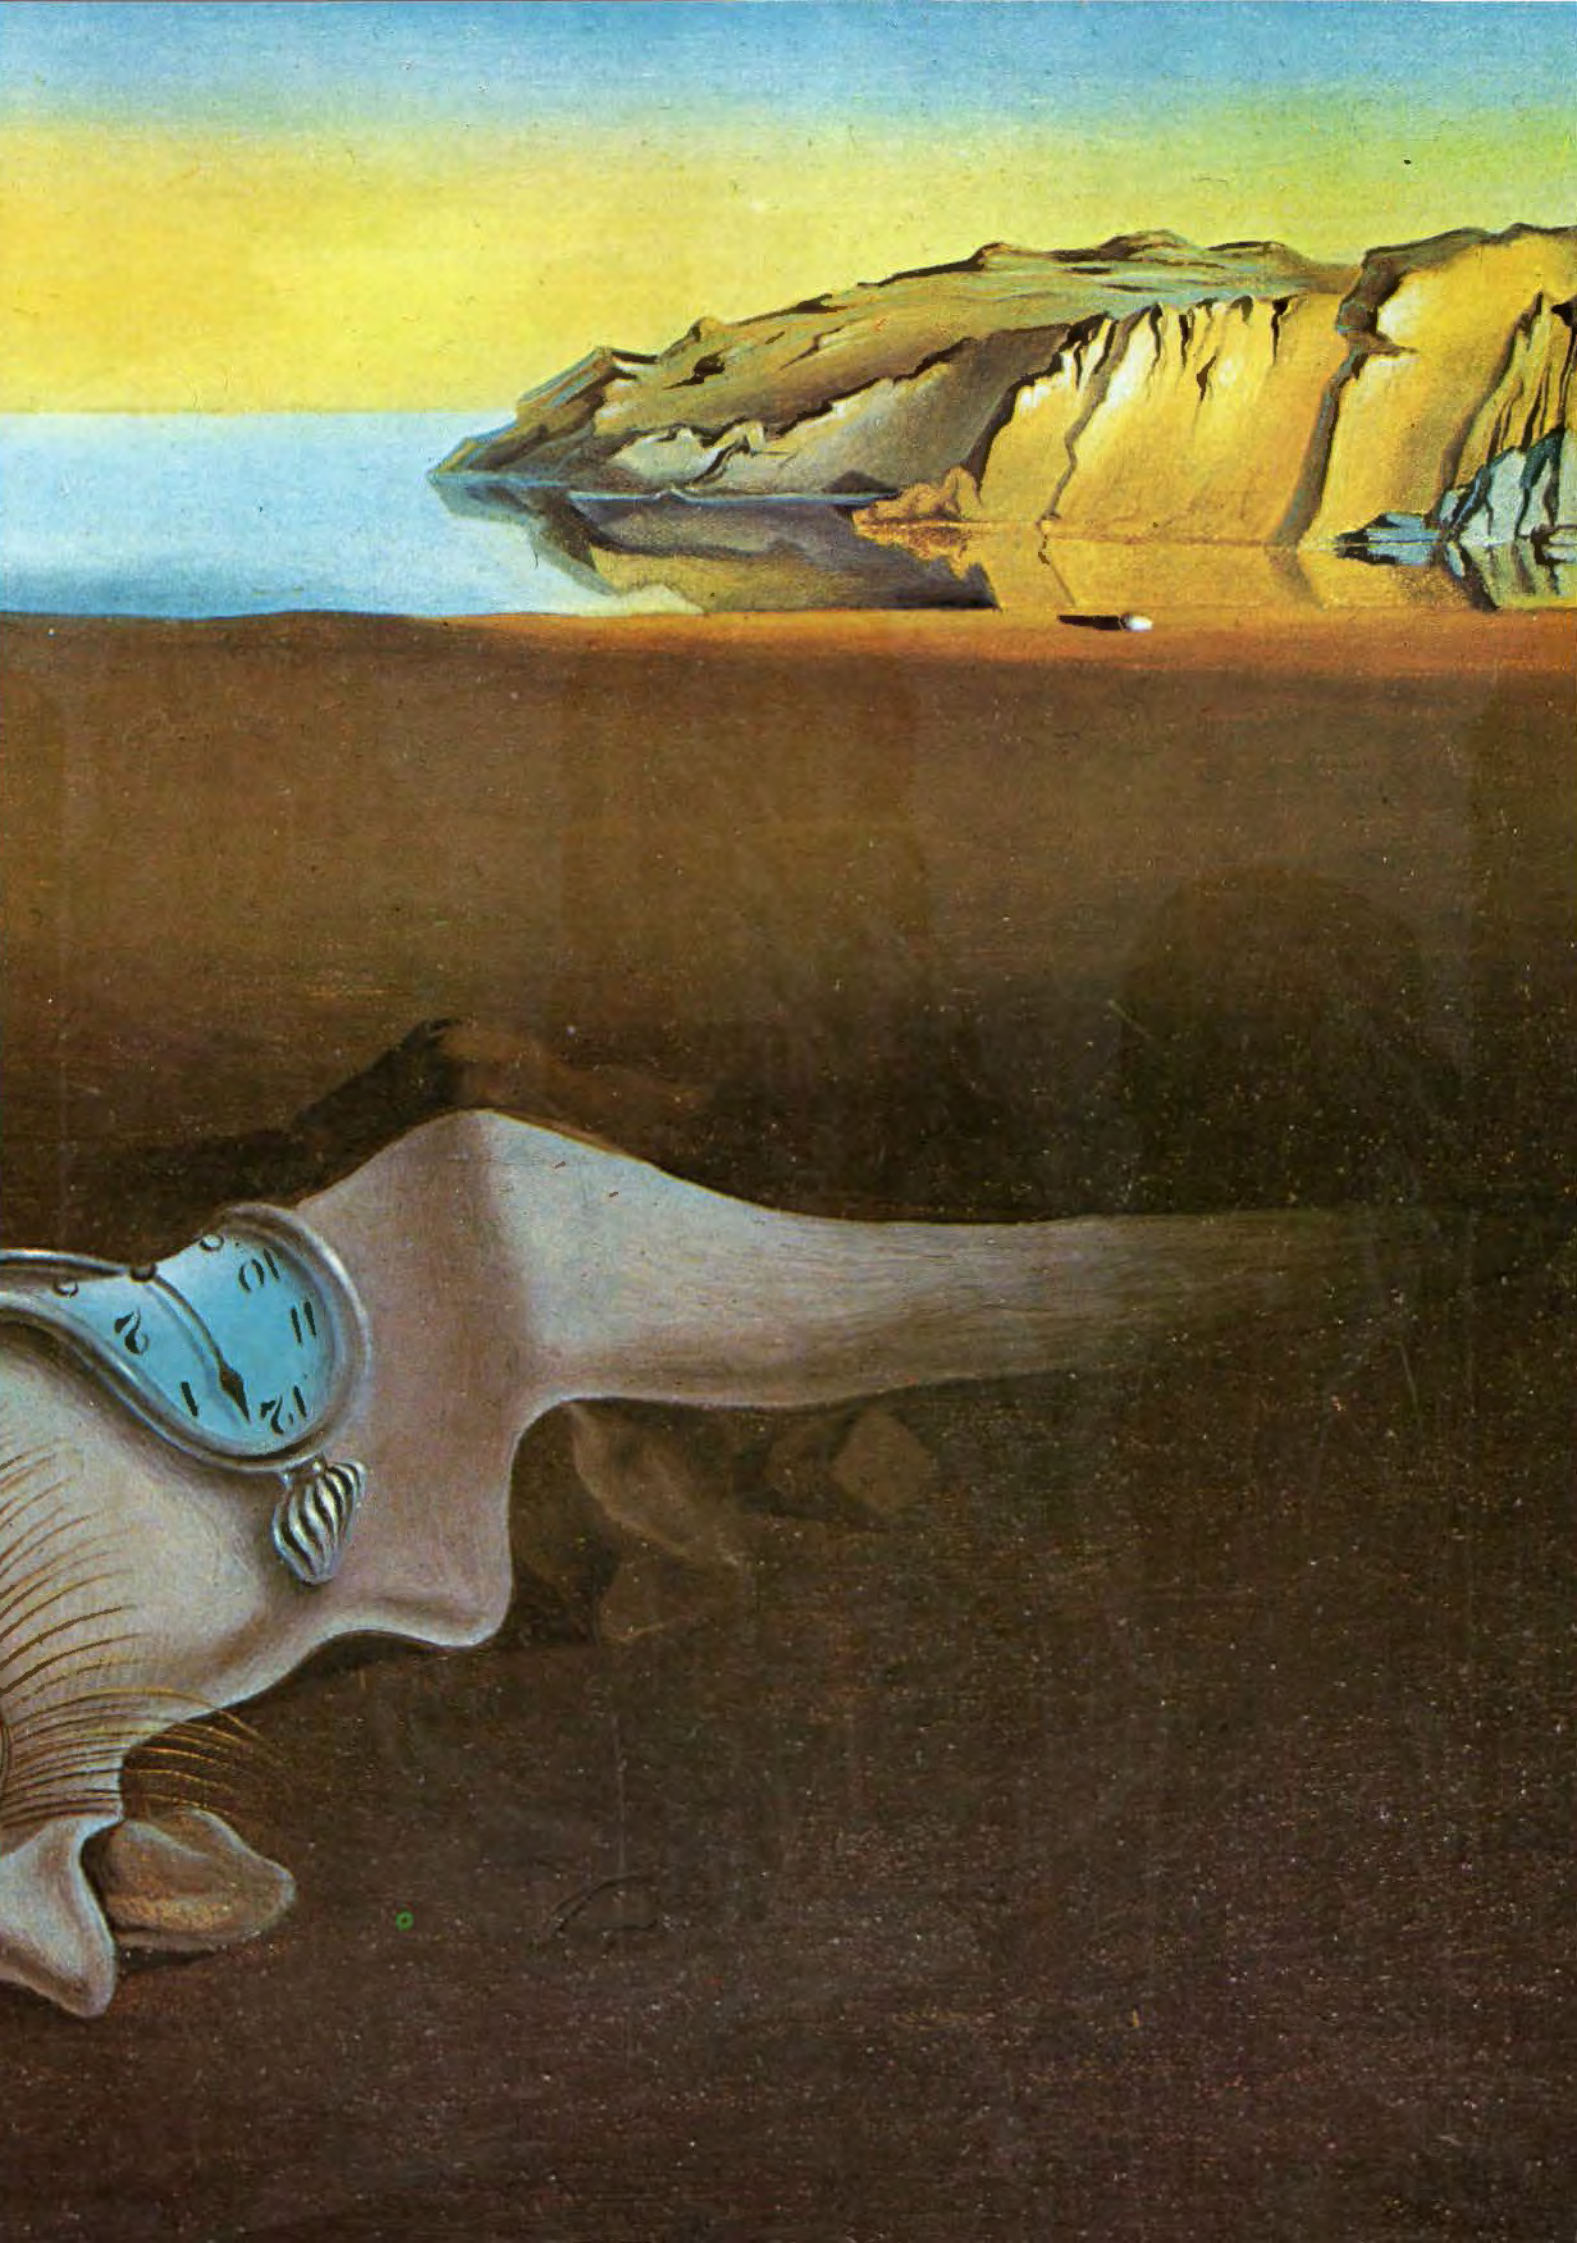
The Enclosed Garden

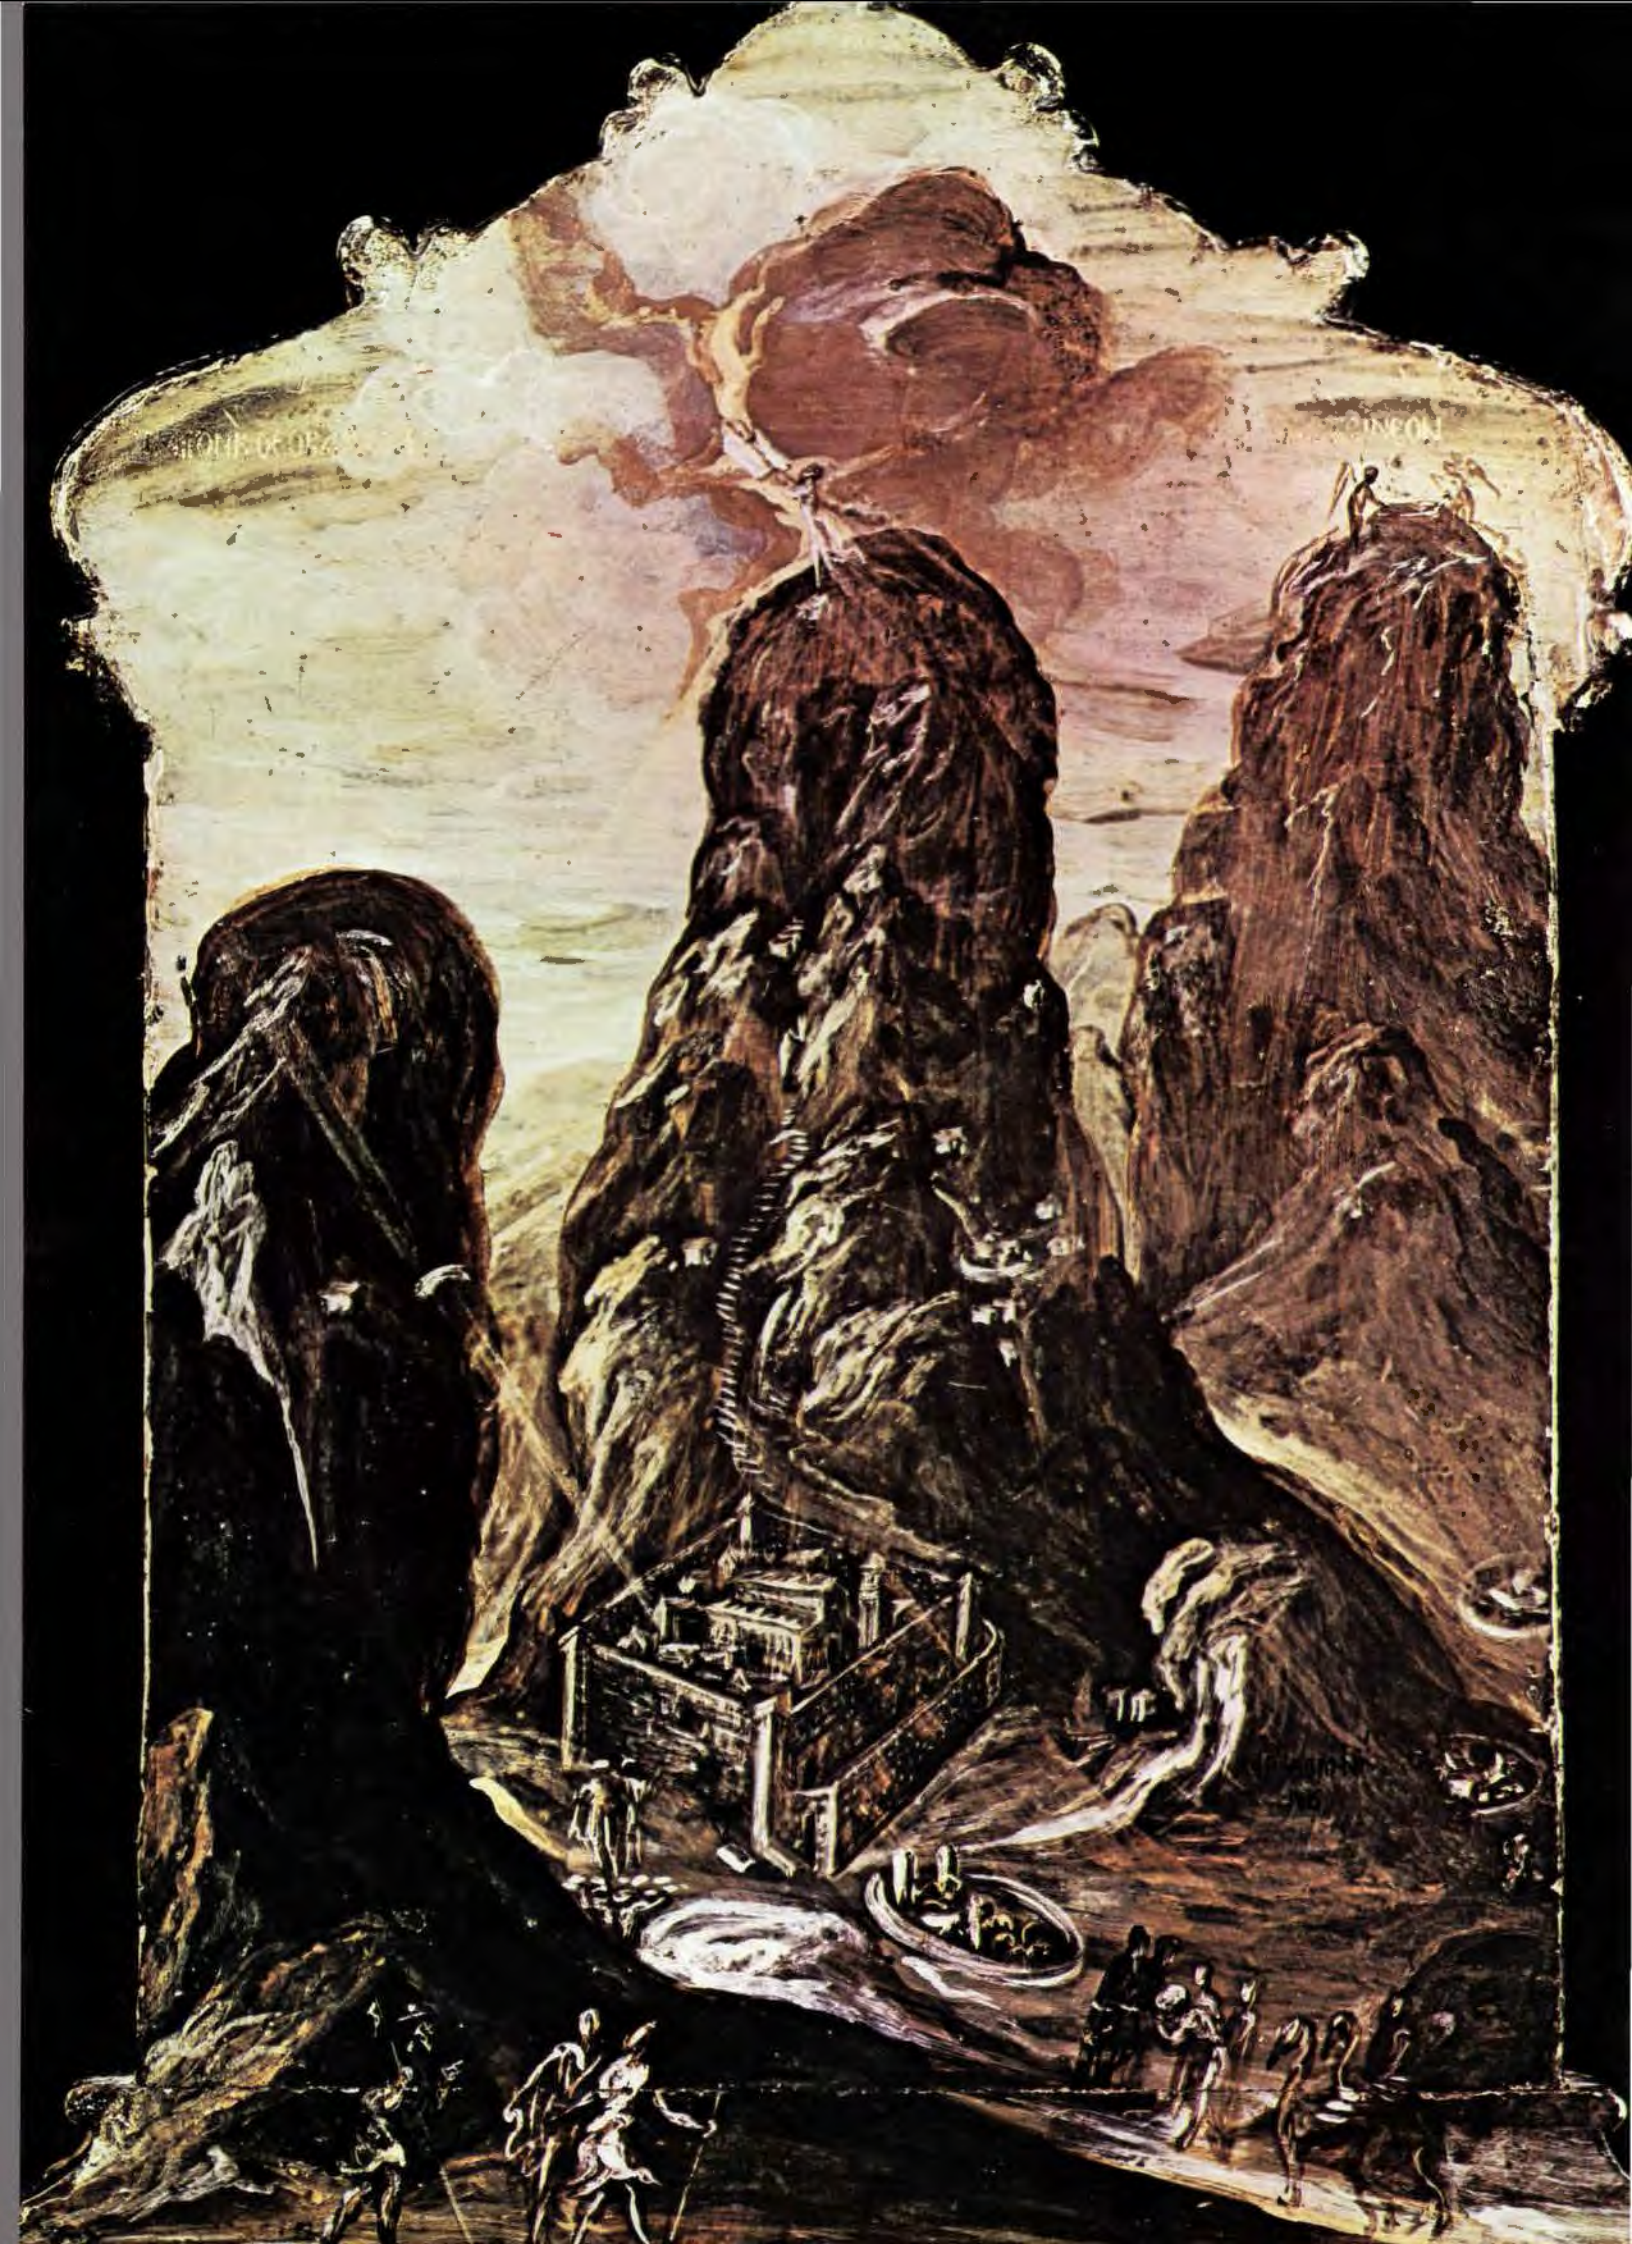
Both garden and desert are places of retreat but in the garden the escape from the everyday world is not to the desert's blinding light of revelation but to a paradise of ordered beauty, rest and gentle love. In the scene of the temptation and expulsion from Eden in the *Très Riches Heures*, the loveliness of the garden is framed by an ominous wood in the background and a line of barren mountains in front, which stand for the world outside the garden, the world of death, disorder, toil and violence from which the garden is exempt.

A garden, like other enclosed, womb-like



Museum of Modern Art, New York





Left **Because they reach up from the earth to the sky, mountains frequently symbolize the ascent from the earthly plane to the spiritual. Moses received the Ten Commandments from God on Mount Sinai, the Greek gods lived on Mount Olympus, and many other peoples have located their gods on mountain-tops. El Greco's painting of Mount Sinai, with the monastery of St Catherine at the foot, brings out the eerie quality of the mountain peak as the home of the divine, and mountains often have a sinister aspect in symbolism** ***Right*** **Another place in which to find God is the desert or wilderness, which is outside the normal world of human and animal life. An altarpiece by Grünewald, showing St Anthony with St Paul the Hermit, who lived in the Egyptian desert, where he was fed by a raven**

Scala

Giraudon/Librairie Flammarion

spaces (a walled city, a courtyard or square, a castle, a cave or den, a church, an arbour or bower) is frequently a symbol of the feminine, and especially of the mother. In the mother's womb new life is created and in the paradise garden of symbolism there is often the secret of life itself – the fountain of life, the Tree of Life in Eden, the golden apples of immortality in the garden of the Hesperides at the world's end (see APPLE).

In the later Middle Ages the *hortus conclusus*, the enclosed garden which shelters the Virgin Mary, the second Eve, and the baby Jesus, the second Adam, became a favourite theme of painting and 'enclosed garden' was one of the stock epithets of the Virgin. Eithne Wilkins explains that: 'The *hortus conclusus* connects both the source and the goal. The garden is the virginal matrix in which the Saviour is conceived. . . It is also the Paradise into which the Saviour draws the soul. The Virgin Mary, as the second Eve, transforms the original garden of Paradise, from which the human race was driven out, and she does so by containing it within herself.'

> A garden locked is my sister, my bride, a garden locked, a fountain sealed.
> Your shoots are an orchard of pomegranates with all choice fruits . . .
> A garden fountain, a well of living water, and flowing streams from Lebanon.

This double allusion (in the Song of Solomon, chapter 4) to the virginity of the locked garden and the sealed fountain, but also to the exuberant fecundity of the orchard and the well, caused Christians to take the passage as a reference to Mary, who was both virgin and the mother of God. A 12th century hymn salutes her as 'Sancta Maria, closed gate, opened at God's command – sealed fountain, locked garden, gate of Paradise.'

Because wild Nature is subdued and controlled in a garden, in modern psychological interpretations a garden is often taken to be a symbol of the conscious mind, as opposed to the forest, which stands for the dark, tangled, rooted growths of the unconscious. Forests do in fact tend to play an uncanny and ominous role in literature and art.

Lush fields and meadows may be symbols of fertility, of infinite space, and of the

A Landscape of Desolation

A sudden little river crossed my path
As unexpected as a serpent comes.
No sluggish tide congenial to the glooms –
This, as it frothed by, might have been a bath
For the fiend's glowing hoof – to see the wrath
Of its black eddy bespate with flakes and spumes.

So petty yet so spiteful! all along,
Low scrubby alders kneeled down over it;
Drenched willows flung them headlong in a fit
Of mute despair, a suicidal throng:
The river which had done them all the wrong,
Whate'er that was, rolled by, deterred no whit.

Which, while I forded, – good saints, how I feared
To set my foot upon a dead man's cheek,
Each step, or feel the spear I thrust to seek
For hollows, tangled in his hair or beard!
– It may have been a water-rat I speared,
But, ugh! it sounded like a baby's shriek.

Glad was I when I reached the other bank.
Now for a better country. Vain presage!
Who were the strugglers, what war did they wage
Whose savage trample thus could pad the dank
Soil to a plash? toads in a poisoned tank,
Or wild cats in a red-hot iron cage –

The fight must so have seemed in that fell cirque.
What penned them there, with all the plain to choose?
No foot-print leading to that horrid mews,
None out of it. Mad brewage set to work
Their brains, no doubt, like galley-slaves the Turk
Pits for his pastime, Christians against Jews.

And more than that – a furlong on – why, there!
What bad use was that engine for, that wheel,
Or brake, not wheel – that harrow fit to reel
Men's bodies out like silk?

Robert Browning *'Childe Roland to the Dark Tower Came'*

immortal life of heaven – the 'green pastures', or the Elysian Fields of Greek mythology. In Fra Angelico's *Last Judgement* (see CAROLE: DUALISM) the angels dance among grasses and reeds, trees and blossoms. In Jan van Eyck's *Adoration of the Lamb* (see EASTER) there is a rich and flowery meadow, and the fountain of life. In the background of both pictures is the city of heaven itself.

The Celestial City

'God the first garden made, and the first city Cain' (the reference is to Genesis 4.17), and the longing to escape from the crowded turbulence of the town to the immemorial peace of the countryside is expressed in many landscape paintings. But the city also has a powerful positive symbolic role in the idea of heaven as a city, the Celestial City of Bunyan's *Pilgrim's Progress* which stood upon a mighty hill, with its foundation higher than the clouds. This is the new Jerusalem of the book of Revelation: 'And I saw the holy city, new Jerusalem, coming down out of heaven from God, prepared as a bride adorned for her husband; and I heard a great voice from the throne saying, "Behold the dwelling of God is with men"' (chapter 21).

C. G. Jung believed that the city is primarily a maternal symbol, 'a woman who harbours the inhabitants in herself like children', and pointed out that cities are frequently spoken of as women in the Bible. In Galatians (4.26) St Paul says that 'the Jerusalem above . . . is our mother' and Revelation itself describes Babylon the great (Rome) as a harlot and the new Jerusalem as the bride of the Lamb. There is an interesting contrast between the earthly paradise of Eden, which is mainly vegetable in composition, and the celestial city which is mainly mineral. The wall of the new Jerusalem of Revelation is built of jasper, its foundations are adorned with jewels, its gates are pearls and its street is gold (see also JERUSALEM; REVELATION).

One More River

Rivers, fountains and wells share the general symbolism of water as the source of life, and the endless flow of a river may signify the flow of birth-death-rebirth, of things eternally ceasing to be and coming into being. A river may mean fertility because it irrigates the soil, or it may be the ever-rolling stream of Time which bears all its sons away to death and oblivion, or there are the black and burning rivers of hell which are currents of destruction and torment. To descend a river from its source to the sea may be symbolic of the merging of a single life in the One, the greater whole of which all things are part. To ascend a river to its source is equally to return to the One, the fount and origin of all things.

A winding stream is a symbol of the tortuous course of human life. To cross a river is to pass the barrier which separates two realms, two states of mind or spiritual conditions. In *Pilgrim's Progress*, for example, the river of death is the last obstacle which the pilgrim must negotiate to reach the heavenly city.

Some individual rivers are either themselves divine, like the Ganges in Hindu belief (see GANGES), or have some important supernatural significance, like the Jordan which separates the wilderness (life in this world) from the land flowing with milk and honey, the Promised Land (heaven). To cross Jordan in many hymns and spirituals, is to cross the river of death and attain the life of the world to come.

Similarly, a ford can symbolize the passage from one realm to another and in legends is quite often a place of combat, representing the difficulty of the crossing. Jacob wrestled with God at the ford of the Jabbok (Genesis, chapter 32) and was given the new name of Israel, as a mark of his new spiritual condition and as a sign that God would favour him and his descendants. There are many combats at fords in the Arthurian legends. In the *Lancelot* of Chrétien de Troyes, for instance, the hero has to overcome the guardian of a ford to cross into the enchanted country to which Guinevere has been taken (see LANCELOT).

Lakes are mysterious, and frequently sinister because the water or life-current in them is still instead of flowing – 'the sedge has withered from the Lake, and no birds sing' in Keats's *La Belle Dame Sans Merci*. Deep in the water of a lake there may be a magic palace of diamond and crystal, of shimmering jewels, the home of fairies, nymphs, seductive and dangerous enchantresses. This palace can be interpreted as an illusory paradise, which shatters at the touch of reality as the images on the surface of the water waver and break on contact with anything solid, and it can stand for the inspired but illusory creations of the imagination.

Valley of the Shadow

Mountains and hills have an extremely varied symbolism, illustrated by the Delectable Mountains, the Hill Difficulty, Mount Caution and the Mountain of Error in *Pilgrim's Progress* (which is packed with landscape symbols – the Slough of Despond, the Valley of Humiliation, the town named Vanity Fair, Doubting Castle and many others). A range of barren, jagged, towering mountains suggests primitiveness, difficulty and danger, spiritual sterility or positive evil – as in J. R. R. Tolkien's *Lord of the Rings*, where the sinister land of Mordor is walled by black and savage peaks. The names given in modern times to some peaks and ranges in the American West – Funeral Peak in Death Valley, for instance, or Skull Mountain in Nevada, or the aptly named Superstition Mountains of Arizona – illustrate the uncanny and ominous quality of mountain scenery.

But mountains are also beautiful and uplifting to the spirit, emblems of the stable and eternal, and because they reach up from earth towards the sky are symbols of the ascent from the earthly plane to the spiritual. St John of the Cross described the way of the mystic as the climbing of a mountain. The Celestial City usually stands on a mountain top. It was on Mount Sinai that Moses received the Ten Commandments from God. The Greek gods lived on Mount Olympus, the Canaanites worshipped their deities in the 'high places' on the hills, and the gods of many other peoples have been located on mountain-tops.

By contrast, the valley is a place where human, animal and plant life flourishes with comparative ease and so it may be a symbol of fertility and of the created world in all its richness. But valleys are also low-lying, at the opposite pole from the mountain summits of the gods, and so they may be evil and ominous. We live in a 'vale of tears' and our journey will bring us to 'the valley of the shadow of death'. A narrow defile or gorge may mean danger, because of its military significance, the home of the forces of evil, the depths of the unconscious mind.

Prado Madrid

***Charon's Boat*, by Joachim Patinir: a river can symbolize the barrier which separates two different spiritual realms, and in classical belief the souls of the dead had to be rowed across the river of the underworld by the grim ferryman Charon. Similarly, in many Christian hymns and spirituals, the River Jordan must be crossed to attain the life to come**

Caves, like other enclosures, sometimes stand for the womb of the mother. The cave was a secure shelter for the earliest human beings and in Jungian theory a cave is primarily a symbol of the security and impregnability of the unconscious. Like all deep and dark places, caves suggest mysteries, shadows and terrors. The dragon guards the treasure-hoard in a cavern deep in the heart of a mountain. The White Demon lives in a mountain cave, where the hero Rustem slays him (see EVIL). Milton's 'loathed Melancholy' was 'born, in Stygian cave forlorn, 'mongst horrid shapes, and shrieks, and sights unholy'. The cave is both grave and womb, the place of death and rebirth, where enchanted sleepers wait to return to the world.

The Landscape of Woman

The idea of Mother Earth expresses the parallel between landscape and woman. Caves, valleys, clefts and chasms, hills, groves, woods and thickets have obvious symbolic connections with the human, especially the female, body and with love-making. The dream-scenery of Coleridge's *Kubla Khan* includes 'that deep romantic chasm which slanted down the green hill athwart a cedarn cover! A savage place, as holy and enchanted as e'er beneath a waning moon was haunted by woman wailing for her demon lover!'

Among many other examples, a more recent one comes from Ross Macdonald's novel *The Three Roads*. 'Her kisses were the fulfilment of a promise too sweet to be believed, like a springtime in midwinter. Somewhere inside him the ice went out with a rush. The black night flowed like a river toward the delectable mountains, through a narrow, desperate gorge, into a warm valley . . .'

The Great Rock

The castle, standing on a hill or in a forest, battlemented and moated, hard to reach and dangerous to penetrate, is another place set apart from the normal world. In it some great and perilous secret may be guarded, like the Grail, or the sleeping beauty, or the prince who is under an enchantment. The castle is the otherworld and there are many medieval stories of a dark castle, ruled by a king or lord who takes prisoner all those who enter his land.

The tower may stand for strength, watchfulness and the ascent to the spiritual plane. It is sometimes a phallic symbol, because of its shape, but in Christian art and literature an enclosed tower is another emblem of the virginity of Mary. The Tower of Babel also stands for ascent but in the sense of the folly of human beings who try to grasp power which is beyond them, who reach unavailingly for the skies, and in Breughel's *Tower of Babel* (see BREUGHEL) the massive and crumbling edifice of ambition is contrasted with the peaceful scenery of ordinary human life.

Ruins are among the most evocative of landscape symbols. They convey a sense of beliefs, ideas or lives destroyed by the passage of time, monuments brought low, the futility and yet the grandeur of human achievement. A rock, on the other hand, stands for the solid, the permanent, the unyielding, and is a symbol of the presence of God and of spiritual support and comfort. When water miraculously flowed from a rock during the Israelites' passage through the wilderness, it was a sign that God was with them (Exodus, chapter 17). And Isaiah (chapter 32) says of the coming king who will reign in righteousness and the princes who will rule in justice: 'Each will be like a hiding-place from the wind, a covert from the tempest, like streams of water in a dry place, like the shade of a great rock in a weary land.'

The Lapp's reputation as sorcerers was partly derived from the *History of the Northern Peoples*, published in 1555, in which Olaus Magnus, Archbishop of Uppsala, described the magical practices of these people of the far north *Above* Two illustrations from the book show (*left*) a reindeer hunt on skis and (*above*) a reindeer impaled by a spear *Left* The reindeer were sacrificial animals, their blood being smeared on sacred objects and used for medicinal purposes; they were sometimes buried alive with their antlers protruding above the ground

Stallo, the stupid giant of Lapp legend, may reflect the Lapps' opinion of their dominating neighbours. Among this small, hardy race, spread across the far north of Europe from Russia to the Atlantic coast, pagan practices survived alongside Christianity until well into the 19th century

LAPLAND

EUROPE was first startled by accounts of Lapland witches in 1555, when Olaus Magnus, Archbishop of Uppsala, published his *History of the Northern Peoples*. Some years later an Englishman, Giles Fletcher, remarked after visiting Russian Lapland: 'For practice of witchcraft and sorcery, they pass all nations of the world.' The poet Milton referred to them in *Paradise Lost* (book 2) to colour his description of hell:

> . . . the night-hag, when, called
> In secret, riding through the air she comes,
> Lured with the smell of infant blood, to dance
> With Lapland witches, while the labouring moon
> Eclipses at their charms.

The ancient Norwegians, believing that the Lapps were skilled in sorcery, were in the habit of visiting them secretly to learn their art: indeed their medieval kings were obliged to prohibit journeys to Finnmark for the purpose. (Finnmark is the most northerly province of Norway, where many Lapps live.) After the appearance of Magnus's work, rumours began to spread that Swedish military victories resulted from Lapp sorcery. This greatly offended the Swedes and perhaps helped to provide the impetus which, more than a century later, was to launch an officially commissioned programme of research into Lapp culture and traditions.

Today we would probably not use the word witchcraft to describe the Lapp religion; but it accurately reflects the attitude of the period, when pagan cults and sorcery were held to be synonymous. The Lapps were extensively converted towards the end of the 17th century, and the change from pagan to Christian belief is reflected in certain of their legends, telling of people killed or otherwise visited with disaster through laughing at the planets or the powers of Nature.

The Shaman's Magic Drum

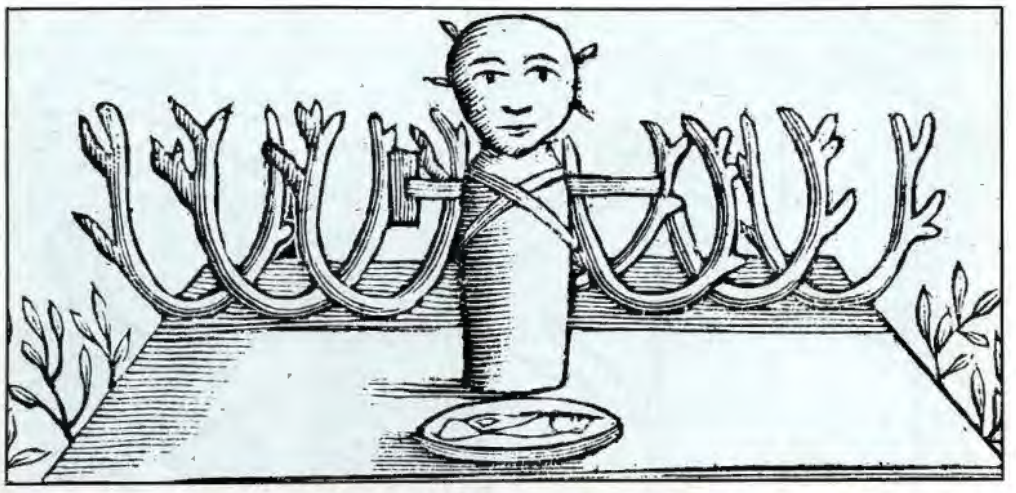
Perhaps the most striking Lappish cult – certainly the best known – was what we call shamanism (see SHAMAN). The *noaide* or shaman acted as an intermediary between the world of man and the supernatural. With the assistance of his magic drum (see DRUM), he fell into a trance and it was then supposed that his spirit left his body and journeyed to the otherworld. The shaman – who might strengthen himself for the ordeal with a concoction of seal oil, and the heads, bones and intestines of fish – produced this state of ecstasy by beating his drum and singing magical songs known as *yoik*. This drum was the chief cult instrument in pagan times and every family possessed one. By the 19th century it had virtually disappeared but a number of examples are preserved in Scandinavian museums.

The shaman's drum was regarded essentially as a magical object rather than a musical instrument; certain rules governed its manufacture. It had to be fashioned from the wood of a fir, pine or birch which had grown by itself in a remote spot, where the sun's rays could not shine on it; additionally, the stem of the tree had to be twisted in a clockwise direction. Its reindeer skin membrane was elaborately decorated with figures of gods and men, spirit animals, and scenes and objects from Nature, all painted with the juice of alder bark, which becomes blood-red when chewed.

The underside of the drum was often hung with brass devices and magic bones or animal parts suspended from leather straps, such as the penis of a bear, its teeth and claws. These objects greatly

increased the magic powers of the drum because to the Lapps, as to many Arctic peoples, the bear was a sacred creature (see BEAR). Large, dangerous and chief game animal, its mysterious winter sleep inspired awe. So did the habit of occasionally walking on two legs, like a human being, which gave rise to ideas that the bear must be semi-human. The shaman was imagined to assume the form of certain animals, of which the bear was one.

Carl Linnaeus, the distinguished 18th century Swedish naturalist, was told of a magic technique for bear-catching. Fresh warm bear dung is mixed with that from a cow. The bear will then follow the cow, attracted by the power of sympathy.



Ritual Bear Hunt

Lapps called the bear by special names – Grandfather, Woolly One, Old Forest Apples, Honey Paws – and the ritual of hunting it involved certain ceremonies. In March or April, when the hibernation period ended, a group of men walked in procession to the creature's den; their leader carried a staff with a brass ring attached. There they planted spears, at such an angle that the bear would impale itself when it came rushing out. The hunters then begged the dead animal's pardon and whipped its body with twigs. When they returned home, the women first looked at them through a ring of brass, with one eye only, and spat red alder juice into their faces.

Cooking the meat was a task reserved for men. Women, who absented themselves while this was done, were only allowed to eat certain portions; these were cooked in a separate pot and handed out on wooden sticks. The bones, which might on no account be broken, were set aside and buried so that one day a new bear would arise.

When the meat from a kill was nearly gone, a solemn feast was held and every last morsel had to be consumed. The hide was then propped up like a target and the women shot at it with bows and arrows, blindfold. The husband of whoever scored a hit was reckoned to be the next to kill a bear. Every woman was careful not to travel on the sledge which had borne the bear's carcass until a year was up. Anyone who did would run the risk of becoming sterile.

Men who took part in the hunt were usually not permitted to cohabit with their wives for three full days; five in the case of the man who had slain the bear. In some places, when the last feast was over, one man seized the iron chain hanging over the fire, circled the fireplace several times and ran out of the door. The women threw ashes after him, a signal that cohabitation might start again.

Healing Blood

Certain parts of the dead bear were saved for medicinal use: the grease as an antidote to gout, the gall against heart disease, and milk poured three times through the animal's bronchial tube as a tonic for ailing children. But it was the blood in particular which was supposed to be strongly potent. Indeed the Lapps were in the habit of drinking blood, and not necessarily that of the

Left **A crude image of the god Thermes – the Lapp equivalent of the old Scandinavian god Thor – incorporates his sacred hammer and the horns of reindeer. Birch and pine twigs are strewn along the approach to the simple altar** ***Below left*** **A Lapp seide or idol was usually a curiously shaped stone or piece of wood. This reconstruction in Nordiska Museum, Stockholm, of a Lapp place of sacrifice includes the forked stick on which sacrificial gifts were hung, and the skull of a reindeer** ***Below*** **A shaman, the Lapp community's leader in religious matters, lies in a trance, his magic drum on his back; it was believed that on these occasions his spirit left his body and visited the otherworld. The shaman's drum, which helped him to achieve a state of ecstasy, was a vital part of his equipment and elaborate rules governed its manufacture**

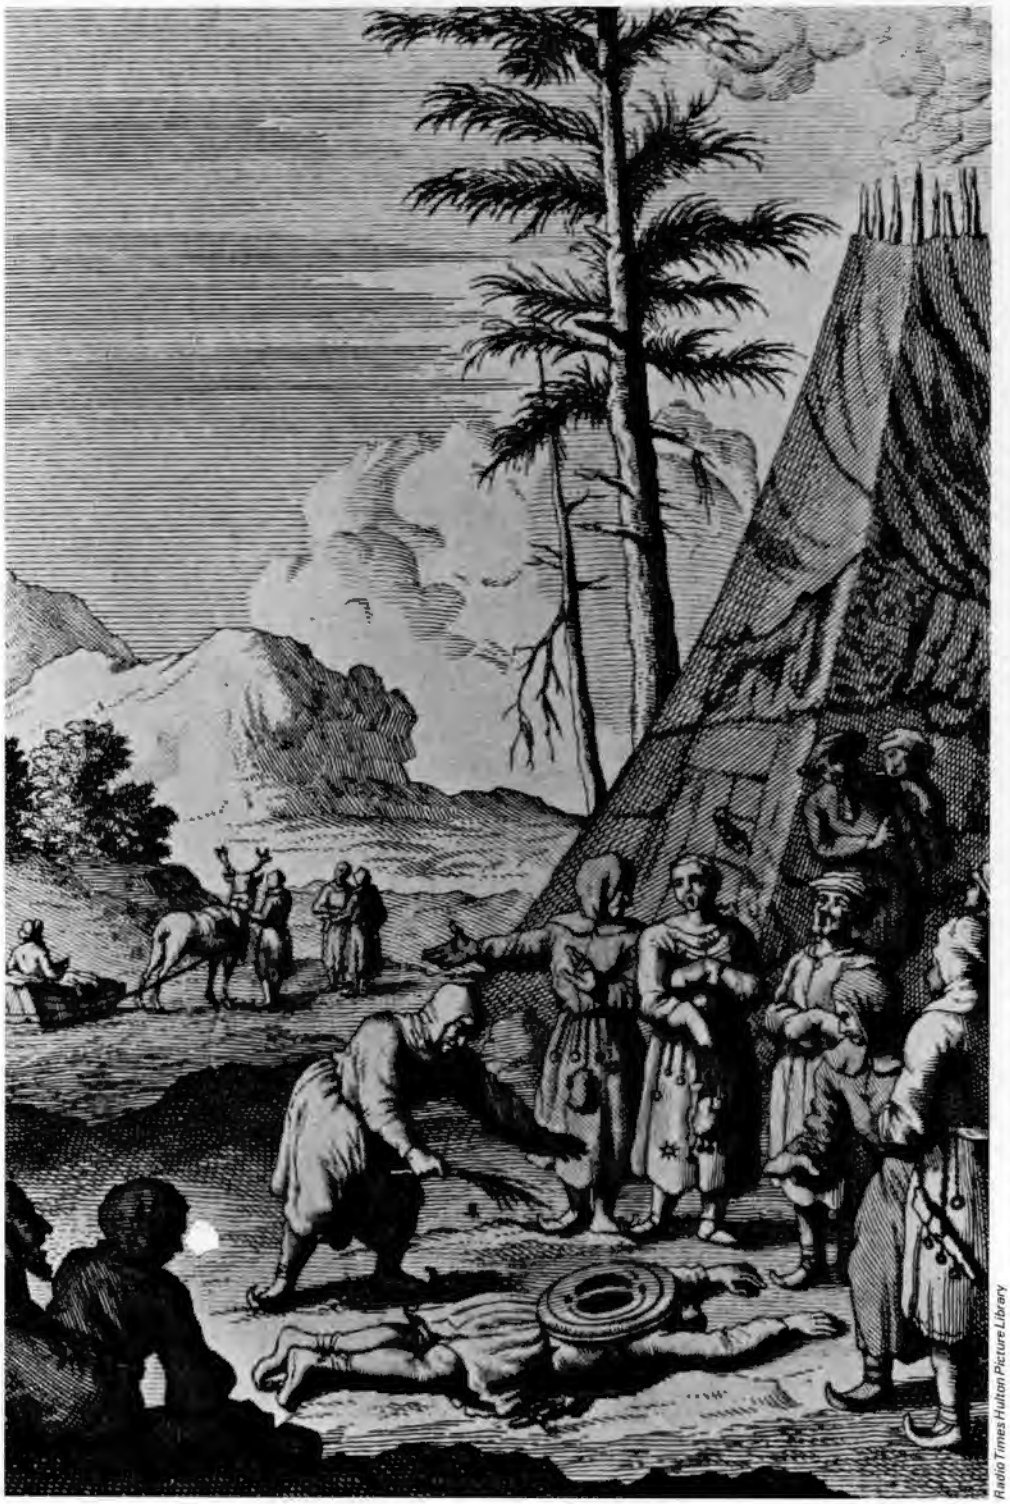
bear, to heal various complaints. In 1732 Linnaeus wrote in his diary:

> Lying-in women at this place are accustomed to drink brandy seasoned with pepper, partly for the sake of its intoxicating quality, by way of a narcotic, and partly to bring on the labour pains. The clergyman's wife told me an infallible method, as she said, to prevent the pains which often follow childbirth. When the woman's first child is born, and the umbilical cord divided, a spoonful of the blood is given her to swallow. This is to be practised at every succeeding labour, and I was assured that each would be rendered more easy, without any after pains.

Puerperal fever was cured by securing a plump female reindeer and stabbing the chest: the blood which came spurting out was consumed by the patient, as much as possible, to the extent of several cupfuls. Reindeer blood and other portions of the animal's body were also preserved and used. Linnaeus says:

> The animal being secured with a halter, the Laplander takes his spear and sticks it into the thorax behind the shoulder, so as to pierce the heart. By this means the blood collects in the cavity of the thorax, none of it appearing externally. After the skin is flayed off, the blood is found coagulated in the thorax, from whence it is extracted, and bruised into a soft mass. With this the poorer sort of people make a kind of soup by boiling along with it the brains of the animal, which the rich do not eat. The testicles are never eaten by any sort of people. The penis serves to make a thong to draw the sledges.

This making use of whatever is to hand characterizes the ingenuity of these people, struggling to survive in one of the world's most inhospitable regions. A Lapp Creation myth tells how, in the beginning, two brothers were created. When the first fall of snow arrived, one brother hid in a cave. The other remained outside and survived: he was the ancestor of the Lapps.



Radio Times Hulton Picture Library

Stallo Legends

A people without a country of their own, the Lapps are spread across a vast area which stretches from the Atlantic shores of Norway to the Kola peninsula in the Soviet Union: they extend across the territories of four countries – Sweden, Finland, Norway and Russia. This political dependence, and the inevitable problems which it has created, are possibly reflected to some extent in the traditional cycle of *Stallo* legends.

These stories, which are sometimes 'acted', are about a stupid man-eating giant who is always outwitted, and may contain memories of fights against hostile neighbouring peoples; for the Lapps are not a tall race, and seldom exceed five feet in height. Some scholars see in Stallo recollections of an alien tax collector. At the beginning of the 19th century, in western Finnmark, small groups of young men used to call at the houses, demanding 'the king's tax', and among these Stallo was always represented by the tallest youth. Dressed in rags, he prodded the girls in each house with a phallus made of wood and asked for payment of the tax;

Once, so it is said, Stallo forced a Lapp girl to marry his son. When it was time for the wedding feast, the bride contrived to tip the cooking pot over the groom, in such a way that his stomach and genitals were completely destroyed. Another story centres round a curious item of material culture. The Lapps thought it very unhealthy to drink water straight from a well, so they made special drinking tubes from the shin-bone of a bird. Stallo's wife had an iron tube which she used for drinking blood. One day a Lapp tricked Stallo into coming out on a frozen river, where he struck him down through a gap in the ice. The giant's wife fetched her drinking tube to come to the rescue, but failed to notice that the Lapp

women had secretly put it on the fire. When she tried to suck it, the blazing coals went into her mouth and she burnt to death, while her husband froze in the icy river.

Stallo and his wife, Lutakis the Treacherous, were specially active on Christmas Eve, and they ate up any children who passed their way at that time of the year. The dreaded *joulo-gadze*, or Christmas Spirits, were also about and the Lapps put steel or flint in the water source to prevent them urinating in it. Offerings of miniature boats, smeared with reindeer blood, were made to them.

A propitiatory sacrifice was also made to the *akkas*, spirits who dwell beneath the threshold, fireplace and cowbyre, in the form of brandy poured out on the ground. These spirits are offended by noise late at night, and the alcohol was intended as an atonement. It was also to induce their aid in childbirth, and after the successful arrival of a baby Lapp women put out meat and cheese by way of thanksgiving. Brandy was evidently regarded with a certain respect. Linnaeus says:

> After they have laid hold of the mug, they dip their forefingers into the liquor and rub a little on their foreheads, as well as on the middle of their bosoms. On enquiring the reason, I was told their intention was that the brandy might not prove hurtful either to the head or the breast.

Another interesting food ritual was the eating of sun-porridge on Midsummer Eve. *Jubtse*, as it was called, was a mixture of flour, milk and butter, eaten by men and women in honour of the sun. First they would kneel and ask the sun to shine benignly on their reindeer herds and the food supply. Then the porridge was consumed and the kneeling ceremony repeated. This magic ritual was evidently intended to promote the strength of the sun at the time of year when it is at its highest point in the sky.

Idols and Holy Places

Lapps worshipped the forces of Nature. They also believed that inanimate objects possessed supernatural power. A *seide* (idol) was, generally speaking, a curiously shaped stone or piece of wood, which the worshipper cushioned on a bed of twigs and surrounded with a semicircle of reindeer antlers. It was offered sacrifices to ensure good luck in hunting and fishing.

These idols often occur in the vicinity of a *saiva* (sacred) lake or mountain. Indeed scholars have found it difficult to say whether the seide is to be regarded as an image of the local divinity or simply as his dwelling, it being the most important object within the sacred area. In Lapp belief saiva lakes are double-bottomed, and a small hole links the two levels so that, if they wish, the fish can easily avoid the fisherman's rod. If this happened, it meant that the spirit of the waters was displeased.

When a Lapp was going to offer a sacrifice, he wore his best clothes and a head-covering. Since it was expressly forbidden to make a noise near holy places, he refrained from saying anything. No Lapp would live in such a neighbourhood, nor even spend one night in the vicinity; hunting in the locality was also taboo. Departure for the sacrifice was through a special door at the back of the dwelling; women were not permitted to use it, nor might they take part in the ritual. They could not go into the holy area, nor could they touch a magic drum, or even look at one. If a woman happened to pass along the same route as a drum, a sacrifice had to be offered by way of atonement and the drum itself was given a piece of silver.

Seidis, like certain other cult objects, were customarily smeared with the blood and grease of a bear or reindeer, and pieces of the slaughtered animal were suspended in the nearby trees, especially the heart and lungs. As sacrificial animals, reindeer sometimes suffered live burial, with their antlers showing above the ground.

Christian missionaries first went among the Lapps in the 13th century. But as late as the early 1900s it is recorded that a Lapp fisherman, disappointed with his catch, struck out at the local idol with his oar and knocked its head off – an interesting case of missionary activity subverting belief in the local divinity, without destroying it.

VENETIA NEWALL

FURTHER READING: Roberto Bosi, *The Lapps* (Thames & Hudson, 1962); Ernst Manker, *People of Eight Seasons* (C. A. Watts, 1965).

They could be found in every Roman household, in field shrines, at busy crossroads and in state temples. By an astute political move the homely and ubiquitous Lares were associated with a new cult – that of the emperor himself

LARES

AS TUTELARY DEITIES the Lares usually protected a given place which supplied them with their distinguishing epithet. Far and away the most frequent, if not oldest, manifestation is met within the household *(familia)*, where the single Lar Familiaris (Household Lar) received regular monthly offerings of garlands on the hearth as well as daily observance at mealtimes. This Lar protected the household and its wealth, no matter how small, and was invoked on important family occasions: sometimes he also gave oracular signs to the householder. The Lar in fact came to symbolize the home.

In the oldest fully surviving Latin prayer, however, the Lares, together with Mars and certain 'seed gods', are invoked by the Arval Brothers (an ancient Roman college of priests) at the boundaries of the cultivated land *(arvum)*. Where two fields joined, the Lar of each boundary line was honoured by the farmer and his slaves; both the convergence of boundaries and its marker were called *compita*. The compital shrine was a small tower with niches for every Lar thought to be present; here the Lares Compitales were found. Because the boundaries of property were usually marked by a path or a road, the Lares Compitales are best known from worship at rural crossroads and busy urban intersections. Sometimes they were the only or chief deities at country junctions where a hamlet comprised a few huts. At a normal junction, made by two roads, two Lares would be jointly worshipped; the practice became established, so that no matter how many lines converged, only two Lares were thought present. Even the Lar Familiaris was depicted in duplicate, although each household had only one Lar. The Lares Semitales were venerated for their protection of paths *(semitae)* and the Viales for their protection of highways *(viae)*.

The great annual festival of the Lares was the movable feast of Compitalia, which fell soon after the winter solstice. Like other winter festivals Compitalia called for artificial light, and the liturgical use of candles first appears here. Indeed, not a few aspects of Compitalia became an integral part of the Western Christmastide. The Lares' victim was the pig, which remained traditional Christmas fare until challenged by fowls.

Very early the Lares enjoyed the veneration of the humble and came to be the most important gods of society's lowest stratum, slaves and freedmen. Such people were of alien extraction, and the Lares exercised a strong force in their assimilation into Roman society. Slaves and freedmen especially observed Compitalia, for it was one of the few state cults to which all persons were admitted, regardless of condition. Much merrymaking accompanied performances of crude, extemporaneous farces. As early as the 5th century BC the Roman government expressed concern over the intrusion of foreign rites at the urban compita. It is highly likely that the first importation of foreign drama was by foreign slaves and freedmen into the winter festival.

Imperial Takeover

Rome and her colonies were officially divided into neighbourhoods *(vici)*, and the countryside into villages (also *vici*), to which belonged a public cult of Lares Vicinales or Compitales. Because the greater population often consisted of slaves and freedmen, the freedmen mayors and slave attendants of each neighbourhood and village supervised regular worship. Shortly after 12 BC, Augustus Caesar converted this cult into the worship of the Lares Augusti, Lares of 'increase' associated with the worship of his *genius*, his personal 'procreative force' (see GUARDIAN SPIRITS). Every householder's genius had been propitiated beside his Lar Familiaris; in this way Augustus successfully adapted a long established cult to the new Imperial religion without imposing his direct worship in Italy (though outside Italy he was directly worshipped). On compital altars portraits and symbols honoured the

emperor and his family; sometimes Augustus donated statues of neighbourhood gods, who acquired the epithet *Augustus*. In the months of May and August the altars were strewn with flowers on his behalf.

At many Roman intersections the Lares' marble altars stood before a small temple housing statues of two Lares and a genius. At most compita in Italy stood a simple altar of stuccoed brick, built against a wall on which were painted the three figures. Lares were represented as Greeks wearing tunics and holding a wine bucket and Greek goblet; usually they appeared to dance while their faces betrayed tipsiness. In contrast, a Roman toga clothed the genius, who held a sacrificial saucer and cornucopia.

Grunting Gods

Lares rarely enjoyed grand worship in state temples. Among the exceptions were the Lares Praestites, 'protectors' of the Roman people. The 'grunting' Lares Grundules, called after the pig victim, numbered 30 and probably protected the 30 civil divisions. The title 'Lar' could also be applied to other gods, such as Silvanus, lord of the forest. Aeneas, the legendary Trojan ancestor of the Roman people, is addressed as a Lar on a dedication of around 300 BC. This designation very probably reflects the custom of adding the appellation Lar to foreign deities or heroes after their cult had been appropriated by slaves and freedmen: Orpheus, for instance, was venerated as a Lar.

The Lares' cult affected a remarkable social change by admitting the slave or ex-slave, now a citizen, to the native religion and giving him a public task. In 214 BC Philip V, Macedon's last great king and Rome's adversary, declared the worth of Roman practice in bestowing minor public office on freedmen. The Italians of southern Italy even imported the Roman cult of the Lares onto Delos, their island mercantile centre in the eastern Mediterranean. By the end of the 2nd century, Greek and oriental slaves of Italian and Neapolitan Greek traders had formed societies of *Kompetaliastai* on Delos.

An inestimable contribution to the growth of Roman culture was made through the development of theatre beyond the urban intersection, while universal participation in compital worship worked towards the assimilation of foreigners. The Lares Augusti marked the first stage of the Imperial cult and continued to thrive till the time of the Christian emperors. But such was the tenacity of this pagan domestic cult that vestiges still linger with us on 25 December and New Year's Day.
(See also ROME.)

Friends of Man

The Calends of May witnessed the foundation of an altar to the Guardian Lares, together with small images of the gods . . . The reason for the epithet applied to them is that they guard all things by their eyes. They also stand for us, and preside over the city walls, and they are present and bring us aid. But a dog, carved out of the same stone, used to stand before their feet. What was the reason for its standing with the Lar? Both guard the house: both are faithful to their master: cross-roads are dear to the god, cross-roads are dear to dogs . . . wakeful are the Lares, and wakeful too are dogs.

Ovid *Fasti* trans J. G. Frazer

Scala

Two Lares, depicted as young men wearing short tunics and holding wine buckets and goblets, are painted in dancing posture on either side of a genius, or guardian spirit, dressed in a Roman toga; this shrine is typical of the altars which stood at many Italian boundaries and crossroads. Lares, who were usually shown in duplicate, were particularly venerated by the lower classes of Roman society

Bodleian Library

Last Judgement

In Christian tradition, the final reckoning on the Last Day or Day of Wrath, when the Last Trump sounds and the dead rise from their graves to be judged and consigned to heaven or hell: distinguished from the 'particular' judgement immediately after death: in Judaism the Day of Yahweh, when God would punish the oppressors of his people, became a Last Judgement at the end of the world.
See JUDGEMENT OF THE DEAD.

C. M. Dixon

Last Supper

The last meal which Jesus ate with his disciples before his betrayal, arrest and execution; the earliest surviving account of it is in St Paul (1 Corinthians, chapter 11); it is commemorated or re-enacted in the ceremony variously called the Lord's Supper, Holy Communion, Eucharist or Mass.
See MASS.

Mansell Collection

According to a Greek myth, the nymph Daphne, fleeing from the amorous god Apollo, called for help and was transformed into a laurel tree. Apollo covered his head with the leaves and decreed that the tree should be sacred to him

Poets, military heroes and Olympic victors all sought the crown of laurel as the highest honour. Sacred to Apollo, the laurel or bay was also associated with oracular powers

LAUREL

THE BAY, *Laurus nobilis*, is the laurel of mythology, not the cherry laurel, *Prunus laurocerasus*, nor the Alexandrian laurel, *Ruscus racemosus*, with which Paris was once crowned. The Greeks, however, call it Daphne in colloquial speech (although botanically the genus *Daphne* is entirely distinct), recalling the myth in which the unwilling nymph of that name, daughter of the river god Peneus, was amorously pursued by Apollo (see APOLLO); she called for help and was transformed into a laurel tree. Apollo, his ardour cooled, crowned his head with the leaves and decreed that the tree should be evergreen and be held sacred to him.

Apollo's prophetess at Delphi probably chewed laurel leaves and inhaled their smoke from a fire to reach a state of inspiration. Many other oracles, including the one at Dodona, made use of this stimulant. The prophetess was concealed from sight by a barrier of laurel, and those asking her advice were supposed to wear a laurel wreath. Later it was considered sufficient for a prophet to hold a laurel bough to foretell the future; another belief was that a laurel leaf under the pillow would enable the sleeper to foretell the future in dreams. Sprays might be burnt during incantations, and omens could be established from the way the leaves crackled. The diarist John Evelyn (1620–1706), repeating these beliefs, added that laurel would also inspire 'poetical fury'.

The Greeks used the laurel wreath to honour poets, military heroes, priests, the victors in the Pythian and Olympian Games and certain high officials. Greek military heralds carried a branch of either laurel or olive, while the Athenian heralds used the Harvest Wreath or *eiresione*, a similar branch bound with wool to which fruits in season would be attached. This wreath was carried in the Harvest Festival procession and was eventually fixed over the farm door for the coming year as an augur of prosperity.

The Laurels of Victory

The sanctity of laurel was very important to the Romans. As J. G. Frazer tells us, records from Imperial times indicate that magistrates presiding over the games at the Circus, and generals celebrating victory, wore the costume of Jupiter as he appeared enshrined in his Capitol temple. Apart from the special robes and crown, the eagle-topped sceptre and the reddened face attributed to the god, they carried a laurel branch in one hand and a laurel wreath on the head, while the four horses pulling the chariot were likewise crowned with laurel.

Generals not only wore a laurel wreath on returning in triumph but would send the emperor their despatches announcing victory in a wrapping of laurel leaves; these despatches were called *literae laureatae*. The messenger also carried a branch of laurel, which was placed on the statue of Jupiter. After a victory not only the commander carried laurel but his soldiers also. It has been suggested that this was partly to show that they were sanctified in this way from the pollution of blood.

Young doctors in former times were crowned with a wreath of laurel in berry – *bacca lauri*. Baccalauréat, the name for a certificate in French, and bachelor, its corruption in English, are derived from this. The practice of presenting a laurel wreath continues in Swedish universities. From the word and its usage comes also, of course, Poet Laureate.

The association of bay with medicine comes from antique times, when physicians regarded it as a panacea and statues of the healing god Asclepios would be laurel-wreathed. The supposed clinical efficacy of laurel can be judged by the advice of the Emperor Claudius's doctors to move the court, during a pestilence in Rome, to Laurentum, capital of Latium, where great numbers of bay trees grew.

Bay was widely regarded as protective

against lightning, and it is recorded how the Emperor Tiberius, who was terrified of storms, would place a laurel wreath on his head and hide under his bed when the thunder rolled. The Greeks believed that laurel was protective against spirits and spectres, and the saying 'I carry a laurel branch' showed that the speaker had fear of neither poison nor sorcery. The Greeks fixed laurel boughs over their doorways when anyone was ill, to keep away evil spirits. Theophrastus (c 370–288 BC) records how superstitious people kept a bay leaf in their mouths all the time, to protect them against ill fortune. Roman merchants would bless their goods with a laurel branch.

The belief that laurel protected against evil spirits and witches was widespread in more recent times. In some Christian areas a twig of bay would be thrown on the coffin at burial, as Sir Thomas Browne recorded in the 17th century; and bay was always a valuable ingredient of the evergreen Christmas decorations of church and home, as a couplet from John Brand's *Popular Antiquities* shows:

> Now with the bright holly all the temples strow,
> With laurel green, and sacred mistletoe.

Christmas dishes were often garnished with bay and John Aubrey tells us how, 'At ye feasts in the halls of the City of London the stewards do wear garlands of laurel.'

Two isolated, more recent beliefs are worth recording. One is the honouring of the magpie, once practised in France, by tying branches of laurel and heather to tree tops, because the birds gave such audible warnings of wolves. The other concerns the 'footling', a person born feet first who was believed to possess special gifts, notably that of healing. It was thought that a footling was prone to accidents which would make him lame, and to avert this the midwife would rub his legs and feet with laurel leaves shortly after birth.

To dream of laurel signifies, first of all, pleasure and victory. To an unmarried girl, it means marriage very soon; to a married woman, that she will soon have a child; to a married man, an inheritance through his wife. In the language of flowers laurel stands, appropriately enough, for glory.

J.K. LAVATER

CALVINIST DIVINE, poet, mystic and investigator of the supernatural, Johann Kaspar Lavater is now chiefly remembered for his work on physiognomy, or the judging of a person's character from his physical features. The 12th son of a doctor, he was born in Zurich in 1741. After being ordained in 1769, he marked the beginning of his career by denouncing the tyrannical bailiff of Gruningen. His confederate in this public-spirited enterprise was his schoolfellow, the future painter Henry Fuseli.

Lavater's interest in the supernatural was deep-rooted. In later life he remembered going as a child into the room where his brother lay dead of consumption, only to be driven out by a 'pale, shapeless phantom', which for long afterwards gave him a horror of being alone. During his whole career he remained fascinated by the apparently miraculous. In about 1771 he issued a circular asking for details of supernatural experiences and amassed a collection of case histories, much as more recent psychic researchers have done. His enemies accused him of credulity and of encouraging eccentric practices, like those of Catherine Kinderknecht, who cured a relation of Fuseli with prayers and a poultice of cabbage leaves. His verdict on the exorcism of the Catholic priest Gassner also earned him notoriety: for though he did not himself witness any of Gassner's cures he believed that the priest possessed a certain power 'which resides in all men, as the image of God . . . a magical power of the mind over the bodies and powers of the corporeal world . . .'

His beliefs brought Lavater into contact with most of the occult fashions of the day. He felt forced to accept the truth of Emanuel Swedenborg's revelations of the spirit world (see SWEDENBORG), although as a Christian he felt 'almost everything repulsive' about them. When the theories of Franz Mesmer (see MESMER) and other supporters of 'animal magnetism' came into vogue, Lavater carried out an investigation, experimenting on his wife. Accused of believing in imaginary cures, he replied that he preferred an imagination which made people well to a reality which left them ill.

But Lavater's chief claim to fame is as the author of the *Physiognomical Fragments* published in 1775–78, a European best-seller on the reading of character from the face, in which his friend and travelling companion Goethe probably had a hand. Physiognomy, said Lavater, is 'the science or knowledge of the correspondence between the external and internal man': for example, as anger makes the muscles stick out, an angry man's protuberant muscles provide a good indication of his temperament. (See PHRENOLOGY AND PHYSIOGNOMY.)

Lavater thought that physiognomy could be made as exact a science as any but mathematics and laid down more exact rules for the judging of character. The physically unfortunate might be thus summed up:

> Inanimate thoughtlessness will be universally perceived in this countenance. The experienced only will discover the peculiar vapidity of the mouth.

Or

> To be avoided: Large bulky persons, with small eyes; round, full, hanging cheeks, puffed lips and a chin resembling a purse or a bag; who are continually occupied with their own corpulence . . .

The physiognomist had himself to be well-proportioned: no one could be a judge of character who had 'a debased mind, an ill-formed forehead, a blinking eye, or a distorted mouth'. 'A strange theory of

aesthetics followed. 'The handsomest painters were the greatest painters. Rubens, Vandyke, and Raphael, possessing three gradations of beauty, possessed three gradations of the genius of painting.' To all objections that often one met with a talented or virtuous person who was physically ugly, Lavater replied that these were the exceptions that proved the rule. Even the study of animals reinforced his theory. 'The crocodile,' he remarked sagely, 'proves how very physiognomical teeth are.'

His own undoubted skill in reading character made him a legend in his own lifetime. Once, for example, after he had been introduced to a stranger, he observed privately, 'This is the face of a murderer'; several days later he discovered his new acquaintance was one of the assassins of the King of Sweden. Physiognomy could therefore be of great practical benefit to the man of the world. 'Three things appear to me to be indispensable to travellers,' he once wrote, 'health, money, and physiognomy.'

Lavater's unorthodox beliefs often caused trouble with the Church authorities, although he was always vindicated. He was visited by half the nobility of Europe, wrote a poem at the request of Queen Charlotte of England and sold his collection of physiognomical drawings to the Empress of Russia.

In 1799, when Zurich fell to Massena's Republican army, Lavater was shot and badly wounded by a French grenadier. He died as a result of his wounds in 1801.

The revival by Lavater of physiognomy may well have had violent repercussions. When later combined with the theories of evolution and survival of the fittest, it could be taken as providing proof of the superiority or otherwise of racial types. Lavater believed that he could tell a person's nationality from his face. 'Englishmen,' for example, 'have large, well-defined, beautifully curved lips.' It is not such a long step to the Nazi with his callipers measuring doubtfully 'Semitic' noses. In 1777 Lavater admitted to the Emperor Joseph II that he often became giddy at the thought of what the universal acceptance of physiognomy might do to mankind. 'But,' he added, 'it will produce no such changes.'

WILLIAM LAW

THE BRITISH have always had a healthy mistrust of mysticism, believing it to 'begin in mist and end in *schism*' and it is therefore hardly surprising that we have produced no John of the Cross and no St Teresa. Yet there is an important English spiritual tradition which, in medieval times, reached its peak with Dame Julian of Norwich and Richard Rolle and in the 17th century in the Caroline divines. William Law comes at the end of this second period of distinctively English spirituality. He looks back to the men who made the Prayer Book and beyond them to the medieval mystics, but he also looks forward beyond the Anglicanism of the 18th century to the Catholic revival.

Law was born in 1686 at King's Cliffe in Northamptonshire, where his father was a grocer. He was educated at Cambridge and in 1711 he was elected a fellow of his college – Emmanuel – and was ordained. When Queen Anne died in 1714 and the government failed to reinstate the Stuarts but instead brought the Hanoverian king, George I, to rule in Britain, William Law, like many others, refused to swear allegiance to the new king as he had espoused the Jacobite cause and supported the Stuart pretenders. This meant that he was expelled from his fellowship at Cambridge and was not allowed to take on a parish. He therefore did occasional service in London and acted as a sort of curate until 1727, when he became the tutor of the father of Gibbon, the great historian. Gibbon called him 'the much honoured friend and spiritual director of the whole family' and Law remained with them for ten years. This was a fairly typical arrangement for those clergy who could no longer hold parishes because they refused to swear an oath of allegiance to the Hanoverians. The non-jurors were an influential set of people, largely comfortably off, who sympathized with, or actively fought for, the Stuarts and whose religion was often a traditional High Church Anglicanism. They took into their homes the clergy who had lost their positions because of their non-juring views and within these families grew up a simple and strict piety which is peculiarly English.

It was here, as a tutor, that Law began to influence the Wesleys, both of whom were friends of the Gibbons, and his influence upon Methodism and its direct, simple Christianity was profound. In 1740 Law returned to his family home at King's Cliffe and set up a household. He was joined by two of the people he had met while living with the Gibbon family, Mrs Hutcheson and Miss Hester Gibbon, and together they organized and ran two schools and some almshouses. They lived a life of simplicity and devotion until he died in 1761.

Law's great contribution was, of course, his writing, in which he excelled – both as a controversialist and as a mystic. As a non-juror he was naturally drawn into the fierce theological battles of his time. He joined with great spirit into the controversy between the non-jurors and the Bishop of Bangor, Dr Hoadly, who was an extreme latitudinarian, supporting the new Hanoverian monarchs and attacking any claim of the Church to divine authority. The High Church party was forced to reply to Hoadly's neutral views which denied the existence of the visible Church. The most effective pamphlet among the welter of charges and countercharges was that written by Law, 'Three letters to the Bishop of Bangor'.

Universal Appeal

Yet it is not for his controversial writing that Law is remembered but for his *Serious Call to the Devout Life*, and his other devotional and mystical writings. Although he led a practical life as a tutor and then looked after the old and the young, his real contribution was as the author of a simple and direct kind of spirituality. He was fundamentally influenced by St Thomas à Kempis and Jan van Ruysbroek, and brought into his books something of their spirit, but it was the vigorous writing, which also characterized his controversial works, which made the *Serious Call* so different. Law was concerned to express the value of a moral and ascetic Christian life, a life lived in simplicity and direct contact with God. The methods he counselled were the fundamental ones of meditation, good works and ascetic practices. He believed that temperance, humility and self-denial were the fundamental Christian virtues, through the practice of which man lives the life ordained of God. The *Serious Call* became a classic and had a more profound influence on the English Church than perhaps any other book, except Bunyan's *Pilgrim's Progress*. It was not merely taken up by the Methodists and the Congregationalists but it was also one of the serious influences upon the Evangelicals in the Church of England, who reacted against the lifeless conformity of the 18th century Church.

More than this, the *Serious Call to the Devout Life* was one of the most precious for the Tractarian leaders – Cardinal Newman and Richard Hurrell Froude. Newman says in his *Apologia*, 'the main Catholic doctrine of the warfare between the city of God and the powers of darkness was also deeply impressed upon my mind by Law's *Serious Call*', and Froude chides one of his friends for calling this 'a pretty book' by saying it was just like referring to the battle of Armageddon as 'a pretty sight'! It is this universality of appeal to both Catholics and Evangelicals that is the remarkable fact about the *Serious Call*. It is indeed remarkably direct and well written, and obviously had a profound effect on the minds of some of the greatest of Church leaders. It does, however, lack any real sense of the community of Christians.

Despite the fact that Law had High Church views about the Church as a divine institution, he makes no real mention of the Church's year or its services as aids to the Christian life. This was, of course, partly because Law was a non-juror and was therefore excluded from much of the life of the Church. Nevertheless, this tendency towards individual ascetic religion became more and more pronounced, particularly after Law's reading of Boehme's works (see BOEHME). Law's later works were highly esoteric and postulated an individualist Christianity which had very little to do with life as it is normally lived.

Despite all this, the *Serious Call* remains one of the great classics of spirituality. Its influence was felt throughout the English Church and its effect on Cardinal Newman's thought must have contributed fundamentally to the Catholic movement in the Church of England and to the reform of Roman Catholicism which Newman began and which culminated in the second Vatican Council.

LEAD

THE DARKEST and heaviest of the seven metals corresponds to Saturn, the dimmest and slowest-moving of the seven planets, and to the colour black (see CORRESPONDENCES). As the outermost of the planets known in antiquity, Saturn was associated with the idea of limitation, with the setting of boundaries, and lead was used to bring its influence to bear.

Religious relics were often encased in lead caskets, to keep their sacred force within an effective boundary and prevent it from dissipating into the air. Similarly, a seal in the form of a lion was made from lead for the medieval Pope Boniface VIII to keep the pain of an operation for stone within bounds, the lion standing for courage and mastery.

Saturn was also the planet of death, with which both black and lead are also connected. In the ancient world a curse intended to kill or harm an enemy was written down, frequently on a piece of lead, and was either buried in the ground or placed in a tomb, the lead and the ground or the tomb carrying a current of death and evil (see CURSE).

A German grimoire called *Doctor Faust's Grosser und Gewaltiger Meergeist* (Doctor Faust's Great Powerful Sea-Spirit), which claimed the notorious Faust himself as its author, says that in operations of black magic the magic circle should be made of lead. Inside there should be a triangle made of three chains taken from a gibbet and nails which have been driven through the head of a man broken on the wheel. The magician should wear a blue robe and his girdle should be a cloth which has been used by an executioner to wipe his sword after beheading a criminal. The lead and other trappings are intended to give the circle a powerful and sinister aura of death and violence.

There is a widespread belief that witches and enchanters, creatures in league with the powers of death and evil, cannot be killed with lead bullets or lead shot: silver has to be used. In the Highlands of Scotland, for instance, it was long believed that if a witch in the form of a hare was shot with a lead bullet, the bullet would rebound and strike the man who had fired it.

Ponderous and dull, lead occupied the bottom rung of the ladder of the seven metals and was regarded by alchemists as the most imperfect of them, the one nearest to the lifelessness of First Matter. From the 'leaden' blackness and inertia of the base material in the alchemist's vessel the perfect gold was to be hatched, and some alchemists called their material 'lead of the air', implying that everything contains its own opposite, for the apparently dead material contains 'the radiant dove' of the spirit, of new life.

Michael Holford/British Museum

Lead coffin lid, from the Minories, London. Lead is traditionally the metal of death and of Saturn, the planet of limitation: holy relics were often encased in lead to keep their sacred force intact

Leaping and Jumping

A way of expressing religious fervour and of inducing ecstatic excitement; high leaps in Basque, Russian, Balkan, British and other folk dances may be rooted in imitative magic, in the form of jumping to make the crops grow tall and the herds increase, as in the hymn of the Curetes of ancient Greece, 'leap for fleecy flocks, and leap for fields of fruit'.

See DANCE; IMITATIVE MAGIC.

Syndication International

Left

Traditionally the side of evil; probably because the left hand is normally the weaker; black magic is 'the left-hand path' and to move deliberately to the left in magic is to appeal to evil influences; the Latin word *sinister* meant both 'left' and 'evil': in palmistry the left hand represents what you are born with, the right what you make of yourself.

See DIRECTIONS; PALMISTRY.

LEMURIA AND MU

THE LOST CONTINENTS of Lemuria and Mu were, if they existed, more extensive than Atlantis and have inspired almost as much fantastic speculation as the more famous vanished land (see ATLANTIS). The idea of Lemuria originally occurred to scientists in the middle of the 19th century when the first flush of enthusiasm for the new methods of biological classification and analysis began to reveal some odd coincidences. It was discovered that the animal and plant life, and even the geology, of continents separated by thousands of miles of sea showed remarkable similarities.

P. L. Sclater, the Zoologist and Fellow of the Royal Society who first gave a name to Lemuria, put the case for his lost continent: 'So certain, indeed, has the law been found to be of adjoining countries producing similar or nearly similar animals and plants, that the converse of this proposition is now generally accepted by naturalists – . . . that if the animals and plants of two countries are alike, they must either now be or recently have been in geographical connection.'

The name Lemuria was taken from the lemur and its relatives whose habitat is limited to Africa, south India and Malaya, although in the Eocene Age they probably inhabited the entire northern hemisphere. Thus the area which Lemuria might have occupied extends from the Malay Archipelago across the south coast of Asia to Madagascar. Further similarities between animal and plant life on opposite sides of the Indian Ocean were observed: for example, out of 35 species of fossil found in Natal, 22 were identical with forms discovered in southern India.

In the 19th century Lemuria received some distinguished testimonials. The great evolutionist Thomas Huxley admitted his belief in the existence of a Miocene continent in the Indian Ocean. Alfred Russel Wallace, the naturalist, thought Sclater's Lemuria 'undoubtedly a legitimate and highly probable supposition' and Ernst Haeckel, the celebrated German biologist, agreed. Haeckel seems to have been the first to suggest that Lemuria was 'the probable cradle of the human race, which in all likelihood here first developed out of anthropoid apes.' This speculation fitted in with the contemporary theories of how mankind had scattered itself over the earth in a series of migrations. From this idea it was only a short step to postulate that Lemuria was in effect the garden of Eden.

A Vanished Race

The concept of Lemuria attracted the occultists, who were attempting to reconcile a fundamentally religious approach to life with the findings of the scientific method. In particular, Madame Blavatsky and her Theosophical Society (see BLAVATSKY) were responsible for incorporating this perfectly legitimate scientific hypothesis into an occult world view. In Mme Blavatsky's *The Secret Doctrine* (1888), that resourceful lady declared that the findings of her own 'esoteric ethnology' tallied with the speculations of Sclater and his fellow scientists. There had been, she thought, five vanished races living on the earth, of which the first lived in a mysterious continent called 'The Imperishable Sacred Land', the second in a 'Hyperborean continent' off the north of Asia, the third in Lemuria, the fourth in Atlantis and the fifth in America. Present humanity was the sixth race, which was fast developing towards a seventh race of superbeings. Mme Blavatsky believed that Lemuria had extended across the Pacific Ocean, and declared that the South Sea Islands were all that remained of that once immense continent.

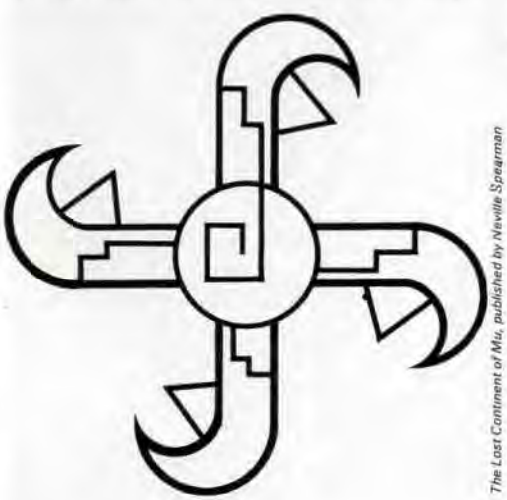
It was in the Pacific that Colonel James Churchward located the continent of Mu. During a famine in India in the 19th century he was engaged in supervising relief work with a Hindu priest with whom he later became great friends. The priest taught Churchward the remains of an ancient language *Naacal*, which he believed to be the original tongue of mankind. With this knowledge, Churchward claimed to have deciphered a series of ancient stone tablets hidden in the temple of which his friend was in charge. These tablets revealed the story of Mu. Mu was a large continent in the Pacific Ocean, with its centre a little south of the Equator; from east to west it measured 6000 miles, and from north to south 3000 miles. It was the historical garden of Eden where 200,000 years ago man had first arisen and had developed an extremely sophisticated form of civilization. When Mu was destroyed in a cataclysmic outbreak of volcanic action the population of the continent totalled 64 million.

The First Colonists

From Mu all human races developed. Racial differences derived from the colonists who were sent out from the motherland in tribal units; after the disappearance of Mu the colonists became degenerate, and their original tribal differences became more marked. Of these colonists, the most powerful unit had been the Uighur Empire, whose capital city is now buried 50 feet below the Gobi Desert; the remainder of the Uighurs became the Aryans.

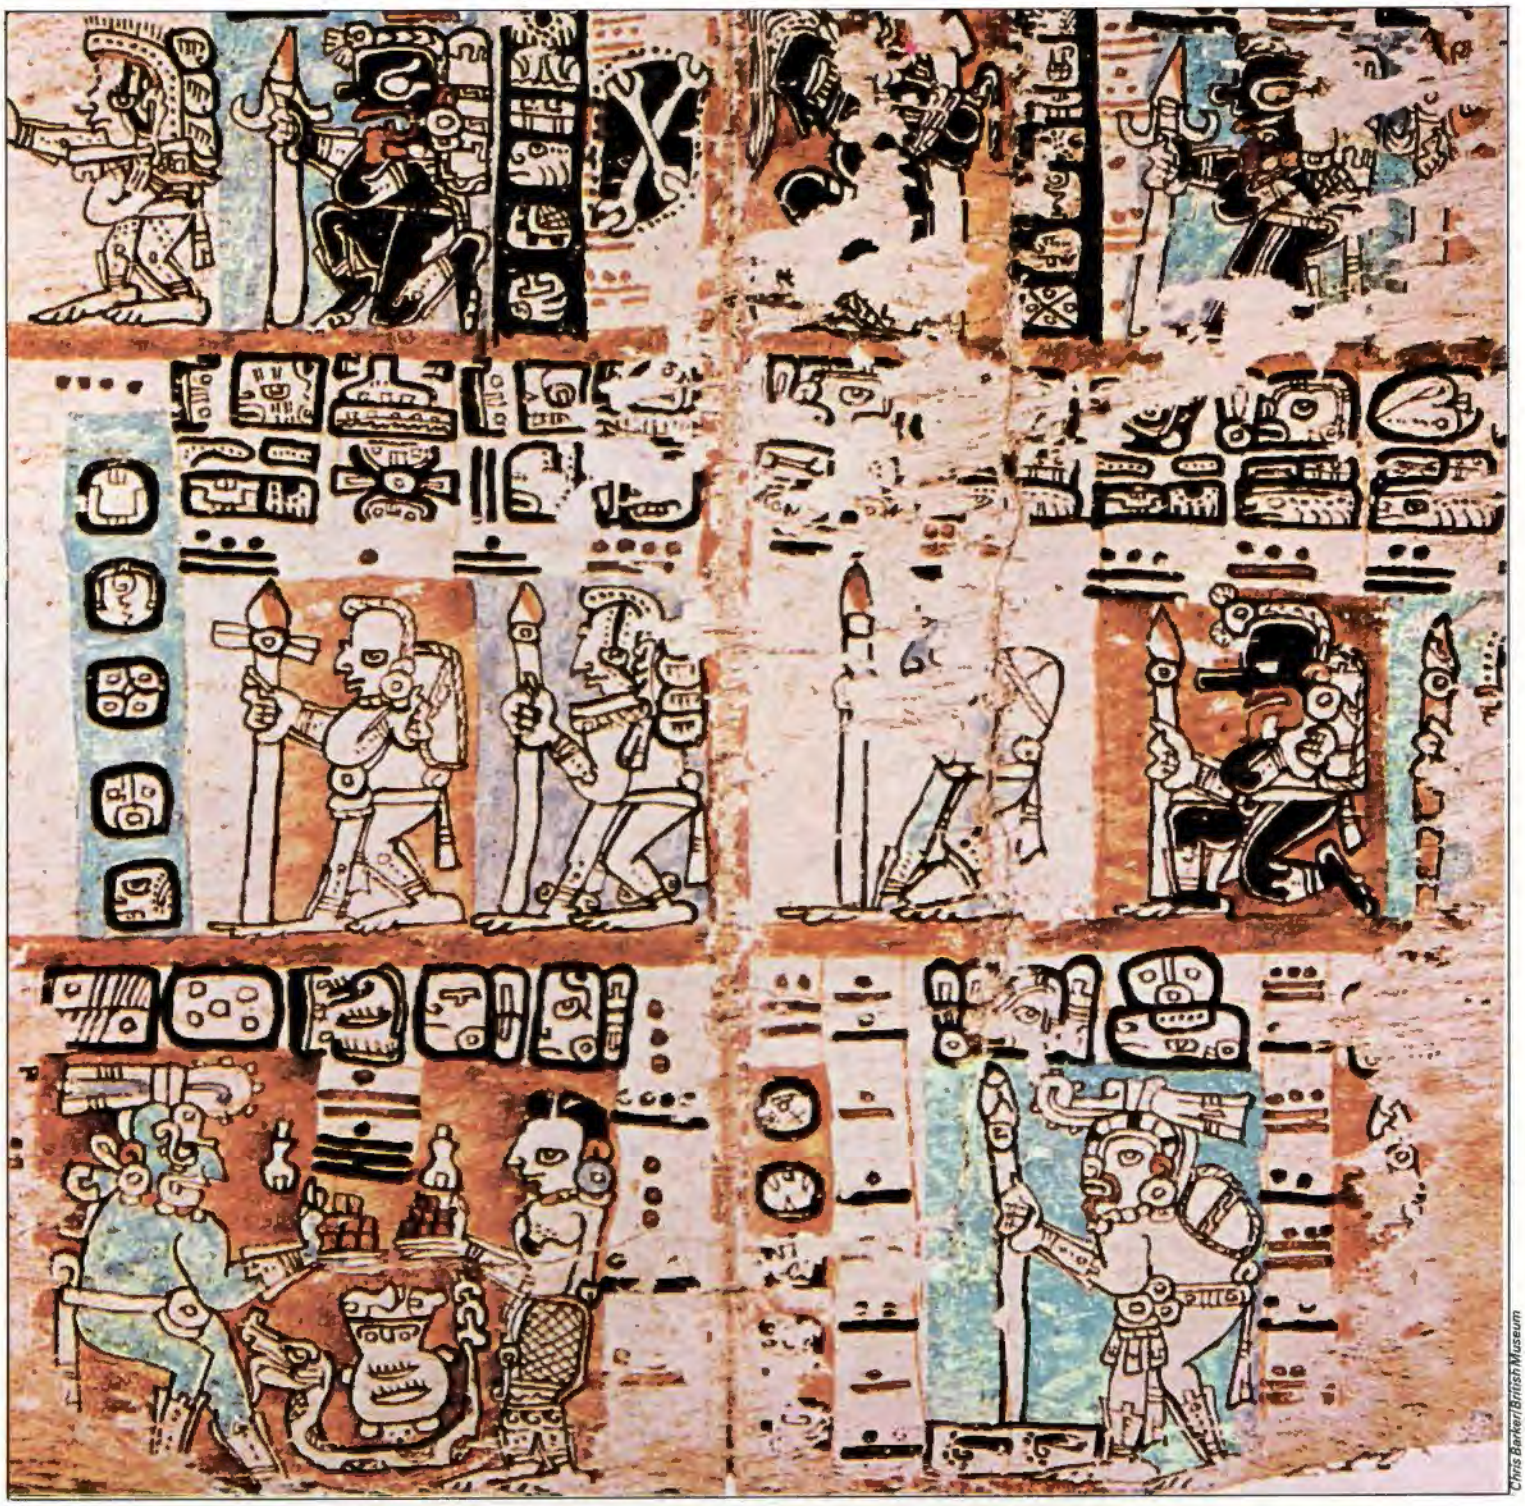
Colonel Churchward's sources were not the most impeccable. He published no direct transcripts of the Naacal tablets, and as corroborative evidence used almost every enigmatic carving in the eastern and western hemispheres.

The most credible of these carvings are a collection of Mayan tablets discovered in



The Lost Continent of Mu, published by Neville Spearman

Left **The Naacal tablets were deciphered by Colonel James Churchward, who believed that they revealed the story of Mu, a lost continent in the Pacific, site of the garden of Eden and the cradle of the human race, which had been destroyed in a volcanic cataclysm. He interpreted this design as showing the symbol of the Sacred Four, the Creator's commands which brought order out of chaos** ***Right*** **The Troano Manuscript, an ancient Mayan work from Central America, has been interpreted as recording the destruction of Mu, which has inspired almost as much speculation as the more famous Atlantis**



Chris Barker/British Museum

Mexico, purporting to show that the Maya came from the west. His photograph of a painting showing a 'king and queen of the Uighurs', the queen carrying a 'sceptre', shows two figures seated in the lotus posture, with the female holding an article known in Japan as a 'thunderbolt', and used as an aid to meditation. The Colonel's description of the society of Mu included the essential subservience of the coloured to the white race.

Churchward belonged to the same school of thought as the Theosophical Society; and he admitted that the old priest who taught him Naacal was also his guru. The two would communicate with each other by 'cosmic telegraphy', and once travelled back in time to see themselves as they had been in a previous incarnation. From Mu, the Colonel maintained, came the 'original religion' of mankind; and he explained the last words of Jesus on the cross, *'Eli, Eli, lama, sabach-thani'*, as being *'Hele, Hele, lamat zabac ta ni'*, which others have described as Maya, but which for Churchward was the original language of Mu. Both in Maya and in Mu the words mean 'I faint, I faint, the darkness is coming over my face.' It is not surprising to find the Great Pyramid invoked as an expression of the religion of Mu, or to discover that the last work of Churchward, *Cosmic Forces of Mu*, although first published in 1934, was begun in 1870, at the beginning of the late 19th century occult revival.

Lemuria and Mu may well have existed. But those who have most keenly argued their existence are not the best qualified to prove it. Both Mme Blavatsky and Churchward pounced upon hopeful elements in scientific thought which at one time seemed to deny any religious view of life, and eagerly incorporated these into a system which allowed belief. Their argument from the evidence of published inscriptions and the existence of lemurs is legitimate but their argument on the grounds of their faith cannot be upheld.

LEO

THE LION'S ASSOCIATION with the heat of summer led to Leo being chosen for the fifth sign of the zodiac, after the constellation in which the sun arrived at the summer solstice. In the days when every country had its king, Leo had good reason to be believed the most important of the 12 signs. Leo, which includes those born between 23 July and 22 August, was the 'natural significator' of kings and rulers. Those genuinely born under the Lion often have a lordly bearing, and expect to be treated with the respect due to their status. If their rank does not merit respect, they require it none the less, for they are confident of their own worth.

It is impossible to bully the Leos, they are only overawed by older persons or by those who are more powerful. They like large jewels, but it never occurs to them that to wear such adornments is sometimes interpreted as conceit. It would be uncharacteristic of Leos to give up using any title or honour that they have earned. They are brave in an emergency, but otherwise they may appear too casual, for they do not easily believe that they are vulnerable to danger. When they are generous, it may not be genuine unselfishness, but simply to boost their own reputation. The poet Manilius (48 BC – 20 AD), wrote that Leo spends on himself any wealth he may acquire, and that he is too selfish to make a good trustee.

Leo is one of the most religious signs and in a temporal sense, too, the typical Leo tends to respect those in power and authority. His sympathies are always more likely to be with the established order than with the revolutionaries. In appearance, he is not often extravagant, for he is likely to think it more important to be conventionally respectable than to dress in an ostentatious manner.

The person born under Leo is usually interested in politics, but in spite of this he is not cunning and prefers everything to be open. He likes to delegate the less important aspects of his life to inferiors, but occasionally he may be cheated, for his mind is straightforward rather than devious, and he is not as perceptive as he would like to think. Leo is self-confident, and in consequence is an obvious choice for any job demanding leadership. Usually he is extremely robust and does not tire easily, but may at times be mentally and physically lazy. He may also he somewhat insensitive, for he has never felt weakness and does not know what it feels like to be at the mercy of someone else. This creates a danger of complacency, for Leo does not easily see himself in the role of victim.

In astrology, those born under the sign of Leo reveal many of the characteristics associated with the proud, lordly lion; the sun is in the fifth sign of the zodiac during summer when the crops are ripened by the heat of the sun: 14th century French manuscript

Bodleian Library, Oxford, Ms. Ashmole 1511

MRS LEONARD

ONE OF THE FEW first-class mediums who have been studied at length by trained neutral investigators, Gladys Osborne Leonard was born of prosperous parents in Lancashire in 1882 and died in 1968. Her autobiography, *My Life in Two Worlds*, gives some interesting hints as to the origins of her mediumship. As a child, she was protected from the fact of death and when she first met it in painful circumstances she was badly shocked. She tells how she used to have 'beautiful visions' which she dared not mention for they upset her parents. Then, in adolescence she encountered Spiritualism, but when she reported this joyful discovery, her mother angrily pronounced it 'wicked and vile'. At the age of 22 she was away from home earning her living as her family had fallen upon hard times. She knew her mother was ailing but one morning she had a vision of her happy and well; in the afternoon came a telegram saying that she had died. This finally convinced Gladys Leonard of the truth of Spiritualism. Not long after, when playing at table-turning with some friends, she fell asleep and on waking was told that she had been acting as a medium. Her friends said that her mother had communicated through her, and also a young girl called Feda who wanted her to practise her mediumship, with Feda as her spirit control, as she had important work to do by this means.

Shortly before the First World War, Feda said that something great and terrible was going to happen to the world and that she would have to help many people, through Gladys Leonard. As a result, the young woman decided to become a professional medium and to devote her life to the task of putting the bereaved in touch with their departed relatives. It is a tribute to her character that at the same time she was prepared to co-operate wholeheartedly with investigators from the Society for Psychical Research, whose avowed object was to search for possible alternative sources for communications which she herself believed came from the dead. On one occasion detectives were engaged to check that she had not obtained information by normal means about a house she described with great accuracy.

The main task of an investigator into the evidence for survival produced by mediums is obviously to seek for alternative mundane sources of information which mediums maintain comes from the dead. He must first try to eliminate such normal explanations as fraud, rational inference, unconscious memory, carelessly revealing remarks by sitters, accidental coincidences and so on. If that can be done, the simplest paranormal explanation of the 'hits' achieved by a medium seems to be telepathic interaction with a sitter – provided that the sitter himself knows about the events referred to. When he does not know about them a more remote source must be sought. That Mrs Leonard seemed able to tap some such source was suggested by many proxy sittings (in a proxy sitting, the sitter represents another person and may be given information relevant to that person and his dead friends which he does not know already). On one occasion, for instance, Miss Radclyffe Hall and Lady Troubridge acted as proxies for a friend who was travelling in Turkey and Mrs Leonard told them facts about that friend's movements which were contrary to their expectations, and others about her adoptive father of whom they knew nothing. On another occasion she went further, warning a regular sitter, the Rev. Drayton Thomas, to expect a letter from a middle-aged man who lived near his previous home – Morton, or some such place – and who had lost a son in a car crash. Within a fortnight came a letter from a man living at Norton, under two miles from where Mr Thomas had once lived. He had been meaning to write ever since he heard Mr Thomas lecture a month earlier, because his son had been killed in an air (not a car) crash. In two subsequent sittings the son himself purported to communicate, and identifying material was produced which meant nothing to the father but was confirmed as correct by another son. The purported son also referred to a friend, the clue to whose identity was a model ship, and again the living son confirmed that a friend of his dead brother's, who had worked for a firm making model ships, had been killed a year after the brother's death.

Mrs Leonard's spirit control, Feda, was passionately concerned to establish that she and other communicators were genuine discarnate (disembodied) spirits and to that end she offered to indicate something printed on a particular page of a particular book which had been placed for the test on a shelf in a house which Mrs Leonard did not know. Five hundred such book tests were analysed by an extremely critical psychical researcher, Mrs Henry Sidgwick, Principal of Newnham College, Cambridge. She classified 92 tests as successful, 100 as approximately so, 96 as dubious, 40 as all but failures and 204 as failures. In other words, nearly a fifth were good 'hits'.

In a further attempt to eliminate the hypothesis of telepathy from any of the persons concerned with the tests, Feda then offered to 'sense the meaning' of passages in books written in a language which neither the sitter nor Mrs Leonard knew. In response to this, Miss Radclyffe Hall and Lady Troubridge bought some books in Greek and set them out on a shelf in their house. Out of a group of 14 tests on these, Mrs Sidgwick classified four as definite 'hits', a further four as probably right, four as very dubious and one as definitely wrong. A typical good 'hit', made ten days before the Armistice of 1918, was to locate the Greek word for armistice on the right line of the right page in the right book and to comment that that was what the communicator was wishing for on the sitters' behalf.

In one ardent attempt to convince an anonymous sitter, Mrs Hugh Talbot, of the continued existence of her dead husband, Feda produced some information which appeared to be known to nobody living at the time. She said that as evidence of his identity he described a small dark leather book, about eight to ten inches long. 'It's not exactly a book,' she went on. 'It's not printed . . . It has writing in.' She rejected Mrs Talbot's repeated suggestion that it might be a red log-book of her husband's. No, it was darker, and would Mrs Talbot please find it and look for something written on page 12 or 13. 'There are two books,' she said. 'You will know the one by a diagram of languages in the front . . . Indo-European, Aryan, Semitic languages . . . a table of Arabian-Semitic languages . . . There are lines, not straight, going like this.' Mrs Talbot was so sure that Mrs Leonard was talking rubbish that on her return home she could scarcely be persuaded to look for the book. Eventually she did so and found right at the back of a top bookshelf, a shabby black leather book of the shape described by Feda. To her great surprise it contained a 'Table of Semitic or Syro-Arabian languages' and on page 13 there was a long and apt extract from an old book entitled *Post Mortem*, describing the blissful situation of the author after death.

It is hard to give a balanced picture in brief of Mrs Leonard's 50 odd years of active mediumship. To concentrate solely on the highlights may create the impression that she never gave vague or indecisive sittings; but no medium can be on top of her form on every occasion and with every sitter. What can be said is that much of her work was studied by experienced investigators, that her integrity was unquestioned, and that she produced a great deal of material which cannot reasonably be ascribed to normal sources. Whether such material was due to an incredible series of accidental coincidences, whether a subconscious level of her personality ferreted it from scattered mundane sources by means of superlative extra-sensory perception, or whether it came from the dead, is still an open question.

ROSALIND HEYWOOD

Psychic News

One of the greatest and most intensively studied of modern mediums, Mrs Leonard 'produced a great deal of material which cannot reasonably be ascribed to normal sources'

Leprechauns

Fairy shoemakers of Irish folklore; they own buried hoards of gold which are much coveted by human beings; if caught, a leprechaun can be forced to reveal where his treasure is hidden but he will vanish if you take your eyes off him; leprechauns live alone and vary in stature from a height of a few inches to the size of a three-year-old child.

See FAIRIES.

Mansell Collection

Leprosy

Disease often believed to be caused by a breach of taboo, or to be the punishment of sin: in the Old Testament the regulations governing lepers and the ritual of their purification are described in Leviticus (chapters 13, 14): the leper Naaman was cured by washing seven times in the river Jordan (2 Kings, chapter 5); a traditional cure is to bathe in human blood, especially that of children: in alchemical pictures, a symbol of the impurities of matter.

LETTERS TO THE DEAD

Michael Holford

THE BELIEF of the ancient Egyptians in a life after death is attested by a rich abundance of material, ranging from the great pyramids of Gizeh to the treasures of the tomb of Tutankhamen. But nothing more vividly illustrates the intense reality of that belief, and also its pathos, than what Egyptologists call 'Letters to the Dead'.

The known examples range in date from the Old Kingdom (2780–2280 BC) to the 19th Dynasty (1320–1200 BC), which indicates that these 'Letters' represent a long-established practice in Egypt. They generally take the form of messages written on pottery vessels, used for making food offerings to the dead. The logic behind the selection of such means for communicating with the dead is obvious. The dead would surely see the messages when they partook of the food in the vessels concerned.

The contents of the 'Letters' reveal that the dead were regarded as still having a lively interest in the affairs of their families, and able to work for their well-being. Thus a widow asks her dead husband to watch over the interests of his heirs, whom false friends were endeavouring to rob of their inheritance.

These messages to the dead were not all appeals for help to promote the interests of relatives in this world. The dead were also feared as being capable of tormenting the living, as the following 'Letter' shows. It was written about 1200 BC by a husband to his dead wife, Ankhiry. He asks: 'What harm have I done you that you so distress me?' He reminds her of their past life together: 'From the day that I became your husband until this day have I done anything that I should conceal? . . . I married you when I was young . . . I did not desert you. I refrained from any action that might grieve your heart.' To reinforce his appeal, he threatens that he will complain about his wife to the gods who sit in judgement as assessors of the dead in the next world.

In ancient Egypt attempts to communicate between the world of the living and the dead were not made only by the former. In some inscriptions the dead speak to the living from their tombs. For example, warnings to would-be violators of their tombs were sometimes given, such as that by Harkhuf, an Aswan noble who lived about 2500 BC: 'As for any man who shall enter into this tomb as his mortuary possession, I will seize him like a wild fowl.' Even stranger, perhaps, in view of the situation implied of the dead as opposed to the living is a tomb inscription, now in the British Museum, dating about 71 BC. A lady, That-I-em-hetep, addresses her husband, who is still alive: 'O my brother, my husband, my friend . . . cease not to drink, to eat, to be drunken, and to marry wives, and to enjoy thyself, and follow the desire of thy heart by day and night.' After this generous exhortation, the dead lady tells of her own grim condition: 'I no longer know where I am, now that I have arrived in this valley of the dead. Would that I had water to drink from a running stream . . . O that my face were turned towards the north wind . . . that the coolness thereof might quiet the anguish of my heart.' We can only wonder at the imaginative effort that went to the composition of this inscription – did it record a message that the husband believed he had received from his dead wife?

In any study of modern magic, one name crops up repeatedly: that of Eliphas Levi, the 19th century French occultist who once claimed to have summoned up Apollonius of Tyana

ELIPHAS LEVI

UNDOUBTEDLY the most renowned French occultist of his generation, Eliphas Levi (Abbé Louis Constant) was born in 1810 and died in 1875. His best-known books, such as *Transcendental Magic, The History of Magic*, and *The Key of the Mysteries*, which are still available in English translations, have been read by successive generations of students of magic and occultism since the first of them was published in 1856. Levi was, however, an indifferent scholar and though his writings contain much that is illuminating, they should be read as literature rather than as technical manuals.

The son of a humble shoe-maker, Levi was born and died in Paris. Educated at Roman Catholic schools and seminaries, he became persuaded that he had a religious vocation; he was ordained a deacon in December 1835 but did not become a priest. He first became interested in occultism in about 1844 and began to study the works of ancient authors such as Guillaume Postel, Raymond Lull and Cornelius Agrippa (see LULL; AGRIPPA). This new phase in his life coincided with his disastrous marriage to Noémi Cadiot, who was 18 years younger.

The major formative influence on Levi's subsequent career as a professional occultist was undoubtedly the eccentric Polish mathematician Hoëne-Wronski (see WRONSKI). Very little is known about their relationship, but it can be inferred that Levi was Wronski's pupil.

In May 1854, after his wife had left him, he visited London for the first time, hoping to earn some money by giving private lessons in occultism. He had not yet published anything in this field but nevertheless came to London with a great reputation as a magus and furnished with letters of introduction to eminent persons. One of them was Sir Edward Bulwer Lytton, the author of the famous 'Rosicrucian' novel *Zanoni* (1842), who was regarded as a major authority on magic and occultism (see LYTTON).

In most respects the visit was a disappointment. He knew little or no English and was therefore unable to make money by teaching. Much to his dismay, he was expected to perform 'miracles' and give practical demonstrations of ceremonial magic. In *Transcendental Magic* he mentioned that he had hitherto purposely avoided this kind of activity. However, after much persuasion and due preparation he finally consented to attempt the magical evocation of spirits on behalf of a titled lady who was a friend of Bulwer Lytton. This was probably his only experience of ritual magic. An account of these ceremonies in a specially prepared 'Temple', in which only he himself took part, and the alleged conjuration of the spirit of Apollonius of Tyana (see APOLLONIUS), will be found in *Transcendental Magic*. Levi was inclined to treat the manifestation as an entirely subjective experience. Nevertheless, he observed that it had been sufficient, as far as he was concerned, to demonstrate the effectiveness of magical ceremonies, although he condemned them as dangerous on moral and health grounds.

Three illustrations by Levi to his *Transcendental Magic*: the Double Triangle of Solomon *(above left)*, showing 'the God of Light and the God of Reflections, mercy and vengeance, the white Jehovah and the black Jehovah'; another symbol *(above right)* of light and reflection, good and evil, the hand making the sign of blessing and projecting the Devil; the seven seals of the book of Revelation *(below)*

Upon his return to Paris in August 1854, Levi was without either a home or money, but was helped by Adolphe Desbarolles (1801–86), who later achieved fame as the author of *Les Mystères de la Main* (1869), the most important 19th century work on palmistry. He now began to attract pupils who studied the Cabala under his tuition. Indeed, during the next 20 years until his death his life was relatively peaceful and satisfying. Although by no means a public figure, his name was now well known in occultist circles in France and Great Britain and to a much lesser extent in Germany.

Wisdom of the Tarot

Levi paid his second visit to England in May 1861, this time in the company of his pupil Count Alexander Branicki, in order to stay with Bulwer Lytton at Knebworth. According to A. E. Waite in *The Mysteries of Magic* (1897) Levi and Bulwer Lytton performed a magical invocation on the roof of the Pantheon building in Oxford Street, but this may be an invention.

In December 1861 he received a visitor from London, Kenneth Mackenzie, who claimed to have received a genuine Rosicrucian initiation in Germany and was later to become well known in esoteric Masonic circles. Later Mackenzie published an account of his meeting with Levi in *The Rosicrucian* (April, 1873), the organ of the Masonic Rosicrucian Society in England. Levi told Mackenzie that he had been studying the symbolism of the Tarot cards for 26 years. He never published a complete Tarot manual, but the stray allusions to these cards in his books greatly influenced the generation of French occultists that appeared upon the scene about a decade after his death. Papus's theory (see PAPUS), outlined in his *Tarot of the Bohemians*, that the 22 major trumps are related to the 22 letters of the Hebrew alphabet and hence have a cabalistic significance, derives directly from Levi. The latter once observed that were he to be again condemned to a prison cell, the only 'book' that he would need would be a Tarot pack since the major Trumps, in his opinion, incorporated a complete system of esoteric wisdom.

Professional occultism ultimately provided Levi with both a refuge from reality and a living. It is unlikely that he ever taught his devoted pupils anything very useful, but since he was a kindly and modest man it is equally unlikely that he ever did them any harm, which is more than can be said for some who followed in his footsteps. His reputation as a learned occultist owes much to legends invented during his lifetime and soon after his death. Nevertheless, for students of the history of modern occultism Levi's life and work represent a fascinating and important phenomenon.

Levitation

Rising and hovering in the air, or making a person or object rise and float in the air, by paranormal means; an ability credited to various saints, mystics and eastern holy men, and one of the characteristic phenomena of physical mediumship; D. D. Home, for instance, was said to levitate both himself and objects including an accordion.

See HOME; MEDIUMS; PSYCHOKINESIS.

Radio Times Hulton Picture Library

Libation

A drink offered to a deity, or the pouring out of the drink: the offering might be poured on the ground or floor, on an altar, on the body of a sacrificed animal, or on the fire; the Greeks and Romans poured a libation to the household gods at mealtimes; blood or wine were frequently offered to gods and the dead.

LIBRA

THOSE BORN BETWEEN 23 September and 23 October are traditionally placed under the sign of Libra, the Scales, the seventh sign of the zodiac. Modern writers describe Libra as the most desirable of the 12 zodiacal signs although the ancient Greeks and Romans preferred Virgo. Libra has been admired because it is ruled by Venus, the planet of love and beauty; but Saturn, the stern planet of righteousness also influences Libra. Thus, Librans do not spend all their time in amorous misadventures or in exercising their charm. Although they are not ambitious they are often interested in politics and administration, and make good civil servants. They are often successful as businessmen or lawyers, for as their sign, the Scales, suggests, they have a keen sense of equity and are good at weighing up conflicting claims and reaching a compromise.

In their attempts to please everyone Librans may sometimes appear rather dull and characterless. But any attempt to be striking involves risks, and this is not a Libran characteristic. Although Librans have a tendency to degenerate into conventionality and timidity, all types are mixed, and if the Sun, Moon and Ascendant are all in Libra, the compromising aspect of their personality will be dominant.

The arts are traditionally ruled by Venus, and a large number of poets, painters, novelists and composers are Librans. Those born under Libra are often collectors or experts, those interested in knowing origins and details of specimens.

Librans are useful people, for they will always try to see that justified claims are met, but in doing this they risk abuse. The Sun is in decline in Libra, and as a result Librans do not like taking the initiative; they prefer to have some text or rule that they can quote before they put forward any suggestion. The ancients, however, thought Libra exceedingly trustworthy, a man who can be allowed to handle other people's money even if he has none himself.

The sun is in Libra, the Scales and the seventh sign of the zodiac, in autumn, the season for treading grapes: 14th century French MS

LIGHT

Light can be the life-creating radiance of the sun but also the scorching and destroying flame that withers the desert

Bibliothèque Nationale

'The people that walked in darkness have seen a great light': illumination, an encounter with light, not only as a symbol but as a real experience, has been reported by mystics in many different traditions

ON THE NIGHT of 21 September 1823 at his house in Palmyra, New York, Joseph Smith, then a boy of 17, was deep in prayer. 'While I was thus in the act of calling upon God, I discovered a light appearing in my room, which continued to increase until the room was lighter than at noonday, when immediately a personage appeared at my bedside, standing in the air . . . Not only was his robe exceedingly white, but his whole person was glorious beyond description, and his countenance truly like lightning. The room was exceedingly light, but not so very bright as immediately around his person. When I first looked upon him I was afraid; but the fear soon left me.' This radiant personage was the angel Moroni, who told Joseph Smith where to find the buried golden plates of the Book of Mormon (see MORMONS).

In religion, legend and symbolism light is primarily connected with good and with creative power. Gods and saints are said to radiate light, and 'illumination' is a term frequently used for the revelation or discovery of the divine, not merely as a symbol but, as in the case of Joseph Smith, as a description of an actual experience, an encounter with light.

Among the first experiences of a baby must presumably be the sensation of coming out of darkness into light, and all our lives long one of the fixed characteristics of our environment is the alternation of light and darkness, on which we pattern the basic rhythm of our lives. In daylight we are active, at night we turn off our conscious energies and go to sleep. Light lets us see, darkness walls us in and makes us blind, groping and afraid. The light and heat of the sun bring Nature to life in the spring, the winter comes in with darkness and cold.

As a result, light naturally means good, activity, creativity, spiritual vision, while darkness means evil, fear and doubt, inactivity, sterility and spiritual blindness. What is done in the light of day is open, public, innocent, but what is done in the dark is secret, furtive, harmful or shameful. The crowing of the cock at the first glimmer of dawn puts to flight the evil beings which infest the night.

But nothing, in symbolism or in reality, is as simple as this clearcut antithesis. The darkness of love-making, of dreams, of the womb or the depths of the mind, has its own powerful fruitfulness. Light can be the life-creating radiance of the sun but also the scorching and destroying flame that withers the desert (which, conversely again, may be a symbol of revelation and the presence of God in the wilderness of asceticism – see LANDSCAPE). Ghosts emit a faint and ghastly radiance, the luminescence of putrefaction. The flickering will-o'-the-wisp leads the unwary traveller astray. Satan puts on the guise of an angel of light.

Let There be Light

People generally seem to feel that darkness precedes light. Darkness is somehow older, more primitive, more fundamental, and light penetrates a darkness that was there before it. 'From non-being lead me to being,' says the *Bradaranyaka Upanishad*, 'from darkness lead me to the light, from death lead me to immortality.' For the Jews and Arabs, the Germanic peoples, the Celts and many others, each day begins in the evening – the night comes first and the light afterwards. Similarly at the very beginning of things: 'at first,' according to a creation hymn in the *Rig Veda*, 'there was only darkness wrapped in darkness.' In Hesiod's *Theogony*, 'Out of Void came Darkness and black Night, and out of Night came Light and Day, her

In most traditions darkness precedes and is older than light, and when light came into being it penetrated a darkness that was there before it, just as the rising sun banishes sleep and the blindness of night and brings the daytime of activity. We pattern the basic rhythm of our lives on this alternation of night and day *Previous page* Sunrise over Lake Hanuel Haupi in Argentina *Left* 'And God said, "Let there be light"': in Genesis God creates light before fashioning his other creations: 12th century manuscript *Right* One of the most popular pictures ever painted, Holman Hunt's *Light of the World,* expresses the Christian imagery of the Saviour as the kindly gleam of hope and spiritual illumination in the darkness of worldliness and sin: the missionary activity of Christians was seen as the bringing of light

children.' In Genesis, in the beginning there was darkness and God said, 'Let there be light'. It was only after making light that God went on to fashion his other creations.

Some people, however, have maintained the opposite tradition, that light existed first and darkness came later. One explanation of why this happened is that the Creator grew weary of endless light and created darkness for relief from it. Or some say that light and darkness have coexisted from the beginning. In China the two great opposites of Yang and Yin correspond to light and darkness respectively. According to a Scandinavian myth, there was a great abyss of emptiness which was charged with magic power. To the south of it was a realm of blazing heat and to the north a realm of freezing darkness. It was the meeting in the abyss of ice from the north and sparks from the south which made life, so that creation resulted from the mingling of opposites, of light with dark and heat with cold. But when the *Prose Edda* comes to deal with day and night, night existed first and was the mother of day.

The Armour of Light

In both the Old and New Testament light is connected with God and goodness. 'There are many who say, "O that we might see some good! Lift up the light of thy countenance upon us, O Lord!"' (Psalm 4). When God becomes king over the whole earth, there will be perpetual light and warmth: 'there shall be neither cold nor night, for at evening time there shall be light' (Zechariah, chapter 14). But God manifests himself not only in light and lightning but also in smoke and darkness. When the Israelites were in the wilderness and camped below Mount Sinai, there was a thick cloud on the mountain and a violent thunderstorm with flashes of lightning. 'And Mount Sinai was wrapped in smoke, because the Lord descended on it in fire; and the smoke of it went up like the smoke of a kiln, and the whole mountain quaked greatly . . . And the people stood afar off, while Moses drew near to the thick darkness where God was' (Exodus, chapters 19, 20). Again, in the vision of God's glory in Ezekiel (chapter 1), 'a stormy wind came out of the north, and a great cloud with brightness round about it, and fire flashing forth continually . . .'

Keble College, Oxford

Jesus said, 'I am the light of the world; he who follows me will not walk in darkness, but will have the light of life'

In other passages to be in a state of sin, to be far from God, is to be in darkness, and in the New Testament Christ is 'the true light that enlightens every man' (John 1.9), which echoes a famous verse in Isaiah (9.2): 'The people that walked in darkness have seen a great light.' Jesus said, 'I am the light of the world; he who follows me will not walk in darkness, but will have the light of life' (John, chapter 8). 'For God sent the Son into the world', says St John (chapter 3), 'not to condemn the world, but that the world might be saved through him . . . And this is the judgement, that the light has come into the world, and men loved darkness rather than light, because their deeds were evil.'

The missionary work which carried Christianity outside Judaism was seen as the bringing of light to the Gentiles. Warning the faithful to be ready for Christ's imminent return to the earth, St Paul says, 'Let us then cast off the works of darkness and put on the armour of light' (Romans 13.12). Light of Light became a title of Christ, and the Devil, by contrast, was chief of the powers of darkness.

There is the same imagery of light as good and darkness as evil in the Koran. 'Allah is the light of the heavens and the earth' but the doings of unbelievers are like 'darkness on a bottomless ocean spread with clashing billows and overcast with clouds; darkness upon darkness . . . Indeed the man from whom Allah withholds his light shall find no light at all' (sura 24).

In Zoroastrianism, with its rival gods of good and evil, the contrast of light and darkness is sharply drawn. The good god Ohrmazd lives in eternal light. 'That light is the space and place of Ohrmazd . . . omniscience and goodness are his totality.' His opponent Ahriman is the master of darkness, 'the will to smite is his all, and darkness is his place.' In the end when Ahriman has been defeated, 'all Ohrmazd's creation will be reunited with him in the eternal light and in unceasing joy for ever and ever' (see OHRMAZD).

In ancient Greek religion there is a contrast – though not clearcut as far as a distinction between good and evil is concerned – between the Olympian gods who lived in a 'comprehensible and business-like atmosphere of daylight', and the chthonian powers who lived underground, shrouded in mystery and approached by night. Behind this is the broad contrast between the worship of sky gods who live in the light of day, and the worship of the Great Mother whose roots are deep in the darkness of the earth (see EARTH; MOTHER GODDESS).

The Divine Spark

The Manicheans, who drew heavily on Zoroastrianism (see MANICHEANS), taught that there were two eternal and uncreated entities, God and Matter, which could also be called Light and Darkness or Truth and Lie. As a result of a complicated succession of mythological events, the powers of darkness were able to seize some of the particles of the divine light, which meant that they had captured part of the essence of God. To keep these ill-gotten spoils in their grasp, they fashioned Adam and Eve, in whom they imprisoned the captive light. Adam and Eve were ignorant of the light within them, until they were redeemed by a heavenly messenger, himself sometimes called 'Jesus the brilliant light'.

The sun as the creator of light and heat has a prominent place in many mythologies. Major Egyptian deities were shown with the disc of the sun as an emblem of power and creativity: Horus with sun disc

The theme of the divine spark, the gleam of heavenly light imprisoned in man and matter, also appears in the Gnostic systems of the eastern Mediterranean and has had a profound influence on mysticism and occultism in the West. It is a way of expressing the belief that in a man's innermost being there is an element of the divine. The discovery and liberation of this inner potential godhead, the true self, is a basic theme of European magic and occultism (see MAN).

A magician is usually very ready to think of himself as a potential god but for a mystic the problem is to avoid putting man on a level with God while claiming that there is a divine element in human nature. In the 14th century, for instance, Meister Eckhart said that there is a spark of divine light in man but emphasized that his soul is a mere receptacle of God's light (see ECKHART). A German Protestant mystic of the 16th century, Hans Denck, said: 'No man can see

The Supreme Radiance

Considered as a whole, the different experiences and appraisals of the interior Light advanced in India and in Indo-Tibetan Buddhism can be integrated into a perfectly consistent system. Experience of the Light signifies primarily a meeting with ultimate reality: that is why one discovers the interior Light when one becomes conscious of the Self *(atman)*, or when one penetrates into the very essence of life and the cosmic elements, or, last of all, at one's death. Under all these conditions the veil of illusion and ignorance is torn. Suddenly a man is blinded by the Pure Light; he is plunged into being. From a certain point of view one may say that the profane world, the conditioned world, is transcended – and that the spirit breaks out into the absolute plane, which is at once the plane of being and of the divine. Brahman, and the Buddha also, are at once a sign of the divine and of being, of the supreme reality. Indian thought identifies being, the divine and the mystic consciousness, the act by which one becomes conscious of reality. That is why one meets the Light both in meditating on being – the practice of the Upanishads and of Buddhism – and in trying to attain a revelation of the divine, the method followed in certain forms of yoga and the mystic schools. Since being is identical with the divine essence, divinities are necessarily luminous or reveal themselves to their worshippers in manifestations of light. But men also radiate light when they have destroyed the system of conditions under which worldly life is lived: that is to say when they have acquired supreme knowledge and attained the plane of liberty.

Mircea Eliade *The Two and the One*

Roger Wood Studio

Christ is 'the true light that enlightens every man'; by his resurrection Christ expressed the triumph of light and life over the darkness of death. *The Resurrection* by Andrea Mantegna

Musées des Beaux Arts, Tours

The god Vishnu reveals himself in a flash of lightning as bright as the light of a thousand suns, and 'by penetrating this light mortals skilled in yoga attain final deliverance'

or know himself, unless he sees and knows, by the Life and Light that is in him, God, the eternally true Light and Life . . . He must find God in himself, and himself in God.' And again, 'The Kingdom of God is in you (a reference to Luke 17.21) and he who searches for it outside himself will never find it; God, the all-highest, is in the deepest abyss with us, and is waiting for us to return to him.'

In the 17th century the doctrine of the 'inner light', the divine light within each human being, was central to the teaching of George Fox and his first followers were sometimes known as 'Children of Light' (see FOX). In the 18th century William Law (see LAW) took up the same theme: 'Consider the treasure thou hast within thee: the Saviour of the world, the eternal Word of God lies hid in thee, as a spark of the divine nature . . .'

The Splendid Lights

In the Cabala the process through which the hidden God makes himself known is described in terms shot through with the imagery of light. It begins with a concentration of divine energy in a 'luminous point' or a point 'dark with luminosity'. The sefiroth, which are aspects of God and stages in the process of divine self-revelation, are called 'splendid lights' in the *Zohar*, and God is 'an absolute light but in himself concealed and incomprehensible', who can be comprehended only through the 'luminous emanations' of the sefiroth.

The *Zohar* also contains the doctrine of the divine spark, the element in man which can eventually find reunion with God from whom it came. According to the Lurianic Cabala the infinite light of the godhead retracted itself, to create a vacuum into which God infused his light. But the vessels containing the light shattered and some of the divine sparks fell into chaos (see CABALA; LURIA).

In the early Church baptism, the initiation into Christianity, was sometimes described as 'illumination' and it was the custom for the candidates at the baptism service to carry torches. Whether this piece of symbolism was borrowed from the mystery religions is disputed but at the climax of the Eleusinian Mysteries there was a sudden blaze of torches.

The sun as the creator of light and life is traditionally linked with gold, the most valuable of metals, and the aim of alchemy was to create the life-giving radiance of the perfect gold: from *Splendor Solis*

British Museum

The Encounter with Light

The illumination is sometimes not a metaphor but an experience. When the apostles received the gift of the Holy Spirit on the day of Pentecost, 'a sound came from heaven like the rush of the mighty wind, and it filled all the house where they were sitting. And there appeared to them tongues as of fire, distributed and resting on each one of them' (Acts, chapter 2). St Paul was converted on the road to Damascus, when 'a light from heaven flashed about him' and he heard the voice of Jesus (Acts, chapter 9).

The sight of light playing on the surface of a dish stimulated in Jacob Boehme a mystical experience which he called a 'spiritual triumph' and which could only be compared with 'that where life is born in the midst of death'. Ghazali, the great Mohammedan mystic, was saved from scepticism by 'a light which God threw into my breast'. In the Indian tradition, among the experiences of the adept who successfully awakens the kundalini is 'a vision of light, which passes from a bright glow to a heaven full of brilliant dots, like stars', eventually followed by a 'suffusion of shining whiteness that is . . . an awareness of the supreme Radiance itself' (see BOEHME; GHAZALI; KUNDALINI).

Mircea Eliade says that 'for Indian thought the Light mystically perceived denotes transcendence of this world, of profane and conditioned existence, and the attainment of another existential plane – that of pure being, of the divine, of supreme knowledge and absolute freedom. It is a certain sign of the revelation of ultimate reality – devoid of all attributes. This is why it is experienced as a dazzling white Light . . .'

In the *Mahabharata* the god Vishnu reveals himself in a flash of lightning as bright as the light of a thousand suns, and we are told that 'by penetrating this light mortals skilled in yoga attain final deliverance'. In the *Bhagavad Gita* when the god Krishna shows himself in his true form, he is compared to the radiance of a thousand suns shining at once. 'I see the splendour of an infinite beauty which illuminates the whole universe. It is thee with thy crown and sceptre and circle. How difficult thou art to see! But I see thee; as fire, as the sun, blinding, incomprehensible.'

Light of Battle

That divine beings radiate light is accepted in all the major religious traditions. There is a Buddhist legend that a crowd of gods went to visit Buddha, who was meditating in a cave. The cave was filled with brilliant light, which some said was the radiance of the assembled gods but others said came from the fiery ecstasy of the Buddha himself. In Japan, Amida is 'Lord of Boundless Light', his head is encircled by a halo of light and he

The Memory of Nature

Within this Astral Light which individually we carry with us at all times and in all places, we live and move and have our being. Every thought that we think stamps an indelible impression on the impressionable substance of that plane – in fact tradition has it that it coalesces with one of the creatures of that plane and then passes away from our immediate control into this pulsating ocean of vitality and feeling to influence other minds for good or for ill. Every living thing breathes and intakes this Light freely, and to none is it exclusive or private. Indeed in it we live very much as a fish lives in water, surrounded on all sides and in every direction: and like a fish we constantly breathe it in and out through astral gills, as it were, taking energy therefrom and adding a variety of impressions thereto with the passing of each moment. Not only is this magical agent the Imagination of Nature, but it also fills the role of the Memory of Nature, for each act that we perform, each thought that enters our brain, each emotion as it leaves the heart, registers itself on the astral matter, remaining there for all time as an eternal record so that those who are able to may see and read. On this topic Eliphas Levi has significantly remarked that 'The Book of Consciences which, according to the Christian doctrine, will be opened on the Last Day, is nothing more than the Astral Light in which are preserved the impressions of every Logos, that is every action and every form. There are no solitary acts and there are no secret acts; all that we truly will . . . is written in the Astral Light.'

Israel Regardie *The Tree of Life*

C. W. Leadbeater's Man Visible and Invisible

Gods, heroes and holy men have long been believed to radiate light, and many occultists maintain that human beings, especially in strong emotional states, emit a luminosity called the aura, which can be seen by peculiarly sensitive observers. Three illustrations from C. W. Leadbeater's book *Man Visible and Invisible*; 'Intense anger' *(left)*: the red zig-zag lines represent the arrows of uncontrolled rage. 'A sudden rush of devotion' *(centre)*: a spiritual experience sweeps over a nun at prayer. 'The Irritable Man' *(right)* is flecked with scarlet depicting the vexations of life

is more glorious than the sun at noon (see AMIDA). Mohammed's face shone with its own light, and so did the face of the Scandinavian god Balder.

The face of Jesus shone like the sun and his garments became as white as light when he was transfigured before his disciples on the mountain and the voice of God pronounced, 'This is my beloved Son' (Matthew, chapter 17). In Christian art the Father, the Son, the Virgin Mary and the saints have haloes of radiant light (see DOUBLE) and the Holy Spirit emits fiery rays of light (for example, in El Greco's *Annunciation* – see BREATH).

Not only does sanctity emanate light but in legends and folktales so do beauty and blood-lust. There are Indian folk stories, for instance, of a prince who marries a woman so lovely that she lights up the bridal chamber on the wedding night. In the *Iliad* (book 18), when Achilles went out in berserk fury against the Trojans, the goddess Athene 'shed a golden mist around his head and caused his body to emit a blaze of light.' When the great Irish hero Cu Chulainn was roused in battle, the warrior's light rose from his forehead as long and as thick as a whetstone. We talk of the 'light of battle' being in someone's eye. Similarly, the 'heat of battle' is a familiar figure of speech, and when Cu Chulainn's dreaded battle frenzy was upon him, the heat he radiated was so intense that he boiled and burst two vats of water. (See CU CHULAINN.)

The radiating light of sacredness is also the light of spiritual vision. Eliade quotes Eskimo shamans who say that you cannot become a shaman without going through an experience called 'illumination' or 'lightning'. After long preparation, the shaman suddenly feels in his head and body a mysterious light, 'an inexplicable searchlight, a luminous fire'. This light enables him to see in the dark, not only literally but in the sense that he becomes clairvoyant. He also has the sensation of rising upwards – 'it is as if the house in which he is suddenly rises; he sees far ahead of him through mountains, exactly as if the earth were one great plain.'

The sensation of rising upwards is one of the distinguishing marks of being in what western occultists call the astral body or 'body of light', which is also an inexplicable searchlight that casts its rays on things not visible to ordinary sight. Agrippa spoke of the spirit vacating its body and spreading over space, like a light escaped from a lantern (see ASTRAL BODY).

The astral plane is said to include but extend beyond the physical plane of our everyday world, and the astral light (the light created by God's command 'Let there be light', according to Eliphas Levi) transmits the rays or waves or vibrations of human will-power, thought, feeling and imagination. In terms of Jungian psychology it is the medium of the archetypes, the basic ideas and symbols of the collective unconscious. In the astral plane thought, fancy and emotion have the same concrete reality as a solid object here on the physical plane, and the astral light is a great reservoir of occult power (like the *mana* of the Polynesians or the *orenda* of the North American Indians). Every human thought makes an imprint on the astral light, it is said, and in it the seer can read the history of the distant past in the Akashic Record or Cosmic Memory, through it the occultist can discern the reality behind the surface appearance of things, with it the magician works as a smith works with metal in his forge, shaping the subtle substance of the astral light with the tools of concentrated imagination and will.

LILITH

CHIEF OF THE DEMONESSES of Jewish tradition, Lilith preyed on newly born babies. Until a boy was eight years old, or a girl 20 days old, there was a danger that Lilith might steal in and kill the child. A typical precaution to keep her at bay was a magic circle containing the words 'Adam and Eve, barring Lilith', drawn in charcoal on the wall of the room where the child lay, with 'Sanvi, Sansanvi, Semangelaf' written on the door.

Lilith also attacked men who were sleeping alone, seducing them in their dreams and sucking their blood. It is this aspect of Lilith which is most prominent in the legends about her. It was said that Adam's first mate was not Eve but Lilith, who was formed by God out of mud and filth. Adam's offspring by her were demons. Adam and Lilith were not happy together, because Lilith considered herself Adam's equal and objected to lying under him in their embraces. When he tried to force her into this subordinate position, she flew away. Adam complained to God, who sent three angels, named Sanvi, Sansanvi and Semangelaf, to bring her back. They found her beside the Red Sea, where she was coupling with lascivious demons and giving birth to a brood of demonic children called *lilin* or *liliot* at the rate of over a hundred a day. The angels told her to return to Adam but she refused, though she promised that if she saw the names of the angels written near a newborn child, she would spare him.

All this occurred before the making of Eve, and it was only after Lilith had declined to go back to Adam that God created Eve. The legend shows how the two different creation stories in the early chapters of Genesis gave room for speculation. Genesis 5.3 which says that Adam fathered a son 'in his own likeness' on Eve was taken to support the belief that he had previously fathered children not in his own likeness, the demons. Lilith is the 'night hag' who lives in the wasteland with wild beasts and hyenas, in Isaiah (34.14), and she may well be the 'terror by night' of Psalm 91.

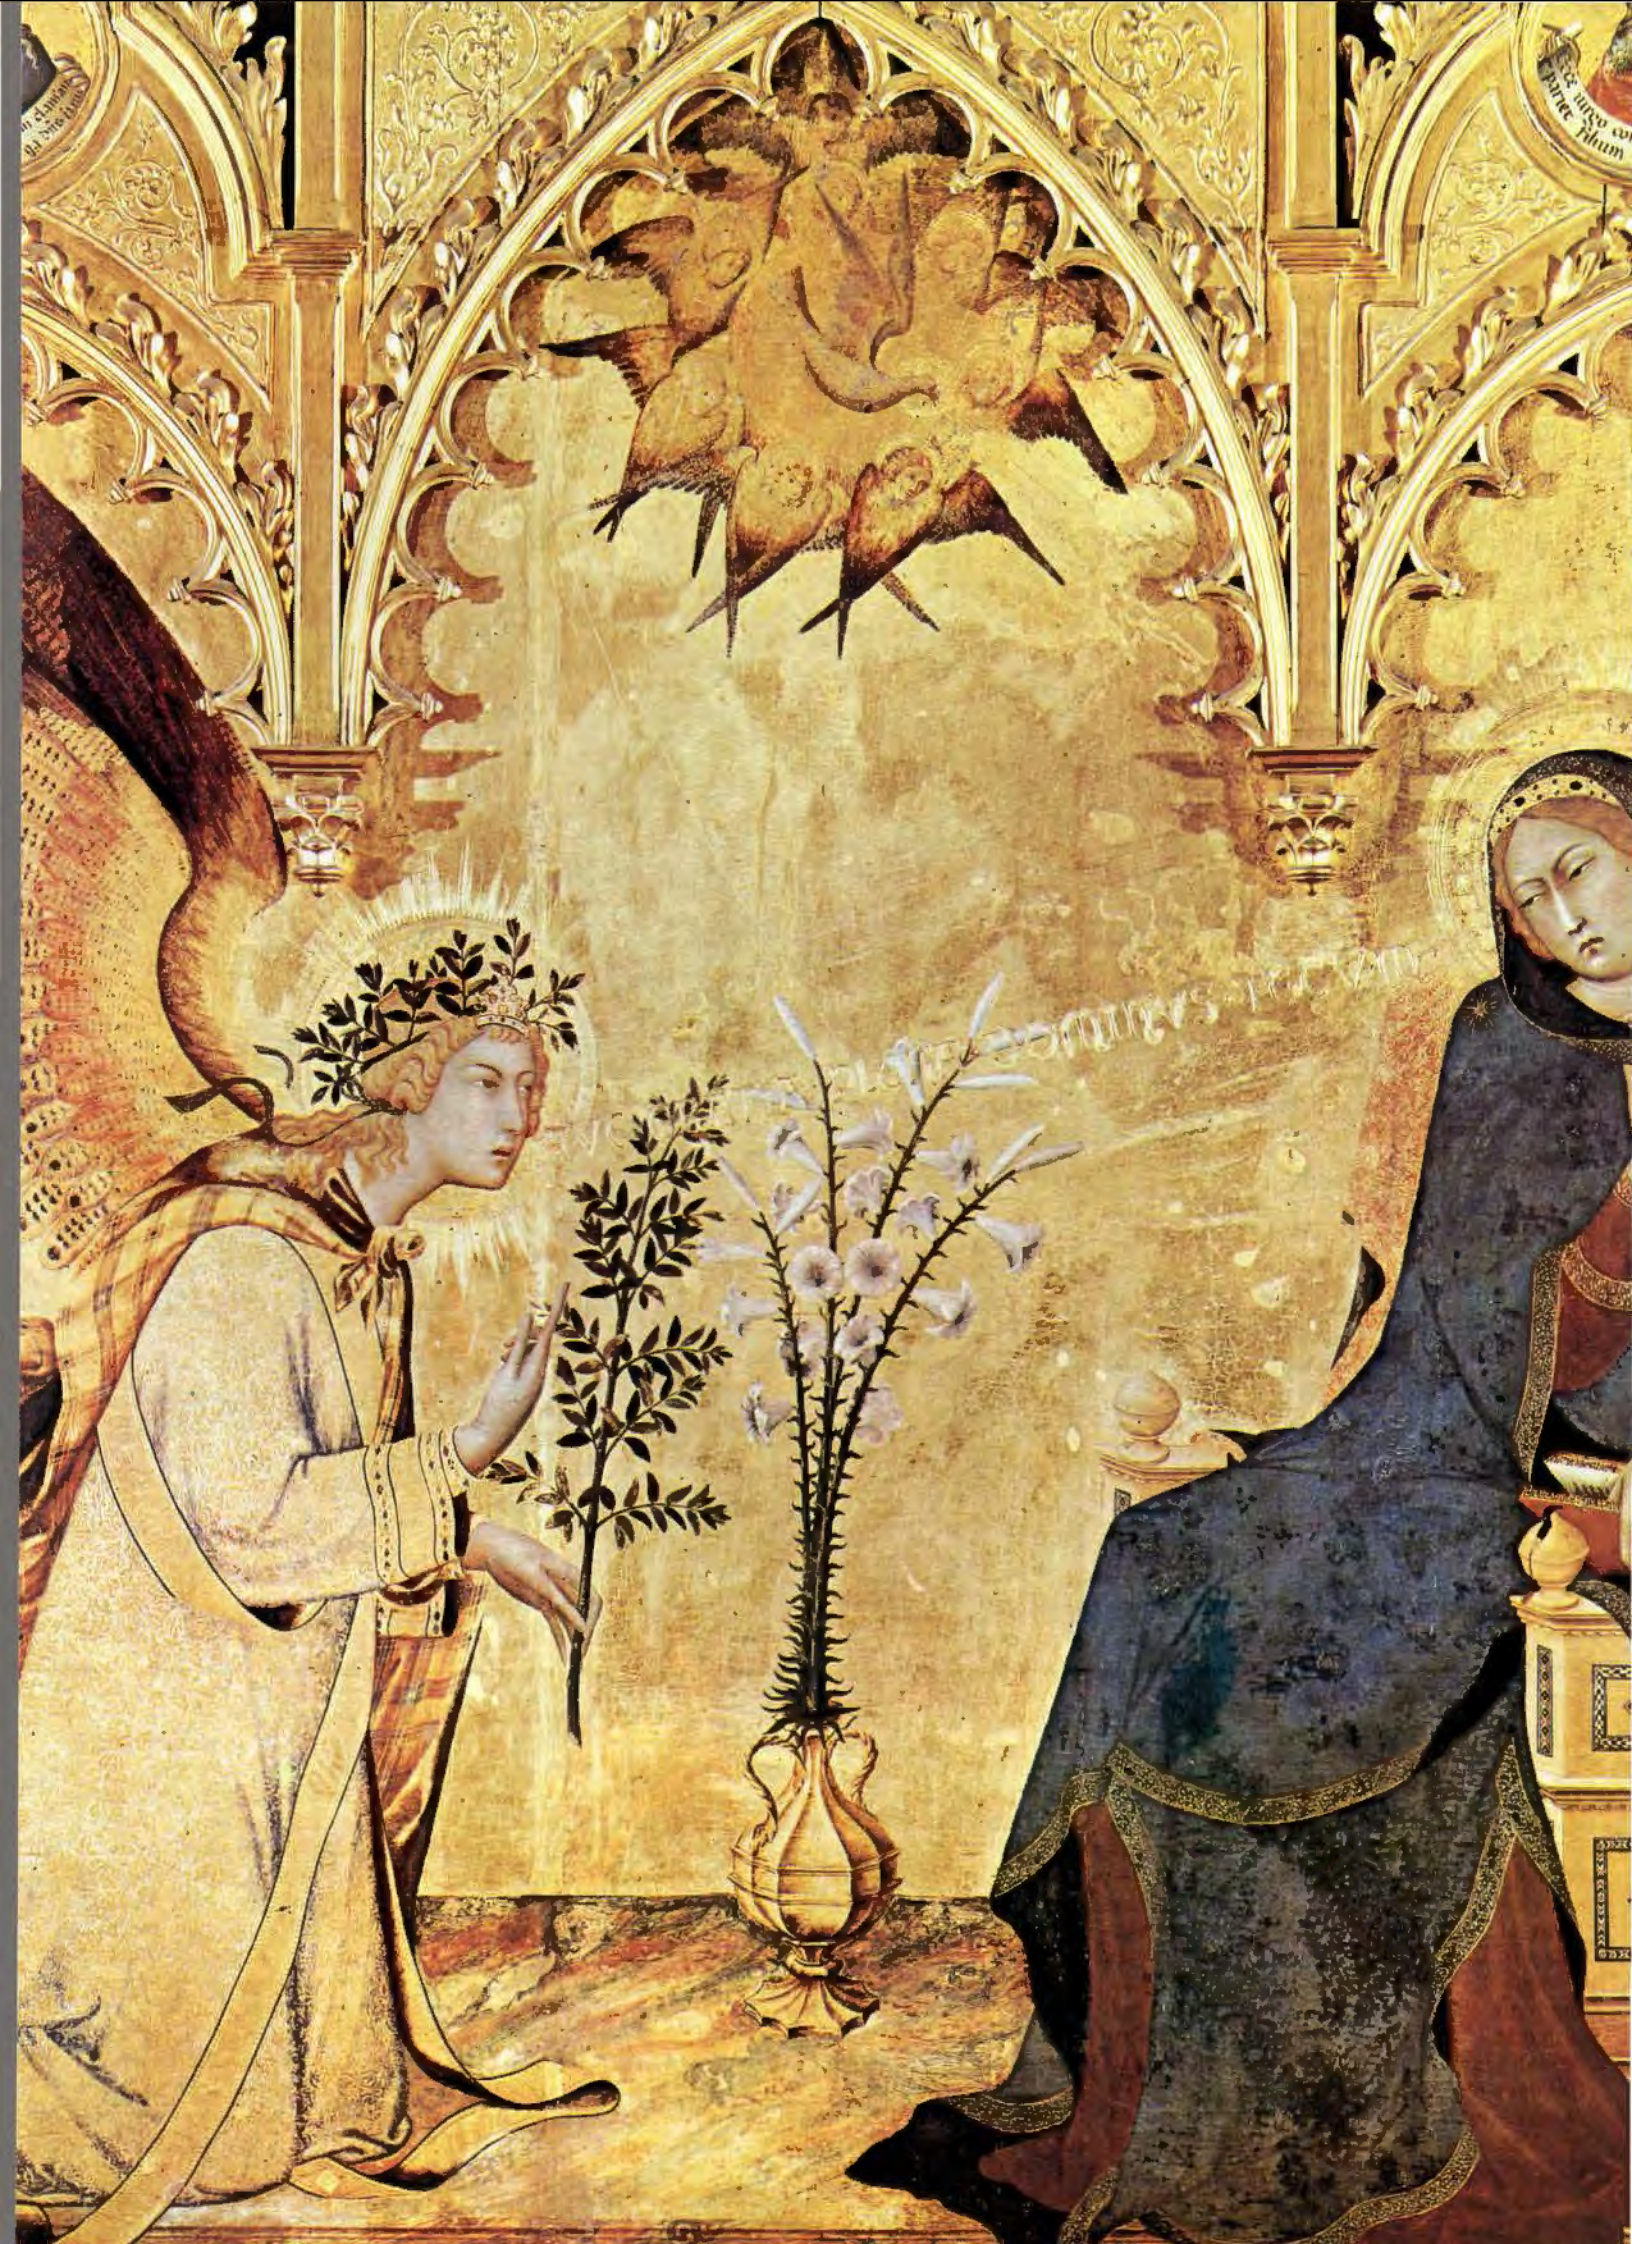
A Sumerian demoness, one of the predecessors of the Jewish Lilith: from a cult plaque

LILY

THE TRUMPET-SHAPED Madonna lily *(Lilium candidum)* is the lily which is usually represented in mythology. Its common name indicates its later importance as a symbol dedicated to the Virgin. Long before the birth of Christ, however, the lily was significant. In early civilizations this flower was a symbol of motherhood and fruitfulness: there are references to it in the mythology of Sumeria, Babylon, Assyria and Egypt. In Crete, where representations of the lily are frequent on pottery, it was sacred to Britomartis, the 'sweet virgin', who was pursued by Minos. After leaping to her apparent doom she was saved in the nets of a fisherman and afterwards became Dictynna, 'mother of the nets' and mother goddess. Both Greeks and Romans placed wreaths of lily and corn – symbols of virginity and fertility – on the heads of brides. To the Greeks the lily was the flower of Hera, who was goddess – among other things – of marriage and childbirth, while the emblem was readily transferred by the Romans to Juno, who had similar responsibilities. One Jewish legend suggested that the lily grew where Eve had shed tears on discovering, after her expulsion from Eden, that she was pregnant.

Most of the many references to the lily found in the Bible – the 'lilies of the field' is a well-known example – are probably mis-translations. It seems possible that *Lilium candidum* was once widespread in Palestine; and there is also a red lily, *L. chalcedonicum*, which may once have been abundant. The only passages which appear to refer specifically to these plants occur in the Song of Solomon: the white lily in the verse, 'My beloved has gone to his garden, to the beds of spices, to pasture his flock in the gardens and to gather lilies'; and the red in the verse, 'His cheeks are like beds of spices, yielding fragrance. His lips are lilies, distilling liquid myrrh.' Even in biblical times the lily represented power against evil; when Judith killed the Assyrian general Holofernes, she wore a crown or wreath of lilies.



Flower of the Virgin Mary

The date of the lily's adoption by Christianity is uncertain, but Ross, in his *View of All the Religions of the World*, wrote in 1696 how 'The Order of the Lily or of Navarre was instituted by Prince Garcia . . . in the city of Nagera 1048 AD, where the image of the Virgin Mary issuing out of a lily was discovered in the time of the King's sickness, who thereupon suddenly recovered his health; and in token of gratitude instituted the Order of Knights of St Mary of the Lily . . .' Louis IX of France established a similar order in 1234, whose members wore a chain of lilies entwined with broom, emblem of humility. Despite these and other ennoblements of the lily, there seems little doubt that the *fleur-de-lis*, France's emblem, was not the lily but the iris, as its stylized heraldic representation clearly shows. The name seems to come from *fleur de luce*, possibly a corruption of *fleur de Louis*, following the tradition that Louis VII, on setting off for the Crusades, took the iris as a badge. In French romance literature, at any rate, the lily is king of flowers, the rose being queen, echoing Pliny, 'The Lily is next in nobility to the Rose.'

In Lady Chapels and indeed generally in churches and religious buildings the lily will be seen among other carved flowers and leaves. This is especially so in Cistercian monasteries where the monks regarded the Virgin as their patroness and the lily was their symbol.

The Madonna lily is in flower at the Feast of the Visitation – 2 July – a festival inaugurated by Pope Urban VI to commemorate Mary's journey to visit her cousin Elizabeth. Paintings portraying this event almost always show a vase of three white lilies; they will also be seen in some pictures of the Last Judgement. The white lily that accompanies the Virgin in innumerable representations is due in part to a papal edict of 1618 which laid down rules 'as to the proper treatment of the white lily in pictures treating of the Immaculate Conception . . . roses, palms and lilies should be employed as the flowers suitable to be scattered by angels . . .' One legend recounts how St Thomas, refusing to believe in the Virgin's resurrection, caused her tomb to be opened; inside was simply a mass of lilies and roses. In the Roman Catholic Church the lily is also the attribute of some eight saints and the angel Gabriel. Considered the most appropriate flower for church decoration, the lily in former times would often have the stamen and pistils removed, so that it would be truly virgin.

The sacred associations of the lily led to its use against witches and their spells; it was one of the flowers used in protective magic on the Eve and Feast of St John and lilies were always prominent on that occasion in the city of London.

Lilies of Heaven

The blessed damozel leaned out
From the gold bar of heaven;
Her eyes were deeper than the depth,
Of waters stilled at even;
She had three lilies in her hand,
And the stars in her hair were seven . . .

And still she bowed herself and stooped
Out of the circling chasm;
Until her bosom must have made
The bar she leaned on warm,
And the lilies lay as if asleep
Along her bended arm

Dante Gabriel Rossetti
The Blessed Damozel

The Greeks and the Romans crowned brides with wreaths of lilies as symbols of purity and fertility; Christians mainly associate the lily with the purity of the Virgin Mary *Left The Annunciation* by Martini and *Right* Catholic Communion Card for Santa Maria Goretti

'Unspotted' and 'Unsullied'

Shakespeare mentions the lily on a score of occasions, always as an emblem of purity, 'the unsullied lily', and sometimes as a direct synonym for whiteness. In *King Henry VIII*, Cranmer says of Queen Elizabeth:

'Yet a virgin,
A most unspotted lily shall she pass
To the ground.'

According to an old superstition, if a man treads upon a lily, he endangers the purity of his wife and daughters.

Symbol of innocence in the living, the lily also signified the removal of sin from the shriven soul at funerals. European folklore tells of lilies springing up on the graves of those executed for crimes of which they were in fact innocent. But such beliefs associate the lily with death, and many people will not have white lilies indoors since they see them as an ill omen. In the garden, however, lilies are a barrier to ghosts.

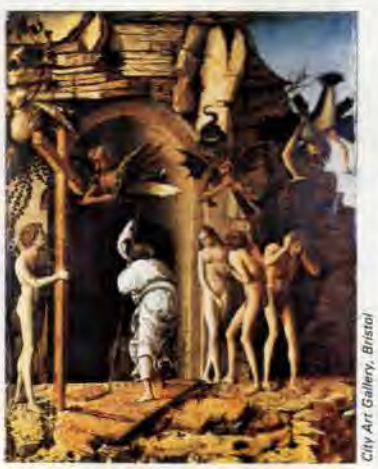
On a more practical level this flower is still used by country people to cure boils. The petals will 'draw' inflammation if their rough side is laid on the spot, and heal with the smooth side. They should preferably be steeped in brandy first. Leaves of tiger lily serve equally well. A Lincolnshire recipe used the mashed-up bulb as a poultice.

In the language of flowers the white lily stands for purity or sweetness, but a yellow one for falsehood or gaiety. To dream of lilies means good luck.

A. J. HUXLEY

Limbo

In Christian tradition, an area on the edge of hell which was not a place of physical torment but of banishment from God's presence: reserved for the righteous who lived before Christ and so had no opportunity of being saved by him; also for children who died before baptism and so could not go to heaven but who did not deserve the pains of hell; and for fools who were not worthy of heaven but were also not responsible for their actions (for them it was a 'fools' paradise').



Scala City Art Gallery, Bristol

Lingam

The phallus, particularly that of the god Shiva in Hinduism, an emblem of male generative and creative power; an object of reverence in Hindu shrines; known from the earliest Indian art where it is a plain stone carving of the penis; often shown in combination with the yoni, the corresponding female symbol, which serves as a base to it.

See PHALLIC SYMBOLISM.

Left 'Out of the strong came out sweetness'; the lion as a trade mark suggests the strength and integrity of the product *Below* Bronze head and shoulders of Sekhmet, the lion-headed Egyptian goddess *Right* 15th century Greek mural showing St Mamas riding a lion; in legends the lion often appears as a friend and helper of man

LION

THE SIZE, strength and magnificent appearance of the lion caused it to be associated in ancient times with divinity and hence with royalty; leonine qualities were attributed to gods and goddesses and this animal is still referred to as the 'King of Beasts'. The Egyptian goddess Sekhmet was represented as lion-headed. At Syracuse in Sicily a lion was led in procession in honour of the Greek huntress goddess Artemis and at Baalbek (in modern Lebanon) chants were sung to a lion apparently regarded as divine, while it ate a calf.

The beast appeared frequently in the role of a guardian, a function which persists to this day. Effigies of the lion guarded temples; a chained lion guards the palace of the Emperor of Ethiopia. Even in China, the guardian lion is a common symbol and at the New Year Festival lion dancers used to gambol in the streets.

In recent times the natural habitat of the lion has become greatly curtailed. Only a few remain in western India, and south of the Sahara they exist in diminishing numbers, although they are plentiful in the reserves and national parks of East and South Africa. The symbolism, mythology and folklore of the lion differs in various regions, according to the extent to which people are familiar with it. Among those who know the beast only by hearsay or in captivity its characteristics have been exaggerated and embellished, whereas in the lore of African tribesfolk accustomed to living among lions, they may be revered or regarded, as in some folktales, as rather stupid and ridiculous animals.

'This Land Is Mine'

African names for the lion and sayings about it may express respect or familiarity but seldom horror or terror. The Arabs of Algeria who used to hunt the lion called him by a name equivalent to 'Mr John Johnson' while in Botswana his name means 'the Boy with the Beard'. Such names are sometimes given to awe-inspiring animals or beings from fear of invoking their appearance, if the real name were used. An African tribe calls it 'the Owner of the Land' and according to a Swahili saying the beast's roar means, 'Whose is this land? Mine, mine, mine.'

Among many primitive peoples the distinction between man and animal is blurred; some African tribesfolk believe that a sorcerer can transform himself into a lion and the Bushmen think that a lion can become a man. The Dinka of Sudan regard lions as their totemic ancestors, sleep out in the wilderness without fear and leave portions of the animals they kill for them. On the Congo and Zambesi Rivers the souls of dead chiefs are believed to pass into lions but among the Ngonis of Central Africa this was not thought of as a privilege reserved for chiefs. Some tribes treated a dead lion with ceremonial respect.

In contrast, the lion of folktales may be depicted as easily outwitted by smaller and weaker animals, as in versions of the widespread and universal motif in which the downtrodden get the better of the mighty (as in Cinderella). In the *Panchatantra* (a Sanskrit book of fables), a Tibetan folktale and some African stories the lion is tricked by the jackal or the hare. One of these relates that a lion one day found a hare leaning against a rock. In answer to the lion's inquiry the hare said that the rock was liable to fall. Would the lion kindly help to support it? The lion obligingly put its weight against it while the hare sneaked away, leaving the lion pushing against the perfectly stable rock. This story illustrates the diffusion of folktales for versions of it are told in Georgia and Puerto Rico, as a part of the cultural heritage brought to the New World by slaves. In contrast to this story, the lion in Aesop's fable, 'The Lion's Share', outwits the other animals.

Michael Holford/British Museum

Magnanimous Beast

There are many tales of the magnanimity of the lion, in which the beast spares or befriends human beings. One of the earliest is the story of 'Daniel in the Lion's Den', and the 'Androcles and the Lion' motif is also ancient. A similar story is told of St Jerome, who is often depicted in art with the lion from whose paw he extracted a thorn. According to another variant, a Christian hermit unable to bury his friend in the hard soil of the desert is surprised and gratified when two lions appear and scrape out a grave with their paws.

Although St Peter compared the Devil to 'a roaring lion seeking whom he may devour', in Christian thought the lion acquired symbolism connecting it with noble virtues such as courage and generosity. Christ was called the 'Lion of Judah', and because of the animal's friendly associations with the early Christian desert hermits it became symbolic of the contemplative life, wisdom and generosity. As the emblem of St Mark it became associated with the city of Venice in Italy.

Natural historians of the 15th and 16th centuries gathered together a great store of fabulous lore concerning the lion, most of it quoted or elaborated from earlier Greek and Latin authorities. Although the greater part of it is fantastic, it includes some grains of truth probably gained from observation; such as, that the lion when gorged will go for two or three days without eating and that it will not kill a man except when in great hunger. Among the fabulous appears the old story that the beast is frightened by the crowing of a cock. We are told that the lion, when ill, may be healed by the blood of an ape, that it charms other animals by circling around them marking a line with its tail, that it is afraid of a mouse or a cart-wheel and that clothes wrapped in a lion's skin are safe from moths.

Today the lion remains a symbol of sovereignty and nobility, appearing alike on the Royal Standard and as a trade mark on articles of merchandise.

Sonia Halliday

The nationalist fervour of pre-1914 Germany and Austria was an appropriate backdrop for the mystical sect of Guido von List

GUIDO VON LIST

FOUNDER OF THE OCCULT German nationalist sect of the Armanen, Guido von List was born in 1848. Whereas his close acquaintance Lanz von Liebenfels, who also had a devoted following (see NEW TEMPLARS), was obsessed with the concept of race, List was mainly preoccupied with occult Germanic folklore. While the youthful Hitler was acquainted with von Liebenfels's writings, there is no evidence that he ever read List's. Nevertheless, it is apparent that there were many members of the pre-1914 German youth movement, and also of the influential *Deutschnational Handelsgehilfenverband* (Clerical Workers' Union), which represented extreme right-wing German nationalist views, who were familiar with List's abstruse theories. Although it would be too much to suggest that List was a major prophet of National Socialism, his name would have been known to most early members of the Nazi Party who were interested in Germanic mysticism.

List was the eldest son of a prosperous Viennese leather-goods merchant, and was 29 when his father died in 1877. He then left the family business, which was so mismanaged by his mother that he lost his inheritance. Until the end of the century he made a precarious living as an author, playwright and journalist.

As early as 1862, when he was only 14, it is said that he stood in front of a dilapidated altar in the crypt of St Stephen's Cathedral, Vienna, and exclaimed: 'When I grow up, I will build a temple to Wotan!' While the history of the revival of Wotan worship in modern Germany is obscure, List may well have been one of its pioneers. At an early age he was steeped in Germanic and Nordic folklore, in that strange world of gods and demons commemorated in Wagner's '*Ring*' cycle.

List's first major published work was *Carnuntum*, a historical novel of the 4th century AD and was followed by his *German Mythological Landscapes* (1891). It was only in 1908 that he emerged as a 'personality' and a Guido von List Society was founded in his honour. The Society was formed at the instigation of a few wealthy admirers to enable him to publish the substance of his 'discoveries', which so far had only been revealed in more or less private lectures. Among the books issued under the Society's imprint were *The Secret of the Runes* (1908); *The Armanism of the Ario-Germanens*, (1908–11); *The Rites of the Ario-Germanens* (1908) and *The Transition from Wotanism to Christianity* published in 1911.

Apart from the Society there was also a secret brotherhood of initiates known as the Armanen. List had invented an ancient race of Germanic wise men of priestly stature whom he called the Armanen. He put forward the theory that their successors, of whom he was the last, had secretly survived throughout the centuries and had left traces of their temples in the names of places, hills and streams. List himself claimed an intuitive or clairvoyant memory of the distant past. All this led to his completely irrational philological techniques which enabled him to discover traces of the Armanen in place names here, there and everywhere. Only List, for example, could have transformed the word hieroglyph, which is of Greek origin, into '*ir-og-lif*' and given it a new and fictitious Germanic source.

Sacred Swastika

Another of his theories was that the swastika was one of the Armanen's most holy symbols. Possibly the earliest allusion to this emblem in a modern German context is List's account of a summer solstice excursion in 1875 to a hilltop near Vienna where he and his friends ceremonially buried wine bottles arranged in the shape of a swastika.

List derived his legendary Armanen from a Germanic tribe, the Herminones, whom he called Irmionen, mentioned by Tacitus, whose *Germania* was prescribed reading for a new generation of Germans who liked to indulge in enthusiastic and seldom historically justifiable ancestor worship. The ancient Germans described by Tacitus were fair haired and blue eyed and for List and his followers they represented a racial ideal. According to List the word 'Irmionen' meant 'children of the sun'. During List's lifetime there were 'Sun' or 'Light' religion groups in existence in Germany but they are unfortunately sparsely documented.

The sacred books of the Armanen, according to List, were written in a 'double language', whose meaning was hidden to profane outsiders but which could be understood by initiates, such as himself. List saw Armanen symbolism everywhere: in old heraldic devices and even in the wooden exterior beams of old houses where, he suggested, they had a runic significance.

The 'Secret Tradition'

Although the Guido von List Society had been founded in Vienna, it had a fair number of members in Germany. These included Philipp Stauff (1876–1923), a violently antisemitic hack journalist who was the Society's official representative in Berlin. Stauff was a founder member in 1912 of the secret Germanen Order which soon recruited a hard core of monomaniac antisemites. The Germanen Order was organized on pseudo-Masonic lines and was intended to be a strictly German counterpart to conventional Freemasonry which was equated with 'international Jewish high-finance' among List's followers (see GERMANEN ORDER).

The Order's original rituals were composed by Hermann Pohl, of Magdeburg, who had previously belonged to a Germanic 'Sun' religion group. In due course Stauff infiltrated a lot of List's eccentric lore into the Order's 'secret tradition'. A lengthy typewritten document drafted in 1921 (now in the West German Federal Archives) indicates the extent to which the Order's leaders envisaged an ideal German state – a prototype for the Third Reich – based upon List's Armanen theories.

List died within a couple of days of his arrival in Berlin in May 1919. He had been invited to spend a holiday at the Pomeranian estate of Eberhard von Brockhusen, the Chancellor of the Germanen Order, but did not survive the strenuous journey from Vienna. The Guido von List Society survived for a few years after his death and then quietly disappeared. Its publications, which now fetch fairly high prices, are still collected by Germans who presumably believe that List had something important to reveal.

ELLIC HOWE

Little People

Respectful and often affectionate term for fairies: believers in fairies frequently preferred not to name them directly for fear of summoning them, and instead used vague, preferably complimentary, terms like 'the little people' or 'the people of peace'; despite the term, not all fairies are believed to be diminutive creatures.

See FAIRIES.

Liturgy

The forms of service used in churches and places of worship; derived from a word used in the Greek translation of the Old Testament to denote the service of priests and Levites in the Temple: also used more narrowly to mean the Eucharist or Communion service.

to be uſed at Sea.

At the Burial of their Dead at Sea.

LIVER

HARUSPICY, THE EXAMINATION of the internal organs of animals, is a mode of divination of great antiquity. Of all the organs, the liver has been particularly favoured for its prophetic utility. This is because among 'primitive' people the liver was (and sometimes still is) regarded as the seat of life. Furthermore, it was believed that when an animal is sacrificed to god it is in a certain sense absorbed by the god. Hence, the examination of the animal is almost the same as an examination of the god and is therefore a means of ascertaining the divine will and the course of future events. If the liver is the primary organ, it follows that its inspection will be a very powerful form of divination. The art of 'liver-gazing' is known as hepatoscopy.

The earliest known practitioners of hepatoscopy were the Babylonian *baru* priests, who developed the art to a very high level of complexity. It was regarded with great veneration and its use was reserved for kings and the highest in the land. The questions put to the god (usually Shamash, the sun god) to whom the animal was sacrificed were worked out in great detail and precision, as may be seen from the clay tablets on which they were recorded, a large number of which have been discovered by archeologists. Several clay models of sheep's livers have been found that were apparently used for reference and teaching. The oldest of these probably dates from about 2000 BC. Every part of these remarkable objects is covered with symbols, since each was believed to relate to different types of future events. It was not only the general shape and condition of the liver that was thought to be significant but the state and colouring of its component parts. For instance, a swollen gall-bladder betokened an increase in power, a depression in the liver-gate (the *porta hepatis*) a lessening of power. Vein markings and colourings, which are different in every liver, were interpreted according to their resemblance to the weapons and symbols of the gods.

Hepatoscopy has been practised in many parts of the world and still is in regions of Southeast Asia, Borneo and Africa. It was one of the ancient Greek forms of divination and, according to Aeschylus, was among the arts taught to men by Prometheus. In the *Prometheus Bound*, the god, impaled and fettered to the rock, tells the chorus of Oceanids how he showed mortals how to interpret 'the smoothness of the entrails, and what colour the gall must have to please the Deities and the good mottled aspect of the liver.' But it never seems to have been so developed as it was in ancient Babylonia and later in Etruria, whence it passed to Rome. The Etruscans (see ETRUSCANS) believed that the art of haruspicy in general had been taught to them by a minor deity named Tages, a grandson of Jupiter. The legend had it that he appeared from a newly ploughed furrow and told the people many marvels of the secrets of divination which were later written down in 12 books.

The Etruscan *haruspex* was a diviner of many parts. He was adept in the interpretation not only of the entrails and organs of sacrificial animals but also of portents and omens such as thunder and lightning. The latter were believed to be signs of the gods, while from a close examination of the former the divine will could be foretold. The Etruscans developed the art of hepatoscopy, it seems, to a degree of 'accuracy' rivalling that of the Babylonians. A bronze liver discovered at Piacenza in 1877 dates from the 2nd or 3rd century BC and its complex markings show that 'liver-gazing' had joined forces with the astrological ideas of the time. It is divided into 40 zones, each connected with a different god or one of the elements.

The liver, regarded by many primitive peoples as the seat of life, was also used in divination: this bronze Etruscan liver from Piacenza is divided into 40 zones, each connected with a different god or one of the elements

Military Appointment

The early Romans were highly suspicious of foreign cults and beliefs, even when they originated in neighbouring areas such as Etruria. They had strict rules of divination that sought to gain a simple sign of divine approval or otherwise of a proposed course of action. The augurs limited themselves to the observation of the flight of birds or of natural phenomena (see AUGURY; BIRDS). But when their own lore and sacred texts failed to provide satisfactory answers, the Romans called in the foreigners.

The Romans themselves originally used *extispicium* (the examination of *exta*, entrails) only to determine whether or not an animal was worthy of being sacrificed but they gradually turned to it for divination as the old rules were relaxed. One reason for this was that traditional Roman methods of augury were difficult or impractical for an army in the field. When a quick decision was needed, disaster might overtake a force if the commander wasted time scanning the skies. For this reason extispicium, and hepatoscopy in particular, was first used widely by the Romans from the time of the Second Punic War (218–201 BC) for military purposes. By the end of the Republic in the 1st century BC, a haruspex was a permanent member of the staff of every commander-in-chief and was consulted on general campaigning policy and tactics.

During the Roman Empire the opinion of the haruspices was sought not only for military but for civil and even for private purposes. But they were never incorporated into the state religion and although they challenged and in many ways superseded the traditional augurs, the haruspices were never accorded the same reverence as the latter. The Emperor Claudius (41–54 AD) granted them equestrian rank and organized them into a College of Sixty. Yet even then the old doubts prevailed and the College was not an order of priests but a body of salaried experts, rather like a modern firm of consultants. It survived until the early 5th century AD.

Now still as a rock, now darting like quicksilver, this ancient creature's unpredictable movements have inspired both awe and fascination; associated with the life-giving sun, the lizard was believed to cure anything from fever to impotence

LIZARD

IN THE WARMER REGIONS of the world, lizards, a group including some 2500 species, are more numerous and conspicuous than in northern Europe. They vary in size from a few inches to creatures such as the so-called Komodo Dragon ten feet in length. Many of the smaller species bask or run about actively on sun-warmed rocks though the larger lizards and chameleons tend to be sluggish. Some, including the European green lizard, are brightly coloured, others have strange adornments such as skin excrescences or patches of colour which are displayed during courtship. The ability of some species to replace a lost tail is one of their many characteristics that has aroused man's curiosity and wonder.

The sun-loving behaviour of many species has inspired various beliefs that they are associated with the sun. In the ancient Near East they symbolized overpowering heat, and in Egypt they were associated with fecundity, probably because of their increased activity when the Nile floods stimulated the resurgence of life. In Dahomey, the lizard is said to have fetched fire from the sun. The reappearance of lizards after hibernation seemed mysterious and in Europe it was believed that during this period they became blind. It was said that in spring these creatures climb up an eastward-facing wall and look to the east; when the sun rises their sight is restored. European lizards are mostly keen-sighted and so the belief arose as long ago as the time of Pliny (1st century AD) that a lizard talisman restored sight to the blind. Lizards appear carved on corbels in medieval cathedrals, such as Southwell and Wells; they symbolize the life-giving and enlightening power of the gospel.

The idea of the lizard as a god, kin to the gods or their messenger, appears to have been due mainly to its associations with the sun. Such beliefs are particularly characteristic of Polynesia, where lizard cults were observed. The Samoans revered several gods in lizard form. The Maoris considered the green lizard to be an incarnation of Tangaloa, the heaven god, and for the Hervey islanders of Polynesia, Tongaiti, the night heaven god, was a nocturnal spotted lizard. In Africa the Shilluk had a tribal lizard god. The Australian Aranda connected the lizard with their sky and earth myths and believed that the sky would fall if they killed one of these creatures.

Like some other animals this reptile tended to be regarded in some places as evil, in others as beneficent. In the medieval Church it stood for rebirth and resurrection, a significance which it may have owed partly to the influence of the Romans who depicted it on grave monuments as a symbol of hope in life beyond the grave, but among other folk it was associated with death. The Santals of India who believe that the soul may appear as a lizard tell the following tale: as a man lay asleep his soul went off as a lizard to drink from a pitcher but the owner placed a cover on it and the man died. Soon afterwards the pitcher was uncovered and the man revived. Such notions arise among peoples who do not distinguish clearly between unconsciousness and death.

Beliefs of a somewhat similar kind linger in Europe. In Austria it is said that a lizard runs out of the mouth of a delinquent child and quickly disappears. In German folklore there are tales of a lizard who is really a bewitched princess, of another appearing as a lizard after death and of witches transforming themselves into these reptiles. There is a belief in Italy that fairies appear as lizards.

Progeny of Devil and Witch

The dualistic ideas associated with lizards are particularly evident where witchcraft and good and bad luck are concerned. Among the Jews, the lizard was considered unclean – a creature born of sexual intercourse between the Devil and a witch. The somewhat hand-like feet of the lizard may have contributed to the notion that it had an uncanny affinity with human beings. In some areas of France and in Schleswig-Holstein a lizard buried alive under the threshold was considered an antidote against witchcraft and in regions of the Near East lizard amulets were worn. From ancient times the lizard figured in sorcery, as used among the ingredients of the witches' brew in *Macbeth*. A concoction including parts of a lizard was smeared by the door of the person it was hoped to bewitch in some parts of Germany.

Because of their resemblance in some respects to snakes, there was a fairly widespread belief in Europe that lizards could sting. On the other hand, among the Slavs as well as the French and English, the lizard was regarded as a protective spirit against snakes and it was the custom to fix one on the roof of a stable to ward them off. In Périgord in France there was a saying: 'The lizard is man's friend'. In parts of Britain it was believed that if a lizard saw a snake approaching a sleeping man it would awaken him, but that for a lizard to cross the path of a bride was ominous.

In general lizards are considered luck-bringers in France and Germany but in the Central Celebes, Indonesia, they are killed to ward off misfortune. When a lizard's tail is seized by a predator it becomes detached and another grows, but an injury at the base may cause an abnormal two-tailed appearance; Italians regard such a two-tailed lizard as particularly lucky. The Latin writer Aelian (170–235 AD), unaware that a lizard after losing its tail could grow another, stated that the body and tail became reunited.

Kunsthistorisches Museum, Vienna

Detail from *The Fall of Man*, a painting by Van der Goes, showing Eve being tempted, not by a snake, but by a human-headed lizard; but the lizard has also been regarded more favourably, as a symbol of resurrection

Lizards were regarded as sacred in various parts of the world. Samoans venerated the creature as the son of the High God and the rainbow, possessing power to ask the weather god for propitious weather. According to a local German tradition the lizard licked away Christ's drops of blood and therefore should not be molested. Sicilians say that the little lizards called San Giovanni must not be killed because they are in the presence of the Lord in Heaven and light the lamp to the Lord.

Administered medicinally, potions containing lizard ingredients have been regarded as cures for many kinds of disease varying from running eyes, liver complaints and syphilis to getting rid of warts. On Easter Eve gypsies in southern Europe placed the dried remains of a lizard, together with herbs, in a specially constructed receptacle. Then all the members of the clan spat on the reptile as it was carried from tent to tent before being thrown into running water. It was believed that in this way the illnesses which might have affected the community during the coming year were banished. In Arabia lizard medicine was prescribed to remedy the impotence of aged men – probably on the assumption that they would acquire some of the vitality of such an active creature. To cure fever a lizard would be buried alive in Madagascar. During the Middle Ages it was believed in England that by licking a lizard a person could acquire the ability to heal wounds and sores by licking them. There was a belief in Germany that rupture in children could be cured by catching a lizard, making the child bite it, and then suspending it on a reed in the smoke of a fire. As the lizard died the rupture would be cured.

Lizard medicine was also administered to remedy the ills of cattle and horses, though, in contrast, Bretons believed the green lizard to be poisonous and blamed it for killing cows by biting them on the nose. In antiquity it was thought that fruit trees could be prevented from bearing unsound fruit by smearing them with the bile of the green lizard. Pliny advocated this procedure and Konrad Gesner, the 16th century Swiss biologist, also recommended it. In Silesia the practice continued into the 20th century.

E. A. ARMSTRONG

The god Lugus or Lugh, who was widely invoked among the Celtic world under a variety of names, appears in medieval Welsh stories as the heroic Lleu, many-skilled warrior and possessor of magical powers

LLEU

THE BIRTH of Lleu, how he acquired his name, his youthful deeds, and his 'death' by his transformation into an eagle is told in the 'Fourth Branch' of the *Mabinogion*, the story of *Math*, which dates to the latter part of the 11th century. The story is heavily embroidered with motifs of an obvious international folktale type; but underneath, and apart from these elements, a nucleus of genuine Celtic mythology can be detected. The tale clearly contains fragments of an ancient cult legend in which the hero Lleu is in fact the god who was widely invoked throughout the Celtic world, in the form Lugus on the Continent, Lugh in Ireland and Lleu in Wales. Lleu is portrayed in the Welsh tales as the son of the sorcerer-warrior Gwydion (see GWYDION) as a result of his incestuous union with his sister, the goddess Aranrhod. Gwydion, who is sometimes referred to as the boy's uncle, carries off the child immediately he is born, and rears him. When he is four years old, 'and it had been remarkable for a boy eight years old to be as big as he', he takes him to see his mother at her stronghold, Caer Aranrhod. She rejects him, and swears he shall have no name unless she herself bestows one on him. This is a dreadful destiny, for in pagan Celtic society the name had a sacred significance – without a name one was virtually without identity. Gwydion deceives his sister, and brings it about that she does in fact name her son.

By magic, Gwydion turns seaweed into fine leather. He creates a splendid ship out of dulse and sea-girdle and, having first transformed himself and the boy into people of different appearance, he sails to the entrance of Caer Aranrhod. 'He took away their own semblance and put another semblance upon them, so that they would not be recognized.' "What men are in the ship?", asked Aranrhod. "Shoemakers", said they.' She asks for a pair of the golden shoes he is making. Finally she goes to the ship herself to be fitted. Gwydion is cutting out and the boy stitching. As Gwydion is measuring Aranrhod's foot, a wren alights on the ship; the boy aims at it with supreme skill. 'Faith,' she said, 'with a deft hand has the fair one hit it.' Thus she inadvertently names her son Lleu Llaw Gyffes (*lleu*, 'fair, bright': *llaw*, 'hand': *gyffes*, 'deft, skilful'). The story goes on to say that 'For that reason he was known as one of the three golden shoemakers'.

One of the early Welsh triads is entitled *Three Golden Shoemakers of the Island of Britain* (a form of literary composition in which subjects or statements are arranged in groups of three in accordance with Celtic custom):

> Caswallawn . . .
> and Manawydan . . .
> and Lleu Skilful-Hand when he and Gwydion were seeking a name and arms from his mother Aranrhod.

Of particular interest in connection with the above episode is the fact that the Gaulish Lugus is invoked in plural form on an inscription from Uxama in Spain set up by the *collegium sutorum*, 'college of shoemakers'. So, among the many skills that this god evinces, that of shoemaking seems to have been of importance.

Wife Formed From Flowers

Lleu's mother, angry at having given her son his name unintentionally, swears that he shall never carry arms until she herself equips him with them – a sorry fate for a hero-elect. In the course of time, Gwydion once more outwits his sister with Lleu's assistance – for they are both powerful magicians. They set out for her stronghold disguised as bards. Gwydion delights the company with his tales, and the two men finally retire leaving the gathering well pleased. Early next day Gwydion uses his magic powers to create an invading host; Aranrhod hears a great clamour, and sees a vast fleet of ships on the water. She comes to the two poets for aid; Gwydion contrives it that she actually provides her son with arms, and puts them on him. At once the magical illusion ceases; Gwydion is triumphant again. Aranrhod, furious at being tricked, swears that Lleu will never have a wife 'of the race that is now on this earth'.

Math, Gwydion's uncle, himself a powerful sorcerer, assists him in fashioning a wife for Lleu out of flowers; she is given the name Blodeuwedd, meaning 'flowers'. All goes well for some time, until she is unfaithful to him while he is absent from home. Blodeuwedd and her lover plot to kill Lleu, but he is almost invincible. By flattery she gets him to tell her the complicated way in which his death can be brought about. Her lover, Gronw, then strikes the fatal blow as Lleu is 'rehearsing' his death for his wife's edification. Here there is a very interesting development in the tale, one in which the mythological elements stand out clearly from the background of international folktale motifs. When Lleu is 'killed' by the poisonous spear 'the shaft started out of him and the head stayed in him. And he flew up in the form of an eagle and gave a horrid scream. And after that he was seen no more.' When he has taken on bird form he in fact flies off and perches in the upper branches of a marvellous oak tree, a tree having special significance for the pagan Celtic peoples (see OAK). This tree is reminiscent of a whole group of sacred, venerated trees in the early Irish tradition. It is situated on a plain, as were many trees of this religious character; it could not be soaked by rain, nor destroyed by fire, a sign of its immortality.

Gwydion goes to seek out Lleu, and finds him in a sorry state in the tree. While Gwydion sings to Lleu, the eagle descends the tree, then alights on Gwydion's knee; Gwydion strikes it with his magic staff and it becomes Lleu again, but pitifully emaciated. Within a year he is healed and is completely restored to his former beauty and vigour. The episode in the tree is in itself fascinating; Gwydion refers to the nine score hardships the 'fair lord' has suffered in the tree. This is strangely reminiscent of a passage in the *Havamal* (a poem in the *Poetic Edda*) which describes a sojourn of the Germanic god Odin (see ODIN) in the sacred ash tree, Yggdrasil, when he sacrificed himself to himself. 'I know that I hung full nine nights on the windy tree, wounded by the javelin, given to Odin, myself to myself.'

Lleu, with Gwydion's aid, takes his revenge on his slayers. The lover Gronw is killed, and the episode is commemorated

in one of the early triads, the *Three Faithless War-Bands of the Island of Britain*: 'The War-band of Goronwy the Radiant of Penllyn, who refused to receive the poisoned spear from Lleu Skilful-Hand on behalf of their lord, at the Stone of Goronwy at the head of the Cynfal . . .' The faithless wife is turned into an owl; 'and for that reason birds are hostile to the owl; and the owl is still called Blodeuwedd.' The story ends with Lleu restored to his former position, ruling prosperously and at peace.

Lleu's counterpart in Ireland, Lugh, was known as *samildanach*, 'skilled in many crafts', which is paralleled by the Welsh epithet Llaw Gyffes, 'skilful hand'. The story of *The Second Battle of Moytura*, like the mabinogi of *Math*, points to the original character of Lugh-Lleu as a god of craftsmanship amongst other things. Lugh wields a powerful spear; 'the spear that Lugh possessed was one of the marvellous things that the Tuatha Dé Danann (tribes of the goddess Dann) brought with them to Ireland'. In the Welsh story Lleu can only be killed by a specially-made spear; here the tale is given a Christian slant, but Lugh-Lleu's connection with a magical spear seems to be endemic in the early pagan tradition.

In *The Second Battle of Moytura* the arrival of Lugh at the court of Nuada the king is described. The gate-keeper demands to know what art he practises, for no one can enter the gates without a specific craft. Lugh claims to be a carpenter; 'We do not need one, we have a carpenter,' says the gate-keeper. Lugh then says 'I am a smith'. 'We do not need one, we have a smith'; he continues to claim to be a champion, a harper, a hero, a poet, a historian, a cupbearer, sorcerer or leech, and so on. Finally he tells the gate-keeper to ask the king whether he has any man who possesses all these skills together. Nuada finally says 'Let him into the enclosure, for never before has a man like him come into this fort'. Lugh then, like Lleu, is young, brilliant, a sorcerer, a warrior, an all-skilled divinity of the type so esteemed in Celtic mythology. He is represented as being the divine father of the great hero Cu Chulainn (see CU CHULAINN); he aids him in battle, and when he is mortally wounded he sends him to sleep and heals his wounds with his magic herbs:

> When the young warrior was come up to Cu Chulainn he spoke to him, and condoled with him for the greatness of his labour and the length of time he had passed without sleep . . . "But I will bring you help" said the young warrior. "Who are you then?" asked Cu Chulainn. "Your father from the otherworld am I, even Lugh son of Ethliu . . ." Then it was that the warrior from the Sidh (an otherworld dwelling) laid plants and healing herbs from the Sidh fortress, and put a healing charm into the cuts and stabs, into the sores and gaping wounds of Cu Chulainn, so that Cu Chulainn recovered during his sleep . . .

On the Continent, as in Britain, there are various place names containing the name of this divinity. *Lugudunum*, for example, 'Fort of Lugus' (modern Lyons), where his great annual festival Lughnasa *(Lugnasad)* on 1 August was clearly replaced by the Festival of Augustus under Roman influence. The feast of Lughnasa has survived widely in the folk traditions of the Celtic world. Other names, such as *Luguvalium*, 'Strong in the god Lugus' (Carlisle), testify to the widespread popularity and influence of this pagan Celtic deity. The mythological stories of the early Irish literary tradition; the evidence of place names and inscriptions; the fragments of true mythology which underlie the international folktale elements in the mabinogi of *Math* – all these show that in the bright dynamic character of Lleu Skilful-Hand we have the genuine remains of a divine figure and of original cult legends; tales which commemorate the deeds and exploits of an early Celtic deity – a god of many skills, possessor of potent magic; a good wielder of weapons, a fine poet; a wise ruler, a good teller of tales.

Sometimes god, sometimes giant, a trickster and thief, Loki was primarily responsible for the death of the beautiful Balder

LOKI

THE AMBIVALENT CHARACTER of Loki – god or giant, jester or demon – presents one of the most tantalizing problems in Scandinavian mythology. Loki plays an important part in the myths. He carries out pranks which bring the gods into danger and then by his cunning rescues them again. He accompanies the great gods, Odin and Thor, on many enterprises and proves himself an accomplished shape-changer and master of duplicity. Finally, out of seemingly inexplicable malice, he causes the death of Balder and so opens the way to the catastrophe of the Twilight of the Gods.

There is no serious evidence that any cult of Loki ever existed in pagan Germany or Scandinavia, yet carved pictures of some of his doings survive on stones of the Viking Age in the British Isles. Possibly the darker side of his character has been influenced by the conception of the Christian Devil, and a menacing horned figure in bonds on a cross fragment from Kirkby Stephen in Westmorland could depict either Satan or Loki.

In the myths Loki is closely associated with the treasure of the gods. One story tells how he mischievously cut off the hair of Thor's wife Sif, and Thor would have killed him had he not found two cunning dwarfs to fashion new hair from real gold. The dwarfs also made a magic ship for Freyr and a spear for Odin. Then Loki set two other dwarfish craftsmen to compete with these smiths, wagering his head that such treasures could not be equalled. The second pair made the golden boar of Freyr and Odin's magic ring Draupnir, and finally began to forge a hammer for Thor (see HAMMER). Fearing he might lose his wager, Loki turned himself into a fly and tried to

Loki maliciously caused the death of Balder at the hands of the blind god Hoder, an act which opened the way to the final catastrophe of the Twilight of the Gods: from an MS in the Royal Library, Copenhagen

At a banquet given by Aegir, lord of the seas, Loki insulted all the gods and goddesses, and was driven out by Thor: a painting by Constantin Hansen

spoil the work, and as he stung the smith on the eyelid at a crucial moment, the hammer was left with too short a handle. Nevertheless the gods pronounced it the finest of all the treasures, and Loki only kept his head because he insisted his neck was not included in the wager and might not be touched; in the end they sewed his lips together instead.

Troublemaker of Asgard

When the giants try to steal the treasures of the gods, Loki is always involved. Once the giant Thjazi bore him off to the land of giants and only released him on condition that he brought him the golden apples which ensured the gods perpetual youth. Loki lured Idun, who guarded the fruit, out of Asgard and Thjazi bore her off with her apples, leaving the gods to grow old and wrinkled. Loki was threatened with death if he did not bring the apples back, so he flew to giantland in the form of a falcon, turned Idun into a nut and flew back, pursued by Thjazi in the form of an eagle. He reached the walls of Asgard just in time, and the gods set fire to a heap of shavings and singed Thjazi's wings, so that he fell into Asgard and was slain.

Another giant, Geirrod, captured Loki while he was journeying in falcon shape and starved him for three months until he promised to entice Thor to his abode without his hammer or belt of strength. Loki managed this but Thor was helped by a giantess who lent him her staff, another belt and iron gloves. Possibly Loki was also responsible for the theft of Thor's hammer by the giant Thrym. If so, he made amends, for he accompanied Thor, who was disguised as Freyja, on an expedition to retrieve the hammer and managed to allay all suspicions by his quick answers. There is also a tale of how Loki stole Freyja's necklace for Odin, turning himself into a flea and biting her as she slept so that it was possible to unclasp and remove the treasure.

On another occasion Loki brought Odin and Hoenir into danger when, with a well-aimed stone, he killed an otter eating a salmon by a waterfall. The otter was the son of Hreidmar in animal form, and Hreidmar seized and bound the gods and demanded as payment for his son's life sufficient gold to cover the otterskin completely. Loki was sent to find the gold, caught the dwarf Andvari swimming as a fish in the river, and forced him to surrender a great golden treasure in exchange for his release.

Loki helped the gods once more when a giant was building a marvellous horse, Svafilfari. The giant had been promised the goddess Freyja as his wife, with the sun and moon thrown in as extra payment, if he could finish the work in the course of one winter, and the gods became afraid that he would succeed and claim his reward. Then Loki turned himself into a mare and lured away the stallion, so that the giant could not fulfil the conditions and fell a victim to Thor's hammer. The result of Loki's encounter with Svafilfari was a wonderful foal with eight legs, and this became Odin's horse Sleipnir, who carried him on his journeys to the land of the dead.

Most of the Loki stories ended happily for the gods, with one important exception, the death of Balder (see BALDER). When the gods realized Loki's guilt, they resolved to kill him. He evaded them for a while in the form of a salmon, but Kvasir the wise found the shape of a burnt net among the ashes of Loki's hearth, reconstructed it and caught the salmon by its tail. The gods then bound him with the entrails of his son, beneath three flat stones. Above his head a snake dropped poison but his faithful wife Sigyn caught it in a bowl, and it is only when she goes to empty this that the writhings of Loki cause the earth to quake. He is doomed to lie thus until the end of the world, and in the account of what will happen at the destruction of the world Loki reappears to fight beside the giants and help to encompass the final overthrow of Asgard. A panel which seems to represent Loki in his bonds and Sigyn beside him with her bowl may be seen on the Gosforth Cross in Cumberland, a Viking monument of the 10th century. Thus behind the merry tales of Loki's pranks, there are more sombre associations with death and evil. He appears as a bitter-tongued troublemaker in the mythological poem *Lokasenna*, when he reviles all the gods and goddesses in turn, accusing them of stupidity, cowardice and

every kind of scandalous behaviour. Sometimes he appears as a terrible giant in the underworld, and his children are said to be the wolf who finally swallows up the sun, the world serpent who lurks in the depths of the sea, and Hel, the corpse-like queen of the realm of death. The picture of the bound Loki struggling in the depths of the earth resembles that of the bound giant in a series of myths and folk beliefs from the Caucasus, and possibly this particular myth may have been influenced by tales brought back by the Vikings from Russia and the Near East. This might explain the tradition about Utgard-Loki, the Loki of the Outer Regions, who in the Latin history of Saxo Grammaticus appears as a loathsome giant lying in a cavern surrounded by death and decay.

Many attempts have been made to explain the strange contradictions in Loki's character. It has been suggested that he was originally a fire god (*logi* means fire), or that he may be identified with a mysterious god Lodur who is mentioned among the deities who took part in the creation of mankind. Another more helpful suggestion is that he is an example of the trickster figure (see TRICKSTER) who is found, for instance, in the myths and folklore of the North American Indians. The trickster takes on animal form, and often becomes a female, as Loki does; he appears in many comic and disgusting situations, and plays many pranks, sometimes appearing as a mocking shadow of the creator god; he is also a culture hero who brings benefits to mankind. He is a popular character among storytellers, and many folktales are adapted so as to present him as the central figure. Dumezil believed that the figure of Loki as the arch-thief is an extremely ancient one, perhaps going back to Indo-European conceptions of the gods. Whatever his origin, Loki will be remembered as long as Norse myths continue to be told, above all for his part in Balder's death.

Lord of Misrule

Master of the revels, who presided over the festivities and buffoonery of the Christmas season in medieval times; in Scotland he was called the Abbot of Unreason; probably descended from the mock king of the Roman Saturnalia; the Bean King presided over the revels of Twelfth Night.

See BEAN; CHRISTMAS

Lorelei

Tall rock on the right bank of the Rhine, near St Goar in Germany, which is noted for its echo; also the name of the water nymph who haunts the rock, combing her hair and singing, to lure boatmen to death on the rocks below; invented in the 19th century, the story is best known from a poem by Heinrich Heine.

The belief that people of British stock are descended from the lost ten tribes of Israel is one of the theories based on the disappearance of these people after their deportation from Palestine in the 8th century BC

LOST TRIBES OF ISRAEL

THE PROBLEM of the whereabouts of the so-called 'lost tribes' of Israel has provoked much speculation which, in the light of biblical prophecy, has frequently taken a religious turn. The background of the problem is that on the death of Solomon, about 926 BC, his son Rehoboam succeeded to the throne of Israel. When the new king rejected demands for reform, the northern part of the country seceded and became a separate state under Jeroboam, the popular leader. Northerners and southerners were alike Israelites, claiming to be the chosen people of their God, but while the north appropriated the name of Israel, the southern kingdom, centred on Jerusalem, was known as Judah. Its people were the ancestors of the Jews: despite all migrations and intermarriage with Gentiles, the main body of the Jewish community everywhere is of Judahite descent, hence the word 'Judaism'. The 'lost tribes' are the descendants, or presumed descendants, of the northerners.

'Israel' first appears as an historical people in an Egyptian inscription dated between 1230 and 1215 BC. The Hebrew serfs depicted in Exodus had probably left Egypt under Rameses II, somewhere about 1280. At the time of the inscription they were gradually settling in Canaan. Moses had given them a loose unity by his own leadership and the cult of Yahweh, the Lord God, who had rescued them from bondage and promised them the land of Canaan.

The book of Genesis, which was compiled after centuries of reflection on these events, portrays Yahweh as the Supreme Being, and asserts the Israelites' descent from patriarchs who possessed the same country long before, with Yahweh's blessing.

The Twelve Tribes

There is no doubt that Israel began as a group of tribes, or that Genesis draws on credible traditions about their origin. The full number is always given as 12. However, the list of tribes with their territories is a little confused. Genesis (chapter 49) traces them back in semi-mythical style to the 12 sons of the patriarch Jacob or Israel, from whom they took their names: Reuben, Simeon, Levi, Judah, Zebulun, Issachar, Dan, Gad, Asher, Naphtali, Joseph and Benjamin. But the parcelling-out of Canaan described in the book of Joshua does not provide for a Joseph tribe but instead for two half-tribes, Manasseh and Ephraim, supposed to be descended from Joseph's two sons. The Levites are a priestly caste rather than a tribe, and live in all parts of the land.

After various changes, the tribe of Judah, which was at first small and perhaps rather heterogeneous, rose to supremacy in the south. It absorbed part of Simeon, and more or less annexed Benjamin. The southern bloc thus formed was always somewhat aloof from the north, and the strip of land between was debatable. David began his reign as king of the south only. When the north submitted to him, he was anointed separately. The split between north and south under his grandson Rehoboam was, to some extent, a return to the pre-Davidic state of affairs.

After the secession, the northern group of tribes counted as ten, the southern as two. The arithmetic was imprecise. Judah gave its name to the southern kingdom, and a recognizable Benjamin survived within this, as well as a Levite element. The southern Simeonites were no longer thought of as distinct. The north, the 'kingdom of Israel', claimed such Simeonite remnants as still maintained an identity, and most of the Levites, making up, with the other tribes, a total of eight-and-two-large-fractions, or (by courtesy) ten. Despite the discrepancy in number of tribes, the difference in size between the two kingdoms was not great.

Judah kept Jerusalem, the Davidic dynasty, the Temple, and the Ark of the Covenant which was housed there. It was a poorer, more rustic state than Israel, but less prone to disturbance, political or spiritual.

Michael Holford

In the 8th century BC the Assyrians invaded the kingdom of Israel, which had split away from the southern kingdom of Judah, and deported many of the inhabitants: this is the origin of the mystery of the 'lost tribes of Israel'. Details from reliefs in the British Museum, showing King Tiglath-Pileser III, one of the conquerors of Israel (*left*), and his captives being counted and taken away in carts (*right*)

The north was more sophisticated and open to pagan influence, as is shown in the story of Ahab and his defection to the worship of Baal. Also, as it lacked the Temple, its kings set up new shrines for Yahweh which never enjoyed the same prestige. In spite of its assumption of the sacred name 'Israel', and in spite of the zeal of its great prophet Elijah, the northern kingdom drifted into religious ambiguity. The Old Testament writers who record its history are of southern allegiance, and denounce even its Yahweh cult as semi-idolatrous. With every allowance made for their bias, it is clear that while paganizing tendencies were checked in Judah by prophets and reforming sovereigns, they made deep inroads among the tribes of the north.

Deported by the Assyrians

The disaster that befell them was therefore considered to be a divine judgement (2 Kings, chapter 17). In 734 Tiglath-Pileser III of Assyria invaded the northern kingdom, deported some of its people, and held on to part of its territory. The Judahites were his allies. After further upheavals the Assyrians besieged Samaria, the northern capital, which was taken and destroyed by Sargon II in 721. Following precedents set by his predecessors, he effected a mass transfer of populations.

This event is the point of origin of the 'lost tribes' problem. The Bible implies that all the northerners were deported. An Assyrian inscription gives the figure as 27,290, and although this may refer only to one instalment of several, it is unlikely that the conquerors emptied the country altogether. Probably they took away most of the Israelites who were concentrated in the larger inhabited places – the upper part of society, the dominant strata of all ten tribes – and left only a poor and disorganized peasantry.

They then refilled the area with colonists from Babylon and other cities. Racial and religious intermingling produced, in time, the hybrid Samaritan stock practising a debased version of the Israelite religion, which the Jews so deeply detested. The surviving strain of the ten tribes in the Samaritan populace dwindled steadily. Whatever pedigrees individuals might still claim, the northern tribal system was dead in its homeland. The topic which has engrossed so many minds, however, is the fate of Sargon's deportees, and the possibility that in some part of the world the northern tribes do still exist in much the same way as the southerners may be said to, because their Jewish descendants still maintain a collective identity which derives from them, however much it may have been spiritualized.

The Faithful Remnant

In 587 Judah suffered the same fate as the north. The Babylonians captured Jerusalem, destroyed the Temple, and carried off the upper stratum of the inhabitants. But these Israelites of Judah, sustained in exile by prophets and teachers, remained faithful to their religion. In 539 the Persian king Cyrus took Babylon and allowed them to return. Among the few who did, to build a new Temple in Jerusalem, were Zerubbabel, Ezra and Nehemiah. Jerusalem was again the religious headquarters, and the majority who did not return were still spiritually loyal to Zion, wherever they might be dispersed.

These heirs of Judah, inside and outside Palestine, were the original Jews. They produced the Old Testament in its present form. With the end of the northern kingdom and its confusing political use of the name 'Israel', this name could revert to its true sense of the chosen people. The Jews were the faithful remnant who inherited the Lord's promises. From the 5th century BC onward, they were 'Israel', and apart from a few ambiguous phrases, there is no biblical indication that anybody else was. The Israel of Malachi, one of the last books of the Old Testament to be written, is the Jewish community and the same usage occurs in the New Testament.

The Jews who restored Jerusalem under Persian protection were willing to accept the surviving Yahweh-worshippers of the south back into the fold (Ezra 6.21). But they refused to accept the hybrid northerners, despite their Israelite blood; the northerners, in their view, were all condemned by the ancestral paganization and rejected by the Lord. Samaria was thus driven into permanent schism. The Jews considered themselves to have become the true representatives of all the 12 tribes (Ezra 6.17).

Some of them seem to have allowed, eventually, that if Jews intermarried with people of northern ancestry, the descendants could count as belonging to whichever northern tribe was concerned. This at least is the simplest explanation of the reference in Luke (2.36), where the Jewish prophetess Anna is 'of the tribe of Asher'. An implication that the Jewish community may contain vestiges of all the tribes, and certainly represents them all spiritually, reappears in the Epistle of James (1.1). Jesus refers to the 12 tribes in Matthew (19.28). When he speaks of his ministry to the 'lost sheep of the house of Israel' (15.24) he may be referring to people of Israelite antecedents, in or out of Samaria, who have lost touch with the faith which should be theirs.

At all events there is no reason to think, as some theorists do, that the reference is to the northerners deported in 721 BC, or that Jesus knew where these 'lost tribes' lingered on and contemplated a mission to them. It is first necessary to grasp what

conclusions the Jews did reach about their fate. The Assyrians 'placed them in Halah, and on the Habor, the river of Gozan, and in the cities of the Medes', according to 2 Kings, 17.6; the author says they are there 'until this day', that is, the date of writing. In other words the deported ten tribes still had a recognized identity in the 6th century BC, when 2 Kings was composed, and were living at the time in Mesopotamia and Persia.

The Jewish historian Josephus, in the 1st century AD, speaks of the ten tribes as somewhere east of the Euphrates River. He does not seem to regard them as lost; they are 'an immense multitude' dwelling beyond the Roman frontier. The apocryphal book 2 Esdras, a little later, gives a story of the tribes wandering on past the Euphrates into a region called Arzareth. Arzareth, however, is not the name of a real location but is taken from two Hebrew words meaning 'another land' (Deuteronomy 29.28).

The Talmud which, after Scripture itself, is the foundation of orthodox Judaism, preserves an obscure hope that the missing tribes will at last be found, purified, and re-grafted to the faithful Judahite stock in the Promised Land. But the rabbis are not so rash as to speculate in detail. The lost tribes are generally ignored, or rather left to God. In some sense they still have a separate existence and are still ten, and that is all we can say.

Jewish tradition adds a few further stories. One concerns a man named Eldad, who turned up in medieval Europe and allegedly belonged to the tribe of Dan. No one was certain who he was or where he came from. There is also a legend of a River Sambatyon, and a secret fastness beyond, where the tribes are hidden. Sabbatai Zevi, who claimed to be the Messiah in the 1660s, was expected to fetch them home to Jerusalem. He failed to do so. Here the Jewish trail ends.

The speculative quest for the lost tribes is a non-Jewish phenomenon, and sometimes vocally anti-Jewish. A recurrent idea is that the Jews have disguised the truth in an attempt to monopolize the divine blessings, and that in reality they themselves are the apostates (more or less), while some other nation is the true Israel of God.

The British Israelites

Ethnologists, in general, deny that the lost tribes could still be a distinctive grouping at all. The deportees must long since have been absorbed by other nations. Some, as noted, may have intermarried with Jews of the dispersion and thus re-entered the continuing Israelite body. Probably far more intermarried with Gentiles. The northerners as a whole never attained the elaborate and stubborn religious identity which preserved the Jews. Intermarriage must almost always have ended distinctiveness after a very few generations. It is possible that a few so-called Jewish communities in Kurdistan and the Caucasus are of northern Israelite descent. But even if they are, they do not constitute a people.

The least fantastic of the theories which profess to locate the lost tribes asserts that the Afghans are Israelites. A claim has been advanced for the Japanese, and study of the American Indians has prompted several fancies on the same lines. The tribes are supposed to have crossed the Bering Strait on the ice and marched southward. Curiously enough, one of the most valuable pioneer works on ancient Mexico was produced by Lord Kingsborough in an effort to prove this thesis.

Most famous of all is the British Israel doctrine. It declares that the exiles wandered through Europe and settled in the British Isles. They became totally paganized on the way, but were converted to Christianity in their new home, and have since proved their character as the chosen of God by taking a lead in the Reformation.

Most of the ethnological and philological arguments employed to support such notions are flimsy in the extreme. We are told, for instance, that 'British' is the Hebrew *b'rit'ish*, meaning 'Covenant Man'. The historical arguments are seldom much better. But the near-worthlessness of the facts adduced is not always fatal to the case. Often these are regarded, not as the evidence at all, but merely as checks or verifications of a belief to be held on other grounds.

British Israelites do not claim that the British people are the lost tribes *because of* the legends and alleged linguistic coincidences which are cited in support of that view. Their starting-point is the Bible, read in a fundamentalist spirit. The prophets foretell various things about Israel which have not been fulfilled in the Jews: that God's people will be powerful, that they will be 'a nation and a company of nations', and so forth. Also, a few passages (notably Ezekiel 36.15–25) certainly seem to keep up the distinction between Israel and Judah after the exile of both, and to foreshadow a final return and reunion.

God's Promises

Fundamentalists refuse to admit that an inspired prophecy can ever be conditional unless it is explicitly stated to be so. Nor do they acknowledge that different inspired writers can use terms in different senses. The outcome here is a logic which runs as follows: firstly, that God's promises must be literally fulfilled; secondly, that they have not been fulfilled in the Jews and, in fact, never can be entirely fulfilled unless there is an Israel distinct from Judah, which must therefore exist; thirdly, that this Israel must still be what it was when the distinction arose, that is, the complete northern tribal system; fourthly, that the prophesied reunion with Judah has not yet happened, and finally, therefore, that the complete northern tribal system must still exist somewhere as a distinct entity, destined sooner or later to be revealed and – presumably – to win the allegiance of the more enlightened Jews.

The British Israelite, or any other theorist

Four knights hold banners with the emblems of four of the 12 Jewish tribes, the lion of Judah, the eagle of Reuben, the bull of Ephraim and the serpent of Dan: from a German Pentateuch, 14th century. The British, Afghans, Japanese and American Indians have all been claimed as the descendants of the 'lost tribes'

who thinks on these lines, feels no obligation to produce scholarly proofs that the lost tribes exist. He already knows that they do because, on biblical grounds, they must. Their reality is an axiom, not a conclusion. His non-biblical arguments are offered mainly as indications confirming the belief he already holds.

While the British Empire endured, the prophetic part of the British Israel theory had a certain force. It was at its strongest after 1917, when Britain took charge of the Holy Land and sponsored Jewish settlement. In that context, the accession of Edward VIII, known to his intimates as David, looked like a fulfilment of the prophecy in Ezekiel (37.24). But while a case could be made out for the Empire being Israel in some symbolic sense, the case for literal ethnic links with the lost tribes could not be sustained. It was altogether too complicated. Celtic Britons, Scots, Anglo-Saxons, Danes, all had to be Israelites of the northern branch. So the Welsh national designation 'Cymry' was equated with 'Cimmerians', the Saxons were alleged to have been 'Sacae' or Scythians, and the Cimmerians and Scythians were then said to have been identical with each other and with northern Israel.

The theory was handicapped further by prejudiced views on the history of the Church, and by entanglement with such aberrations as pyramidology. After 1936 it slowly declined. Its solid appeal lay in the public events which seemed to bear out some of the prophecies. In the post-imperial age, the absence of any such apparent fulfilments reduces the lost tribes to a theme of speculation only.

Throwing dice or coins, or selecting a biblical verse with a pin are seemingly random operations, but the patterns of chance may be subject to occult laws which as yet we can only guess at; the drawing of lots may be a method of unveiling wisdom concealed deep in man's unconscious

LOTS

THE DIVINERS OF ANTIQUITY believed in the possibility of predicting good or ill fortune. The materialist may scoff but there are many in the West today, and far more in the East, who do not for a moment doubt it, provided certain techniques are mastered and applied. Among the many methods for discovering what the future holds and the answers to the vast number of problems set by the human condition is the time-honoured one of casting lots, a word derived from the Anglo-Saxon, *hlot*. Known as astragalomancy or astragyromancy, this method is supposed, rightly or wrongly, to make clear to man the designs of providence, the will of the gods, the decrees of fate. And by this seemingly chancy proceeding disputes may be settled, decisions arrived at and forthcoming periods – propitious or the reverse – illumined.

The objects used in casting are dice, dominoes or tiddlywinks, coins that bear a different image on either side or pairs of knucklebones. In addition, many other small objects with or without distinguishing marks or symbols on them may be used, such as coloured marbles, glass beads, pebbles or precious stones (cleromancy; lithomancy). They are shaken or mixed in an urn or similar receptacle, from which one or more may be drawn or thrown on the ground at random. Arrows, sticks, rods, discs or plates can serve the same purpose.

The meaning of the number, colour, shape, symbol or marking is interpreted by a seer, or with the help of works such as the Chinese I Ching in which these numbers and symbols are equated with written 'answers' or predictions (see I CHING). The gift of clairvoyance of course gives a deeper interpretation than the written word.

A modern method of divination from dice, which is not intended to be taken too seriously, is shown in the diagram. Choose a question from the list, or make up a question of your own. Concentrate on it while shaking two dice and throwing them within a circle that has been traced on the top of a table. Add the two numbers revealed. Then throw again, adding these numbers to the former. With this total consult the list of answers (see diagram).

String of Destiny

The Greeks used verses taken from the *Iliad* and the *Odyssey*, while the Romans preferred to take theirs from Virgil. Such verses were inscribed on a number of discs which were strung together, called *sortes* (from the Latin *serere*, to string). Their popularity led to the title Sors being added to the many names bestowed upon the goddess Fortuna. At the famous oracular centre of Praeneste, the sortes were inscribed upon tablets carved from sacred oak trees and housed in a chest or ark made of hallowed olive wood. To ascertain the ruling of the presiding deity the inquirer received a tablet drawn from this chest by an acolyte, which could only be done on certain days of the year. The prophetic words found upon the tablet were then made clear or interpreted by a learned and pious priest. If the prediction proved to be favourable and was eventually fulfilled, it was the custom for the satisfied inquirer to present a votive offering to the temple of the goddess. Later, in Imperial Rome, the Virgilian Sortes of the Latin augurs were one of the most renowned and successful methods employed to discover the decrees of fate for man.

With the official establishment of Christianity, the words of Virgil were replaced by verses taken from the Gospels. The method, the Sortes Sanctorum, was to open the gospels at random and prick the page with a pin, with the eyes shut or blindfolded. The text upon which the pin alighted revealed the answer to the question posed. After the Reformation, Protestants made use of both the Old and the New Testaments for this purpose.

References in the Old Testament to the casting of lots are numerous. In Leviticus (chapter 16) Aaron is commanded by God to take two goats to the door of the Tabernacle and cast lots upon them. One lot was for the Lord and the goat upon whom it fell

Destiny From the Dice

A simple method of divination from dice. Choose a question from the list below (or make up one of your own). Concentrate on it while shaking two dice and throwing them in a circle traced on a table. Add the two numbers shown, throw again, and add the second total to the first. With the combined total consult the list of answers

QUESTIONS

Shall I fall in love?
Will happiness be mine?
Will danger threaten?
Will I find what is lost?
Shall I gain my wish?
Will I be successful?
Will the debts be paid?
Is good fortune on the way?
Will I get the expected letter?
Must I wait for bad news?
Must I wait for good news?
Will I be found out?
Am I being betrayed?
Shall I try another profession?
Does my beloved love me?
Should I go to law?
Can I trust my colleagues?
Should I move house?
Will I go on a journey?
Am I to be married soon?
Will I love more than once?
Will I make him/her happy?
Will I be rich?
Will I have children?

ANSWERS

4 Yes, if you are unselfish
5 No, if you are not prudent
6 Yes, think of trees and gardens
7 Yes, if you rely on yourself
8 Yes, if you co-operate
9 Yes, if you seek only the best
10 No, if you make difficulties
11 Chance it
12 If you are sincere
13 Only if you distrust words
14 Of course, but make sure to conquer
15 Only if you insist
16 If you are yourself
17 Of course
18 If you work hard
19 Await a message
20 Only if you are very discreet
21 Not if you refuse to take risks
22 Certainly, but change your habits
23 In an unlikely place or an unlikely way
24 No, unless you are charitable

would be the sacrifice; the other concerned the sins of the people and the goat upon whom it fell would be the scapegoat and be driven out into the wilderness as an atonement. We are not told how these lots were marked nor exactly how they were thrown. And in Proverbs it is made clear that it was the Lord who guided this method of choice: 'The lot is cast into the lap; but the decision is wholly from the Lord' (Proverbs 16.33).

In the New Testament, the Roman soldiers standing at the foot of the cross parted the garments of Jesus among them by casting lots, thus fulfilling the words of the prophet, 'They parted my garments among them, and for my clothing they cast lots' (John 19.24). When the place of Judas as an apostle had to be filled by another, Joseph Barsabbas and Matthias seemed the most likely candidates and lots were cast as to which of the two was the one chosen by God the lot fell to Matthias, who was from then on numbered among the apostles (Acts 1.16).

In the *Nihongi*, the Japanese cosmological 'bible', it is recounted how certain discontented princes in the year 658 AD sought to divine the future of their treasonous plans by drawing slips of paper that had been magically inscribed. Such a proceeding followed intoned incantations and the making of offerings to the appropriate spirits. That most ancient of mysterious books, the I Ching, shows what an important place divination by lots played – and still plays – in China and all over the Far East. Taking this book as the foundation for his divinatory art, the celebrated medieval Japanese seer Taka Shima Kaemon made prognostications with far-reaching and astonishingly accurate results. In Japan he is still held in high esteem, and many a modern politician or business man there consults those sages who carry on the tradition said to be transmitted from him, through his successors, to this day. Originally the I Ching method consisted of drawing long and short yarrow stalks from a cylinder or other receptacle; this has largely been replaced by the throwing of coins, much as we toss pennies, calling 'heads or tails?'

Meaning of Coincidence

To seek to understand the supposed value of decisions or predictions arrived at by the casting of lots and kindred methods of divination, it is necessary to abandon the largely Western theory of causality and to embrace what C. G. Jung (see JUNG) spoke of as 'synchronicity'. Cause and effect express the evolutionary aspect of both physical and psychological phenomena, while synchronicity stresses the random, the variant, the unique. All quartz crystals are found to be hexagonal in form, but no two of these crystals are exactly alike. The hexagonal is the ideal form, but nevertheless in actuality there are variants, however minute. The leaves of an oak tree may be classified at a glance as oak leaves, yet no one is identical with another; and similarly with fingerprints.

Today physicists unveil the deviants in the scientifically generalized patteru while

Axel Poignant

Our ancestors believed that casting a 'lot', which might be any small object, could reveal the future and the will of the gods, but a lottery has become a mere game of chance: lottery ticket seller in Spain

the seer finds truth through chance happenings. Meditating upon the changing face of Nature, its devious behaviour, the seer finds seemingly nonsensical details significant. The flight of birds, the fall of a twig, a sudden movement upon the tranquil surface of a pool – such chance happenings hold profound intimations for the visionary. Their supposed messages need only to be interpreted and for this task there is an inborn gift as well as a discipline. So it is with the fall of dice or the shaking of yarrow stalks. The movement or change taking place in a particular moment of time has for the believer a lasting significance; it is the writing on the wall if we are able to read it. If the prophetic words come true the incredulous will speak of coincidence, but this very coincidence is a truth that exists outside time and space yet impinges upon the space-time continuum according to as yet hardly surmised laws. The dangerous rocks of superstition may be circumnavigated if such revelations are submitted to a thorough psychological analysis. For there is more than one meaning hidden in a prognostication; oracles speak with many tongues.

Synchronicity, as explained by many Jungians, is an attitude towards Nature diametrically opposed to that of causality, although a reconciliation along parallel lines is not impossible, as some advanced physicists will admit. Causality explains how events expand one from another, present facts being determined by those of the past as demonstrated by Freud's assertion that the psychoneuroses have their origins in the infant's situation within the family, or Darwin's theory concerning the evolution of the species.

The hypothesis of synchronicity makes use of the coincidences of the non-rational as defining the present as well as indicating future tendencies or rhythms; These are seen as flux or change and are popularly called chance, fate or destiny – the lot of the individual and the pattern of an unfolding and infolding Nature, the rhythmical heart-beat of life. Thus separate things occurring simultaneously in the present, if studied by a seer, can be used for predicting the future.

Wisdom of the Unconscious

The dangers of making deductions from synchronicity as the term is being used here, and acting accordingly, are obviously great. Man's mental growth in the direction of rational thought and behaviour is still far from reaching perfection and is constantly threatened by a break-through from the more powerful irrational impulses. It is hard to believe that the wisest and noblest men of every civilization have allowed for, and often relied on, the lottery of synchronitic analogies and simultaneous parallels. Perhaps it is in the realms of unconscious or superconscious mind potentials that some explanation must be sought. Should this be true, the submerged areas of the mind must be supposed to extend beyond the normal conscious range of the individual, having the power of an 'oversoul' or group mind with a psychic vision greater than the normal, and being able to operate with the mechanism of association which utilizes random occurrences, such as the fall of dice, as a kind of alphabet spelling out symbolically directions of which the unconscious is already aware, that is to say the direction in which the life pattern is flowing. Those born or trained to catch intuitively such symbol-messages should therefore be able to make us cognizant of solutions to problems, the answers to questions and future trends. After all, dream interpretation, that time-honoured divinatory and therapeutic method, is now held to be the royal road to the unconscious as well as its safety valve. The dream has been reinstated medically and treated with respect by mental specialists. Who knows but that divination by casting lots is not another method for unveiling the deeper wisdom concealed in the extraordinary complexities of the human unconscious?

LOTUS

RICHEST IN SYMBOLISM of all the flowers of the orient, the lotus has a vast range and subtle variety of meanings in religion, philosophy, mythology and art, particularly in India, China and Egypt. In essence it signifies the female principle of life, from which stems fertility, prosperity, creation itself; and also enlightenment, immortality and resurrection.

The sacred lotus which occurs in mythology is the great white water-lily, *Nymphaea lotus*, native to Africa. This is a fragrant, night-flowering species with blooms up to 10 inches in diameter. A variety with much smaller flowers extends the range across India as far as Australia. There is also a blue-flowered African species, *Nymphaea caerulea*, which appears particularly in Egyptian representations.

The so-called Indian lotus, *Nelumbium speciosum*, is a very handsome plant having platter-like leaves each with a central stalk, and a large, globular pink flower held well out of the water, to be followed by a fascinating cone-shaped seed vessel. Although now regarded in India as a holy plant, it is evident from carvings and paintings that the original sacred lotus there was also the white water-lily.

The association of the water-lily with the life-giving Nile made it one of Egypt's many sacred objects, standing for fertility and resurrection. It was used in funeral rites and was among the commonest votive offerings, many tomb paintings showing it tied to the pillars of a shrine or house. It became part of social ceremony: at any gathering each guest would be presented with a lotus flower; special guests might have a necklace of the blooms, and stems were fixed to head-dresses in such a way that the flower hung down in the centre of the forehead. Lotuses also played an important part in the general decorations.

The white water-lily of Africa was the sacred lotus of ancient Egypt, a symbol of fertility and resurrection because of its connection with the life-giving river Nile. It was used in funeral rites and offered to the gods, here to the lion-headed goddess Sekhmet

British Museum

Osiris, god of the underworld, is usually represented as wearing a crown of lotus blooms, while Horus, in his aspect of god of silence, sits on a flower, Buddha-like, his fingers to his lips. In Egyptian mythology the water-lily represented the newly-created earth, seen in the form of the flower floating on the water, enshrining the mysterious secrets of the gods.

The flower was equally sacred to the sun: an association due partly to its ray-like petals. Statues of divinities sometimes carry a lotus sceptre in each hand, and the flower was often placed on the mummies of women, where it ensured their purification and re-birth. With other flowers, those of water-lilies were often placed in sarcophagi; the mummy of Rameses II, for instance, was associated with the blue lotus.

The Cosmic Flower

Conventionalized, the water-lily produced in architecture the well-known lotus bud and flower capitals of Egyptian pillars and formed the basis of many stylized patterns. These were transmuted by the Assyrians and other Near Eastern peoples, and it has been suggested that the lotus is the basis of the Assyrian sacred tree. From Egyptian capitals the lotus theme was taken up by the Phoenicians and became part of the Greek Ionic style. In Greece a multitude of patterns were developed from it, which are found also in India and in Etruscan and Roman art, the latter handing on themes into Byzantine, Romanesque and indeed all later decorative art; truly a remarkable example of the water-lily's symbolic regenerative powers.

In Hindu mythology the lotus represents the female life principle, and is the symbol of the *yoni* or female generative organs. When the lingam or sacred phallus is depicted, it is often shown resting on or surrounded by lotus petals. The earliest representation of the lotus in art is found among the flowers adorning the head of a statue of an Earth Mother figure (c 3000 BC) discovered at Mohenjo-Daro in the Indus valley. Such a fertility goddess appears later as Lakshmi, the consort of Vishnu, who emerged out of a lotus which sprang from his forehead: she is known also as Padma (lotus). In the form of Kali, she holds the lotus symbol of regeneration in one hand.

In Hindu creation mythology the spirit of the Supreme Being was personified by a golden lotus on a great sea. From Vishnu, the 'lotus-navelled', issued a lotus on which sat Brahma, the 'lotus-born' Creator. The lotus expanded into the universe, and from its petals arose the mountains and rivers. Buddha was associated with this flower at his birth, and it was his symbol, topped by a trident representing the sun. From this mythology of creation is obtained the familiar prayer and incantation, inscribed millions of times upon prayer-flags and prayer-wheels, 'O, the Jewel in the Lotus'.

Chinese Buddhists believed in a 'western heaven' where, in a sacred lake of lotuses, the souls of the dead await admittance to paradise in lotus buds. Each soul rests in its bud until the time appointed for its opening; the plant flourishes or wilts in accordance with the piety of the individual soul during its earthly existence. A pure soul, belonging to a truly devout man, will be released from the bud immediately into the divine presence. In China, the lotus was more especially the emblem of purity, because it is not of the earth but rises spotless and immaculate from the waters.

The Lotus-Eaters

The lotus which brought forgetfulness to the Lotus-eaters of Greek legend is a small tree of the buckthorn family, *Zizyphus lotus*, found all round the Mediterranean. The fruits of this tree were, and still are, used for food and can be made into a kind of bread. It was once an important item in the diet of the poor and the word *lotophagi*, lotus-eaters, became synonymous with poverty – a reality considerably less attractive than the myth.

In the richly significant gestures of the Hindu dance, the lotus is a recurring symbol, and in yoga the *chakras* or centres of super-physical energy are known as the six lotuses, the seventh or supreme chakra, the *sahasrara*, being the thousand-petalled lotus. The flower is linked with the heraldic rose of England in the collar of the Order of the Star of India, where it alternates with the rose and palm. In the language of flowers the lotus represents eloquence; the flower alone, estranged love, and the leaf, recantation.

Loudun Nuns

Nuns of an Ursuline convent at Loudun in France, scene of the most famous case of alleged demonic possession in European history: a priest named Urbain Grandier was accused of bewitching the Mother Superior and other nuns, was found guilty and after appalling torture was burned alive in 1634.

The home of Bernadette Soubirous, the young French girl who experienced visions in which she spoke with a 'Lady' who revealed to her a miraculous spring, is now the greatest centre of pilgrimage in the Roman Catholic world

LOURDES

PILGRIMS SEEKING to pay devotion to our Lady of Lourdes and suppliants hoping for relief from their ailments are among the two million annual visitors to this city. Lourdes, in the department of Hautes Pyrenées in the old French province of Bigorre, has a population of 16,000, 414 hotels and 450 souvenir shops. Industry apart from tourism is represented by slate and marble quarries. The greatest centre of pilgrimage in the Catholic world, Lourdes owes its celebrity to the apparitions seen in the Grotto of Massabielle in 1858 by Marie-Bernarde Soubirous (1844–1879) who was canonized as St Bernadette in 1933. The principal pilgrimages are on 11 February (Feast of the Apparitions of Our Lady of Lourdes), 25 March (Feast of the Annunciation), 18 to 25 August (the National Pilgrimage) and 8 December (Feast of the Immaculate Conception), when huge crowds take part in the ceremonial processions by day and night.

The curative powers of the mineral and thermal springs of the Pyrenees have been famed since Roman times, and the healing Madonnas of various towns in Bigorre have enjoyed local repute. But in 1858 Lourdes (population then about 4000) possessed neither healing shrines nor waters. The town was confined to the area east of the River Gave de Pau and south of a smaller stream, the Lapaca, which joins the Gave from the east. At the junction of the Gave and the Lapaca (the present Bridge of

St Bernadette's visions of the Virgin Mary transformed the small town of Lourdes into the greatest centre of pilgrimage in the Roman Catholic world: the spring which miraculously appeared in the barren floor of the grotto is believed to be healing water, capable of curing even the hopelessly crippled *Above right* and *right* Pilgrims at Lourdes

***The Vision* at Lourdes: Bernadette first saw 'the Lady' in 1858. 'She was wearing a white dress and a blue sash and a yellow rose on each foot . . .'**

the Grotto) the Gave abruptly changes its north-to-south course. Turning sharply to the left it flows from east to west between the Ribère meadows to the south and a hill to the north which is now called the Mont du Calvaire and is surmounted by a Calvary (a representation of the Crucifixion). In 1858 a millstream known as the Savy cut off a triangle (the Ile du Chalet) from the bend in the Gave, which it rejoined just beyond a spur of the Calvaire Hill. The spur is called Massabielle (*masse vieille*, old rock). The Grotto of Massabielle was then a rather shallow and boulder-strewn cavern with a floor of sand and earth accessible by wading across the Savy or by a rough steep path winding over the Massabielle and reaching the cavern from the west.

The Savy is now underground and the Gave diverted to allow the construction of the Esplanade of the Grotto, a broad promenade capable of accommodating hundreds of visitors on foot or in wheelchairs. Communion may be taken at the altar in the Grotto. The spring discovered by Bernadette is piped to the Baths further along the Esplanade, where the pilgrim can be immersed in hope of a cure or merely as a form of devotion.

'I Saw a Lady'

Bernadette, the eldest child of François Soubirous of Boly Mill on the Laca, suffered from indifferent health and was asthmatical from the age of six. The family had been reduced to living in the worst accommodation in Lourdes, the so-called Cachot, a part of the old prison in the Rue des Petits Fosses. In 1858 Bernadette returned to Lourdes from a stay of some months at the village of Bartres. At that time she was illiterate and spoke not French but Bigourdian, the dialect of Bigorre. Her character appears to have had an earnest side which was masked by the gaiety of her outward disposition. According to the Curé of Bartres, although she found it hard to learn her catechism by rote she was very attentive, devout and unassuming. It is difficult to

assess how much she knew about the dogma of the Immaculate Conception of the Virgin Mary which had been proclaimed by Pope Pius IX in 1854 after a referendum of the higher clergy, or whether she had heard of the apparition of the Virgin to two children at La Salette near Grenoble in 1846.

On 11 February 1858 Bernadette, her sister 'Toinette' and a friend were gathering firewood when they came to the bank of the Savy opposite to the grotto. Her companions ran through the stream but Bernadette stopped to take off her shoes, and at that moment occurred the first of her mystical experiences at Massabielle. Only in 1861 did she become literate enough to put it in writing, but throughout the affair she had never changed or elaborated her story; one of the facts which generated complete confidence in her honesty. Bernadette wrote: 'I heard a noise . . . I saw the trees were not moving at all, I . . . looked at the grotto. I saw a lady . . . she was wearing a white dress and a blue sash and a yellow Rose on each (bare) foot the colour of the chain of her rosary; when I saw that I rubbed my eyes, I thought I was seeing things, I put my hand in my pocket, I found my rosary in it, I wanted to get my hand up to my forehead, it fell back, the vision made the sign of the cross, then my hand shook. . . . when I had finished my rosary, the vision disappeared all of a sudden.'

Though Bernadette's first feelings were of surprise and awe, she keenly desired to see the Lady again. In the course of 18 subsequent visits the apparition appeared to her on all occasions save one. As the news spread, Bernadette was accompanied by increasing numbers of spectators amounting at the end to several thousands. The great majority of the spectators saw only Bernadette in prayer or apparently conversing with an invisible companion. A few claimed to have seen the Virgin themselves but even those Catholic scholars and scientists who accepted the supernatural origin of Bernadette's visions tended to reject these other visionaries as fraudulent or self-deluding.

The Miraculous Spring

Throughout the affair Bernadette treated the matter as essentially a private one. She sought for no publicity and gave matter-of-fact and down-to-earth replies to the numerous interrogations she had to undergo. Within a few days a number of respectable citizens were convinced of her honesty and tended to believe that the apparition was perhaps supernatural. Great interest attached therefore to the 'Lady's' identity. At first Bernadette referred to her merely as 'Acquerò' – she, 'that', or 'that one'. Later she called her 'the Lady'. From Bernadette's descriptions the Lady resembled a girl of Bernadette's own age, 14, with a manner that was happy and gay. Simply attired, this apparition differed in style from the regal and splendidly dressed Madonnas of earlier French visionaries. On the third visit, acting on instructions, Bernadette asked Acquerò to write down her name, and received the spoken reply, 'That isn't necessary. Will you be kind enough to come here for a fortnight.' When Bernadette assented she was told, 'I don't promise to make you happy in this world but in the next.' As usual in 19th century France, matters stood delicately between Church and State, and to visit the grotto Bernadette ignored an order by the police to keep away; the only instance of disobedience in her entire life. At the seventh appearance the Lady revealed three secrets to Bernadette with the words 'I forbid you to repeat this to anyone'. The secrets, doubtless personal to Bernadette, were never revealed.

On later visits Acquerò enjoined penitence and prayer on behalf of sinners and told Bernadette to 'Go and drink at the spring and wash in it.' The observers were mystified when Bernadette began to scratch at the floor of the grotto. But water seeped into the hole she had made. Such was the advent of the miraculous spring which now yields good quality drinking water, neither thermal nor mineral, to the quantity of some 9000 gallons a day. Pilgrims began collecting it in bottles within a few days and soon the first cures were being claimed. 'Go and tell the priests that people are to come here in procession . . . and have a chapel built here,' said Acquerò. When Bernadette reported this to the Curé of Lourdes, who was suspicious and uneasy, he gruffly demanded that the Lady give her name if she wanted a chapel. On the next visit, Acquerò, after twice failing to answer, said in the Bigourdian dialect: '*Que soy er Immaculate Conceptiou*' (I am the Immaculate Conception), the words now inscribed beneath her statue in the grotto.

The Seventeenth Apparition

April 7, Wednesday. Bernardette, under pressure of inner prompting since noon the previous day, arrived at the Grotto at 5 a.m. The news that she would be going had travelled the town the night before, and several hundred people were already present, and possibly as many as 1,000 by the time the apparition was over. She had brought with her a thick votive candle. . . . With this candle burning before her, steadied by her hands and with its butt resting on the ground, Bernardette began reciting the rosary. The arrival of Dr. Dozous . . . caused a disturbance. He pushed his way close to the visionary, but refused to remove his hat. To the objections of the devotees, he retorted that he had no intention of catching a cold in the head. Bernardette fell into ecstasy. After about half an hour, people noticed that something very queer was happening to the candle. Bernardette was still supporting it between her palms and sheltering the guttering flame with her fingers against the draughts. The flame appeared to be licking her fingers, licking between them, scorching them. . . The crowd acclaimed a miracle then fell silent. Bernardette, undisturbed by the commotion, moved into the Grotto to conclude her conversation with Acquerò. The ecstasy in all lasted nearly an hour. As soon as it was over, Dozous grabbed Bernardette's hands, scrutinized them for burns, found nothing the matter with them, and proclaimed himself converted.

Alan Neame *The Happening at Lourdes*

The Curé was startled by this somewhat abstract description and puzzled by the fact that Bernadette clearly had no conscious notion of the meaning of the phrase.

Officially Sanctioned

At the end of the fortnight Bernadette said farewell to Acquerò in the belief that she would not see her again in this life. The police banned the grotto to the public but the interdict was withdrawn on orders from Paris after a visit by the celebrated Catholic journalist Louis Veuillot and the governess of the Prince Imperial. The Curé vetoed a suggestion by the civil authorities that Bernadette be detained for treatment at a sanatorium. After an episcopal enquiry the devotion already instituted by the faithful was approved and in 1862 a Commission judged that 'Mary the Immaculate Mother of God did truly appear to Bernadette Soubirous.'

Whether the Virgin Mary did converse with Bernadette at Massabielle is a question that evades logical or scientific decision and will continue to do so. Although we need not accept, neither can we positively deny the possibility that Bernadette's visions were only elaborate hallucinations conjured unintentionally from the depths of her own soul. It may be that Acquerò was only a 'psychological projection', an involuntary attempt to find a heart in a heartless world. Even so there is an affecting and poetic simplicity about Acquerò, and perhaps 'That one' represents some profound and true intuition of reality revealed to babes but hidden from the wise and prudent.

After Acquerò's leave-taking Bernadette attended, first as a day-scholar and then as a boarder, the school which now bears her name, the Hospice of the Sisters of Charity. In 1866 after two serious illnesses she sought of her own volition to become a nun. The conventual authorities had their misgivings about her both as a 'visionary' and as a potential physical invalid. But she was accepted at the mother-house of the Hospice, the Convent of Saint Gildard at Nevers, 300 miles away on the Loire. Here, in 1879, she died after an exemplary life and prolonged physical suffering, without ever visiting Lourdes again. She had wept bitterly when in 1866 she saw the grotto for the last time and spoke of it as her heaven on earth. Whether on her deathbed she saw Acquerò again is unknown. Saint Gildard is now itself a notable place of pilgrimage and cures are achieved at the sepulchre of Bernadette, who was exhumed incorrupt in 1925. The cures, whether at Saint Gildard or at Lourdes, fall into the general pattern of 'faith healing' and there is nothing to suggest that they are any more or less miraculous than the general run of faith cures.

LOVE MAGIC

In the same spirit that our forefathers ate periwinkles mixed with earthworms, there are still people today who eat oysters hoping that it will improve their love-making; from the desire to bind the loved one ever more closely, men and women have resorted to bizarre and often dangerous magical practices

OF THE TWO distinct types of love magic, the first is the collective or general charm or medicine which allegedly 'works' on anyone, and which is selected because of its distinctive appearance, shape or taste, or easily recognizable symbolism. This type, composed of various ingredients, may be provocative of heat or shaped in the likeness of the male or female sexual organs. The second type is the specially adapted and individual charm, the use of which is based upon the assumption that a state of love can be transmitted by magic from one individual to another. This second type incorporates the exchange of locks of hair, nail-parings and blood, but more often some personal object which has been endowed with magical qualities by a witch or wizard. The personal charm has always been considered to be far more effective than the more general type, since it is supposed to exert a direct influence upon the one who is to be charmed.

The choice of the symbols or objects used in love magic has varied according to culture or individual circumstances. In ancient India, for example, human beings were believed to be the offspring of trees, the sap of which was in consequence thought to assist procreation. The testicles of humans and animals have been in high demand as love stimulants at various times, as have vegetables whose shapes have suggested the male or female genitals, two examples being beans and cress. Bartolomeo, personal cook to His Holiness Pope Pius V, achieved immense fame among European gastronomes with his speciality, a pie of bulls' testicles, and the French nobility of the 18th century gorged huge helpings of bean soup and truffle soup, and sipped delicate liqueurs in the vain hope of renewing their spent sexual energies.

Fish, because of their fecundity, have always been held to be an aphrodisiac food, and in particular the oyster. The flesh of the partridge was favoured by the impotent because this particular bird was notorious for its lascivious disposition and its supposed power to impregnate its mate by the sound of its voice. The lizard, because of its imagined likeness to the phallus, was also considered an aphrodisiac food. Certain Australian tribes actually forbade the eating of lizards by boys for fear that the resultant craze for sexual intercourse would be damaging to their healths.

To the casual eye it would seem that all the resources of Nature must at one time or another have been utilized as ingredients in love magic. Even fruit in the shape of the golden apple of Aphrodite compelled the frigid Atalanta to submit to the commands of love. The symbolism of the apple in the magic of sex has been commemorated for all time in popular legends of the temptation of Adam, although the account in Genesis does not specify this fruit (see APPLE). The song of the Sirens falls into the category of love magic because of the compulsion it exercised over the luckless mariners whom it lured to their destruction.

The love potion, a magical aphrodisiac which makes the drinker fall in love with the next person he or she sees, has a long history in popular belief and in legends like the tale of Tristan and Isolde: 'How Sir Tristram Drank of the Love Drink', by Aubrey Beardsley

The Potent Mandrake

The best known of all the aphrodisiacs of the ancient world was the mandrake or mandragora, a purple-flowered tuber with roots which often resemble the human body. Known also as 'Circe's Plant', it has been used in the form of a love potion from very early times. Pliny the Elder declared that, 'When a mandrake root in the shape of a male genital organ was found, it secured genital love'. This plant, which was said to emit a terrifying scream when dragged from the earth, was used not only for aphrodisiac purposes but also in medicine (see MANDRAKE). Satyricon, a smooth-leaved plant with a twofold root, when dissolved in goats' milk, was supposed to endow a person with the power to effect 70 successive acts of copulation.

In the British Isles the lovelorn could always draw upon the bounty of the countryside for the power to perform the nuptial act. The marigold, which was called 'husbandman's dial' by the Anglo Saxons, was used as an ingredient in love charms and also used in wedding garlands. St John's wort, a midsummer plant renowned for the power of expelling demons, witches and fairies (see ST JOHN'S WORT), was also used as a cure for barrenness, for a childless wife had only to pick this flower while walking naked in her garden and she could expect to be a mother before next Midsummer Day. The poppy, however, was a love-killer and was commonly used in love magic as an anaphrodisiac. The periwinkle was supposed to induce love between a man and a woman if powdered with earthworms and eaten with meat.

Among other plants and vegetables which have been resorted to by man for the restoration of his flagging energies have been artichokes, asparagus, leeks, parsnips, turnips and truffles, together with the humble lettuce and cabbage. A really single-minded lecher who was prepared to eat his way into a maiden's affections could call upon a wide variety of the most exotic stimulants.

The philtre or love potion was the principal method by which the aphrodisiac was administered. Both the philtre and the potion were produced as articles of commerce and belong therefore as much to the lore of medical quackery as to magic. The philtre might be a concoction of narcotic perfumes, the testes of animals, onions, ginger or cinnamon, the choice of a particular ingredient being based upon an imagined relationship between the symbol and the sexual objective. The mixture, which was usually taken in liquid form, could be extremely unpleasant, doubtless in deference to some mystical principle of primitive shock therapy. Human brains, hearts, livers, urine and skin were commonplace ingredients, but a really potent compound might require the marrow and spleen of a boy who had been murdered at the very moment of feasting his eyes upon some illicit scene of lust. To be completely effective the love potion required a magical spell to be muttered over it by a witch at the time of its preparation.

Lethal Potions

A closely allied department of love magic was the anaphrodisiac or lust-killer, which ranged from relatively innocent 'rings of oblivion' supplied by medieval magicians to women who desired to get the old love out of their systems before proceeding with the new, to such drastic measures for

The Romans prepared for love-making by feasting on red mullet, octopus, cuttlefish, oysters and the electric ray

So irresistible are the forces of love that different mythologies personify it as a god whose magic arrows of desire overwhelm mortals. The Greek Eros (*above left*) was at first a great primal force: he later became prettified into a mischievous child (*right*). The Hindu god Kama (*above*) rides a parrot and bears a bow of sugar-cane with a quiver of arrows tipped with flowers

dampening the fires of lust as lizards soused in urine or a liniment of mouse dung.

In the application of magic to love-making the objects utilized have ranged from the sexual organs of the stag to the horn of the rhinoceros with its obvious phallic implications. Oriental love, however, for its successful consummation demanded honey compounded with pepper, and the liquorice-tasting root of the plant ginseng, which is considered by some to be a true aphrodisiac.

The Western world has made its own peculiar contribution to the lore of love magic in the shape of a number of curious recipes, most of them handed down in its folklore. The Greek physician Dioscorides of the 1st century AD, lists a number of amatory lures including a paste made from the tuber of orchids and goats' milk, and a species of turnip succinctly described as 'provocative to venerie'.

The Greeks, who were uninhibited in love matters, were inclined not only to have their cake but to eat it in the form of phallic-shaped loaves. The Romans prepared for love-making by feasting on red mullet, octopus, cuttlefish, oysters and the electric ray, but if these measures proved ineffective they were plied with pepper and myrrh.

The history of love magic had its darker side, however, for many of the aphrodisiacs which were peddled to the public were poisonous. The Roman poet Lucretius is said to have committed suicide during a bout of sexual frenzy brought on by a love potion. The magicians of Thessaly, who were the principal specialists in this line in Southern Europe, used drugs which were capable of driving a man insane, according to Juvenal.

Less harmful, if ineffective as love stimulants, were certain unfamiliar foods which acquired an aphrodisiac reputation.

Bodleian Library Filmstrip

At the beginning of the present century a resinous compound called 'dragon's blood' was still being burned by estranged wives

Even the potato when first introduced into Europe became a delicacy for the well-to-do, arising from the erroneous belief that it cured impotence, and in 16th-century Spain this vegetable was highly prized for its supposed virtues. The tomato, under the name of 'love apple', became much sought after as an aphrodisiac – so much so that the Puritans declared it to be poisonous. As a result the tomato went into eclipse as an article of diet, only regaining its good name in the 19th century.

Cannibalism for Love

In other forms of love magic lovers could be bound together in an unbreakable union by the mutual exchange of charms, locks of hair, nail-parings and occasionally human blood. This type of rite in all probability represented an early form of the marriage ceremony. In 17th-century England there was a popular custom in which a silver coin known as a 'commendation ninepence' was broken into two pieces, each lover taking a part, the giver saying at the same time 'To my love', and the receiver 'From my love'.

Included in the strange arts practised by the love magician was 'knot-tying', a device for rendering a man impotent by remote control. This involved the ritual knotting of a piece of cord, after which the frustrated lover could only recover his lost powers by paying the price demanded for untying of the knot (see also STRING).

The amatory arts provided a means of livelihood for a large number of magicians and charlatans, who prescribed not only the better known love recipes but certain dubious compounds of their own. Among these practitioners was the witch, with her undoubted skill in resolving emotional disturbances by words of power and whose stock-in-trade consisted largely of handed-down vestiges of ancient herbal and magical lore. Only the foolhardy would be likely to call upon the services of a witch as a marriage counsellor for the repellence of their philtres was proverbial, including such delicacies as toads' venom, ox bile, thieves' flesh, asses' lungs, and corpses exhumed from graveyards. The once-popular superstition that the eating of human flesh reinvigorated the lover is said to have made it necessary to place guards over Thessalian cemeteries to protect the graves from marauding witches. Among other ingredients of a witch's brew was hippomanes, a substance found in the heads of newly-born foals, and also small stones taken from the head of the perch.

Partly owing to its association with witches, love magic was declared illegal in England in the 16th century. A curious clause was included in the Witchcraft Statute of 1542, making it a felony to 'practise or cause to be used . . . any invocation of spirites, witchcrafts, enchantments or sorcerers to . . . provoke any person to unlawful love.' A similar clause occurs in the later Witchcraft Act of 1563; and in the Act of King James I in 1604 there is a further clause prohibiting the taking up of any human body 'from the grave where it resteth' for use in 'any manner of witchcraft, sorcery, charm, or enchantment.' The procurement of 'unlawful love' by magic was one of the slanders against Anne Boleyn which was circulating before her fall from favour; it was suggested that she had lured King Henry into matrimony by means of witchcraft. According to another story Henry's son, King Edward VI, became in turn a victim of love magic, inflicted upon him by Lady Jane Grey.

The decline in magic as a specialized art does not appear to have had any immediate effect upon the beliefs and practice of the population in general. Love magic descended to the successors of the witch, the village wise man and the itinerant quack. The victim of unrequited love could go to the local apothecary who would be able to supply an instant remedy in the form of an aphrodisiac known as Spanish fly. In the poet Gay's *Shepherd's Walk* occur the lines:

> Straight to the 'pothecary shop I went
> And in love powder all my money spent.
> Behap what will, next Sunday, after prayers,
> When to the alehouse Lubbukin repairs
> These golden flies intn his mug I'll throw
> And soon the swain with fervent love shall glow.

The 'golden flies' refer to the dried blister-beetle or Spanish fly which when applied to the sexual organs arouses desire at the risk of causing vomiting, and other unpleasant and dangerous effects. Cantharides, another name for this aphrodisiac, was among the remedies peddled by Count Cagliostro (see CAGLIOSTRO) in the 18th century and was the drug administered to prostitutes in the form of bonbons by the Marquis de Sade, several of whose victims afterwards died.

Modern Mythology

Despite the gradual decline in ancient magical beliefs generally, love magic survived in one form or another. At the beginning of the present century a resinous compound called 'dragon's blood' was still being burned by estranged wives. At Hallowe'en a young girl would stand combing her hair before her mirror, an apple in one hand, in the hope of compelling the image of her future husband to materialize in the glass over her left shoulder. In another type of Hallowe'en divination a snail would be placed in a flat dish overnight and from the tracings of its slime in the morning the girl was supposed to be able to deduce the initials of her husband-to-be. Even today it is not uncommon for a gypsy girl to wear an ivy leaf close

The Love Potion

Now when the maid and the man, Isolde and Tristan, had drunk the draught, in an instant that arch-disturber of tranquillity was there, Love, waylayer of all hearts, and she had stolen in! Before they were aware of it she had planted her victorious standard in their two hearts and bowed them beneath her yoke. They who were two and divided now became one and united. No longer were they at variance: Isolde's hatred was gone. Love, the reconciler, had purged their hearts of enmity, and so joined them in affection that each was to the other as limpid as a mirror. They shared a single heart. Her anguish was his pain: his pain her anguish. The two were one both in joy and sorrow, yet they hid their feelings from each other. This was from doubt and shame. She was ashamed, as he was. She went in doubt of him, as he of her. However blindly the craving in their hearts was centred on one desire, their anxiety was how to begin. This masked their desire from each other.

Gottfried von Strassburg *Tristan*

Roger Wood

The angel of love, bearing the bow and arrows of desire which were attributes of the Greek Eros, appears to the lover in a garden: 15th century French illustration to a famous medieval poem, the *Roman de la Rose*

to her heart when embarking on a lover's tryst to ensure that all goes well; while schoolgirls still chant:

> Ivy, Ivy, I love you
> In my bosom I put you.
> The first young man who speaks to me
> My future husband he shall be.

Possibly one of the very last relics of this type of love divination is the pretty custom of pulling petals from the daisy, to the rhythm of the familiar litany, 'He loves me, he loves me not' in the manner of young lovers of long ago.

The older mythology of love magic makes its appearance in a number of sexual myths which are still current. One example is the supposed power of spiced foodstuffs and shell-fish to lure virgins from the path of rectitude; while an equally mystical principle lies behind the custom which is still often observed of placing the nuptial bed on a north-south position in alignment with the magnetic poles. Modern magical aids which range from hypnotic suggestion to vitamin pills, all point to a continuing demand for artificial boosters for the rites of love. This is particularly true in the United States where a preparation known as 'Long Tong's Syrup of Joy' is still widely sold; the equally famous 'Come Back Oil' is used by the neglected Louisiana wife to anoint the body of her sleeping husband.

A lingering belief in anaphrodisiacs, preparations intended to lower rather than heighten desire, exists in the more cloistered corners of society. Serving soldiers the world over are victims of the illusion that the military hierarchy arranges for a sedative to be secretly added to the regimental tea, while the virtue of work as a sexual deterrent is reiterated by elderly nuns in the form of the maxim that the best antidote to lecherous thoughts is to set to and scrub the convent floor.

ERIC MAPLE

LUCIFER

'SATAN, so call him now,' says Milton in *Paradise Lost*, 'his former name is heard no more in Heaven.' The former name is Lucifer (light-bearer), which the Romans gave to the morning star. The Devil acquired it when early Christian theologians, including Tertullian and St Augustine, identified him with the falling star of Isaiah's celebrated diatribe against the ruler of Babylon: 'How art thou fallen from heaven, O Lucifer, son of the morning!' This star had tried to exalt himself above the others, had said to himself, 'I will be like God', and had been hurled down from heaven in punishment. The passage was the foundation of the doctrine that the Devil was a great archangel who rebelled against God from pride. Christians connected it with the words of Jesus in Luke (10.18), 'I saw Satan fall like lightning from heaven', and with the description of the war in heaven, in Revelation, in which the Devil and his angels rebelled against God and were defeated.

'Lucifer, son of the morning' translates the Hebrew *helel ben shahar*, 'day-star, son of the dawn'. There is another reference to this obscure figure in Ezekiel's prediction of the coming downfall of the king of Tyre (chapter 28). Here he is an angel, blazing with brilliant jewels, who was in Eden, the garden of God, walking up and down among the 'stones of fire' (the stars). He may have been the hero of an earlier story in which the morning star tried to steal the role of the sun but was defeated, this myth itself stemming from the observation that the morning star is the last star proudly to defy the sunrise, but as the sun's rays strengthen, his light fades. Alternatively, it has been suggested that the story is another version of the fall of Adam and his expulsion from Eden, the divine spirit who tried to rival God being the First Man himself.

In Germany in the early 13th century a few Satanist heretics, who were called Luciferans, were discovered and persecuted. They worshipped the Devil, who they said was the brother of the Christian God. They believed that he had created the world, that he was the provider of all good things on earth, and that he had been wrongfully and

Lucifer, 'light bearer', the Latin name of the morning star, became one of the names of the Devil when a passage from the book of Isaiah was taken to refer to the archangel who had tried to make himself the equal of God *Left* The Devil manifesting himself, from *Dictionnaire Infernal* by Collin de Plancy *Right* Lucifer, from a 15th century manuscript

treacherously ousted from heaven. One day he would defeat God and regain heaven, and they expected an eternal future of happy immortality with him there. Meanwhile, they took care to do everything which would offend God and nothing which would please him, and every Easter they received the sacred host at Mass, and kept it in their mouths until they could spit it into a cesspool to show their contempt for Christ. Or so they confessed, though as their admissions were extorted from them on pain of death if they refused to confess, it is uncertain how much truth there is in them.

The persecutors gave an interesting description of the initiation ceremony of the Luciferans. The new member went to a meeting, at which he was greeted by a toad and kissed it on the backside or the mouth. If he kissed it on the mouth, it deposited something in his mouth. Sometimes it looked like a goose or a duck, and sometimes it was as big as an oven. Next there appeared a man who was skeletally thin and very pale, with black eyes. The new member kissed him, finding him icy cold, and with that kiss all remembrance of his Catholic faith left him.

Then all the members sat down to a feast, in the presence of a statue, and afterwards a huge black cat came down from the statue and they kissed its backside. The leader of the group asked the man next to him, 'What does this teach?' He answered, 'The highest peace', and another added, 'And that we must obey.' Then the lights were put out and there was an indiscriminate sexual orgy.

Later, the candles were lighted again and a man appeared from a dark corner. From his hips down he was as black as the cat but the upper half of his body shone like the sun and his radiance illuminated the whole room. The leader of the group took a piece of the new member's clothing and gave it to the shining man, saying 'Master, I give this to you which has been given to me'. The shining man returned it to him with the words, 'You have served me well, you will serve me more and better. I leave what you have given me to your care.' Then he disappeared.

This ceremony may be nothing but a fantasy, of course, but it could have been stage-managed without undue difficulty. If the name of the Luciferans means anything, they may have identified Lucifer, the light-bearer who was also the lord of life on earth, with the sun. The upper part of the shining man's body may have represented the sun of the daytime and the black lower part the night sun or black sun, which passes through the darkness under the earth during the night. The black sun is the leader of the stars, which follow him towards the western horizon and disappear beyond it – the stars fallen from heaven, the angels who fought with Lucifer.

(See also DEVIL; SATANISM.)

Son of the Morning

How art thou fallen from heaven, O Lucifer, son of the morning! how art thou cut down to the ground which didst weaken the nations! For thou hast said in thine heart, I will ascend into heaven, I will exalt my throne above the stars of God: I will sit also upon the mount of the congregation, in the sides of the north: I will ascend above the heights of the clouds; I will be like the most High. Yet thou shalt be brought down to hell, to the sides of the pit.

Isaiah, chapter 14 (Authorized Version)

Thou hast been in Eden the garden of the God; every precious stone was thy covering, the sardius, topaz, and the diamond, the beryl, the onyx, and the jasper, the sapphire, the emerald, and the carbuncle, and gold . . . thou wast upon the holy mountain of God; thou hast walked up and down in the midst of the stones of fire. Thou wast perfect in thy ways from the day that thou wast created, till iniquity was found in thee . . . therefore I will cast thee as profane out of the mountain of God.

Ezekiel, chapter 28 (Authorized Version)

Bodleian Library Colour Filmstrip

Why is one man extraordinarily lucky in all he does, while another is dogged by misfortune? Is luck the gift of the gods or the product of one's own temperament, the individual's response to events?

LUCK

WE SUFFER FROM LUCK, enjoy it, envy it in others, and then we seek to divine the factors which condition our situation of being lucky or unlucky. This is all part of the happy inconsequence of the human mind. There are factors in all our thoughts which are not either rational or truly conscious. We have presentiments for no obvious reason, and when we find we have ignored them we say, 'It's just my luck'.

All nations have the idea of luck, and in the classical civilizations the idea was formulated as a personal spirit which helped or hindered the individual's purposeful actions. This quality could also attach to things. Something lucky for one person might not help another; a charm to bring love to a man who needed rest would not be particularly helpful.

Many charms were made and blessed by soothsayers to aid the good luck of their clients and there are innumerable examples of such things as magic rings and talismans. One tries hard to find the lucky number which will be a sign of coming fortune. Three may bring you luck if you believe that it was on 3 March you met your soul mate, or 333 won the raffle for you. Three is the number for you, while other numbers bring luck to other people. Such things are not true luck-bringers, but signs that luck accompanies their appearance. If you could compel good luck it would not be luck any more, but science.

The essence of luck is its lack of any obvious rationale. One person is usually lucky, and another is accident prone. To the ordinary person this remains inexplicable. In recent years psychologists have made studies of human behaviour and have shown that many things accepted as chance are due to our individual response to events. There is usually a history of worry behind the accident, or of confidence behind the success. The scientist is proving what we have always suspected, that we ourselves are closely linked with what presents itself to us as luck or misfortune. There is reason behind that ancient idea that the spirit of good fortune links itself with particular individuals, but most of us seek to bring luck our way; to condition chance to our needs.

Shape of Things to Come

From time to time people experiment with all kinds of rituals for establishing good fortune, some of them being extremely simple methods such as tossing a coin. In practice such a method may be misleading. A personal experience of the author's was of tossing a coin to find whether to turn right or left on the roads when hitch-hiking home from camp during the Second World War. Sometimes the luck of the road gave pleasant results in an easy lift, at other times it also gave pleasant results in interesting detours; but it was never possible to suggest that tossing the coin had any more realistic function than of acting as a spur to decisions which were not reached rationally. The decision by coin was neither rational nor effective magic, it was purely luck.

There are many other fascinating methods of trying to see the outcome of future events. Counting the number of birds in a field is of very ancient origin, certainly going back to pre-Roman times, when the birds concerned were the owl, the wren or the jackdaw. The 'four-and-twenty blackbirds' that were 'baked in the pie' of the familiar nursery rhyme are the flock of blackbirds which some families claim appears near their house at the time of death of an important member of the family. In ancient tradition these were the birds of Rhiannon the lady of the underworld, and were symbolic escorts of the soul on its way to the happy islands of the dead in Avalon. Similarly people consulted the state of their luck by the movements of animals. The appearance of hares crossing one's path is a symbol which goes back to very ancient times, but the passage of a black cat across the path portending luck or otherwise seems to have been of medieval origin. According to popular legend the introduction of cats through the more civilized parts of the world was due to Dick Whittington, Lord Mayor of London in the 14th century.

There are also methods of telling the weather by looking at the wind and rain, methods known to every peasant farmer in the old days and to shepherds everywhere. On investigation most of these prove to have a reasonable and sound scientific basis and therefore our prophecies for a short period in the future are based on observation of current phenomena: 'Red sky at night, shepherd's delight', indicates that the end of a cloud sheet is away to the west and the sun has penetrated underneath and illuminated the clouds – consequently one may expect a fine morning to follow, at least in the northern hemisphere. Here luck for the farmer is seen a little way ahead by a primitive scientific method.

Dreams of the Future

The luck of the future, too, is estimated by seers of various qualifications. There is usually a definite stimulus needed, some symbol which the seer contemplates and in which he sees more than is apparent in the mere form of the object. This applies to the reading of palms by the seaside fortune teller as well as to the experience of visions through crystal-gazing or looking at a blot of black ink.

In these matters the personality seems to travel into a kind of picture world where symbolic visions arise and are retained by the memory in a more or less complete form so as to give visual images of the future event. This would seem to be a method of circumventing luck, but of course it was just foreseeing how luck would fall.

Further groups of ideas of the future are sought out by methods resembling the ancient system of drawing lots (see LOTS).

Popperfoto

These include picking cards from a pack or laying them out in a regular order, face downwards, and then turning them up so that the skilled interpreter can read the story that they tell (see CARDS). This is more commonly done with the Tarot cards than with ordinary playing cards. These methods produce very good results in the hands of experts, the majority of whom find that a great deal of energy has gone out when making predictions from the cards. This suggests that the process is not just reading 'according to the book', as one might do at a tea-party among friends, but implies some extra strain by which some part of the personality becomes cognizant of events in a totally different way than by just reading the cards. We are dealing again with a specialized kind of clairvoyance. Even the deeper interpretation of dreams (see DREAMS) by the trained psychologist depends on taking the dreams as an index of the person's own situation. Some dreams however do accurately record future events but how these are stimulated and how they relate to the normal structure of the unconscious portion of the psyche is by no means clear. However, they are in a class by themselves and they are usually recognized by the dreamer because of a certain strangeness of lighting or of content which makes them quite remarkable among dreams, and leaves a deep impression which is immediately remembered when the event previously dreamt about takes place.

Fate or Free Will

There is no time limit to this kind of dream. The event prognosticated may appear a day or several years after the dream, so that as an index of prognostication of the future these dreams are not easily brought into any scientific order. What is more they most frequently refer to trivial events which only concern the individual dreamer.

Dreams of this kind are rather startling phenomena which remain vividly in the memory and raise again the whole question of predestination, of the dependence of man upon a code which determines everything to be done. How free will and choice can function in a universe where every decision even of minor matters can be dreamed about before the event is not clear. Does the dreamer simply see the luck of an event in a future time, or is it a study of an inexorable fate in which luck plays no part?

This mysterious field where one is faced by the problem of free will or predestination is immensely confusing. There are historical examples of peoples who have accepted events as the will of the gods and have made no progress in either material or political culture for centuries, merely carrying on a reasonably satisfactory traditional life. Other people have thought they could determine events by action according to their own will; and although their actions have sometimes resulted in terrible international disasters, at other times they have followed their belief in their luck or inspiration and have contributed to the advance of human culture and the enjoyment of a fuller life by millions of people. Whether these advances were fated or not simple cannot be proved; the individual must make personal choice of an explanation of the working of the universe.

Even so, the reaction of the individual to what he assumes to be fate is of considerable importance. It may be that in a universe subject to determinism one has to follow certain general streams of development, but nevertheless the reaction of the individual to events is apparently of extreme importance to personal development. This seems to have been the opinion of many of the world's greatest religions. A person is exhorted to act according to the will of God, and this presupposes that he seeks this greater mind controlling the universe. In this lies the whole basis of behaviour for those who are not of a totally materialist opinion. We are back to the ancient view that luck is the gift of the gods.

Forecasting Future Inventions

Throughout history, men have sought to obtain knowledge of the future and to explore the facts of the past by means of all manner of magical devices. The controlled method of the ceremonial magician, working with symbols and protective garments and using chants which are especially designed to stir the very depths of the personality, seeks to evoke images which will provide him with knowledge of past and future events in a reliable way.

There is much evidence that these methods have produced information not obtainable by normal means. There are also the few natural seers, such as the famous Nostradamus (see NOSTRADAMUS), whose prophecies have spanned vast regions of time and given accounts of future events which are later seen to be basically true though clouded by the problems of description of unknown things. For instance it was not possible in the Middle Ages to look into the future and describe accurately a modern household: how would an Elizabethan philosopher react to seeing somebody touch a button on a wall and produce a shining light as bright as a thousand candles? The human mind of the seer must experience immense difficulty in describing things which in the future would be commonplace, but which in the present are totally unknown. For most of us the experience of looking into the future is the occasional personal event. Do these things reveal luck or fate? There is the continuing problem.

Left **The Daruma or Tumbling Doll is one of the oldest and most common toys in Japan and is also a good luck charm. Usually painted red all over, except for the face, its base is weighted so that it always swings back to an upright position and this ability to 'come out on top' in all circumstances accounts for its value as a lucky charm. These dolls are bought on the first day of the New Year to insure good fortune for the whole year to come**

Below **'The essence of luck is its lack of any obvious rationale': picking winners with a pin is a simple method that appeals to many people**

Chris Barker

RAYMOND LULL

THE CATALAN mystical philosopher and missionary Raymond Lull (or Lully) was born in Palma about 1235. The son of the governor of Majorca, as a boy he was over-indulged and his early life was one of dissipation and excess. There are several disreputable anecdotes of Lull's youth; on one occasion he pursued a girl on horseback right into Palma cathedral. He married early and his wife Blanca bore him two children.

At the age of about 30, in 1266, he experienced a vision of Christ which profoundly disturbed him and led to his conversion. He determined to dedicate his life to the apostolic mission of preaching to the heathen. To this end he devoted the next nine years to the study of Arabic, theology and philosophy, neglecting his ordinary affairs to such an extent that his estates were taken out of his charge, at the request of his family. In 1275 he withdrew to write his first important book, *Ars magna*. This work, although it dealt with 'the art of finding truth' in general, more specifically set out to extol the merits of the Christian faith and to denigrate the value of Judaism and Islam. The revolutionary element of the *Ars magna* was Lull's use of a system of letters to represent ideas and of geometrical diagrams to explain the overlapping and logical alternatives of these ideas. This 'logical algebra' is an attempt to uncover first principles and thereby to reduce all knowledge to a meaningful whole.

At Miramar, where Lull had persuaded the king of Majorca to build a Franciscan monastery, he acted as professor of Arabic and philosophy and produced many unorthodox treatises. He travelled untiringly back and forth over the greater part of Western Europe, preaching, lecturing and attempting to enlist the support of popes and kings for his missionary activities. In his own words, he was 'mad with God' or 'God's own madman'.

In 1291, blaming himself for his timidity and indecision since his conversion 25 years earlier, Lull set out for Tunis, where he preached openly to the Moslems for a year before his imprisonment and expulsion. Over a period of years, he made unsuccessful efforts to gain papal support for the setting up of missionary colleges, and continued his travels, campaigning as he went. His second mission to the Moslems at Bougie (in modern Algeria) ended in the same way as the first,with a six-months' prison sentence. On his release he travelled again to Paris and Vienna, where in 1311 he witnessed the nominal adoption of his long-advocated proposals, which included the teaching of oriental languages in universities and monasteries. He continued his campaigning until 1314, when, at about the age of 80, he returned once more to Bougie. His preaching inflamed the Moslem inhabitants of the city and he was set on and stoned outside the walls, dying of his wounds shortly afterwards. In Majorca Lull is venerated as a saint and martyr, and in Spain he is honoured also as a thinker and poet; his beatification was confirmed in 1847. His body is buried in

Inspired by a vision of Christ and describing himself as 'God's own madman', Raymond Lull dedicated himself to mystical philosophy and to the preaching of Christianity to the heathen: he died after being stoned by Moslems whom he had attempted to convert

Palma cathedral beneath a fine mausoleum, and miracles are said to take place there.

The written works of this great scholar and mystic blend the intellectual with the sublime. His *Arbre de Sciencia* (Tree of Science) is full of dialectic keys, truths intertwining like the roots, trunk, branches and leaves of the same tree of science. Lull himself had studied zoology, botany and mineralogy, and published treatises on these subjects. Fascinated by chemistry, he carried out many experiments, including the preparation of nitric acid. His didactic novel *Blanquerna* (1283), which describes a new Utopia, traces the development of his mysticism and philosophy. Its fictional framework is a vehicle for presenting the ideals of medieval religion, and a section of it, published separately as *Llibre d'amic e amat* (The Book of the Lover and the Beloved), and also his *Llibre de contemplacio* (Book of Contemplation) celebrates the union of man with God with an intense spirituality.

In his lifetime, Lull's ideas and activities met with both respect and suspicion. Jean I, son of the king of Aragon, praised his exceptional virtues in 1288, but the Church was becoming increasingly concerned about his teachings, and denounced his strange doctrines. The Inquisition saw his prolific writing as flagrant heresy and viewed his ecstasies with mistrust. He was criticized for his orientalism and his affinity for Islam, but most suspect of all was the influence of the Jewish Cabala on his philosophy.

Lull's use of symbolic letters, his flexible geometric diagrams, and his 'first principles' all derived ultimately from the esoteric language of the Cabala. The theologians of Salamanca proclaimed authoritatively that Lull's contemplative philosophy was descended from magic. Even as a scholar he was viewed in some quarters with alarm, and he was believed to practise alchemy. It was said that he had studied with Arnold of Villanova (1493–1541) at Montpellier and that this famous magician had introduced him to dangerous mysteries. While in Paris, he had moved in circles that were alarmingly close to occultism.

It was also believed that Lull possessed the Elixir of Life, the Philosophers' Stone, since he knew the signs, the words and mysterious letters. Indeed, his *Ars magna* was interpreted by some as being the great secret work of the alchemists and the legend grew up that its symbols had been revealed to him as he sat beneath a tree: sensing an indefinable presence he looked up and beheld hieroglyphs and numbers marked upon its leaves. In fact, there is little or no evidence to support the opinion that Lull was an alchemist, and alchemical works once attributed to him are apocryphal.

Despite doubts concerning Lull's orthodoxy, the Church admired this great mystic who had been granted a vision of the world beyond. He was also a martyr. But the Church could not forgive Lull for his reputed alchemical activities. In response to public opinion, Rome bestowed on him the title of 'blessed' but not of 'holy'.

A Prodigious Author

Yet the prodigious literary activity of Lully left behind him a mass of writings destined to exercise no little influence on succeeding generations. He was perhaps the most voluminous author on record. Juan Llobet, who in the middle of the fifteenth century taught the Art of Lully in the University of Palma, had read five hundred of his books; some authors assert that their total number reached a thousand, others three thousand. Many have been lost, many spurious ones have been attributed to him, and the bibliography of his works is hopelessly confused; but Nicolas Antonio, after careful sifting, gives the titles of three hundred and twenty-one which may safely be ascribed to him. Of these there are sixty-one on the art of learning and general subjects, four on grammar and rhetoric, fifteen on logic, twenty-one on philosophy, five on metaphysics, thirteen on various sciences – astrology, geometry, politics, war, the quadrature of the circle, and the art of knowing God through grace – seven on medicine, four on law, sixty-two on spiritual contemplation and other religious subjects, six on homiletics, thirteen on Antichrist, the acquisition of the Holy Land, and other miscellaneous subjects, forty-six controversial works against Saracens, Jews, Greeks, and Averrhoists, and sixty-four on theology . . .

H. C. Lea *A History of the Inquisition*

According to the cabalistic teachings of Isaac Luria, sparks from the divine light of creation fell into the grasp of the forces of evil: man's task is to assist God in the task of restoring cosmic harmony.

ISAAC LURIA

JEWISH MYSTIC and Cabalist, Isaac Luria Ashkenazi (1534–72) spent the last years of his short life in Safed in Upper Galilee, a major centre of cabalistic activity and of ascetic and devotional life at that time, where he soon acquired a great reputation as an inspired and holy man of God. Luria was much younger than the other leading scholars and saints in Safed, and did not leave any written works. His reputation was based on his magnetic personality and the veneration in which he was held by the small group of his elect disciples, to whom he imparted his teachings orally.

Even after the death of the *Ari* (the holy 'lion' of Safed), as Luria came to be called, when some of his disciples committed his teachings to writing, these manuscripts were jealously guarded and not allowed to circulate. Towards the end of the 16th century, manuscripts of the 'Lurianic teaching' began to circulate (at first in pirated copies) – partly in the version propagated by Israel Sarug in Italy, and partly in the 'canonical' version of Luria's chief disciple Hayyim Vital Calabrese. After 1630 his teachings also began to appear in print and by the middle of the century Lurianism had established itself as the major dominant form not only of Cabala (see CABALA) but of Jewish theology and devotional practice.

Unlike the highly speculative Cabala of his contemporaries, Luria's teaching exhibits not only striking originality but also a powerful mythological character. In fact, the Lurianic myth, developed undoubtedly in the course of intense meditations and visions, has some markedly 'gnostic' features. Although Lurianic Cabala is original and novel in many respects, cabalistic orthodoxy claims that it is merely the revelation or rediscovery of the true meaning of the ancient texts.

The main features of Lurianism are the doctrines of retraction *(tsimtsum)*, the 'breaking of the vessels' *(shevirath ha-kelim)* and restoration *(tikkun)*. The doctrine of tsimtsum seeks to account for the possibility of the existence of a created world: if God is all in all, how can anything else exist? According to the Lurianic myth the Infinite Light of the Godhead 'retracted' itself so as to create a vacuum (the *tehiru*) in which creation could take place. Into this empty space – an infinitesimal point with respect to the Godhead but infinite space in respect of potential non-divine being – God began to infuse some of his creative light. In order that creation-in-the-making should not be annihilated by the intensity of the divine light, the latter had to be carefully channelled and structured in the form of the Adam Kadmon (or more correctly, Qadmon), the 'Primeval Man' and archetype of the cosmos. However, some of the lights bursting out of the Adam Kadmon were too powerful: they broke the 'vessels' or 'pipes' that should have contained them. Whilst some of these Divine light sparks returned to their divine source, others 'fell' together with fragments of the shattered vessels, into the primordial space where they became held in the grip of the power of chaos, that is, ultimately the demonic forces of evil.

The Fortunate Fall

According to Luria, there is thus a catastrophic event in the very heart of the divine and at the root of the cosmos. Catastrophe did not come with Adam's fall, or with the fall of the angels. It is something far more basic, for the whole history of the 'creation' of the world and of Adam is an attempt by God to heal the results of the primordial 'breaking of the vessels' and to restore everything, including the fallen divine sparks, to their proper place. In fact, Adam was created because God needed a helper in the difficult task of 'restoration', but Adam failed in his task and through his failure made things worse. Since then the crucial task of bringing about the tikkun has devolved upon Israel who, through a life of ascetic piety, strict observance of the commandments and cabalistic meditation, must lift up the fallen sparks and help to bring about that state of redemption and cosmic harmony of which God and man are equally in need. Until then, both God and man are, as it were, equally 'unredeemed', or at least 'in exile', since not only is Israel exiled but the divine sparks too, after the breaking of the vessels, are 'fallen' into the wrong spheres of being.

Why the original catastrophe of the 'breaking of the vessels' should have occurred at all is an obscure point and the Lurianic texts, aware of the audacious and near-heretical character of their speculations, are reticent and at times contradictory on this point. Luria's original doctrine seems to have been that the 'retraction' and subsequent 'breaking of the vessels' were a catalytic process in which the Godhead purged itself of its own diffuse potential of evil. It was, therefore, a necessary process and a kind of 'fortunate fall'. After the breaking, this evil became objectified in the *qelippah*, the demonic realm of evil and the 'shells', and redemption depends on all sparks of the divine being extricated from the power of the shells. The latter would thereupon collapse, evil would cease, the cosmic exile come to an end, and the unity of the Creator with his creation be established.

According to Scholem (*Major Trends in Jewish Mysticism*) it is the intensely dramatic character of the Lurianic mythology which accounts for its success in cabalistic history. The pivot of the Lurianic system is the mystery of exile and redemption. This was an existential and spiritual dimension which was especially meaningful to the Jew. Its strong messianic orientation was essentially activist: man (that is, Israel) should not wait for redemption to be wrought by God (since God himself needed the help of man), but should actively strive to bring about the state of 'restoration' and 'redemption' by mystical actions and meditations as detailed in the cabalistic manuals. The messiah is not a redeemer, but will appear after the tikkun has been accomplished as a symbol of the redeemed order. Lurianic cabalism was one of the major influences in precipitating the great messianic movement associated with the name of Sabbatai Zevi and also provided some of the background and the vocabulary of the later mystical revival movement known as Hasidism (see HASIDISM). Lurianism also came to the knowledge of Christian Cabalists, mainly through Latin translations and especially Knorr von Rosenroth's *Kabbalá Denudata*. (For Adam Kadmon, see also MACROCOSM: MAN.)

R. J. ZWI WERBLOWSKY

Lycanthropy

From Greek words meaning 'wolf' and 'man', the transformation of a human being into some other carnivorous animal, especially a wolf but alternatively a bear, tiger, leopard or, in South America, a jaguar; form of insanity in which the sufferer believes he is the animal and behaves accordingly.

LYTTON

This English novelist and politician is today best known for his novels dealing with the occult: his concept of a subterranean race with 'superhuman powers is said to have inspired one of the secret societies that sprang up in Nazi Germany

BULWER LYTTON

IN HIS LIFETIME (1803–1873), Edward George Earle Lytton Bulwer Lytton (created Baron Lytton of Knebworth in 1866) was known as the author of a number of historical romances and novels of society and of the occult, as a successful playwright and as a politician who rose to be Secretary for the Colonies. At his death, his novels dealing with the supernatural were patronizingly dismissed in his obituaries as foolish aberrations that would soon be forgotten. As it has turned out, the exact opposite has taken place. Today his occult stories, such as *Zanoni*, are better known than all the rest, apart from *The Last Days of Pompeii*.

In *Zanoni*, Bulwer Lytton describes the hero, Glyndon, as having been fascinated by the portrait of an ancestor who was reputed to have achieved strange powers by secret studies and to have lived far beyond the normal span of life. In fact, Edward Bulwer had an interesting 17th century forbear, Dr John Bulwer, who devoted much energy to alchemy and Platonic mysticism, and to the study of communicating with the deaf and dumb. He published *Chirologia, or the Natural Language of the Hand* in 1644.

Such a background perhaps throws light on a story which Edward Bulwer himself tells of his boyhood. At the age of eight he said to his mother one day: 'Pray, mamma, are you not sometimes overcome by the sense of your own identity?' 'My mother looked at me in amazed alarm', he says, and said, "It is high time you should go to school, Teddy."'

After being privately educated he went to Cambridge where he made friends with Chauncey Hare Townshend, who became a great student of mesmerism, a subject Bulwer himself studied attentively.

He first visited the Continent in 1825, spending some time in Paris. He took part in the social life there, but had a curious second life in solitude at Versailles, writing and studying, and fighting with a feeling of melancholy. To sleep soundly he had to go out riding for hours every day. 'All my life through,' he said, 'I have found the necessity of intervals of complete solitude for the cure of the morbid symptoms which half-solitude engenders.'

He married Rosina Wheeler in 1827, much against the wishes of his mother, who thereafter withheld the financial assistance the young couple badly needed. Bulwer worked hard at articles and books to bring in some money. A daughter was born and, three years later, a son, but their relationship deteriorated. Rosina was selfish and extravagant and she developed an increasing hatred for her husband which she later vented in libellous and obscene letters which she sent to his friends and to clubs and hotels where he might be. There is no doubt that eventually she became deranged. They separated in 1836. Two years later Bulwer was created a baronet, adding his mother's name, Lytton, to his surname.

Lytton's letters confirm that he studied all the medieval writers on divination and magic, and the content of his novels of the occult shows that he had mastered these subjects and believed that there was a solid basis of truth underlying them. His favourite method of divination was geomancy, using four rows of random ticks on a sheet of paper, and combining this method with astrology. He wrote a long prediction of the career of Disraeli which proved to be an accurate summing-up, and various personal friends received 'horoscopes' from him.

Elementals in Oxford Street

From a letter he sent to Hargrave Jennings, author of a two-volume work on the Rosicrucians, it is apparent that Lytton himself was a Rosicrucian belonging to an organization with occult knowledge. He organized a club for the practice and investigation of ceremonial magic, to which he recruited Eliphas Levi (see LEVI) among others. Members are said to have attempted to evoke elemental spirits on the roof of a building in Oxford Street in London, in 1853.

The occultist Mme. Blavatsky (see BLAVATSKY) said that the Eastern Brotherhood of Adepts claimed Lytton as a member. Andrew Lang in his *Historical Mysteries* (1904) suggests that Lytton met the Count of St-Germain, who was said to have discovered the Philosophers' Stone and to be more than 2000 years old, in Paris in 1860.

He frequently put his own beliefs into the mouths of characters in his novels; for instance Margrave, in *A Strange Story*, says: 'The pentacle itself has an intelligible meaning, it belongs to the only universal language, the language of symbol, in which all races that think – around, and above and below us – can establish communion of thought. If in the external universe any one constructive principle can be detected, it is the geometrical: and in every part of the world in which magic pretends to a written character, I find that its hieroglyphics are geometrical.'

According to one writer, Lytton had the power of telekinesis, and was able to influence objects from a distance; he had seen him cause a letter to fall on the floor from a table, and flutter along to his hand. He also took part in psychical observations on the medium D. D. Home and witnessed a number of his feats (see HOME).

Lytton had a number of traits bordering on the eccentric. His astrological birth-map shows the planet Venus in mid-heaven and the moon exactly rising in the east in the sign of Cancer. One of the peculiarities of the Cancer temperament is said to be a fondness for change of residence, and certainly Lytton rented or owned no less than 38 homes. He would take a fancy to a place, rent it, and live there, writing busily.

Another odd trait was his fear of being buried prematurely in a state of trance or coma, and he left specific instructions in his will to make this impossible. He had a curious way of notifying his manservant when he wished to sleep an hour or two longer in the morning after having worked late into the night. A set number of cigars was always left on his bedside table, and his manservant was able to tell from the number that had been smoked whether he should call him or not. In the daytime he was noted for smoking a very long Turkish pipe.

Occasionally his power of intense concentration could have amusing results. He had taken two young lady visitors to Knebworth, his family home, to the private lake in the park, and had been talking very earnestly to them. 'He became so absorbed in his subjects – spiritualism and theology – that when we got back into the boat he forgot to haul up the anchor, and rowed and rowed without observing no way was made!' And the same lady who reports this records that 'he had a slender hand like an Eastern's. This I remarked when he was showing the lines of marriage on it. "Look," he said, "they are all broken."'

The Luminous Lodge

It is a strange circumstance that in the curious atmosphere of superstition and neo-paganism in which the Nazi movement grew, one of Bulwer Lytton's novels had a strong influence. In Berlin in the early 1930s a group calling itself 'The Vril Society' or 'The Luminous Lodge' came into being. The scientist Dr Willy Ley says that this secret society drew its inspiration from Lytton's *The Coming Race* and that its members firmly believed in the existence of a race of men and women of superhuman powers who inhabited great caverns below the surface of the earth (see SUBTERRANEAN RACE). These people were said to use the Vril power of the human body to do all kinds of wonders. This Vril resembles the oriental tradition of the spinal fire, the serpent-fire or Kundalini (see KUNDALINI).

Members of 'The Luminous Lodge' firmly believed that the Vril people would one day emerge to take control of the earth, and they determined to develop the Vril power in themselves so as to be the equals, not slaves, of the Vril people. They concentrated on practices similar to yoga for this purpose.

In 1870, Lytton himself wrote of his concept: 'I did not mean Vril for mesmerism, but for electricity, developed into uses as yet only dimly guessed, and including whatever there may be genuine in mesmerism, which I hold to be a mere branch current of the one great fluid pervading all nature.' In this letter written a century ago, Bulwer Lytton seems almost to have had an intuitive foresight of the very modern 'laser beam'.

The *Mabinogion* contains a wealth of Celtic lore and legend, and some of the earliest surviving material of the Arthurian legends: 'Kynon comes to the castle' by Norman Ault; this and subsequent illustrations are from the 1910 edition of Lady Charlotte Guest's translation of the work

Much that belongs to the old half-forgotten world of Celtic Britain and the pagan past is enshrined in the stories of the Mabinogion, *medieval Welsh tales that have had a profound effect on European literoture*

MABINOGION

THE MABINOGION is a collection of 11 medieval Welsh tales. The stories, especially the earliest (those known as the 'Four Branches') appear as the result of a sudden blossoming of Welsh prose in the 11th century AD. They were to spark off literary flames throughout Europe, and to exercise a profound influence on medieval secular writings both on the Continent and in the British Isles. This descriptive passage from the story of Culhwch and Olwen, probably the oldest of the tales, is completely illustrative, even in translation, of the elegance and the evocative power of these stories.

> She was sent for. And she came, with a robe of flame-red silk about her, and around the maiden's neck a torc of red gold, and precious pearls thereon and rubies. Yellower was her head than the flower of the broom; whiter was her flesh than the foam of the wave; whiter were her palms and her fingers than the shoots of the marsh trefoil from amidst the fine gravel of a swelling spring. Neither the eye of the mewed hawk, nor the eye of the thrice-mewed falcon, not an eye was there that was fairer than hers. Whiter were her breasts than the breast of the white swan, redder were her cheeks than the reddest foxgloves.

The later stories show strong Norman-French influence, but the Four Branches *(Pedeir Keinc)* of the *Mabinogion* – in spite of the elegance of the language and the veneer of sophistication in the descriptions of the society portrayed – reveals an underlying stratum of mythology and barbarity. It demonstrates that the origin of many of the elements of which these tales are composed was not in the aristocratic courts of medieval Wales, but in pagan Britain. The various motifs must at one time have formed part of the cult legends and the folktales that circulated orally in the Celtic world in pre-Christian times, to be welded together much later by the skill of Welsh writers.

Magic abounds in them. Ancient gods and goddesses masquerade as brocade-draped kings and queens. The crude Iron Age fortress becomes the medieval castle. Individual cults such as the cult of the human head (see HEAD), animal cults, shape-shifting and taboo can all be discerned in the wealth of literary invention and the presence of numerous international folklore motifs, which do much to alter and obscure old traditions.

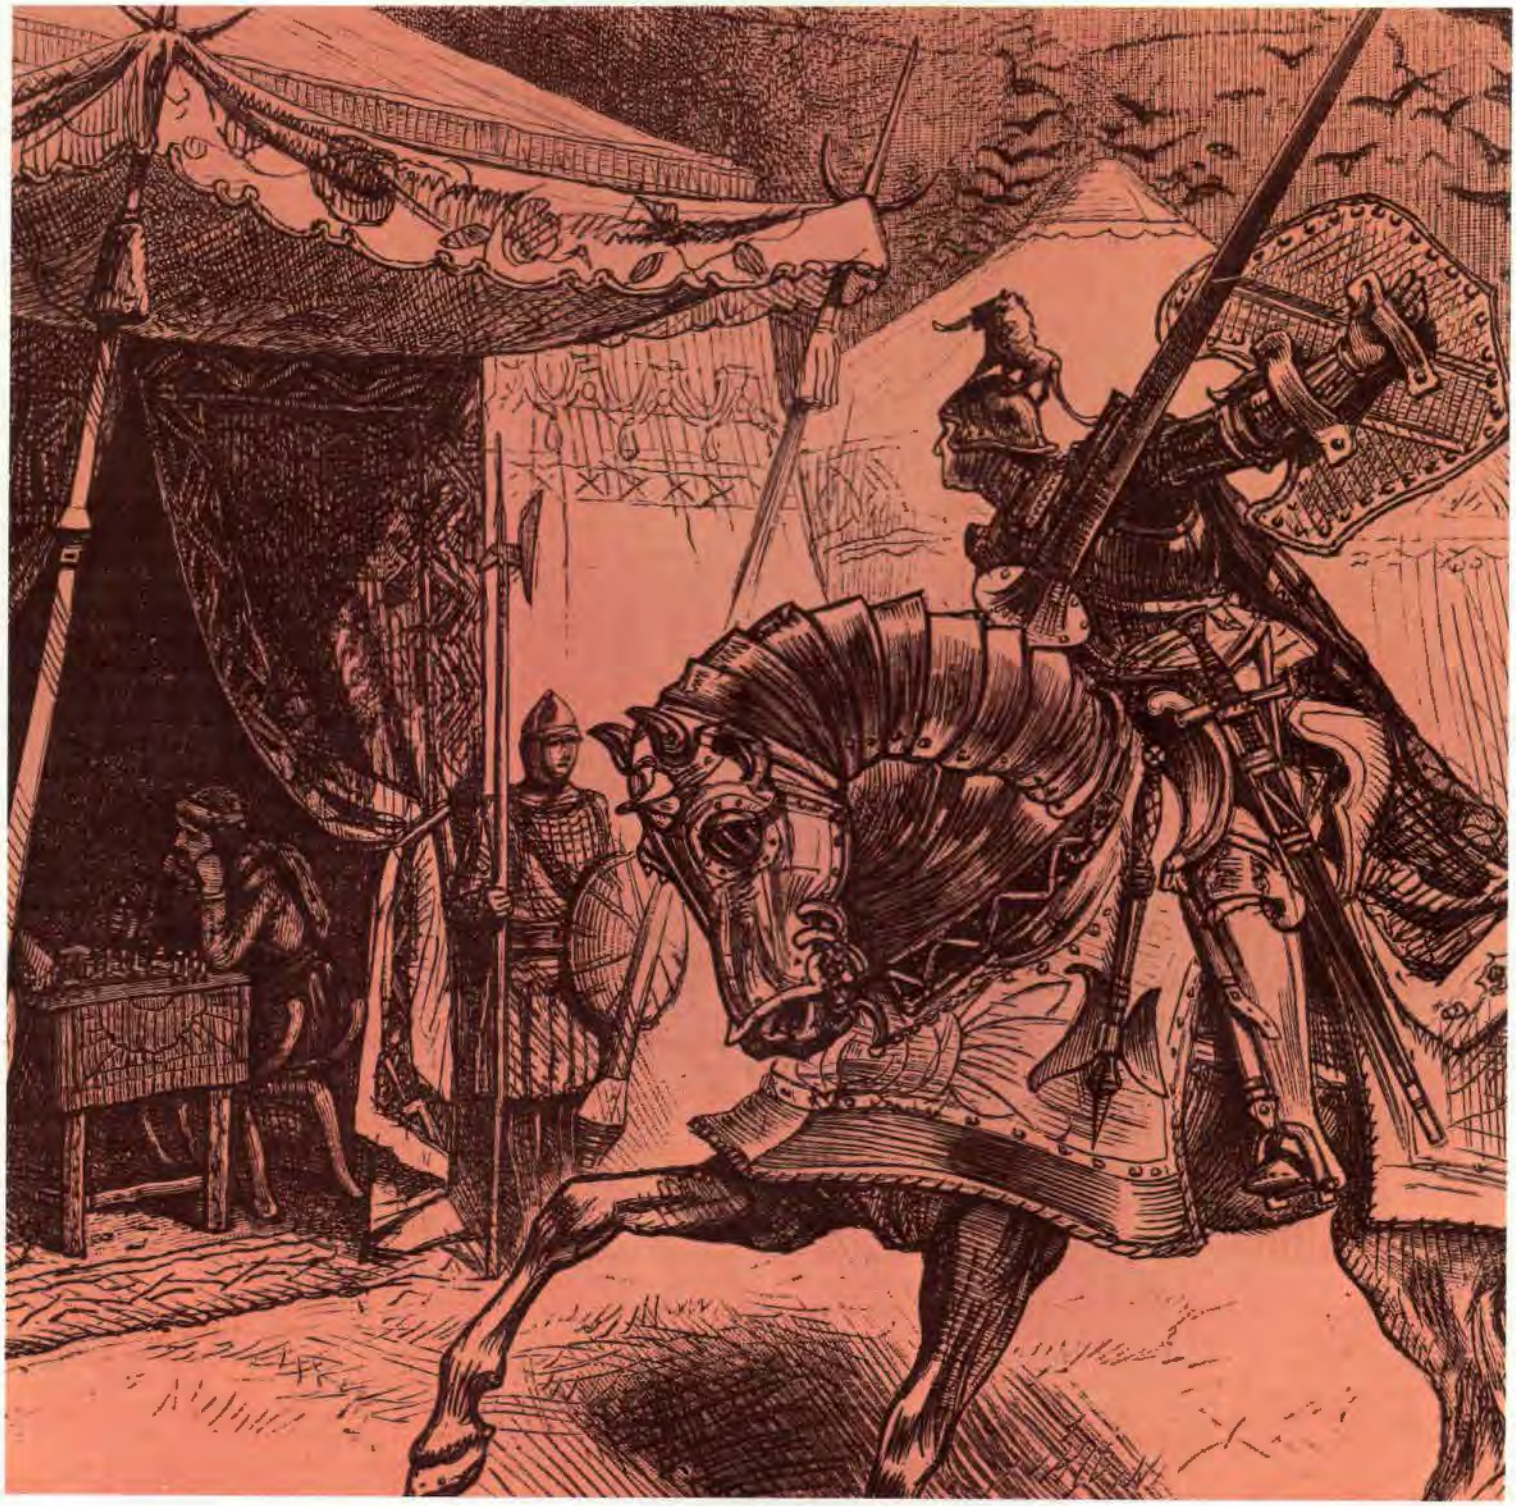
The title *Mabinogion* is in itself erroneous; it was given to this group of tales by Lady Charlotte Guest, who translated them in the 19th century. Her achievement was remarkable, and no matter how incorrect or improbable some of her conclusions, which were based upon the information then available, may now seem to be, one can only accord her the highest praise and respect for what she set out to do, and actually achieved, within the limitations of her time. Lady Guest took the word *Mabinogion* for a plural form of *mabinogi*, but the word 'mabinogi' (whatever its meaning) could only apply to the Four Branches, those of Pwyll, Branwen, Manawydan and Math.

These magnificent compositions are preserved in two Welsh collections, the White

Book of Rhydderch and the Red Book of Hergest. Some of the stories clearly predate the actual manuscripts by a considerable period of time. The probable date of the manuscript of the Four Branches, for example, would seem to be somewhere round about the second half of the 11th century AD; and the written form of the story of Culhwch and Olwen goes back at least another 100 years. But the subject matter of the tales reaches right back into the pagan past; in the same way as new and vital growth derives from the gnarled roots of an ancient tree, seemingly independent of them but, in fact, ultimately utterly dependent, springing directly from them although coming into being so much later in time. As Gwyn and Thomas Jones say of the antiquity of these tales: 'No one doubts that much of the subject matter of these stories is very old indeed, coeval maybe with the dawn of the Celtic world.'

The stories that comprise the *Mabinogion* are very diverse. There are the Four Branches; two short pieces called The Dream of Macsen Wledig and Lludd and Llefelys; Culhwch and Olwen, the earliest Arthurian tale in Welsh; The Dream of Rhonabwy, a romantic tale; and the later Arthurian romances, The Lady of the Fountain, Peredur, and Gereint son of Erbin. Although these last show strong Norman-French influence, there is a basic unity between all these tales, in spite of their manifold differences. The subject matter is primarily ancient, and is composed of a blend of mythology and folklore. The Welsh storytellers must have had many hundreds of tales in their repertoire, and therefore their supply of ready material for entertainment was considerable. Tales were known orally, and centuries passed before they were written down in some form or another.

There can be no doubt that the Four Branches are the finest tales in the *Mabinogion*. Originally mabinogi meant 'tale of a young man or hero'; later it came to mean simply 'tale, story'. The first of the Four Branches, a splendid, moving tale, is concerned with Pwyll, prince of Dyfed, and his exploits; with his heroic defeat of Arawn, king of the Celtic otherworld; with his marriage to the goddess Rhiannon (Great Queen), and with the birth of his son Pryderi.



John Freeman

Like other Celtic bards, the Welsh story-tellers must have had many hundreds of tales in their repertoire and were held in great esteem. The *Mabinogion* stories are distinguished for their elegance and evocative power, and also for the treasure of mythology, legend, folklore and magic which they contain *Left* An army of ravens appears in the tale of the Dream of Rhonabwy *Above* A group of Arthur's warriors confront a giant at the castle of the Giant Gwrnach

The birth of the heir brings about a tragic situation; the infant is stolen from his mother's side on the night of his birth and the mother is accused of infanticide, of slaying her son whilst still unbalanced by the pangs of birth, and is punished accordingly.

It is her extraordinary punishment that constitutes one of the vital clues to the mythological elements in this tale. Rhiannon is the insular equivalent of Epona, 'Great Mare', the Celtic fertility goddess venerated far and wide in the Roman Empire. Rhiannon, on account of her supposed crime, is made to act as a horse. She has to wait beside the horse-block in her husband's court every day, and carry on her back all such as seek to interview the household.

> With that Pwyll, Head of Annwn, arose, and the war-band and the hosts. And that hap could not be concealed. The story went forth throughout the land, and the chief men came together to make representation to Pwyll, to request him that he should put away his wife for a crime so outrageous as that she had wrought. The answer Pwyll gave was: 'No cause had they to request me that I put away my wife, save her having no offspring. But offspring I know her to have, and I will not put her away. But if she has done wrong, let her do penance for it.'
>
> So Rhiannon summoned her teachers and her wise men. And as she preferred doing penance to wrangling with the women she took on her penance. The penance imposed on her was to remain in that court at Arberth till the end of seven years, and to sit every day near the horse-block that was outside the gate, and to relate the whole story to every one who should come there whom she might suppose not to know it: and to those who would permit her to carry them, to offer guest and stranger to carry him on her back to the court. But it was chance that anyone would permit himself to be carried.

It was not chance, however, that caused her to be linked with horses and horse cults in the first place, and there is clear evidence that she was indeed an insular horse goddess, equivalent to and ultimately identical with, the Epona of the Celtic tribes in Europe.

The second of the Four Branches of the *Mabinogion*, Branwen, Daughter of Llyr deals with the marriage of Branwen, sister of Bran the Blessed, King of Britain (see BRAN), to Matholwch, King of Ireland, and the tragedies that resulted from this union. Through the evil influence of Effnyissen, Bran's sinister and enigmatic brother, the marriage is a failure from the start, and the Irish king avenges insults brought about by Effnyissen on the innocent Branwen. He tries to conceal from Bran what is in fact happening to his sister for as long as possible, but ultimately the truth is known and Bran is incensed beyond words, and grieves for his innocent sister's suffering.

Bran sets out for Ireland with his retinue. His followers go by boat but he himself, because of his huge size, has to wade across. One of the finest and most typical passages in early Celtic literature now follows.

> And the swineherds of Matholwch were upon the sea-shore one day, busied with their swine. And because of the sight they saw upon the sea they came to Matholwch. 'Lord,' said they, 'greeting.' 'God prosper you,' said he, 'and have you any news?' 'Lord,' they said, 'we have wondrous news. A forest we have seen upon the deep, in a place where we never saw a single tree.' 'That is a strange thing,' said he, 'could you see aught but that?' 'We could, Lord', said they, 'a big mountain close to the forest, and that moving, and a lofty ridge on the mountain, and a lake on each side of the ridge, and the forest and the mountain and all those things moving.' 'Why,' said he, 'there is no one here will know anything of that, except Branwen knows. Do you ask her.'
>
> Messengers went to Branwen. 'Lady,' said they, 'what thinkest thou that is?' 'Though Lady I am not,' said she, 'I know what that is: the men of the Island of the Mighty on their way over, having heard of my woes and of my humiliation.' 'What is the forest that was seen upon the sea?' they asked. 'The masts of ships and their yards,' said she. 'Alas,' said they, 'what was the mountain that could be seen alongside the ships?' 'Bendigeidfran, my brother, that was,' said she, 'coming by wading. There was never a ship in which he might be contained.' 'What was the lofty ridge, and the lake on each side of the ridge?' 'He,' said she, 'looking towards this island; he is angered. The two lakes on each side of the ridge are his two eyes, one on each side of his nose.'

All the basic ingredients of mythology are present here. The outcome of this invasion is death all round. The boy whom Branwen has borne to Matholwch is murdered. Effnyissen bursts the sacred cauldron of rejuvenation and bursts his own heart at the same time. Bran is mortally wounded and Branwen dies of grief for her son, her brother, and the general awfulness and tragedy of the situation. The story ends: 'and that is how this branch of the mabinogi ends, concerning the blow to Branwen which was one of the Three Unhappy Blows in this island; and concerning the Assembly of Bran, when the hosts of sevenscore districts and fourteen went over to Ireland to avenge the blow to Br. en: and concerning the feasting in Harddlech seven years; and the singing of the birds of Rhiannon, and the Assembly of the Head for fourscore years.'

The third branch, Manawydan son of Llyr, deals with the marriage of the god Manawydan, the equivalent of the Irish Mannanan mac Lir, the god of the sea, to the goddess Rhiannon after the death of Pwyll, her first husband. It contains the motif of the magical spell which causes

Rhiannon and her son Pryderi to disappear, leaving Manawydan alone with Pryderi's young wife Cigfa. Manawydan earns their living by making shoes. The story then describes the return of Rhiannon and her son. Manawydan has caught the wife of the enchanter who cast the spell, in the form of a mouse. The enchanter begs of Manawydan: 'Now set my wife free for me.' 'I will not set her free, between me and God, until I see Pryderi and Rhiannon with me free.' 'See, here they come,' he answered. With that, behold, Pryderi and Rhiannon. He rose up to meet them, and greeted them, and they sat down together. Manawydan asks the sorcerer then, 'In what servitude have Pryderi and Rhiannon been?' 'Pryderi would have the gate-hammers of my court about his neck, and Rhiannon would have the collars of the asses, after they had been carrying hay, about her neck.'

It is interesting that Rhiannon's latent identity with the Celtic horse goddess Epona is revealed in this tale by the fact that her equine associations take the form of punishment. She is forced to behave like a horse in order that she may be degraded. This is perhaps a Christian slant on the old pagan cult.

The Hue of Heaven's Lightning

The fourth branch of the *Mabinogion*, that of Math and Mathonwy, is concerned with the theme of the king and his prophesied death. In this tale many mythological motifs are apparent in the various episodes described. Shape-shifting, both the metamorphosis into another human form and the change to an animal shape, is commonplace. The death of Pryderi, Pwyll's son, takes place in this tale, as a result of the machinations of the sorcerer Gwydion and his brother Gilfaethwy. Pryderi dies after his pigs, which had been given to him by the lord of the otherworld, have been stolen by the two men. The main figure in the tale is the god Lleu, and his birth, his naming, his equipping with arms and his marriage are the chief events around which the story revolves. A magical wife is created for him from flowers by his magician uncle. Her subsequent infidelity and its dramatic consequences lead us to the end of the tale (see GWYDION; LLEU).

Culhwch and Olwen, probably the earliest of the 11 stories, is a most dramatic and beautifully constructed tale, with a strong mythological and magical undercurrent. It also abounds with international folklore motifs.

The god Maponus (known from north British dedications) figures in Welsh literature as Mabon son of Modron, literally 'Son, son of Mother'. In this tale he plays an important role in the hunting of the magical, transformed boar Twrch Trwyth, with which much of the tale is concerned. The story is full of colour and vivacity and fine description. A splendid passage describing the young hero-elect's appearance as he sets out for his cousin Arthur's court is typical:

> Off went the boy on a steed with light-grey head, four winters old, with well-knit fork, shell-hoofed, and a gold tubular bridle-bit in its mouth. And under him a precious gold saddle . . . A gold-hilted sword on his thigh, and the blade of it gold, and a gold-chased buckler upon him with the hue of heaven's lightning therein, and an ivory boss therein. And two greyhounds, white-breasted, brindled in front of him, with a collar of red gold about the neck of either, from shoulder swell to ear. The one that was on the left side would be on the right, and the one that was on the right side would be on the left, like two sea-swallows sporting around him. Four clods the four hoofs of his steed would cut, like four swallows in the air over his head, now before him now behind him. A four-cornered mantle of purple upon him, and an apple of red gold in each of its corners: a hundred kine was the worth of each apple. The worth of three hundred kine in precious gold was there in his foot-gear and his stirrups, from the top of his thigh to the tip of his toe. Never a hair-tip stirred upon him, so exceeding light his steed's canter under him, on his way to the gate of Arthur's court.

Culhwch and Olwen is a document of the first importance for any study of the sources of the Arthurian legend. Arthur figures here in a guise quite different from the civilized, elegant emperor of later tradition. He is portrayed as a British king, without any veneer of sophistication. He typifies all that one finds in the Celtic tribal god, whether or not his own origin lay in ancient Celtic mythology (see ARTHUR).

The Dream of Rhonabwy, for all its sophisticated and complex structure, also stems from the old heroic traditions of the pagan Celtic world. But a fundamental change occurs in the three latest tales of the *Mabinogion*: The Lady of the Fountain, Peredur, and Gereint, son of Erbin. The influence of Norman-French life and letters in these stories is powerful, and stands out clearly in all the descriptions of personal appearance and the material background. Landscape is vague, not detailed as in the earlier group. Place-names sink into an anonymous world. It is singular that the best passages in these Arthurian romances are those that stem from the ancient native tradition.

The *Mabinogion* has been translated into English three times, Lady Charlotte Guest's version, which appeared between 1838 and 1849, being perhaps the best-known. A rare collection of medieval tales, written in Welsh, the *Mabinogion* enshrines much that belongs to the old, half-forgotten world of Celtic Britain and the pagan past. Its very richness, and the hints it contains of other stories, indicates what a vast and varied repertoire the early story-tellers must have had. An Irish *ollamh*, 'professor', was required to know 350 prose tales by heart and there is no reason to suppose that the repertoire of the Welsh *cyfarwydd*, 'story-teller' was on a lesser scale.

The story-teller was held in high esteem throughout Celtic history; he played a vital role in the entertainment of the aristocracy and in the preservation of tradition. In the story of Math, after Gwydion and his companions have come to Pryderi's court, Pryderi asks one of the men to tell a tale. 'Why,' said Pryderi, 'gladly would we have a tale from some of the young men yonder.' 'Lord,' said Gwydion, 'it is a custom with us that the first night after one comes to a great man, the chief bard shall have the say. I will tell a tale gladly.' Gwydion was the best teller of tales in the world, and in a society where the competition was great and the standards formidable, this is high praise indeed.

MACROCOSM AND MICROCOSM

'KNOW,' said the 3rd century Christian theologian Origen, 'that you are another world in miniature and that in you there is a sun, a moon and stars too.' The theory of macrocosm and microcosm is a spectacular development of anthropomorphism, the universal tendency of man to picture God or the gods, and the whole world around him, in his own image. The universe, the macrocosm (from Greek *makros kosmos*, 'great world') is regarded as a human organism on a gigantic scale and man, the microcosm (from *mikros kosmos*, 'little world') as a miniature copy. He is made of the same materials and he contains a soul, which is the human equivalent of the world-soul that animates all Nature. Everything in man, his ideas and emotions, his instincts and cravings, his confusions and contradictions, has its counterpart in the universe.

But man is also made in the image of God, as the book of Genesis says, and so, in effect, God is the sum total of the universe and man is a tiny replica of both the universe and God (though this is over-simplified, for many who think in these terms have maintained that although God is present in everything that exists, he is more than the sum total of everything in the universe). The theory is of great importance in magic, since if man contains God and the universe in himself, then with his own resources he can wield supreme power over all things.

Agrippa, Paracelsus and other occult philosophers of the Renaissance adopted the theory of macrocosm and microcosm enthusiastically but the theory itself was much older. It was well known in medieval Europe which had inherited it from the late classical world, where again the universe was believed to be a living and divine organism.

Though discarded by modern science, the theory has retained its value for occultists and magicians, who believe that science's picture of the universe accounts for only a small part of reality. It has the great attraction and advantage of satisfying

and reconciling two powerful opposite feelings that human beings have about themselves and their place in the world. On the one hand, man is insignificant, a toy copy of a vast original, at the mercy of forces incomparably greater than himself. On the other, he is crucially significant, 'the measure of all things', the potential godhead and master of Fate.

In the 17th century, Robert Fludd, following numerous earlier precedents, constructed cosmic diagrams to illustrate and classify the connections and parallels between the 'great world' and man (see CABALA; FLUDD). He originally drew the theory of macrocosm and microcosm from classical philosophers but, like other theorists of his period, he found the same ideas in the Cabala. Here ordinary human man is a small-scale replica of Adam Kadmon, the heavenly or primordial man, man as he was originally created by God. Adam Kadmon is the vast human organism that is the universe and, if not God, he is at least very close to being God. His body is the Tree of Life, which is the underlying structure of the universe and the structure of God as he reveals himself.

It is this relationship between man and God which made it possible for Cabalists to say that it is the duty of man to promote the wholeness of God. It is the relationship between man and the universe which encouraged the construction of systems of correspondences between different factors or forces in the universe and their equivalents in man (not only in the Cabala, of course, but outside it as well).

The theory of macrocosm and microcosm was one of the pillars of alchemy. The universe was alive and just as man's body contained a soul, so all matter contained the universal spirit or world-soul. As Jung observed: 'In order to explain the mystery of matter he (the alchemist) projected yet another mystery – namely his own psychic background – into what was to be explained.' Alchemy combined chemistry with mysticism because the universe outside the alchemist was built on the same model as the universe inside him. The metals were 'begotten' in the earth in a way which paralleled human reproduction, and 'grew' like human children. To concentrate the universal spirit in the Philosophers' Stone was also to achieve spiritual perfection and completeness (see ALCHEMY).

The theory is also a bastion of traditional astrology (though not all astrologers would now accept it). The four elements and four qualities are the basic constituents of everything in the universe and they are the basic constituents of man, not only of his body but of his character, the four 'humours' determining each individual's personality-type (see ELEMENTS). Many astrologers still classify the zodiac signs in a horoscope in terms of the four elements.

From the 11th century on, diagrams of the human body showing how its organs and members correspond to the zodiac become increasingly frequent in manuscripts, accompanied apparently by a growing tendency to fatalism, to the feeling that man's life is dictated to him from his birth. Each man carries the starry heaven and its influences within himself ('in you there is a sun, a moon and stars too') and as the planets move along their courses in the sky, so will human beings follow the appointed pathways of their lives. It was this link between the universe and man which enabled the calculable and predictable movements of the heavenly bodies to be used as an index to the otherwise incalculable behaviour of human beings. On the other hand, the same link encouraged the attempt to use the power of the planets in magic.

MADNESS

THE WORD 'MADNESS' has no place in the scientific terminology of psychologists but it has long been used in everyday speech for deviations from 'sane' behaviour. What in fact constitutes sane behaviour is a matter of dispute. If it implies adjustment to the cultural milieu of one's environment, then it would appear to be only a relative term.

Some aberration from so-called normal standards seems to be almost a prerequisite for certain careers. The lives of the great musicians, poets, painters and writers often fall markedly short of the accepted norms of sanity and sobriety. How often evidence of a morbid turn of mind is found in the lives of the famous. The lover and the poet were bracketed together with the lunatic long before Shakespeare's time.

The history of the religious and arcane traditions suggests that spiritual activity, both orthodox and unorthodox, inclines the human personality very strongly towards odd or eccentric behaviour that may often border on madness. It is almost axiomatic that the gods and spirits never speak to the perfectly sane or the perfectly sober. The wonder-worker, prophet, medicine-man and magician, all have more than a touch of abnormality.

The shaman or sorcerer-priest of the tribes living in the northern and Arctic latitudes of Finland, Siberia and America is frequently classed as a psychopath. In spirit he flies up to heaven, descends to hell, and dives to the nethermost regions of the sea. He receives messages from the dead, communes with spirits. But his mental balance is insecure and he is easily 'unhinged'. If suddenly angered or startled he loses his self-control completely. His eyes redden and bulge out, his face goes through the most hideous contortions, and unless restrained he will not hesitate to maim or murder the person who provoked him. If frustrated from working off his rage, he will roll about on the ground screaming and foaming at the mouth until he loses consciousness. When he regains it, he is himself again. In the eyes of his people such a man is naturally believed to be possessed, and very susceptible to the

Previous page **The belief that there is a connection between the moon and madness is widespread, and the word 'lunatic' itself is derived from *luna*, 'the moon': 17th century French engraving showing the rays of the moon affecting women's minds *Above* Painting by Goya of a scene in a lunatic asylum; in a different society the inmates could have been revered for their supranormal powers *Above right* In primitive societies dancing always had a religious or cultic basis, and was one of the methods used to induce a state of ecstasy: North American Indians performing a scalp dance in celebration of victory; from Catlin's *North American Portfolio* (1844)**

influences of inspiration or divine suggestion (see also SHAMAN).

Many of the symptoms mentioned above are akin to those of epilepsy, a peculiar nervous affliction during which the victim similarly loses consciousness, falls to the ground and undergoes convulsions. From earliest times 'the falling sickness' was regarded as divine in origin, and those who suffered from it were described as the 'blessed ones'.

Ecstasy is another curiosity of religious experience. The Greek term *ekstasis* means 'standing aside', and originally signified bewilderment or insanity. It may range in degree from the deep, intense exhilaration of physical or mental fulfilment to the sudden mystic rapture of the saint or prophet. The experience of the saint in ecstasy transcends anything known in everyday life. Like the madman the saint is 'beside himself'. The priestess of the ancient Greek oracle of Delphi attained a state of ecstasy as she sat on the sacred tripod placed over a fissure in the ground, breathing the toxic fumes that emanated from it. She would go into a trance and deliver prophecies supposedly inspired by the god Apollo. Since most of her utterances were unintelligible ravings, a special class of priests was assigned to interpret and make sense of them.

There was once a widespread belief that it was possible for a demon to enter a person and take 'possession' of him, causing him to behave in an unnatural and violent manner. In such cases the possessed exhibits all the characteristics of another personality; he speaks in a different voice and behaves in a manner quite unlike his normal self. The state of possession can become epidemic. So shocking is the sight of some forms of possession that an onlooker may succumb to an attack himself.

This contagious possession usually takes a religious form and can assume alarming proportions. This history of medieval monasticism records periodical epidemics of possession that raged in religious institutions. Nuns were particularly susceptible to possession by 'demons'. They suffered convulsions, had erotic visions which they described in lurid detail, used obscene language, spoke in strange voices. Often the possession lasted for many months and the convents where the nuns lived remained in a state of permanent uproar.

The prescribed method for expelling the invading spirit was exorcism, a ritual that was performed by a priest during which the spirit was solemnly commanded to leave, and the adjuration was supported by threats, admonitions and abuse (see EXORCISM). Very often the 'demon' replied in kind. A curious feature of these exchanges between exorcist and spirit is that it sometimes resembles the dialogue between psychoanalyst and schizophrenic patient.

The lives of saints and ascetics have always been of interest to students of psychopathology, because abnormality is often present to a remarkable degree in their behaviour. Some, no doubt, nowadays would qualify for admission to a mental hospital. The patron deity of many strange sects in Hinduism is the god Shiva, whose 1008 names include one that means 'mad'. Likewise, the *sadhus* or ascetics of India are sometimes spoken of as *pagal*, 'mad', a description that does not in any way detract from the reverence in which they are held. In the words of Ramakrishna, the founder of a world-wide cult, 'the true saint behaves as though he were mad.'

Some Christian ascetics in Egypt and Syria between the 3rd and 7th centuries were incredibly crazy, yet they aroused the admiration of religious people and set an example that aspirants to the holy life tried to emulate for centuries after. They lived in solitude and silence, kept long fasts and vigils, and meditated in complete darkness for months at a stretch. Some, the Browsers, lived only on leaves, herbs and roots, the Dendrites lived on the tops of trees and the Stylites lived on the tops of pillars. One of

Su Gooders

the most famous of the last group was St Simeon Stylites in the 5th century AD. He built a pillar 16 feet high surmounted by a platform, 4 feet square, with a low balustrade around it. He never came down from this edifice, except to build and occupy another 30 feet high. He went on to a third pillar 45 feet high, and ended his days on a pillar 80 feet in height. In all he spent a total of 36 years on the tops of pillars. Ethiopians, Jews, Persians, Armenians, Medians and Saracens travelled to the outskirts of Antioch to gaze at him. Great virtue was said to accrue from the pilgrimage and those who saw the wonder retailed the legend of his saintliness when they returned to their homes and villages (see SIMEON STYLITES).

'Slain of the Lord'

Asceticism is but one method of inducing the state of 'dissociation'. Now largely obsolescent in psychological literature, this term is still used to describe the mental phenomena that occur when normal perception seems to shift, either wholly or in part, to another level of awareness and activity. Such dissociation may be intentionally induced and has been used in magic and religious ceremonial from earliest days.

Dancing, singing, whirling, howling, fasting, flagellation, mediumistic trances, illness, fevers, meditation, prayer, intoxicants, hypnosis, drugs, all these can precipitate one beyond the confines of the everyday world into a condition of trance, euphoria, mania, clairvoyance.

Wilhelm Wundt (d 1920), the German psychologist, called dreaming a state of 'normal temporary insanity'. Some authorities find a close connection between Spiritualism and schizophrenia. Flagellation and other sadistic and masochistic rituals were common in many religious cults. In times past dancing always had a religious or cultic basis; even if warriors danced to prepare for war or to celebrate a victory, it was still essentially a religious rite. Ecstasy was implicit in the dance. The Roman writer Cicero (d 43 BC) said, 'No one dances when he is sober, unless he happens to be a lunatic'.

Perhaps the most extraordinary exhibition of the alliance between madness and the religious dance is found in the dancing mania of the Middle Ages (see DANCING MANIA). Europe knew several epidemics of this type, starting in the 11th century, but the most widespread was one that began in 1374 at Aix-la-Chapelle, when men, women and children joined hands and danced through the streets. They were in a state bordering on delirium, calling out to the saints, shouting of their visions of heaven and hell, all the while dancing, until they fell exhausted to the ground. This frenzy was accompanied by convulsions, foaming at the mouth and blackouts. The mania spread to Belgium, the Netherlands and Germany. At one time the dancers on the streets of Metz numbered 11,000 persons. Attempts were made to exorcize the mania, but to no avail, and it eventually died out.

In modern times the best example of religious mania is seen in the tumultuous upsurge of religious enthusiasm in revivalist movements. A veritable madness seems to grip the congregations who get carried away on the crest of a powerful wave of feeling that seems beyond control.

The most extraordinary example of revivalism was in Kentucky at the turn of the 18th century (see HOLY ROLLERS), but there were other well-known revivals in Ireland and Wales. The preachers who precipitated the mania delivered sermons about everlasting hellfire for lost souls, and their terrifying prophecies of doom for the unredeemed caused a fierce blaze of religious emotion. A member of the congregation would suddenly utter a moan, which would be echoed here and there by others. Then there would be a shriek, and a dozen throats would respond with piercing screams. Someone would suddenly jerk about and fall to the floor, and his collapse would be followed by wholesale convulsions and fits. The crowd would stamp and chant, and the more sober among the faithful would start removing the 'slain of the Lord', carrying them away like so many logs of wood.

Individuals dedicated to things spiritual were traditionally divided into two classes; the dichotomy between them is seen in the rational, level-headed member of the 'establishment' on the one hand, and on the other the unorthodox prophet and rebel sitting at the outer gate of cities. One is versed in the law, the other is in tune with the Infinite. In Judaism one is the Pharisee conscious of his righteousness, the other a Jeremiah foretelling doom. In Hinduism

one is the pandit weighed down with book-learning, the other is the yogi steeped in the mysteries of another dimension. And so it is in all religions. The archbishop and the saint of Christianity; the mullah and the Sufi of Islam; the noble Apollonian and the drunken Dionysiac of the ancient Greeks (see DIONYSUS).

To the common people, those who fell into the second category were not so much dangerous as blessed. In the East the madman had inviolable privileges. Even if feared, he was revered. He was the divine one, and his incoherencies were pondered over for symbolic messages and hidden meanings. The ranting shaman, the prophet with his outlandish garb and fearsome visage, the paranoiac witch-doctor, were psychopathic by modern standards, but in their own societies were believed to be able to commune with the spirit world and the shades of the dead.

The rational part of man's brain insists on putting the question, 'How can man commune with the spirit world?' but there is an ancient, irrational, instinctual area which is aware of a hidden dimension which it does not attempt to understand. A shifting of consciousness, a displacement of the mental faculties is probably essential if this hidden dimension is to be revealed. Crazy persons are 'cracked', 'unhinged', 'screwy'. The eccentric is 'off-centre', his mind not quite even in its functioning. Some imbalance seems necessary to make the personality more receptive to material from 'out there', and to enable an individual to have visions of 'things that never were on sea or land'.

The mental patient who sees the skull beneath the living face, and the prophet or medicine-man to whom the hidden realities of the spirit world are revealed, both experience a shifting of consciousness, a displacement of the mental faculties: *The World of Madness*

Camera Press London

The Validity of Nonsense

There was a time when religious faith had the reputation of being absurd, and sometimes gloried in it. In the 3rd century Tertullian, one of the great Fathers of the Church, declared *Credo quia absurdum* ('I believe because it is absurd') and today an echo of this is often heard in scientific circles. Mathematics and physics are creating a new mysticism of their own, and it is rash to say that anything is absurd. The eminent Danish scientist, Niels Bohr (d 1962) in summing up a discussion following a lecture by another physicist said, 'We are all agreed that the theory is crazy. The question which divides us is whether it is crazy enough to have a chance of being correct. My own feeling is that it is not crazy enough.'

Today we are verging on an irrational concept of the universe. We are almost certain that Nature is not rational and it is doubtful if man's senses get him any closer to ultimate truth. Voltaire conceived of beings with a thousand senses who were no nearer to an understanding of reality than creatures with only five. Growing acceptance of the validity of nonsense ar ' irrationality in literature, art and even science, confirms the wisdom that makes religion respect the lunacy of the saint. Who can tell whether the meagre data that trickles in through the senses can give a clearer inkling of what it is really like 'out there' than the dream, the delirium, the fantasy or the vision? Perhaps the absurd and irrational experiences of mysticism, prophecy, poetry, magic and the supernatural provide one crystal pane in the dome of many-coloured glass through which man may catch a glimpse, however fleeting, of things true and eternal.

BENJAMIN WALKER

Maenads

Or Bacchae, frenzied women devotees of the Greek god Dionysus; armed with ivy-twined staffs tipped with a pine cone, and clothed in animal skins, they roamed the mountains celebrating the cult of Dionysus with ecstatic dance and song: they tore live beasts apart and devoured the flesh, probably as a rite of communion with the god.

See DIONYSUS.

Michael Holford

Magi

Or magians, 'wise men', plural of magus, a great adept of the occult arts; from a Persian word from which our 'magic' is derived: learned Persian priests, revered as sages, magicians and diviners: three magi, or wise men or kings, brought the infant Jesus gifts of gold, frankincense and myrrh, an event commemorated in the festival of the Epiphany; according to tradition, their names were Kaspar, Melchior and Balthasar, and their bones were buried in Cologne Cathedral.

Cassiel.

The ultimate aim of magic, in the European tradition, is to achieve total domination of the universe, 'the all encompassing divine power which religion reserves for God but which magic reserves for man'

THE QUESTION 'what is magic?' has many answers and magic is not easy to define, even within the Western tradition and putting aside the magic of other peoples. A magician is an obvious person to look to for an answer and the most notorious of modern magicians, Aleister Crowley, supplied one in his book *Magick in Theory and Practice*: 'The question of magick is a question of discovering and employing hitherto unknown forces in Nature.'

This suggests that the common view of magic as something intended to work miracles, to set aside the order of Nature, is wrong-headed. Magicians are concerned with forces in Nature, even if they are peculiar, generally unrecognized or even, to a sceptic's eye, non-existent forces (though it takes a determined sceptic now to dismiss all of them as non-existent). The feats claimed by or attributed to magicians – influencing someone at a distance, for example, or being in two places at once, or mind-reading, or knowing what is going to happen in the future – may be 'supernatural' in that they seem to break natural laws, as these laws are understood at any given time. But either the feats are unreal and impossible or, if real, they are within the order of Nature as all reality must be.

Previous page **Magicians invoke intelligences to help them control cosmic forces: invocation to Cassiel, 'chief of the spirits', from the *Book of the Spirits*, a magical textbook *Above* For a magical operation to be successful driving forces deep within the practitioner's being must be liberated; the paraphernalia of magic is part of the attempt to break the constraints of reason and convention: witches' kitchen, Witches' Museum, Bourton on the Water**

Magicians are convinced, partly because of their basic cast of mind and partly as a result of their experiences, that the account of the universe given by science describes only part of the reality, and not the most important part: that there are far more things in heaven and earth than are dreamt

Michael Busselle

of in a rationalist and materialist philosophy. As Eliphas Levi said, in *Transcendental Magic*: 'It is in like manner with all the miracles of magic; a law exists which is ignored by the vulgar and made use of by the initiate.'

The 'scientific' background of magic itself is in a curious way both out of date and up to date. The theory of macrocosm and microcosm, on which European magic is based, was discarded by scientists long ago and the astronomy of traditional astrology is pre-Copernican. For 300 years or so in the West, the accepted picture of the way in which the universe works has largely excluded the forces with which magicians deal. It is only comparatively recently that experiments in psychical research have begun to suggest that some of these forces – extra-sensory perception, precoguition, psychokinesis – may well be realities.

But a magician is not a scientist or psychical researcher who has gone off along an odd track. He does theorise about his secret forces but he is much more interested in employing them. Magic is concerned above all else with the acquisition and exercise of power. 'Magic,' Levi said, 'is the traditional science of the secrets of Nature which has been transmitted to us from the magi. By means of this science the adept becomes invested with a species of relative omnipotence and can operate superhumanly – that is, after a manner which transcends the normal possibility of men.' A magician with less respect for Christianity, or less anxious to avoid the unfavourable notice of the Church, would leave out the word 'relative'. Omnipotence unqualified, supreme power over all things, is the ultimate goal of magic, though it is expected that it may take many reincarnations and lifetimes to achieve it.

A magician, unlike a scientist, is not concerned to explain his secrets. On the contrary, he wants to preserve them as mysteries. Magicians revel in what is secret, obscure, concealed and mysterious. This is one of the reasons for the obscurity of so much occult writing. If you are cherishing a great secret, it spoils it if you tell it to other people. But it also spoils it if you do not reveal at least a little bit of it, hence the occultist's love of hints, allusions,

'Magic has power to experience and fathom things which are inaccessible to human reason. For magic is a great secret wisdom, just as reason is a great public folly'

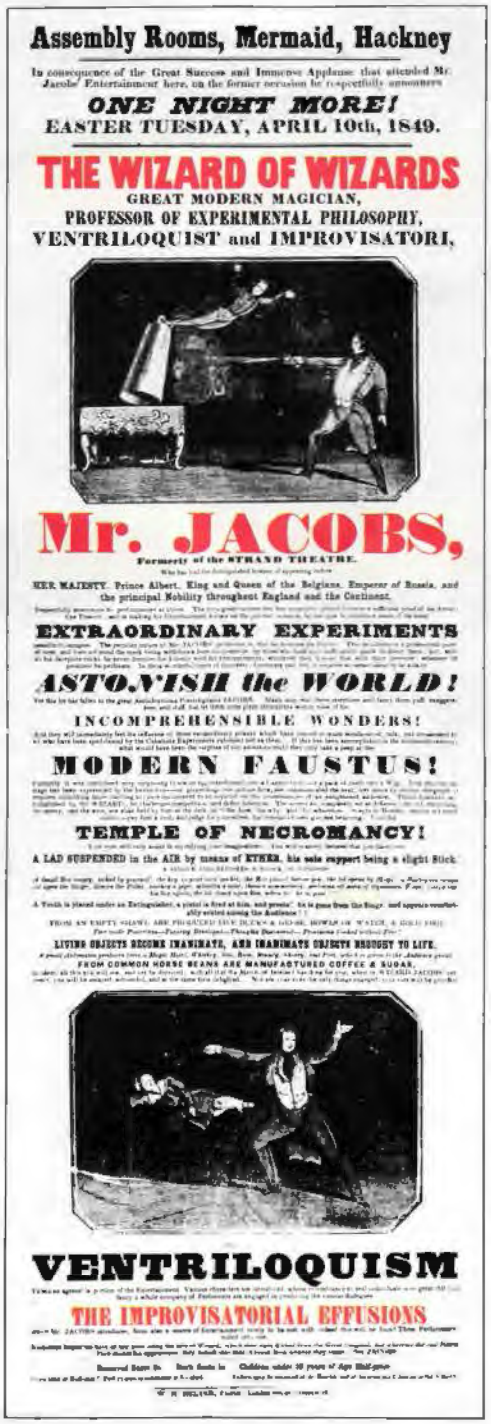
symbols and veiled language. Levi's famous four rules for the adept were 'TO KNOW, TO DARE, TO WILL, TO KEEP SILENCE.' Characteristically, this instruction to keep silent occurs in one of the longest and most revealing books about magic ever written.

Another reason for obscurity is that magic tends to be highly elitist, as a glance at much of the occult literature about Atlantis or Lemuria will show, and as Levi's distinction between 'the vulgar' and 'the initiate' suggests. Magicians are the adepts, the select few who have plumbed mysteries that are too deep and too dangerous for the common herd.

But there is another and better reason for silence and mystification. Magic is essentially an art and, like other arts, it can be learned but it cannot be taught. This statement has instantly to be qualified by asserting its opposite (appropriately, since it is a fundamental law of magic that all things are arranged in opposites, and it is the magician's business to reconcile them). Magical groups and orders usually have a hierarchy of degrees, or grades – frequently ten of them, corresponding to the ten sefiroth of the cabalistic Tree of Life (see CABALA) – and an initiate works his way up the ladder of the grades, receiving instruction in ever-deepening mysteries on the way. Traditionally, he must be taught and initiated by someone to whom authentic doctrine has been revealed, and one of the duties of the higher grades is to help the novices. All the same, the secrets cannot simply be explained to the learner. They must be contemplated, experienced and mastered by each person for himself afresh. At the climax of the Eleusinian Mysteries the initiates were not given a lecture, they were *shown* something (see ELEUSIS). It was for each of them to sense for himself what this revelation meant.

And finally, explaining anything involves rational analysis and reasoned exposition but deeply embedded in the European occult tradition is an intense distrust of reason. The powerful gnostic strain in Western magic, which Levi and Crowley did much to resuscitate, values as the paths to the truth behind the outward appearance of things, not reason, but insight, intuition, imagination, inspiration. You cannot find the one great underlying reality by thinking about it. 'Magic,' Paracelsus said, 'has power to experience and fathom things which are inaccessible to human reason. For magic is a great secret wisdom, just as reason is a great public folly.'

Victorian poster advertising the appearance of 'The Wizard of Wizards' in London in 1849

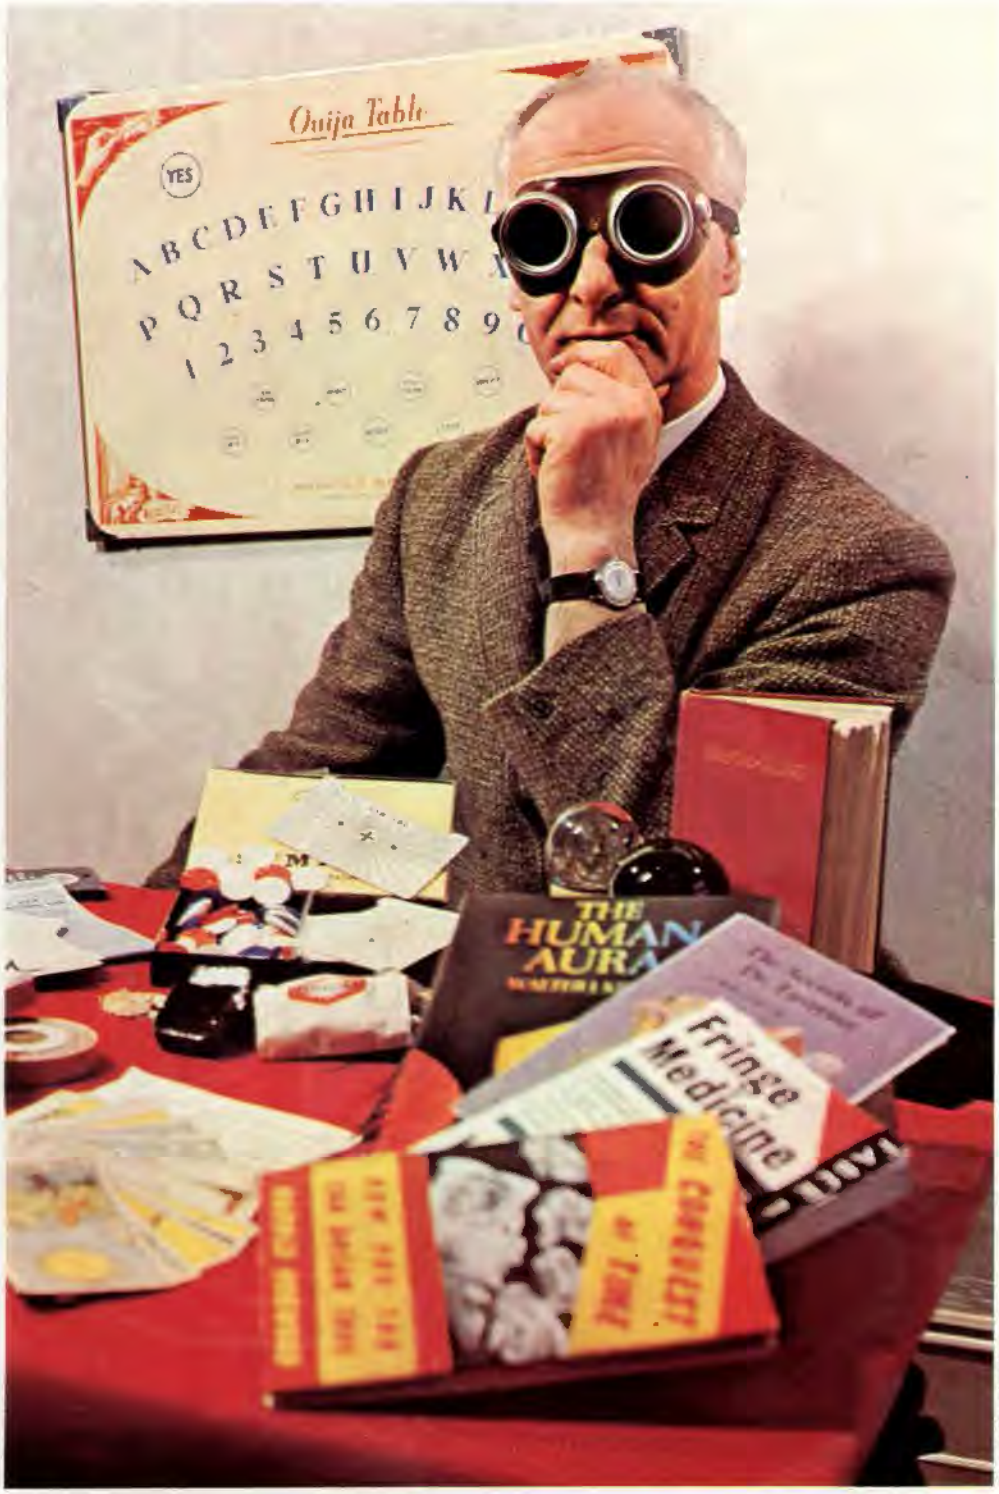


It is not on order but on disorder of the mind that the magician relies for power and the vision of truth. A magical operation of any difficulty cannot be performed successfully in a normal condition of mind. This is one of the factors behind the use of chanting, robes and evocative paraphernalia, sex, sadism, drugs, passionate and ferocious imaginings, and the acting out of emotion in magical rituals. These techniques or 'weapons' (not all of which are used by all magicians) are designed to break the constraints of reason and convention, to liberate the driving forces from the depths of the magician's being.

But again the opposite is also true, since it is essential that the magician remain the master of the forces which he has unleashed, and not be swept away by them. And although they distrust order and reason, magicians have paradoxically constructed a rigidly orderly classification of everything in the universe, sorting all phenomena into a limited number of pigeonholes – the number itself being predetermined: seven if the traditional planets are taken as the index, ten if the sefiroth are, 22 if the Tarot trumps and the 'paths' of the Tree of Life are. These systems are not reached at random but depend on a certain logic (see ALPHABET; CORRESPONDENCES; FORCES; PATHS).

The Power of Infinity

Systems of correspondences stem from the magician's view of the universe, which is based on the old classical and medieval picture of it. The universe is regarded as a human organism on a colossal scale and man as a copy of it in miniature (see MACROCOSM). Man is also a miniature replica of God and so, by a process of mystically expanding himself, a man can become the sum total of all things and the wielder of supreme power. One of the Hermetic texts says that a man can transcend all limits of time and space, can become higher than all height, lower than all depth, can take to himself the qualities of all creatures, can be everywhere at once, can be both living and dead. 'By such an expansion of the range of his consciousness, man may rise into oneness with God, who is Himself the Whole'.



Camera Press London

A modern dealer in magic and spells, John G. Williamson displays his wares which include a psychic trumpet, Tarot cards and a ouija board; he himself is wearing goggles which he designed to pick up the 'psychic aura'

Hundreds of years later, Agrippa spoke of the master magician as the man 'who has cohabited with the elements, vanquished Nature, mounted higher than the heavens, elevating himself to the archetype itself with whom he then becomes co-operator and can do all things.' Hundreds of years later still, Crowley defined God as 'the Ideal Identity of a man's inmost nature' and the ultimate goal of magic, the Great Work, as 'the raising of the whole man in perfect balance to the power of Infinity.'

If man is the universe in miniature, then all factors in man are duplicated on a greater scale in the universe. Man is vibrantly alive and clings to life with intense tenacity, therefore there is in the universe a life-force, a power or vibration or tendency, call it what you will, that makes for the continuance of life. Man has in himself forces of love and desire, therefore there is in the universe a greater force of love (called, for convenience, Venus). Man has feelings of hatred, aggression and destructiveness, paralleled in the universe by a fierce current of destructive energy (Mars). The viruses, impurities and waste products of the human body have their counterparts in the universe as demonic intelligences (in the Cabala the 'shells' or 'husks', the worthless rubbish of creation).

All drives and forces which are powerful in man will also be powerful in the universe at large, hence the magical importance of sex. Similarly, the fact that human beings are swayed by signs and symbols, by gestures and above all by words, means that these weapons will be effective in swaying and controlling the forces of the universe (see INCANTATION). But all other things in Nature, colours, jewels, animals, herbs, everything, must also have counterparts in man. How do we know which factors in man reproduce the colour red or the number eight, iron or the diamond? The answers are given in the correspondences, which classify everything in terms of the great driving forces that are common to man and the universe outside him. Man is alive and his mind and body contain energy, and correspondingly the universe as a whole and each individual piece of it contain energy, which the magician who knows the hidden links and connections can use in his operations.

The correspondences are arranged partly in terms of the planets and partly in terms of the Tree of Life. This method is the descendant of the medieval picture of the universe as a system of concentric circles or 'spheres'. Before a child is born, so the theory went, his soul descends from God in the outermost sphere to the sphere of the zodiac signs and fixed stars. Then it descends to the sphere of Saturn and through the spheres of the remaining planets. From the innermost sphere, of the moon, the soul descends to earth, which is at the centre of the system, and is born in a human body.

At death, the soul sheds its physical body and tries to find its way back to God through the spheres, shedding characteristics on the way. But it will meet many dangers and difficulties in this ascent and one of the springs of European magic was the attempt to discover the correct passwords and procedures which the soul would need to pass the guardians of the spheres, spiritual beings which would bar its passage.

This idea of the soul's ascent after death has brought into Western magic the whole notion of 'rising through the spheres', not after death but in this life. The magician attempts to explore the mysterious layers of existence that surround the plane of our normal, everyday life, gaining increasing knowledge and power with each further exploration until at last the supreme goal is reached. The spheres, the sefiroth of the Cabala, are stages in the process by which the godhead revealed itself, the major driving forces of the universe and the steps of the magician's stairway to the godhead

Mansell Collection

Left **The attempt to become a god is the 'great work' of both alchemy and magic; the alchemist's efforts to transmute base metals into gold paralleled the magician's attempts to attain the divine while still in the body: alchemist at work in his laboratory *Right* Astrology has always been important in magic and magicians attempt to use the influence of the planets for their magical operations: chart from a 17th century version of the *Key of Solomon* the most influential textbook of European magic *Right below* The magic circle of Agrippa: the six-pointed Seal of Solomon is contained within concentric circles in which names of power are written; standing inside this circle the magician and his assistants are protected against the forces conjured up during a magical rite**

(and correspond to the degrees or ranks of the occult hierarchy).

The picture of the soul's descent through the spheres before birth, acquiring characteristics from each planet, is one of the foundations of traditional astrology, which is also based on another fundamental magical doctrine, the law of 'as above, so below'. This law is again part of the theory of macrocosm and microcosm, the doctrine that as God is in the world 'above', so man is in the world here below. It states the old belief that events on earth parallel the doings of the gods in heaven.

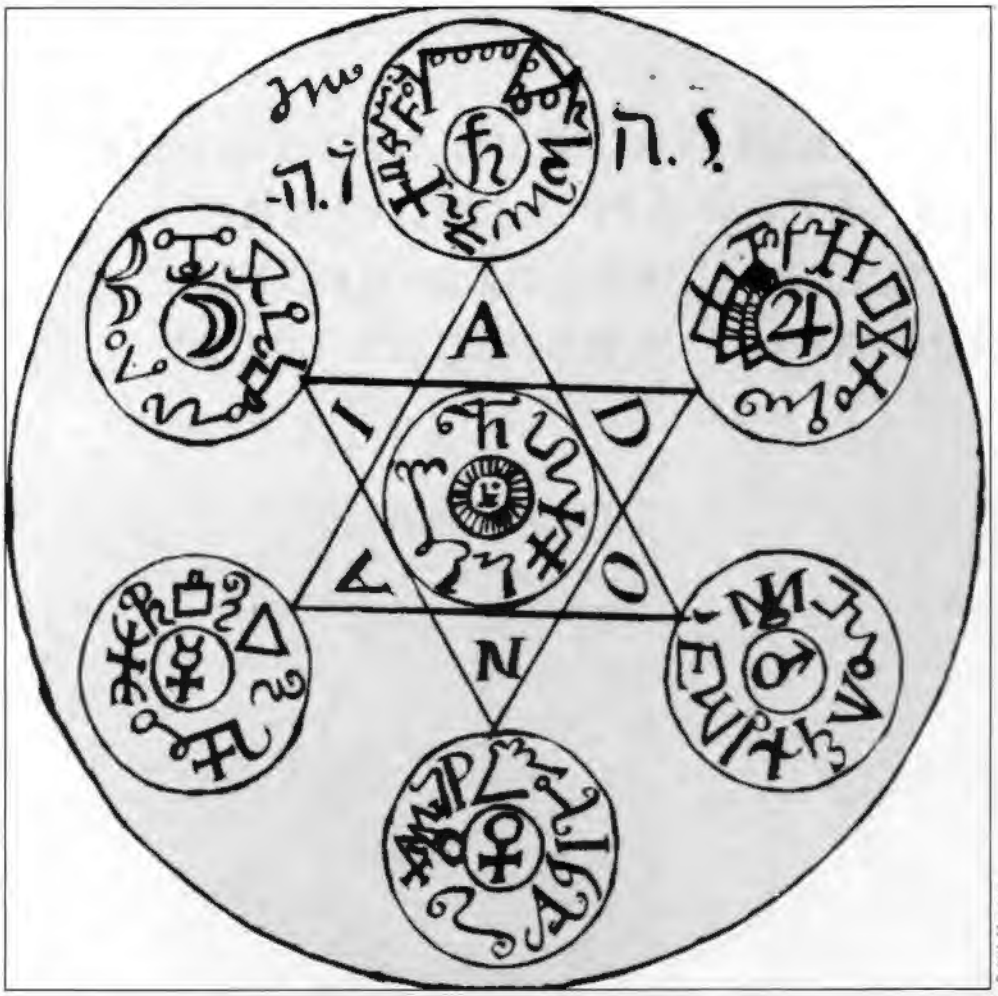
In ancient Mesopotamia where each city-state had its own god, changing relationships between the city-states and the temporary supremacy of one over others, were thought to reflect changing relationships between the gods. The Babylonians and Assyrians connected their gods with the planets and in the later classical world the universe as a whole was generally believed to be alive and divine, and the sun, moon and planets were regarded as deities. If man is a microcosm, then these gods have their counterparts in human beings and their movements in the sky influence human character and behaviour.

If 'as above, so below', then conversely, 'as below, so above'. The planetary forces influence man's behaviour but man's behaviour can influence planetary forces. This gives point to the magician's attempt to use the starry influences for his own purposes, by timing an operation for a planet's day and hour, by choosing an operation suitable to the planet's nature, and by using colours, numbers and metals which correspond to it (see DAYS). A dramatic example of 'as below, so above' magic occurred at Rome in 1628, when Pope Urban VIII employed a magician to ward off an eclipse which he feared meant his death. The magician arranged two lamps, standing for the sun and moon, and five torches for the planets in a sealed room, and assembled colours, jewels and planets corresponding to the beneficent planets Jupiter, Venus and the sun. He was trying to create a favourable 'sky' in place of the hostile real sky outside, either to prevent the eclipse from occurring or at least to guard Urban VIII, who was in the sealed room, against its effects.

An Accidental Werewolf

In magical theory, since the magician is the cosmos in miniature, he can control cosmic forces by manipulating his own inner ideas and drives. He can reach out into the universe, as it were, and call down or 'invoke' into himself a force or intelligence which he must be able to master, unless he is to be forever obsessed by it. Alternatively, he can summon up or 'evoke' from within himself a force or intelligence which he then projects into the universe outside him, which can influence the behaviour of others and which may even become visible to them. In either case, his principal weapons are the limitless force of his will, an imagination so concentrated and vivid that it affects or creates reality, and the paraphernalia of robes, colours, wands, swords and symbols, which are used to focus his will and imagination, and which are also intimately linked with the force he hopes to use.

The crucial role of the imagination follows from the belief that because man is a microcosm, his thoughts must have a parallel reality in the universe outside. In modern parlance, each idea or imagining of the human mind makes an impression upon the astral light (see ASTRAL BODY; LIGHT). If a magician can create a sufficiently vivid image in his mind, he creates a reality in the astral light which he can project at others. Franz Hartmann said, in *Magic White and Black*, that if the image is held in the mind with sufficient clarity, 'it will become comparatively dense, and can be



British Museum

Mansell Collection

projected upon the mental spheres of others, so that they may actively see objectively that which exists subjectively as an image within our own mind.'

It is in this way that artificial elementals are said to be formed, poisonous animal or grotesque entities, possessed of a temporary lease of life and sent to prey on a victim's mind. Dion Fortune said that the process involves 'forming a clear-cut image in the imagination of the creature it is intended to create, ensouling it with something of the corresponding aspect of one's own being and then invoking into it the appropriate natural force.' She herself once accidentally created a werewolf in this fashion.

The Blindfold

Some magicians accept the distinction between 'invocation' and 'evocation', and that 'spirits' or intelligences exist outside the human mind. Others are more doubtful but say that for practical purposes it is convenient to assume that they do. J. W. Brodie-Innes, a member of the Golden Dawn, remarked that, 'Whether the Gods, the Qliphothic forces or even the Secret Chiefs really exist is comparatively unimportant; the point is that the universe behaves as though they do.' (The Qliphothic forces are the 'husks' of the Cabala and the Secret Chiefs were the hidden leadership of the Golden Dawn.)

Whatever may be true of entities outside himself, 'the hitherto unknown forces' which the magician tries to exploit exist inside himself, and one of the great objects of magic is the discovery of the 'true self'. Our real, inner selves, magicians tell us, are buried under layers of restraint, convention, rationalism, materialism, standards and viewpoints which have been impressed on us in our upbringing and education, a whole number of constricting influences. We all go about wearing a thick psychological and spiritual blindfold which prevents us from seeing who we really are. The blindfold has to be removed, the lumber cleared away, to liberate the limitless power of the true self. For it is each man's true self (or divine spark or inner light) which is the potential godhead. When Crowley said, 'Do what thou wilt', as he tirelessly reiterated to the annoyance of almost everyone who knew him, he did not mean 'do whatever you like' but 'do what your true, inner self

In magical theory good and evil ultimately do not exist at all. They are among the opposites which are aspects of a greater reality that unites and transcends them

Bodleian Library Colour Filmstrip

'As above, so below' is a fundamental magical doctrine, based on the belief that as God is in the world 'above', so is man here below; the magician attempted to use this concept to attain his objectives, while the astrologer based his art on the theory that the movements of the planets influence events on earth: frontispiece to a 13th century English book on fortune telling, showing Socrates with Plato

impels you to do.' Though his own life is a discouraging example of the consequences of his medicine, the prescription itself may not be valueless.

The problem, which all occult groups recognize and many of them attempt to guard against, is that magic makes an intense appeal to human hunger for power. Both the theory of magic and its practice vitiate the customary moral distinction between black (evil) magic and white (good) magic. In magical theory good and evil ultimately do not exist at all. They are among the opposites which are aspects of a greater reality that unites and transcends them. And in magical practice all methods and all experiences tend to be grist to the magician's mill, for if the supreme goal is to become and master everything, then the magician must experience and reconcile every aspect of 'the All' in himself – evil as well as good, hate as well as love, cruelty as well as affection, tears as well as laughter. Magic has kept its long hold on the human mind because of the promise of power, which it holds out, however delusively, to each one of us, the prospect of spiritual mastery in the shape of the all-encompassing divine power which religion reserves for God but which magic reserves for man.

MAGICAL PAPYRI

MAGIC AND RELIGION always walked hand-in-hand in ancient Egypt, and are often hard to separate: even in the early hymns and prayers there is evidence of a strong magical element with the underlying purpose of gaining power over the deity for the furtherance of personal ends. Love potions, wax images, talismans and curses were all extremely popular, and it was natural that the Greeks who settled in Egypt in large numbers from the 4th century BC onwards should come under the spell of the ancient traditions of Egypt, and under Egyptian influence in their own approach to religion and magic. The magical papyri are a rich source of material for illustrating the ways in which the Greeks (and later the Romans) in Egypt attempted to combine existing magical practices with elements of their own religion and that of other cultures.

A merchant travelling in Egypt in 1778 was offered a jar, containing 40 or 50 papyri, which was said to have been discovered near ancient Memphis. He bought one of the rolls for a small sum and subsequently took it back to Italy where he presented it to Cardinal Stefano Borgia as a curio. The Danish archeologist Schow has told how he found the papyrus in the Cardinal's museum at Velitri ten years later. Details of the story, including the postscript that the rest of the jar's contents were burned for their pleasant aroma, have been questioned, but the fact remains that the surviving fragment, which became known as the Charta Borgiana, whetted the appetite of scholars, though it contained only a list of workers at Ptolemais Harbour in 192–193 AD.

It was well known that for centuries papyrus had been the staple writing material in Egypt. There were examples in the hieratic script (the simplified cursive form of hieroglyphic) which had survived from earliest times, and the elder Pliny had devoted several chapters of his *Natural History* to a description of the manufacture of papyrus in the Roman period; but, apart from a few references in the works of medieval scholars and humanists to surviving fragments, these were the first discoveries of actual papyri written in Greek.

It was Napoleon's campaigns in Egypt that laid the foundations for more systematic investigations in the 19th century, as a result of which so many Greek papyri were found that the work of deciphering and editing them became sufficiently important to justify the formation of a special branch of classical scholarship known as papyrology (a term first mentioned in 1898). Naturally scholars have paid most attention to the literary discoveries, but a large number of the texts are non-literary, amongst them many magical papyri which cannot fail to be of interest to students of magic, ancient and modern.

In 1928 the first volume of Karl Preisendanz's work *Papyri graecae magicae* appeared, followed by the second volume in 1931 and the third, of which the stock was destroyed by an air raid over Berlin, in 1941. Other special collections of magical papyri are those of Th. Hopfner and S. Eitrem, but many isolated texts have also appeared in the last 20 years or so, which add interesting details to the general picture without invalidating the conclusions that may be drawn from a study of the more comprehensive collections.

The range covered by these texts is a very wide one, extending from the long hymns in verse contained in Preisendanz's first volume (the 'Great Paris Magical Papyrus' has 3274 lines), to brief recipes and imprecations, many of them accompanied by elaborate, if sometimes crude, illustrations. The substantial magical books date from the late 3rd and 5th centuries AD but some of the smaller texts have been placed as early as the 2nd century.

A. D. Nock, in his article on 'Greek Magical Papyri' in *Journal of Egyptian Archaeology* 15 (1929), expressed the opinion that the longer papyri were actual working-copies used by practising magicians 'like the books burnt by St Paul's Ephesian converts . . . or the magical books handed down in Germany from generation to generation.' It is even probable that many of them belonged to the same library. The shorter texts appear to have been extracts from such magical books, supplied on demand to meet specific needs and occasions.

This view is supported by the existence of alternative versions of the same recipes containing variations of method and names, and often described as 'another copy'. For example, in the same text, the 'Great Paris Papyrus', there are two versions of the correct procedure for slandering one's rival to the moon, within 150 lines of each other. The general impression is of professional magicians compiling their handbooks from existing models without worrying too much about coherence or consistency, and selling the required extracts to their customers.

The longer magical papyri were probably textbooks compiled by professional magicians, and the shorter texts may well have been extracts taken from these books and sold to individual clients: part of the *Papyri Osloensis*

University Library, Oslo

In language and style, as in content, the texts vary greatly, from the poetic to the semi-illiterate. For example, an invocation of Helios, the sun, in the Louvre Papyrus (in Preisendanz's first volume) reads:

> Hither to me, greatest in heaven, for whom the heaven became a dancing-place (magical words followed by a Coptic word), do such and such (magical words), you who are the friend of oracles, golden of countenance, golden-gleaming, shining with fire in the night, mighty mighty lord of the universe, shining forth early in the day, setting in the west of heaven, rising from the east, in form like a circle, running towards midday and passing the time in Arabia (magical words), harbinger of the holy light, circle in fiery form (magical words), brilliant Sun, sending light over the whole world, covering the Ocean (magical words), I pray you by the egg. I am Adam the first born, my name is Adam. . .

Contrast the lucidity and rhythmical symmetry of this calm invocation with the staccato incoherence of the following extract from a fragment published by A. S. Hunt as 'A Greek Cryptogram' in the *Proceedings of the British Academy* for 1929:

> Adonai (magical word or words), accomplish for (name) what I have written hereon for you, and I will leave the east and west as it was formerly established and will save the flesh of Osiris for ever and will not break through the bonds wherewith you made Typhon fast, and I will not call those who have died violent deaths but let them be, I will not pour out the cedar-oil but will let it be, I will preserve Ammon and will not slay him, I will not scatter the limbs of Osiris, and I will hide you from the giants . . . Eieieieieieieiei choin (followed by several magical words of which only Aoth and Jacob are intelligible). Declare the secrets of Isis . . .

But even this cryptogram retains certain elements of formal style, however crude, when compared with many other texts like, for example, this *agoge* or spell for a lover from Eitrem's *Papyri Osloenses*.

> Write with a bronze stilus on an unbaked potsherd: 'Hecate, you, Hecate, of three shapes, all the magical signs of every one having been completed, I adjure you by the great name of Ablathana and the power of Agramari, for I adjure you, you, who control the fire of the Hawk and those in it, that (feminine name) be consumed, and to pursue (her) to me (masculine name), because I hold in my right hand the two serpents and the victory of Iao Sabaoth, and by the great name Bilkatrimopheche, shaking the fire, Stoutoukatoutou, for her enflamed to love me, in fire for me, yes, tortured. Sunkoutouel am I.' Write 8 magical signs, so; give me the favour of all things, Adonai.

Even this translation conceals the grammatical errors and peculiarities of spelling

which, together with the accumulation of epithets and the use of what are to us meaningless combinations of words and vowels, are the main features of the language and style of popular magical texts on papyrus.

Two further examples from the same papyrus are also worth quoting. A 'remedy to break spells' runs as follows:

> You take (a piece of) lead, and you engrave upon it the figure Mononthoun (?), holding in his right hand a torch, in his left a dagger, and on his head three hawks, and under his feet a scarab, under the scarab a serpent biting its tail. That which is written round the figure is this. (Magical letters and sign follow.)

A curse combines in a most unusual manner all the features that have been mentioned as being typical of these papyri, with universal elements and an invocation of angels:

> You take a plate of lead and write on it with a bronze stilus the following names and the figure. You anoint the plate with the blood of a hat and roll it up in the usual way; you open a frog (toad), and put it (the plate) into its stomach, sew up the frog with Anubis-thread and a bronze needle and suspend it on a reed taken from the spot with hairs from the tail of a black ox with its hind-legs (tied to the reed) in the eastern part of the place near tu the rising sun.
>
> Ousirisesengenbarpharanges. (This complex is written in the shape of a heart by cutting off the letters successively from each end.) Erikisephearararacharaephthisikera. Rikisephthearararacharaephthisiker. Ikisephthearararacharaephthisike. Base. Lord angels, as this frog vanishes away and dries up, so may also the body of (masculine name), born of (feminine name), because I adjure you who are placed to command the fire, Maskelli, Maskello, and the rest . . .

Above all else, the magical papyri, the numerous amulets collected in one volume by C. Bonner, and the charms on lead tablets testify that the syncretism or fusion of different elements characteristic of popular religion from the Hellenistic period onwards, has a prominent place in magical practice. Apart from the traditional Greek deities, of whom Hermes, Hecate-Selen, Apollo-Helios, Aphrodite and Eros are predictably to be found most often (though the last two are not as important for the love charms as one might have expected) there are Egyptian deities like Isis, Osiris, Horus, Anubis and Seth-Typhon, side by side with very strong Semitic, especially Jewish, and other oriental ingredients as well.

Threatening the Gods

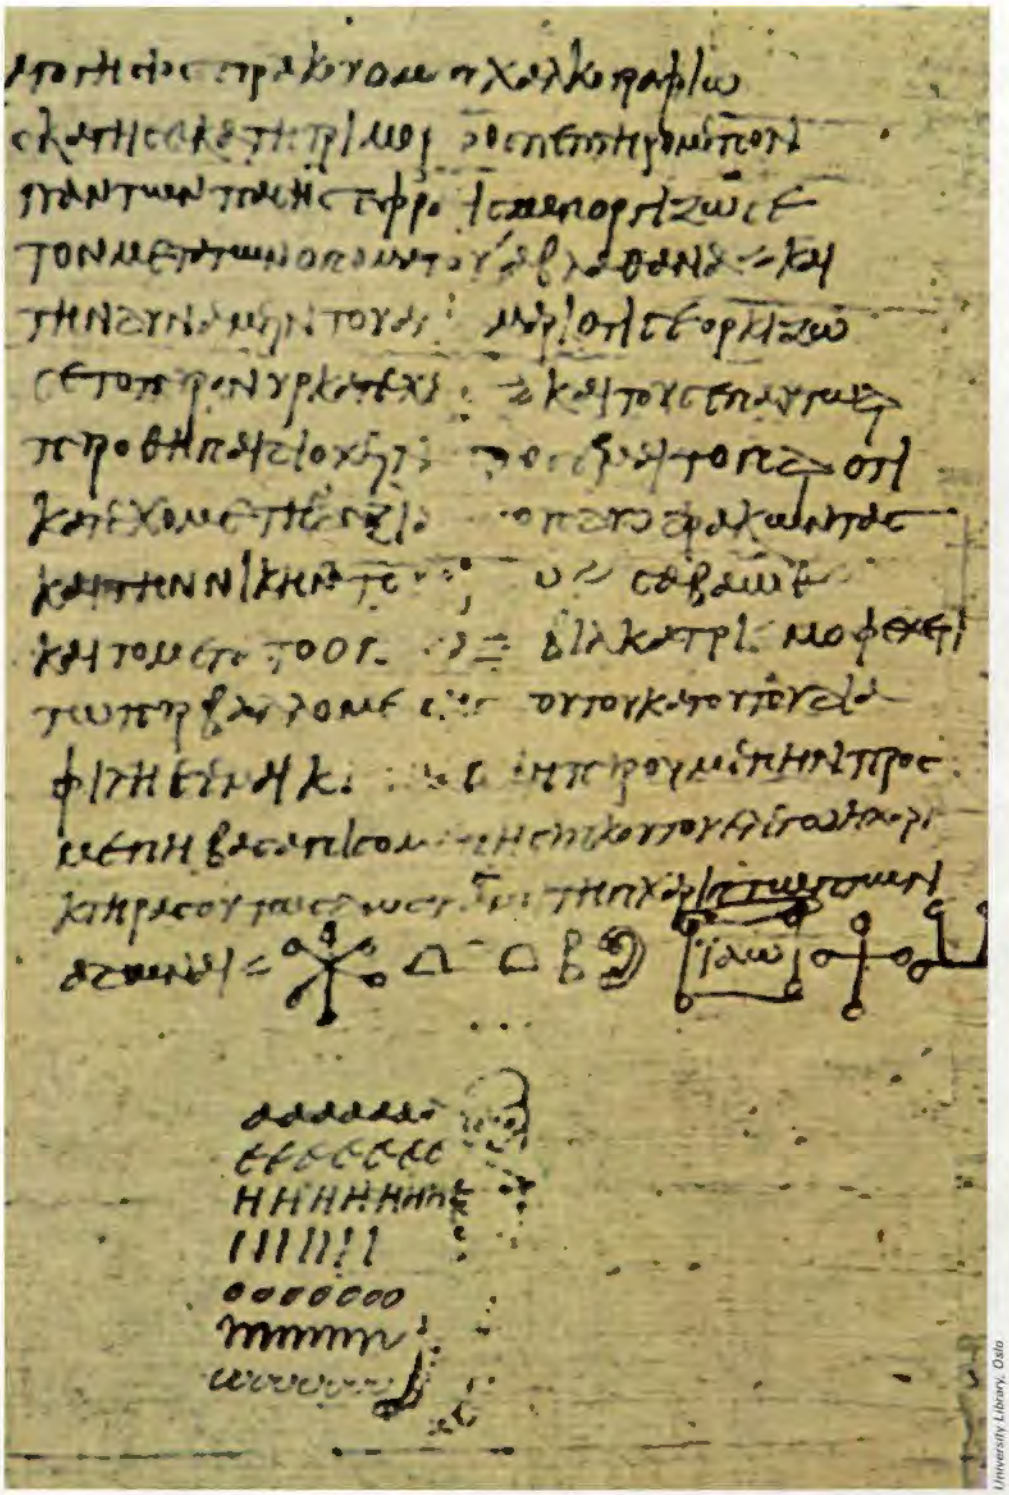
One papyrus, the large Berlin text which opens Preisendanz's work, illustrates the typical mixture with its association within a relatively narrow compass of the names Apollo, Paieon, Iao, Michael, Gabriel, Abrasax, Adonai, Pakenbeth (for Seth-Typhon), Aion, Physis, Adonaios, Eloaios (for Elohim). As H. I. Bell wrote in his *Cults and Creeds:* 'All was fish that came to the magician's net; the more deities he could include in his spells the more likely these were to be effective.'

It is not surprising therefore to find

Christian references too, as in this early 4th century Coptic exorcism quoted by Preisendanz: 'Hail, God of Abraham, hail, God of Isaac, hail, God of Jacob, Jesus Christ, Holy Ghost, Son of the Father, who is among the Seven and in the Seven.' Angels, saints, the Virgin Mary, the Holy Ghost, Moses, all appear cheek by jowl, reinforced by citations from psalms, the Lord's Prayer, St Matthew's gospel and the book of Proverbs, to quote a few examples.

But M. P. Nilsson has rightly stressed that the Christian elements were relatively few if one considers that Christianity was the predominant religion of the period. He has explained this paradox as being the result of the natural hostility of Christians to magicians: to the latter Christ was merely one among many powers, to the former he was the most powerful of all mediators, the son of the only true God.

The attitude revealed by the magical papyri is essentially utilitarian. As Nock has picturesquely put it: 'the Gnostics were passionately eager to know how the wheels went round' but 'the authors and readers of the magic papyri desired simply to be able to make them turn'. Their objects were to acquire power and through it to achieve success in love, beauty, popularity, health, wealth, and victory over, or revenge on, an enemy. The means to gain these objects were to hand, if men could but discover the secret of the right approach; and it is a characteristic of these magical papyri, as of Egyptian magic in general, that they threaten deities



University Library, Oslo

The magical papyri illustrate how the Greeks and later the Romans in Egypt attempted to combine current magical practice with elements of their own religion and those of other cultures; by their adaptation of existing religious ideas and forms they claim a place of honour among sources of knowledge of the religion of Graeco-Roman antiquity *Left* and *Far left* Extracts from the *Papyri Osloensis*

almost as often as they implore them, confronting them with others who may be even more powerful.

Underlying all else, however, there was a deeper concern, also typical of the period, to break the power of destiny, fate or necessity, and this preoccupation led the magicians to use astrology as a means to achieve their ends. There are often signs too of an approach which is closer to that of contemporary mysticism: as the 'Berlin Papyrus' puts it, 'If you have the god for a friend, you will be reverenced as a god yourself.' This mystical piety is best seen in the process called 'introduction to the sun god', which involved winning over the deity as a familiar spirit, a guide and companion to a new spiritual state and the acquisition of new and greater powers of magic.

The magical papyri are full of evidence, if evidence is needed, that religion is a house of many storeys and that, even if magic is the 'disreputable basement', it is not difficult to pass on to higher levels, and back again. Scholars have rightly emphasized the fundamental opposition of magic to true religion in its attitude to the gods but, by their adaptation of current religious ideas and forms, the magical papyri claim a place of honour among our sources of knowledge of the religion of Graeco-Roman antiquity.

MAGIC SQUARES

'NOW THIS TABLE being with a fortunate Saturn, engraven on a plate of lead, helps childbirth; and to make any man safe or powerful; and to cause success of petitions with princes and powers; but if it be done, Saturn being unfortunate, it hinders buildings, planting and the like, and casts a man from honours and dignities, causes discord, quarrelling, and disperses an army.' This comes from Francis Barrett's *The Magus* and the 'table' is the magic square of Saturn.

Numbers and letters are containers of power in magic (see ALPHABET; NUMEROLOGY) and if arranged in a square, and following certain rules, they are believed to make powerful talismans. Barrett's *Magus* and Eliphas Levi's *Transcendental Magic* reproduce the squares of the planets given in Agrippa's *Occult Philosophy*. The squares of Saturn and Jupiter are:

4	9	2
3	5	7
8	1	6

4	14	15	1
9	7	6	12
5	11	10	8
16	2	3	13

In a number square, each number from 1 to the highest number used must appear once, and only once. The vertical and horizontal rows of numbers and the two long diagonals across the square must each add to the same total (15 in the Saturn square, 34 in the Jupiter square). It is the fact that the squares meet these complicated requirements that gives them their magical force.

The Saturn square has 3 rows of 3 figures, and Saturn corresponds to the third sefirah of the Tree of Life, the Jupiter square has 4 rows of 4 figures, and Jupiter corresponds to the fourth sefirah, and similarly with the squares of the remaining planets. Mars has 5 rows (each adding to 65), Venus has 7 (adding to 175), Mercury has 8 (adding to 260) and the moon 9 (adding to 369).

The square of the sun has 6 rows of 6 figures, each row adding to 111, and the total of all the numbers used in the square is 666, the celebrated 'number of the Beast'

Numbers arranged in a square according to certain rules are thought to make powerful talismans; the magic square in *Melancolia,* an engraving by Dürer, was believed to have curative properties and was used to treat various diseases

(see GREAT BEAST). The deduction which can be drawn from this is that the Beast of Revelation is an aspect of the sun or life-force, the fierce drive that impels living creatures to survive and procreate. Barrett seems to have had Christ and the Antichrist in mind when he wrote of this square that, engraved on gold when the sun is well-aspected, 'it renders him that wears it renowned, amiable, acceptable, potent in all his works, and equals him to a king, elevating his fortunes, and enabling him to do whatever he will. But with an unfortunate Sun, it makes one a tyrant, proud, ambitious, insatiable . . . to come to an ill-ending.'

Magic squares have been used since very early times in China and India, where they are still inscribed on stone or metal and worn for good luck and protection against evil. The Saturn square is the oldest one of its type known, and appears in the I Ching Cabalistic magicians were particularly interested in it because its row-total of 15 equals the first and last letters of the Tetragammaton, the name of God (see NAMES), so that it could be considered an encapsulation of the godhead.

Magic squares can also be made with letters:

S	A	T	O	R
A	R	E	P	O
T	E	N	E	T
O	P	E	R	A
R	O	T	A	S

S	A	L	O	M
A	R	E	P	O
L	E	M	E	L
O	P	E	R	A
M	O	L	A	S

The square should read the same from the left, from the right, downwards or upwards. The Sator formula is the most famous of all magic squares, found inscribed on old bibles and drinking vessels, and scrawled on fragments from a Roman villa near Cirencester. The *Egyptian Secrets*, a curious hotchpotch of spells and charms falsely attributed to Albertus Magnus, says that a witch cannot stay in the same room with the Sator square, and also recommends it as a cure for colic and as a general protection against plague and sorcery. If written on a wooden plate and thrown into a fire, it was believed to have the power of putting the fire out, and in Saxony in 1742 it was ordered that plates inscribed with the Sator square be kept handy as fire-extinguishers.

Many attempts have been made to translate the Sator square but it is now generally accepted that it is a Christian charm which uses the letters of *Pater noster* and the letters A and O, so that it combines the first two words of the Lord's Prayer with Alpha and Omega, Christ as the first and the last.

The Salom square has the power of causing a girl to fall in love with you, if you touch her bare skin with it. It comes from *The Sacred Magic of Abra-Melin the Mage*, an 18th century French manuscript edited and translated by MacGregor Mathers (see SACRED MAGIC).

Mathers explained that the words on Abra-Melin's squares 'represent generally the effect to be produced or in other words are simply the Hebrew or other appellations of the result to which the square is to be applied.' But he had little success in translating them and many of them seem to be meaningless. Not all of them even meet the requirement of reading the same in all directions. Other recommended squares are:

K	I	T	T	I	K
I	S	I	A	D	I
T	I	N	N	A	T
T	A	N	N	I	T
I	D	A	I	S	I
K	I	T	T	I	K

A	T	S	A	R	A	H
T	O	A	L	I	S	A
S	A	D	O	R	I	R
A	L	O	T	O	L	A
R	I	R	O	D	A	S
A	S	I	L	A	O	T
H	A	R	A	S	T	A

The Kittik square causes spirits to bring timber for you if you are constructing a mine. The Atsarah square will make you see visions of lakes and rivers.

M	I	L	O	N
I	R	A	G	O
L	A	M	A	L
O	G	A	R	I
N	O	L	I	M

C	A	S	E	D
A	Z	O	T	E
B	O	R	O	S
E	T	O	S	A
D	E	B	A	C

If you write the Milon square on parchment and put it on top of your head, under your hat or cap, the spirits will secretly reveal to you all things past and future. The Cased square is so sinister that we are told, 'This symbol should never be made use of', followed by the instruction to hide it somewhere where the person you wish to harm will pass by. Mathers translated it as: 'overflowing of unrestrained lust' (Cased), 'enduring' (Azote), 'devouring, gluttonous (Boros), 'idle, useless' (Etosa), 'to overtake and stick close' (Debac).

MAGNETISM

THE TERM 'animal magnetism' was coined in c 1766 by F. A. Mesmer (see MESMER) to denote a supposed fluid or force, pervading the universe, but especially concentrated in animal nervous systems and magnets. It was not identical with electromagnetism but possessed certain analogies to it.

The general idea was not new, but Mesmer gave it some distinctive twists. He was led to postulate the existence of this fluid by observing that the movements of the planets and other heaveuly bodies produced fluctuations in the course of diseases, and that magnets or the hand of a vigorous person might exercise a striking therapeutic effect when applied to the body of someone who was ill. He thought that the fluid had properties resembling those of electromagnetism because it could apparently be stored in objects submitted to 'magnetization' and transmitted from these to other objects or to the bodies of patients; and because it apparently possessed polarity, some parts of the body, and certain people and objects, exerting a counteractive influence upon positively magnetized persons and things.

From Mesmer's arrival in Paris in 1778 until about the year 1850 the 'mesmeric' movement grew and flourished enormously on the Continent and, towards the end of the period, in the United States and Britain. Most of its practitioners and supporters adhered to theories resembling Mesmer's, but there were many variations. One of the most important of these resulted from a discovery, first made in 1784 by Mesmer's pupil the Marquis de Puységur, that by touching or stroking with the hand or a magnet it was possible to place susceptible persons in a 'somnambulic' trance in which, though showing some of the signs of being asleep, they were unusually responsive to the commands and wishes of the operator.

Puységur accepted, at least to begin with, Mesmer's theory of a universal fluid, and he compared a healthy man to a vase in contact with an inexhaustible reservoir of fluid. A sick man is someone whose contact with this reservoir has become obstructed, and the magnetist is able to transmit a fresh supply of fluid to him with beneficial results. The responsiveness of the somnambulic subject to the operator's wishes shows that the operator must be able to direct the fluid by his will.

Later in his career Puységur showed much less interest in the supposed universal fluid, and a leading mesmerist of that time, J. P. F. Deleuze, wrote in 1813 that the important question was not 'whether there is a fluid spread throughout the whole of nature, but whether there exists a modification of that fluid, or a special fluid, of which man can make himself master for the purpose of directing it in accordance with his wish.' Deleuze himself was convinced of the fluid's existence, but not of its universality.

Some writers, especially in Germany where a new period of literary romanticism was beginning, took a very exalted view of the supposed fluid. Dr J. H. Jung-Stilling, whose *Theory of the Science of Spirits* was first published in 1808, regarded it as a half-way house between spirit and matter, to be equated with the ether of physicists. He believed that it was especially concentrated in the human organism, and was the medium through which the rational element in man, his 'spirit', could control the body. Disturbances of this ether, such as those produced by a mesmerist, could affect the spirit, perhaps partially freeing it from the body, and so releasing its inherent clairvoyant faculties. Jung-Stilling called the union of a rational element, or spirit, with a particular portion of etheric fluid the 'soul', and it is the soul, not just the spirit, that survives death. Similar doctrines have been propounded by many modern Spiritualists.

It is worth inquiring in a little more detail into the facts, or alleged facts, that convinced not a few intelligent persons of the existence of the magnetic fluid. In addition to the points already touched upon – the alleged cures, the fluid's apparent capacity for storage and transmission, and its supposed tendency to bipolar distribution – five classes of phenomena especially struck the mesmerists.

Firstly, the sensations of warmth, pricking, and so on, which were frequently said to follow the application of the operator's

hand, or a magnet, to the skins of subjects; secondly, the way in which the bodies and limbs of certain entranced subjects could sometimes be attracted towards, or repelled from, those of their mesmerists in a quasi-magnetic manner; thirdly, the supposed fact that if a mesmerist directed a jet of 'magnetic fluid' at the region of his subject's head that was linked by phrenological theory with a certain psychological quality, the subject would respond appropriately (for instance, if the fluid was aimed at the area associated with a sense of humour, he would laugh); fourthly, the taste that could supposedly be detected in magnetized water; and fifthly the luminous appearances that entranced, and presumably clairvoyant or hypersensitive, subjects claimed to see around magnets, magnetists and magnetized persons and things, and passing between magnetists and the objects of their endeavours.

Many people were particularly impressed by these last phenomena and in the late 1840s the whole subject of animal magnetism received a boost from the apparently related findings of a noted Austrian chemist, Baron K. von Reichenbach (1788–1869), whose *Physico-Physiological Researches* was translated into English in 1850.

He believed he had shown that certain sensitive persons, especially spontaneous cataleptics and somnambules, could, if kept in the dark for upwards of an hour, perceive characteristic lights emanating from magnets, crystals, metals, the human body, stars, planets and other objects; and could also feel sensations of heat or cold in connection with the lights. To account for these phenomena, Reichenbach postulated a quasi-magnetic emanation or fluid, which he called 'Odyle' or 'Od Force'. He conceived it to radiate outwards, but in very different degrees, from all objects and also to be generated by heat, light, electricity, friction and all kinds of chemical change. Odyle exhibits polarity. The negative pole of a magnet appears blue, and induces a feeling of coldness, whilst the positive pole appears red and causes a feeling of warmth. The right hand is odylically negative and the left positive, the sun negative and the moon positive. Uncharged bodies can be charged by being brought into contact with a charged body. (See also DOUBLE.)

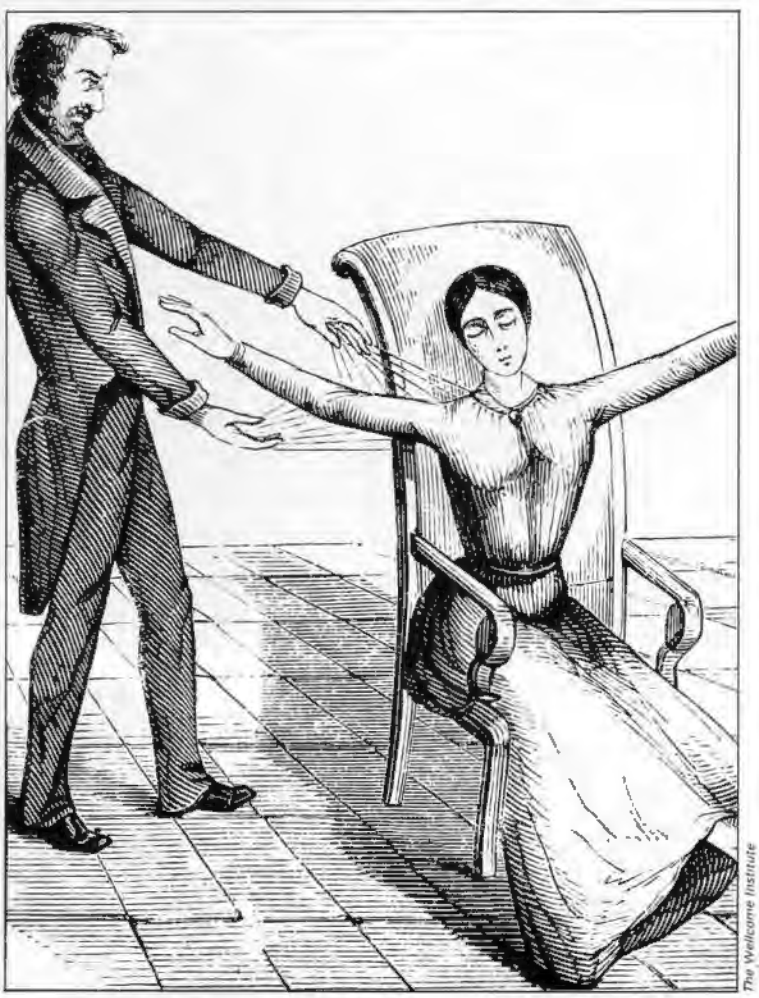
Reichenbach used no mesmeric subjects, and his experiments were conducted over five years with more than 100 persons. His contemporaries were impressed. The obvious similarity of his doctrines to those of the animal magnetists delighted the latter, and induced some sceptics to change their opinions. In his *Letters on Animal Magnetism* (1851), W. Gregory, Professor of Chemistry at the University of Edinburgh, made an extended attempt to marry the two sets of doctrines, which indeed Reichenbach himself had done up to a point.

Gregory remarks on the similarity of the lights seen by people who had been magnetized, around magnets and the hands and persons of their mesmerists, to the lights reported by Reichenbach's subjects. He relates the somnambulic state to Reichenbach's claim that the odyle of a sleeping person is redistributed away from the head. Perhaps in the somnambule a similar redistribution takes place, the effect of which is to cut off the external senses from their brain centres, whilst leaving the intellect active. In this state, the somnambule's brain may be sensitive to faint odic radiations from distant objects, radiations which would otherwise be drowned by the influx of ordinary stimulation. Mesmeric clairvoyance may perhaps be explained in this way.

The opponents of animal magnetism had, for the most part, confined themselves to accusing the magnetizers and their subjects of charlatanry, an explanation which was in many cases preposterous. There had, however, always been persons who, while accepting the alleged phenomena, at least in a sense, had sought to explain them in terms of such concepts as imagination and suggestion. A French Royal Commission, appointed in 1784 to investigate Mesmer's claims, reported experiments suggesting that the efficacy of magnetization depended entirely upon whether or

According to the magnetists, a sick person was someone whose contact with the magnetic fluid that fills the universe had been obstructed, and he could be cured if he obtained a fresh supply *Below left* and *Below* Woodcuts showing a mesmeric session in about 1840; it was thought that the operator could transmit the fluid to the subject by using his will *Right* Patients undergoing treatment at a 'magnetic dispensary': 18th century etching

The Wellcome Institute



The Wellcome Institute

not the subject believed that an attempt at magnetization was being made, and not at all upon whether this was in fact the case.

In France in the early 1800s the Abbé Faria gave public demonstrations very like those of modern stage hypnotists. He seems to have avoided the mesmeric paraphernalia, and to have attributed his results to self-suggestion on the part of his subjects. In the 1820s, a Paris physician named A. Bertrand arrived, after an extensive review of the literature, at an essentially modern view of the matter. F. Podmore says of him, 'the whole machinery on which the early writers relied as demonstrating the existence of a fluid – celestial, magnetic or electric – he sweeps away in a word by showing that the results were due to the imagination of the subject, preternormally alive to the least suggestion, by word, look, gesture, or even unexpressed thought by the operator.'

In 1838, Thomas Wakley, editor of the *Lancet*, was able to demonstrate, as the French Commissioners had done before him, that magnetized objects produced their effect only when the subjects suspected they had been magnetized. An unmagnetized gold sovereign induced a cataleptic state when it was merely warmed as though it had been held in a hand. Wakley believed that the subjects were simple frauds but a few years later the more temperate James Braid, a Manchester surgeon, was led, as a result of similar observations, to a view resembling Bertrand's.

For the magnetists Braid's repetition of some of Reichenbach's experiments was particularly unfortunate. He found that in response to suggestions subjects would not merely see flames round magnets but continue to report them when the magnets had, unknown to them, been removed. Once a subject had grasped what was expected of him, further suggestions were unnecessary and the character of the hallucinations could be changed by adroit leading questions.

Healing by Touch

The magnetic movement in Britain and the United States subsided rapidly after the 1850s, perhaps not so much because of the findings of Braid and others as because its impetus and personnel were absorbed into the newly founded Spiritualist movement (see SPIRITUALISM). In France, however, during the later 19th and early 20th centuries, a number of people continued to believe that there was a residue of phenomena not explicable in terms of suggestion, and indicating some kind of emanation from the human organism. However, experiments upon photographic plates, upon straws and paper cylinders made to rotate by the approach of the hand, and so forth, show complete ignorance of proper scientific method. Little evidence has come to hand of emanations having properties at all like those of the alleged magnetic fluid or Od Force.

In the 1880s two prominent members of the newly-founded Society for Psychical Research, Edmund Gurney and F. W. H. Myers, found hints of the magnetic effluence in experiments in which a subject's hands were screened from him and one of his fingers would be made immobile and insensitive by the hypnotist's merely pointing at it. Somewhat comparable results were reported by S. Alrutz in 1922. It is, however, difficult to feel confident that the subjects could not have picked up small sensory clues. A number of persons (for example, A. de Rochas in 1891 and Sir William Barrett in 1882 and 1922) have presented evidence that some sensitive subjects can tell through visual sensations whether an electro-magnet, whose switch is out of range, is on or off; but the precautions in these experiments were hardly exhaustive.

All in all, the only modern experiments which might in any way be used to support the views of the animal magnetists are some quite recent ones by G. H. Elgnin and others, in which human agents have produced beneficial results on lesions in animals without actually touching them. In these experiments there were of course untreated 'control' groups; and animals are presumably immune to suggestion. B. Grad and others have reported somewhat comparable findings in experiments on the growth of seedlings. But it is hardly necessary to remark that experiments such as these must be assessed with extreme caution.

MAGPIE AND ROOK

ONE OF BRITAIN'S larger birds, the magpie has a loud and raucous voice; it is exceptional in building a large covered nest, from sticks, and its long tail and black-and-white plumage attract attention. It is wary but also bold, and where it is not persecuted the magpie will frequent houses and even nest in cities. There is some evidence that it moved into parts of Europe in comparatively recent times. The European folklore of the magpie is therefore not of very great antiquity.

The magpie's contrasting plumage contributed to its being regarded as a mysterious, sinister and oracular bird. According to a North of England legend, it was a hybrid between the raven and the dove, the two birds released by Noah from the ark, and therefore had not been baptized in the waters of the Flood. In Germany witches were said to ride on magpies or to appear as these birds, and in Sweden there was a saying that in August the magpies go off to draw the Devil's waggons of hay, hence their neck feathers can be seen to have been rubbed by the yoke. In north-east Scotland the magpie was 'the De'il's bird' and was believed to have a drop of Satan's blood on its tongue. It could acquire human speech if its tongue were scratched and a drop of blood from a human tongue inserted.

Such beliefs probably arose from the calls uttered by a party of magpies which sounded, to the imaginative, like human chatter; and from the fact that it had been observed that magpies in captivity are able to imitate words. In Brittany it was said to have seven of the Devil's hairs on its head. Because of the bird's sinister and Satanic associations in many areas, it was considered unlucky to kill a magpie, or thought advisable to do so only during certain periods of the year.

Significant Numbers

These associations gave rise to legends in which the bird was represented as anti-Christian. It was said that unlike other birds it did not go into full mourning after the Crucifixion, hence its black-and-white appearance. In France another legend related that the magpies pricked Christ's feet with thorns while he was on the Cross, but the swallows tried to pull them out, acquiring their blood-red breasts as a result. From this time on the magpies were condemned to nest in tall trees whereas the swallows found shelter under the eaves of houses.

As with many creatures and objects which raise doubts in men's minds because of their behaviour and appearance, the magpie is regarded ambivalently in folklore. It may bring good or bad luck according to circumstances, and in a number of country rhymes one may expect propitious or unfortunate events according to the number of birds seen. One of these rhymes, well known and widespread, is:

> One for sorrow, two for mirth,
> Three for a wedding, four for a birth.

In South Germany a magpie calling near a house was said to portend disaster, but if it merely chattered the arrival of a guest was expected. English folk also regarded the chattering of magpies as predicting the arrival of strangers.

In Norway a pair of magpies nesting close at hand was believed to bring good luck and Shropshire folk would express a wish when a magpie was seen. A Welsh informant tells me that his father, a distinguished physician, would take off his hat on encountering one of these birds.

Because the magpie makes a massive nest with the entrance at the side, it acquired some of the folklore associated with the woodpecker, as this bird also enters its nest in a tree trunk from the side. In France it was believed that the magpie knew a magical herb which she would apply to any barrier placed across the nest entrance, so causing it to spring away.

The magpie is generally regarded as being mysterious and sinister, partly because of its black-and-white plumage, and in many areas it is thought to have Satanic associations

Mansell Collection

Rooks for a Rainy Day

The rook is so common in Britain and rookeries so obvious in the countryside that it is not surprising that considerable lore should be associated with the bird. The traditions and sayings mainly concern inferences to be drawn, and predictions which can be made concerning the weather and human affairs.

In Yorkshire it was believed that when rooks congregated on dead branches there would be rain before night but that if they perched on live branches the day would be fine. In Devonshire it is said that if rooks stay at the rookery or return in the middle of the day there will be rain, and similar beliefs are held elsewhere. There is a basis for these ideas to the extent that rooks cover their chicks when it rains. In the Cambridgeshire fens it is also assumed that if rooks fly far away from their nests in the morning there will be no rain. It is said in this area, and indeed elsewhere, that when they make aerial dives and twists bad weather is on the way.

In Shropshire it was believed that rooks never carry sticks to their nests on Ascension Day but perch quietly without doing any work. There was also a saying that if you did not wear something new on Easter Day the rooks would let fall droppings on your clothes. The association of these birds with religious festivals seems to have been an extension of the idea that because their congregations were so vocal, rooks must have some affinity with human beings.

There was a widespread belief that the desertion of a rookery betokens ill for those on whose land they were established, and another that the birds leave before the downfall of the family owning the estate. It was a fenland tradition that rooks always knew when a gamekeeper had died. They would form into a line and fly over his coffin as it was carried to the church for the funeral.

E. A. ARMSTRONG

Popperfoto

A popular Hindu statuette shows Gandhi being crowned by Ganapati, or Ganesha, the god of good fortune. Gandhi's championship of India's downtrodden masses brought him reverence as a Mahatma, a man who embodies the universal spirit in a specially noble form

Best known for its application to Gandhi, the Hindu title of reverence 'Mahatma' was also used in a particular sense by the founders of the Theosophical Society

MAHATMAS

MAHATMA is a word of Sanskrit derivation, commonly translated 'Great Soul' and used as a title of reverence. But *atman* is not a precise equivalent of 'soul', since it goes outside the individual. In Hinduism the self is usually thought of as a particular manifestation of the universal being, the indwelling spirit of all things, which is one and the same in all, though perceived as many. The atman in a person has this metaphysical reference. It is 'the self as manifesting the Supreme Self' (see BRAHMAN).

A Mahatma is a man whom the Eternal Reality shines through. He embodies the universal spirit in a specially noble and lucid form. He has risen above the mass of humanity but still belongs to it. Holy himself, he is a beacon of hope for his fellow-mortals, a proof that they too can rise higher, in this life or in future lives. His greatness of soul radiates beyond himself.

Mahatmaship is connected with the Hindu idea of *darshan*. The sight or presence of a great man is good in itself, a blessing, a spiritual tonic. This belief is one reason for the tumultuous crowds that press round Indian public heroes, and not only religious heroes. The blessing of darshan can be obtained by coming close to an adored leader such as Jawaharlal Nehru, without his being a saint or even a believer. A Mahatma, however, is the kind of person pre-eminently qualified to dispense it.

In one way or another, the conception transcends normal experience. For the superstitious the true Mahatma is a wonder-worker. Hindus who deny him this superhuman power nevertheless admit that his

special quality cannot be pinned down by everyday definitions. A Mahatma is not simply very wise or very philanthropic. He is not necessarily a priest, a monk or a hermit, though lonely asceticism is Hinduism's hallowed path to spiritual heights. Nor need he be a Brahmin. Several of the Great Souls of Hindu tradition are Kshatriyas, members of the warrior caste. Gandhi himself belonged to the merchant caste, a degree lower. Before his own designation as a Mahatma he applied the title to the politician G. K. Gokhale, as a mark of esteem. Hinduism never formally canonizes either the living or the dead. The status of a Mahatma is a matter of acclaim.

Mme Blavatsky's 'Masters'

The Western public was introduced to the word Mahatma by popularizers and interpreters of Asian thought who began to attract notice during the 1870s. Sir Edwin Arnold used it in his translation of the *Bhagavad Gita*. But the special meaning which it acquired in the West, and retained for some decades, was due to Helena Petrovna Blavatsky (1831–91). With Colonel Olcott, she founded the Theosophical Society, and herself supplied most of its doctrines (see BLAVATSKY).

Mme Blavatsky went to India and enjoyed cordial relations, for a time, with Swami Dayananda Sarasvati, a leader of the reform movement in Hinduism. She was not, however, in any genuine sense his disciple. Instead she claimed to be under the telepathic guidance of certain Mahatmas whose present country of residence was not India. These were adepts or initiates, masters of occult wisdom, who had attained spiritual liberation from the world but stayed below to help mankind. They lived in Tibet, where secret caves housed enormous libraries, and here Mme Blavatsky had met some of them during a mysterious visit.

Her own chief Master was Koot Hoomi, and she had another named Morya. She substantiated their existence with portraits. They appeared to some of her followers and answered letters which she accepted for transmission to them; the answer was in writing and sometimes arrived by 'precipitation', seeming to fall from the air.

Two of the most notable early Theosophists were A. P. Sinnett, editor of the Indian newspaper *The Pioneer*, and A. O. Hume, founder of the Indian National Congress, which later became the party of independence under Gandhi's leadership. Both were prepared to believe but they grew doubtful, and Sinnett tried vainly to reach Koot Hoomi without going through Mme Blavatsky.

The published letters of Koot Hoomi contain nothing to support such an extraordinary authorship. The handwriting, the stationery and some quirks of phrasing and spelling are alleged to point to Mme Blavatsky herself, as the amanuensis if nothing more. There is some evidence, hotly disputed, that she employed pious frauds to buttress her claims in other ways. The 'precipitation' of the letters turned out under scrutiny to be a very dubious process.

Mahatmas in the Theosophical sense were never proved to exist. Mme Blavatsky's ex-mentor Swami Dayananda, who was certainly one of the most authoritative of Hindu spokesmen, declared flatly that they did not.

The Gandhi Cult

Like several other leaders of Indian nationalism, M. K. Gandhi (1869–1948) had links with Theosophy. As a student in London he met Mme Blavatsky shortly before her death in 1891, read her *Key to Theosophy*, and became an associate member of her Society. He went no farther, and his later opinions of Theosophy varied. At one time he called it 'humbug'. At another he praised it for its presentation of the best in Hinduism. But several Theosophists influenced him, and Indian politics brought him into a somewhat stormy relationship with Annie Besant (see BESANT), who presided over Theosophy after the foundress's passing. It does not appear that he took any interest in Mahatmas, of whatever sort. His own application of the title to Gokhale was hardly more than a sincere compliment.

He is said to have been first saluted as a Mahatma himself by Indian admirers during his civil rights campaign in South Africa, which ended in 1914. But the real bestower of the accolade was the poet Rabindranath Tagore, who was his host on his triumphant return to India. Tagore was referring to him as 'Mahatma Gandhi' early in 1915 and wrote of him in a poem as 'the Great Soul in beggar's garb', an allusion to his simplicity of dress. Swami Vivekananda, another leader of Hindu reform, had given currency to the idea that a true Mahatma in 20th century India would be one who championed the downtrodden masses. Gandhi did this a great deal more evidently than other Congress figures. His religious ardour and strict personal morals reinforced the cult which grew round him.

The masses turned to him as a Mahatma long before they knew him as a politician. A campaign in 1917 for the redress of peasant grievances proved his unique, messianic power over them. This made him the irreplaceable leader of the national movement, a position he held for about 15 years. His first bid for Indian self-rule, in 1921, acquired much of its force from the personal mystique. Rumours spread that he would expel the English by magic, and that they could not arrest him because he would simply fly away. When they did arrest him, one of the reasons for the cheerfulness he expressed was that the myth had been exploded. Indians would henceforth be more ready to work out their own salvation, instead of relying on him.

After his release from prison, however, Gandhi still had to endure the importunities of hordes of darshan seekers whenever he travelled. Many literally climbed over him, yelling, jostling and clawing. He was often in need of first aid for scratches on his legs. The superstitious credited him with performing miracles, which he could sometimes refute but not always.

An English observer noticed his dislike of the cult. Gandhi seldom looked sterner than he did when confronting his worshippers. He tried again and again to replace the popular slogan 'Mahatma Gandhi ki-jai' ('Victory to Mahatma Gandhi') with others of a less personal kind. But his attempts to get rid of his unwanted and, in his own view, undeserved title were doomed to failure. Finally he surrendered with a wry humour and a classic comment: 'The woes of Mahatmas are known only to Mahatmas.'

Mahayana

Buddhist movement which arose in about the 10th century AD and became the dominant type of Buddhism in China, Japan, Korea and Vietnam; the name means 'great course' or 'great vehicle', as distinct from the Hinayana (lesser course or vehicle) of Sri Lanka and most of Southeast Asia.

See BUDDHISM; JAPAN.

Robert Skelton

Gordon School

General Gordon meets his end as Khartoum falls to the followers of Mohammed Ahmad al-Sayyid, one of many Messianic leaders to claim the title of Mahdi

In all periods of Moslem history rebels and reformers have claimed to be the Mahdi, the righteous deliverer and descendant of the Prophet who will cleanse the world of wickedness

MAHDI

A SHIITE TRADITION quotes Mohammed as saying, 'I am the Prophet and Ali is my heir, and from us will descend al-Mahdi, the seal (the last) of the imams, who will conquer all religions and take revenge on the wicked.' The idea of the Mahdi, 'he who is rightly guided' (that is, guided by God), first developed among the Shiites, a minority group in Islam, political in origin; they supported the claims of the descendants of Ali, who was the prophet's cousin and was married to his daughter Fatima. Ali, according to Shiite belief, was the first of 12 imams, sinless leaders of the faithful possessed of a divine light. The 12th imam, called the Expected One, was held to have disappeared in about the year 878, but still to be living in hiding, waiting to reveal himself before the Last Day when he would make Islam supreme and abolish wickedness. (See also ISLAM.)

The expectation of the Mahdi, the one who is to appear before the end of the age, has also been prevalent among Sunnites, who constitute the main body of Moslems. In times of trouble the idea of a deliverer to set things right and inaugurate prosperity appealed to the common people. But it is noteworthy that al-Bukhari and Muslim, considered the most reliable compilers of Sunnite tradition, do not mention the Mahdi. They record traditions about Jesus returning and defeating Antichrist. Other compilers relate traditions that Mohammed foretold that the Mahdi, who would bear the same name as his, would make an end of oppression and tyranny, fill the earth with equity and justice, and rule for seven or nine years, during which period he would give anyone who asked as much wealth as he could carry. Jesus is said by them either to descend after the Mahdi and kill Antichrist, or to descend with him and help him to do so.

Numerous Claimants

There have been many claimants to the office of Mahdi, but although Mahdis have risen and passed away, the expectation still remains. Mahdis have appeared in different parts of the Moslem world. For example, there was a claimant in the Yemen in the 12th century who was overthrown by Saladin's brother. In the 17th century in Indonesia a man called Iskandar collected a fleet, proclaimed himself as Mahdi and took to piracy. A few claimants deserve special mention.

In the 1st century of Islam, Mukhtar raised rebellion against the Umayyads, who had monopolized the caliphate, asserting his support of al-Mahdi Mohammed Ibn al-Hanafiyya, a son of Ali by another wife than Fatima. This short-lived rising ended with Mukhtar's death in Kufa in 687. Though this was a Shiite rising, the so-called Mahdi was not a lineal descendant of Mohammed. It is also doubtful whether Ibn al-Hanafiyya really claimed to be the Mahdi.

Ubaydallah, a Shiite claimant of the Ismailite section, who had come from the East to Morocco where he won over the Berber tribe Kitama, began to establish himself as Mahdi in 909. He claimed descent from the Prophet through Ali and Fatima, a claim strongly rejected by his opponents. His career was mainly one of conquest. In Tunisia he founded his capital al-Mahdiyya, and by the time of his death in 933, there had begun a caliphate, known as the Fatimid caliphate, which conquered Egypt and ruled there and in Syria till overthrown by Saladin in 1171.

Ibn Tumart (c 1078–c 1130) appeared as Mahdi in Morocco, claiming descent from Fatima. After studying in the East he returned determined to introduce reformation. His bases were the Koran and Tradition. He taught a strict monotheism, denying that God has attributes. Having won over the Berber tribe Masmuda and announced himself as Mahdi, he had their support in the sacred war *(jihad)* against pagans and against Moslems who rejected his teaching and strict manner of life. The dynasty of the Almohads was established and rnled in Morocco and Spain for over a century.

Mohammed Ali al-Sanusi, who had founded a brotherhood of Sufis (mystics

and ascetics – see SUFIS), began in 1840 to spread his propaganda in Libya. After his death in 1859 his son Mohammed al-Mahdi ruled in Libya till his death in 1902, a period of prosperity based on oases and control of caravan routes. He was expected to be the one who would expel foreigners and renew Islam, and some people after 1902 felt that he had not really died.

Holy War in the Sudan

Mohammed Ahmad al-Sayyid (d 1885) arose as Mahdi in the Sudan, founded a Sufi brotherhood and gained great influence by his asceticism, persuasive teaching and sympathy with the sufferings of the poor. In 1881 he announced his divine appointment as Mahdi and defeated various British forces, eventually taking Khartoum in 1885, when General Gordon was killed. Five months later he died in Omdurman. His followers carried on his religious teachings, combining, as is natural in Islam, religion with politics. The Mahdi is still honoured. In 1898 Kitchener ordered his body and tomb to be destroyed, but the tomb was rebuilt and opened in 1947.

In India Ghulam Ahmad declared in 1890 that he was the Mahdi. Other claimants had considered fighting for the faith necessary, but he argued that jihad is a spiritual warfare. This movement has been actively missionary.

There is an expectation among Moslems that God will send a reformer at the beginning of every century; this belief is not necessarily connected with the idea of the Mahdi, but is occasionally associated with it. Ghulam Ahmad, for instance, was welcomed by his followers not merely as Mahdi, but also as coming, according to his claim, in the spirit and power of Jesus, and as the reformer for the beginning of the 14th Moslem century.

The great prehistoric temples of Malto, extraordinary feats of engineering, were constructed long before the pyramids of Egypt: their use and purpose is still uncertain

MALTA

RELIGION BELONGS to the world of ideas, but it is difficult to reconstruct past ideas without the help of the written word. There are long periods of human history before the invention of writing which are rich in material remains, yet our interpretations of the religious beliefs behind them cannot be anything more than reasoned, but necessarily unprovable, guesses.

Malta provides a perfect example of this. Through the third millenium BC it supported a rich culture which devoted a great part of its efforts to religion, and of which the remains have survived in great quantity and variety. The temples of Malta were an extraordinary achievement in their art, their architecture and their engineering, at a period well before the pyramids of Egypt. They are built of great blocks of stone, up to 20 tons in weight, but inside were faced with carefully dressed slabs, often tastefully decorated. They are mostly constructed to a standard plan, which was altered slightly with time. First there is a great oval forecourt, sometimes built up from the sloping hillside by means of an impressive terrace. Above the court rises a concave façade consisting of a course of block set on end with their faces exposed, topped by horizontal courses. At the centre is the entrance.

Through this, one enters the long side of a large oval chamber, walled in the same way but much more carefully. The apse formed on either side is usually partly screened off, either by a wall with a restricted doorway or by a row of decorated blocks. Against the walls are often block or slab altars. In the earlier temples, a third apse in the centre opens opposite the entrance, giving a trefoil plan.

Subterranean Mysteries

In a separate category is the Hypogeum of Hal Saflieni. This is a labyrinthine complex of artificially cut caves extending to a depth of 40 feet below the rock surface. The entrance area and the oldest part of the site appears to be a series of burial caves. Beyond and below this is what we can only regard as another temple. Many of its details are meticulous copies of the architectural features of the temples above ground. Others, like the carved ceilings and painted wall decoration, show what has been lost in the surface ruins. One chamber, the Oracle Room, has a deep booming echo. The innermost and deepest parts of the site are great store-rooms. But the site's main purpose was for burial, since the mortal remains of upwards of 6000 individuals were found in the side chambers.

So far, this tells us nothing of the rituals which were performed in these temples. Indeed, we are anticipating in calling them temples at all, though we can immediately add that there was no trace of contemporary domestic occupation found in any of them, nor of human burial except in the Hypogeum. A temple is a building designed for religious rites. What rites?

Clearest is that of animal sacrifice. Large rectangular blocks and three-slab tables can only be altars. Rows of sheep are represented in relief on some of the blocks. Perforations at ground level look like tethering places. Caches of animal bones would seem to be examples of actual offerings. And in one famous altar at Tarxien is a small cupboard which held a long flint knife-blade and the horn of a goat. Other evidence of offerings may, but need not, be associated. Pottery offering bowls, found in their hundreds, always broken, would be more appropriate for fruits or grain than for meat. Holes pierced through the stone paving probably took libations, but whether the offerings were of blood, milk, wine or some other liquid cannot now be determined. Large stone bowls with fire-scorched interiors occupy prominent positions on some sites. The great forecourts suggest ceremonials or processions in front of the temples.

More intriguing is the evidence for some sort of priesthood. The screens and barholes are on the inside of the doors, so someone had to remain inside to close them against the general public outside. Then there are the 'oracle holes', apertures up to a foot or so across, connecting the main

chambers with the small, and one is tempted to say secret, rooms within the walls. Though we can only guess at what passed through them – confessions and absolutions, offerings and alms, are as likely as oracles – they also imply a public on one side and a restricted, perhaps privileged, group on the other.

Black or White Magic?

To whom were the temples dedicated? Of the many surviving figures, only one unarguably represents a deity. This is the great stone statue at Tarxien, once about 9 feet high but now destroyed to waist level. It shows an obese standing figure in a pleated skirt, with extraordinary hip measurements, near-spherical calves and tiny feet. There are many smaller statues and figurines in stone and clay of apparently the same divinity, standing or seated. All are oddly sexless. In contrast there are a few obviously female ones, the finest being a beautifully and naturalistically modelled terracotta from the Hagar Qim temple, the so-called Venus of Malta. Only one is considered male, the 'priest' from Tarxien, but there is nothing to prove either his sex or his profession.

A few of the smallest figurines are different yet again, gross and deformed distortions of the human body. Some could be votive offerings, models of pathological conditions from which a sufferer had recovered or wished to recover. One looks suspiciously like black magic – it is jabbed all over with sharp flint splinters which remain in the wounds.

A famous terracotta figurine from the depths of the Hypogeum sums up our difficulties. It shows a woman of generous proportions lying on her side on an elegant couch. A cloth or rug is draped closely over her from the navel down. Her hands are beneath her head as if in sleep. Everyone is agreed that this is a highly significant figure, but unfortunately the significance escapes us. We have no way of knowing if she is a worshipper, a priestess or the goddess

The temple at Mnajdra, one of the finest of the 30-odd megalithic temples to be found on Malta. All are similar in plan and construction, consisting of intercommunicating oval chambers built of blocks of stone up to 20 tons in weight

herself. Even more problematical is what she is doing. Is she seeking a cure, for sterility perhaps, by sleeping in a sacred site? Or hoping for a dream in which the future will be revealed to her, or the will of the goddess made known? Or even just sleeping? She may, of course, be sleeping the sleep of death.

We are a little better off when we turn to the nature of this religion. Tentatively we regard the deity as a goddess, the Maltese variant of the Mediterranean Great Mother, but in view of the sexless figures, even this cannot be regarded as anything like certain. Fertility was clearly an important aspect of the religion. The obesity of the figures implies it, and the associated symbolism goes far to prove it. At Tarxien once more, one of the blocks bears relief carvings of a bull and a sow with 14 piglets at suck. Unmistakable carved stone phalli have been found in some numbers.

There also appear to have been close associations with death and the underworld. The snake decorating a block from the Ggantija in Gozo, Malta's sister island, would be entirely appropriate. The libation holes lead down into the earth. A recent suggestion is that the above-ground temples, though not themselves used for burials, were built copies of the rock-cut tombs which took the islands' dead. The Hypogeum offers the strongest argument for this link with the underworld.

There are hints of other sides to the goddess's powers, such as healing and foretelling the future, and one must not forget that dark suspicion of black magic. Nor can one even guess what others may have left no mark in the material record.

MAN

'We must all die, we are like water spilt on the ground, which cannot be gathered up again': religious, mystical and magical ideas about man's role in the world supply an invaluable insight into the hopes and fears of the human condition

ALL THE MAJOR RELIGIONS are based upon distinctive evaluations of human nature and destiny. In some religions, such as Christianity, this evaluation is consciously formulated into a doctrine of Man; in others it finds expression in ideas and terminologies that are never precisely defined, but clearly incorporate basic assumptions about life. Indeed, on the final analysis, religion itself stems from mankind's endeavour to understand its own reason for existence relative to the universe in which it finds itself placed.

That man, from the very dawn of culture, was able to abstract himself from the business of living and ponder the enigma of human destiny is attested by his burial customs. For the very fact that man has so concerned himself about his dead symbolizes the difference of his attitude to death from that of the other animals, which show no care for their dead (see BURIAL; CULT OF THE DEAD). The earliest known writings certainly show that men must have reflected on human nature and destiny long before they could record their opinions in writing. For these writings, of Egyptian and Sumerian origin and dating from the third millennium BC, reveal a maturity of expression indicative of long established traditions of belief. They also show that the two peoples concerned held very different views about human life in this world and the next.

The Egyptian view of man's nature and destiny, despite its great antiquity, is one of the most complex ever recorded (see EGYPT). One of its most notable characteristics is the preoccupation with death that seems to characterize ancient Egyptian civilization.

Below **To the Egyptians man was a complex mixture of physical and spiritual: the soul, shown as a human-headed bird, hovers above the body *Right* Vishvarupa, the manifestation of Vishnu in which the Hindu god embodies the whole universe. The conception of the universe, or macrocosm, as a gigantic man also appears in Manicheism, Gnosticism and the Cabala**

British Museum

What is Man?

O Lord, our Lord,
how majestic is thy name in all the earth! . . .
When I look at thy heavens, the work of thy
fingers,
the moon and the stars which thou hast
established;
what is man that thou art mindful of him,
and the son of man that thou dost care for him?
Yet thou hast made him little less than God,
and dost crown him with glory and honour.
Thou hast given him dominion over the works
of thy hands;
thou hast put all things under his feet . . .

Psalm 8

Hamlet . . . indeed it goes so heavily with my disposition that this goodly frame, the earth, seems to me a sterile promontory, this most excellent canopy, the air, look you, this brave o'erhanging firmament, this majestical roof fretted with golden fire, why, it appears no other thing to me than a foul and pestilent congregation of vapours. What a piece of work is a man! how noble in reason! how infinite in faculty! in form and moving how express and admirable! in action how like an angel! in apprehension how like a god! the beauty of the world! the paragon of animals! And yet, to me, what is this quintessence of dust? man delights not me.

Shakespeare *Hamlet*

Bodleian Library Colour Filmstrip

This preoccupation was indeed a fact; yet it was not inspired by any innate morbidity of temperament. On the contrary, the Egyptians had a fierce love of life, and it was this love that made them so concerned about death. They were basically optimistic, for despite their profound abhorrence of death, they believed that they had the means, if properly employed, to secure resurrection from death and a happy afterlife (see OSIRIS).

The Egyptians planned for the life after death in a practical manner, as they did for their life in this world. They had a lively apprehension of the perils that faced them after death, particularly of the judgement before Osiris, but these were really incidental, and the wise and prudent would so arrange their affairs that they might safely surmount all obstacles. However, despite this great concern about their eternal destiny, the ancient Egyptians remained curiously unconcerned about the purpose of their existence. Their creation myths almost completely ignore the creation of mankind. In contrast to their Mesopotamian neighbours, they never seem to have asked why their creator gods had made men and women like themselves (see CREATION MYTHS).

The Plague of the Living

The peoples of ancient Mesopotamia took a very different view of human nature and destiny. In one way it was a more thoughtful view, in that they were interested in the purpose of mankind's existence. The explanation given in their mythology was that the gods originally had to labour to provide their own food. Tiring of this obligation, they had created mankind to serve them by building temples and providing sacrifices. However, although the Mesopotamians were concerned to find a divine purpose for the human race, they came to form a most pessimistic estimate of human destiny.

They believed that the gods had intentionally made mankind mortal, so that when they ceased to have any further use for an individual, he died. Death effected an awful change in those who died. For while living, a human being was a kind of psycho-physical organism, being compounded of a material body and an animating principle, called in Akkadian *napistu*. At death this organic whole was irrevocably shattered. What survived, known as the *edim* or *etimmu*, was a horrible daemonic entity that could terribly plague the living, especially if its body were not properly buried. Its everlasting abode was *kur-nu-gi-a*, 'the land of no-return', located far below the earth, where all the dead dwelt, in dust and darkness, with no differentiation between the good and the wicked. There they were ruled by the terrible god Nergal and his grim wife Ereshkigal.

The pessimism of this Mesopotamian view of man's destiny calls for explanation and its likely cause has a great significance for the study of religion. It would seem, on the one hand, to have been based on a realistic estimate of the phenomenon of death as the complete disintegration of the living person. On the other hand, it was inspired by the inability of the unsophisticated mind to conceive of complete personal extinction. Hence the grim belief that something did survive of the former living person, though horribly transformed and so doomed to an existence of unending misery. (See also MESOPOTAMIA.)

This Mesopotamian view of man was not unique in the ancient world; parallels to it are found in ancient Israel and in Greece. The Hebrew estimate is graphically presented in the story of the Fall of Adam. Yahweh, the god of Israel, makes Adam out of clay, and then animates him by breathing 'the breath of life' into his nostrils. Adam thus becomes 'a living soul' (*nephesh*, which is akin to the Babylonian *napistu*). The animals are also described as 'living souls', and are similarly fashioned from clay. After Adam commits his fatal act of disobedience, Yahweh pronounces his doom: 'clay thou art, and unto clay shalt thou return.' Since Adam was the progenitor of mankind, this fate was inherited by all his descendants.

The official Hebrew doctrine of Man was, accordingly, very similar to the Mesopotamian view. The living person was regarded as a psycho-physical organism, compounded of material body and an animating principle, *nephesh*. Death irretrievably shattered this composite entity, and the consequences are vividly described in 2 Samuel (14.14): 'We must all die, we are like water spilt on the ground, which cannot be gathered up again.' What survived this disintegration departed to Sheol, an awful subterranean deep, like the Mesopotamian 'land of no-return'.

This pessimistic view of human destiny was changed in the 2nd century BC by the acceptance of the idea of a resurrection and judgement of the dead. What caused the change is not clear but it had significant repercussions for the Hebrew doctrine of Man. Human destiny was now extended with positive significance beyond death. However, because the traditional conception of human nature, as a compound of physical and psychical elements, was retained a resurrected life meant a reconstitution of the physical body. On this point, Hebrew eschatology became similar to that of Egypt, for both were based on the conviction that a body was essential to personal existence. But where the Egyptians sought to preserve the body by mummification, the Jews looked to its miraculous reconstitution by Yahweh.

The Urns of Fate

What may be described as the classical Greek evaluation of human nature and destiny was as pessimistic as the Mesopotamian and early Hebrew views. It first finds expression in the Homeric poems. The most dramatic presentation occurs in the *Odyssey* (book 11), which describes how Odysseus descended into Hades to learn the cause of the misfortunes that prevented his return home after the fall of Troy. In Hades he meets the shade of his dead mother. He tries vainly to embrace her shadowy image, and cries out in frustration and grief. His mother's shade replies: 'this is the way decreed for mortals when they die. The sinews cease to hold the flesh and bones together; for they are destroyed by the power of the blazing fire, as soon as the (conscious) life (*thymos*) leaves the white bones, and the shade (*psyche*), hovers about and then flits away.'

This passage mentions the three constituents of human nature, according to Homer: the body, which was cremated at death; the *thymos*, which was the conscious or rational self; the *psyche*, the life-principle. Death disintegrated the union of these constituent elements: the body was destroyed, the *thymos* ceased to exist, and the *psyche* descended to Hades. The *psyche* was imagined as a shadowy replica (called an *eidolon*) of the living person, but it had no consciousness. In Hades the shades of the dead are portrayed as being capable only of making chirping noises like birds. However, as this episode in the *Odyssey* shows, they could acquire a momentary consciousness by tasting the

Far left **'We must all die, we are like water spilt on the ground, which cannot be gathered up again': in the Old Testament death and the other ills of the human condition are the consequences of man's disobedience; Adam and Eve with the Tree of Knowledge, from a 13th century MS *Left* The Tree of Life, equated in this 18th century drawing with the cross on which Christ died to rescue human nature from the predicament to which the sin of Eden had condemned it. In the foreground 'this present evil world' is contrasted with the heavenly New Jerusalem in the background**

blood of a sacrificed animal – an idea derived from the primitive belief that blood is the 'life-substance'.

Several attempts are made in the *Iliad* to account for human fate. In one place Zeus is pictured as arbitrarily handing out mixtures of good and bad lots to individuals from two urns that stood on the floor of Olympus. Other imagery is used elsewhere: that the gods 'bind' men's fates upon them; that 'mighty Fate' spins 'her thread' of destiny at a person's birth; that Zeus weighs the fates of heroes in his golden scales. The fluidity of this imagery suggests that, at this early stage in Greek thought, the problem was gradually emerging of relating human destiny to the divine government of the universe. But it was a problem that was never satisfactorily solved, for the Greek concept of deity was essentially based on experience of cosmic power, which is indifferent to human aspirations and values. This is clearly evident in Stoicism, which represented the most sustained effort made in the Graeco-Roman world to produce a philosophy of life in terms of a realistic appraisal of the human situation.

According to Stoic doctrine, the superiority of man over the animals lay in his possession of a rational mind *(nous)*, which enabled him to grasp the scheme of the universe. This implied that man could consciously will 'to live according to Nature', which in practice meant conforming one's desires and conduct to the limitations of human existence imposed by the physics of the universe. It was an austere creed, which offered the individual no hope beyond the personal satisfaction of having the strength of steeling himself to accept ultimate personal extinction. For death, as the Stoic philosopher Epictetus explains, is necessary, 'so that the revolution of the universe may be accomplished; for it has a need of the things that are now coming into being, and the things that shall be, and the things that have been accomplished.'

Stoicism was a product of the innate rationalism of the Greek mind, which could assess life objectively, uninfluenced by a religious tradition that claimed the authority of divine revelation. As such it appealed to minds sufficiently educated to appreciate its logic and resolute enough to live according to its austere counsel. But there is an abundance of evidence that, apart from professed Stoics, many ordinary people also resigned themselves to the fate that Homer first describes, and which finds expression in subsequent literature of all kinds. The many surviving funerary monuments, carved with scenes of the last farewell of the deceased, express a quiet but infinitely sad acceptance of the inevitable. Occasionally a note of defiance is heard, as in the following epitaph: 'I was not; I became; I am not; I care not.'

The Body, A Tomb

This pessimistic estimate of man's nature and destiny, which can be traced throughout classical culture, from Homeric Greece to Graeco-Roman society, was not accepted by all. Despite its obvious realism, many sought for a more comforting creed. The ancient Eleusinian Mysteries and Orphism promised their respective initiates deliverance from death and a blessed afterlife. Orphism was the more sophisticated cult and it involved the idea of the transmigration of souls, an idea which implied a very different conception of human nature from that of the classical tradition. It presupposed that in each person an immortal ethereal soul *(psyche)* was imprisoned in a material body. Orphic mythology explained that this situation was due to an ancient crime, and that the soul's true destiny was to return to its original divine source. This destiny could be achieved only by the soul's realization of its true nature, and by following a discipline designed to emancipate it from attachment to the world of material things. A favourite

The Calamity of Original Sin

To consider the world in its length and breadth, its various history, the many races of man, their starts, their fortunes, their mutual alienation, their conflicts; and then their ways, habits, governments, forms of worship; their enterprises, their aimless courses, their random achievements and acquirements, the impotent conclusion of long-standing facts, the tokens so faint and broken, of a superintending design, the blind evolution of what turn out to be great powers or truth, the progress of things, as if from unreasoning elements, not towards final causes, the greatness and littleness of man, his far-reaching aims, his short duration, the curtain hung over his futurity, the disappointments of life, the defeat of good, the success of evil, physical pain, mental anguish, the prevalence and intensity of sin, the pervading idolatries, the corruptions, the dreary hopeless irreligion . . . all this is a vision to dizzy and appal; and inflicts upon the mind the sense of a profound mystery, which is absolutely beyond human solution.

What shall be said to this heart-piercing, reason-bewildering fact? I can only answer that either there is no Creator, or this living society of men is in a true sense discarded from His presence . . . And so I argue about the world; – *if* there be a God, *since* there is a God, the human race is implicated in some terrible aboriginal calamity. It is out of joint with the purposes of its Creator.

John Henry Newman *Apologia Pro Vita Sua*

Anthropomorphism, the tendency to picture the divine in human form, is extremely widespread, as is the tendency to believe that man himself is potentially divine *Right* Manjusri, the Buddhist personification of wisdom *Centre* Apollo, the Greek god of the arts and prophecy *Far right* Spirits in human form, an aboriginal bark painting from Australia

Orphic saying was *soma, sema*, 'the body, a tomb'. (See ELEUSIS; ORPHEUS AND ORPHISM.)

Orphic ideas seem to have influenced the philosophy of Plato, in which the immortality of the soul is a major theme. He represents his master Socrates as exhorting his fellow-countrymen 'to take care of the soul'. He accepts the idea of the transmigration of the soul through many incarnations in both human and animal bodies, from contact with which it is contaminated and must make atonement. He proclaims it to be the task of the philosopher, through his superior knowledge, to free his soul from bondage to the body and assist it to regain its original state of blessedness.

This dualistic conception of human nature, of an immortal soul dwelling in a mortal body, became a firmly established tradition in the Graeco-Roman world. It was the basic concept of Gnosticism, Hermeticism, Neo-Pythagoreanism and Neoplatonism. These religio-philosophical cults were concerned to explain how the ethereal soul came to be incarcerated in a physical body, living in a world of material things. Each offered a way, usually involving esoteric knowledge and discipline, by which the soul might be delivered from its bondage and return to the divine source from which it had fallen. These ideas profoundly affected the Christian doctrine of Man.

Raised Incorruptible

Since Christianity originated in Judaea and the first Christians were Jews, Jewish ideas about human nature and destiny inevitably formed the basis of the primitive Christian view. As the New Testament shows, belief in the resurrection and judgement of the dead were fundamental tenets of the new faith. The conception of the resurrection reflected the Jewish view of human nature as a psycho-physical organism in a very literal sense. This is most notably seen in the description of the resurrected Jesus. According to St Luke (chapter 24), when the disciples saw Jesus in his resurrected state, they were terrified, supposing 'that they saw a spirit'. But Jesus assured them of his physical reality: 'See my hands and my feet, that it is I myself: handle me, and see; for a spirit has not flesh and bones as you see that I have.' When some disciples still remained doubtful, he proposed a further test: 'Have you anything here to eat?' They gave him a piece of a broiled fish, which he proceeded to eat before them.

This amazing emphasis upon the concrete reality of the resurrected body of Jesus reflects the belief of the early Christians about the essentiality of the physical body. But as the writings of St Paul show, when this Jewish idea was presented to Gentiles who held the dualistic view of human nature that derived from Plato and Orphism, offence was given. In consequence, adjustments were made to accommodate belief that the soul was immortal by nature and able to exist independently of the body However, the Jewish concept of a physical resurrection was too integral a part of the original Christian message to be abandoned. It was retained, together with the idea of a Last Judgement.

The Christian doctrine of Man thus taught that God created human souls to be immortal, but placed them in physical bodies with which they became essentially connected. At death, the soul left the body and was immediately judged. For the majority of mankind this judgement resulted in the soul's consignment to purgatory, to expiate its sins. At the Second Coming of Christ, the decomposed bodies of the dead would be reconstituted and their souls would re-enter them for the Final Judgement.

The Christian doctrine of Man involved the doctrine of original sin. It was taught that Adam had implicated all his descendants in his original act of disobedience to his Creator. Consequently, all subsequent generations were deserving of God's wrath from the moment of birth, quite apart from the guilt they later acquired by their own actual sins. Being thus a Fallen Race, mankind was predisposed to evil. This meant, according to Christian theologians, that man was not only unable to save himself from the state of perdition into which he was born, but he could not even desire to repent without God's grace. The means by which God provided salvation for mankind is expounded in the doctrine of the Atonement, and constitutes an essential part of the foundational teaching of Christianity (see ATONEMENT). Those who repented of their sins and accepted Christ as their Saviour could hope that, after enduring the cleansing fires of purgatory, they would be reunited with their bodies, and, justified at the Last Judgement, would pass on to the eternal bliss of the Beatific Vision of God.

The doctrine of Man in Islam has some affinity to those of Judaism and Christianity; the fact constitutes part of the problem of the relation of the Arabian religion to Judaism and Christianity, which predated it. The affinity is especially marked in the eschatology of the Koran. Mohammed regarded himself as sent by Allah to warn his countrymen of the coming of divine judgement. This 'Last Judgement' would involve the resurrection of the dead, and would result in the vindication of the faithful and their reward in paradise, and the eternal damnation of the wicked to the torments of hell.

Souls Beneath the Throne

Man was, by implication, created to serve Allah and repudiate all other gods. According to the Koran, man is made of fire-clay which was transformed into flesh. Within the body was a vital principle or soul *(nafs)*, and the two united to form the living person – hence the stress laid on a physical resurrection at the Last Day. The theme of human predestination figures much in Islam, owing to the supreme emphasis put on the omnipotence and omniscience of Allah. It leads to such uncompromising statements as that of sura 25 of the Koran: 'Allah leadeth astray whom He willeth and guideth whom He willeth.' However, the very word 'Islam' is derived from an Arabic verb signifying the idea of submission to a supreme will. As such, it presupposes that the individual has the freedom of will to submit himself absolutely to the commands of Allah.

The meagre references in the Koran to the nature of man led to much later speculation about the soul. The belief became generally established that human souls were created by Allah and kept in a shrine beneath his throne until required for their respective incarnations. The immortality of the soul was also accepted. The Sufi mystics held that the soul was of divine origin and craved for reunion with its Creator, and that this reunion could be achieved by mystical trance. However, despite these developments, Islam has remained essentially a simple faith founded on the revelation, made to Mohammed, of Allah's purpose for man, and formulated in a few practical precepts of conduct (see ISLAM; SUFIS).

The Way of Deliverance

While these various evaluations of human nature and destiny were being worked out in the ancient Near East and Europe, in India another estimate was gradually established which was destined to affect most of the peoples of eastern Asia. This estimate was similar to that of Orphism in as far as it was based on the idea of the transmigration of souls. But the Indian interpretation dates from about 600 BC, and is undoubtedly older than the Orphic view. Whether the latter derived from India has been much debated, without any agreed conclusion. The idea of the rebirth or transmigration of souls is not necessarily a sophisticated concept, and it occurs among many primitive peoples, so that the Indian and the Orphic views might well have had separate origins.

The Indian view of Man is certainly a sophisticated estimate. It maintains that the individual self, or *atman*, is really identical with Brahman, the source or principle of existence. But owing to *avidya*, or ignorance, the atman believes itself to be an individual self-conscious person. In turn it takes the phenomenal world for reality, and involves itself in it. Consequently, it becomes subject to the process of Time, which is manifested in unceasing cycles of creation and destruction. For the atman or self this means *samsara*, or rebirth, which is likewise a ceaseless process of dying and being reborn, with all the attendant suffering. Together with samsara operates the law of karma, which causes the atman to work out in each incarnation the consequences of its actions in past incarnate lives. This process conditions the form of each period of rebirth.

Thus, according to this Indian doctrine, at any given moment every living being is in that state of fortune, be it good or ill, which his past karma has entailed. However, this situation is not hopeless and Hinduism, in its various forms, offers a way of deliverance. Basically this involves the effective apprehension of its own true nature by the atman. Such apprehension implies the recognition, as the *Chandogya Upanishad* tersely puts it, that 'the self of mine within the heart, this is Brahman'. But this recognition is not just a mental act; if it is to be effective, it involves an effort to abstract the self from its fatal attachment to existence in this world, which it has taken for reality. Such abstraction is difficult and can be achieved only by a hard discipline. When *moksa*, 'salvation', is finally achieved, individual existence in this world ceases, and the atman is absorbed into Brahman as a drop of rain merges into the sea (see BRAHMAN; HINDUISM; KARMA).

This Indian interpretation of existence, in its early Upanishadic form, seems to have provided both the basis and point of departure for the Buddhist doctrine of Man. Buddhism concentrated particularly on the miseries of human existence by way of introduction to its own gospel of salvation. It accepted the doctrines of samsara and karma; but it rejected the Hindu concept of a self (atman) that was continuously reborn to new forms of incarnated life. Instead, it maintained that the idea of the empirical self stems from a conglomeration of various mental and physical factors *(skandhas)*, which produce the sensation of individual existence in a material world. Since this illusory self cherishes its sense of personal being, it takes the world apprehended by its senses for reality and attaches itself to it. Hence, as in Hindu thought, the individual becomes subject to the process of continuous death and rebirth, with all their concomitant suffering.

According to the Buddhist analysis of the human situation, this universal illusion of personal existence is due to a kind of primordial ignorance (avidya), which it is the task of the Buddhist teacher to expose. To gain deliverance from samsara and

Man as microcosm, illustrating the theory that man is the universe in miniature, that he contains 'in himself all that is contained in the greater world': drawing from *Utriusque Cosmi Historia*, a work by the 17th century mystical philosopher Robert Fludd

karma, the disciple has to pursue an austere discipline of mind and body. The final suppression of all desire for personal existence achieves Nirvana. Owing to the essential subtlety of Buddhist metaphysics, it is very difficult to be certain what this term means. Literally it implies personal extinction; but as used in Buddhist texts it seems to denote a positive state of being, yet one that is so wholly other from empirical existence that it negates all known forms of being (see BUDDHISM: NIRVANA).

Yin and Yang

The spread of Buddhism throughout eastern and south-eastern Asia has meant that the Buddhist view of human nature and destiny has influenced a large part of mankind. It was accepted into China, where it tended to intermingle with or affect the native faiths of Confucianism and Taoism. The native Chinese evaluation of man, however, had certain distinctive features.

The interpretations of man so far described, although they have varied much in their estimates, have had one feature in common. They all set mankind, as a unique species, over against the rest of creation. Instinctively they assume that man should have a special destiny in the scheme of things. The Chinese estimate has notably lacked this assumption. On the contrary, it has stressed man's integration with his natural environment. This approach finds characteristic expression in the idea of Yin and Yang. The terms denote two alternating principles which the Chinese, from at least the 5th century BC, discerned as operative in all forms of being throughout the universe. Man was not excepted from their operation, and a Yin-Yang anthropology was elaborated which explained human nature in these terms. The following passage from the *Lu-shih Ch'un Ch'ui* succinctly states this view: 'Heaven, Earth and all things are like the body of one man, and this is what is called the Great Unity *(ta t'ung)*.' And it goes on to define the duty of the Sage as that of showing 'how the *yin* and *yang* form the essence of things, and how people, birds and beasts are in a state of peace'. (See also CHINA.)

The original teaching of Zoroaster on the subject of Man is obscure. He uses two terms, *urvan* and *daena*, signifying the non-physical components of human nature that survive death. The urvan seems to approximate to the 'soul', and the daena to denote something akin to 'conscience'. In later Zoroastrianism five constituents of human nature were distinguished and the idea of the daena was also curiously elaborated. The dead were described as meeting their daena after death: to the righteous it appeared as a beauteous maiden; to the wicked as a hideous hag. Zoroastrian eschatology involved a corporeal resurrection, with adults restored to a physical state of 40 years of age, and those who had died as children to the form of 15 years. There was also an Immediate and a Final Judgement of the dead. (See also ZOROASTRIANISM.)

S. G. F. BRANDON

The Universal Man

'What is man that thou art mindful of him? . . . Yet thou hast made him little less than God' (Psalm 8). These opposite feelings, of man's humble insignificance and yet of his overwhelming importance, were expressed for hundreds of years in the West, in the theory of macrocosm and microcosm, that man is the universe, and perhaps God, in miniature, a toy copy of a great original. 'Man,' Agrippa said, 'hath in himself all that is contained in the greater world, so that there remaineth nothing which is not found even really and truly in man himself,' and man 'also doth receive and contain even God himself . . . Therefore man is the most express Image of God, seeing man containeth in himself all things which are in God' (see AGRIPPA).

Since the universe, or macrocosm, is conceived of as a gigantic human organism it has naturally sometimes been pictured as the body of man, the universal or primal or heavenly man. In the Cabala this is Adam Kadmon, whose body is formed by the sefiroth of the Tree of Life. In the Lurianic Cabala, when the divine light of the godhead flowed out into space, the first being which came into existence, the first and highest manifestation of the godhead, was Adam Kadmon. It was from his eyes, ears, nose and mouth that the splendid lights of the sefiroth shone forth (see CABALA; LURIA).

Adam Kadmon is not the same as the godhead, which is beyond human comprehending, but he is God the Creator, God manifested in the universe, and he is the God who can be known by man, for earthly man is a miniature image of him. Adam Kadmon is the whole universe as we know it, the sum total of all the possibilities open to man, and it has been pointed out that his mind, which is the 'universal mind', resembles Jung's collective unconscious.

In Manicheism, the primal man was a manifestation of God, clothed in the armour of light and sent out to do battle with the invading forces of darkness. It was his defeat which allowed particles of divine light to be captured by the evil powers and imprisoned in matter. In the Lurianic Cabala, the divine light emanating from Adam Kadmon broke the vessels which should have contained it, and so particles of light were scattered, a catastrophe paralleled by the Fall of Adam in Eden. The biblical Adam, according to

this theory, was at first a spiritual man, not a physical one, a 'great soul' whose body was made not of matter but of light. He was created to restore the fallen sparks of light to their proper place but he failed. His 'great soul', in which the entire soul-stuff of humanity was concentrated, shattered and its divine sparks became exiled in the world of human matter and earthly human nature.

In Gnosticism, again, man contains the divine spark, the inner seed of heavenly light imprisoned in the darkness of the material world and the physical body, a spark which can escape from its prison to be reunited with its source in the godhead. The liberation comes when it realizes its identity (paralleled in Hinduism by the self's 'effective apprehension of its own true nature' – see above). 'The Gnostic is a Gnostic because he knows, by revelation, who his true self is.' Similarly, the Manicheans believed that their doctrines 'revealed to them their real identity', and so freed them from the grip of evil and matter (see GNOSTICISM; MANICHEANS).

Gnosticism and Manicheism seem to have been based originally on a religious experience, the discovery of the true and divine self in a man's innermost being, described as the higher Self, the twin or familiar, or the guardian angel. The discovery and liberation of the true self remains the great aim of Western occultism and magic. It is this divine element in his nature which in magical theory gives man his potentially limitless power. 'The proper study of mankind is man', with a vengeance, for man is both the measure and the master of all things.

The idea of a power underlying all magic, residing in the king, the priest and the shaman, and even in objects and places, is common to many religions; a power which may be dangerous or beneficial, according to the way in which it is directed

MANA

ORIGINALLY A POLYNESIAN concept of spiritual power, mana is invisible, imponderable and yet powerful. Mana derives from the divine ancestors and enters to some degree into all beings and things descended from them. The nearer the descendant is to the source, the more powerful the content of mana: a Polynesian chief who was chosen because of his close kinship with the gods was the vessel of a greater degree of mana than a commoner.

Such beliefs are widespread in human communities, and so the use of the word has been extended to cover similar concepts in many cultures often far removed from Polynesia. It is the mysterious power by which English kings cured scrofula, the King's Evil, by touching the victim. It is the force which fills objects used by famous shamans, so that no one else dare use them. R. H. Codrington, who defined the term as he found it in use among the Melanesians, tells us that mana was the power underlying all magic, and the means by which men were able to cause and cure sickness, control the forces of matter, and to bless and curse others.

In some ways the concept of mana reminds us of the now defunct theory that all motion in space, including that of light, was transmitted through a medium known as the circumambient ether. Mana is thought of as being the means by which telepathy works across space. The reason is that people need to think of a medium of some kind through which the idea, or the power, is projected.

Mana was lost through contact with lesser containers. It flowed from the more powerful to the less powerful and sometimes caused destruction. This applied not only to material objects but to human beings as well. The fear that harm might come from contact between humans was very important socially. It conditioned the relation between the sexes at times of crisis, since women were universally regarded as the powers of earth and fertility, and therefore absorbed mana. At times of war, and during hunting festivals, women were kept separate from men. A warrior who had intercourse before setting out on an expedition might bring had luck to the whole venture. This superstition was found in many parts of the world, and was based on the belief that with the emission of a man's semen he was losing mana to the powers of earth. He would either have to go through a series of rituals to regain power, or else leave the expedition. Among the ancient Chibcha of Colombia, a boy captured for sacrifice to the sun god when he reached puberty was set free if a girl took him as her mate. The power he contained had been taken by earth and moon forces and so would be of no avail to the sun.

Among the Maori of New Zealand there were times when a chief, as the head of a line descended from the gods, became so full of mana that no one dared touch him. In particular his head was a centre of force, and was never touched by others of lesser rank. The most critical period was when he was being decorated with his *moko* tattoo. Then he could not touch anything without a risk of setting off a rush of dangerous power, and had to be fed by noblemen with gruel poured into his mouth through a wooden spout. The tattoo artist was magically protected, but as he worked with mallet and tiny shell-pointed comb, he had to make sure that he never actually handled the flesh of his subject. All women were kept away from the house where the great magic was pulsating. At this stage anyone accidentally touching the chief or his more important belongings would drop dead, probably from sheer horror at the consequences.

Mana was the power which guarded the objects placed under a tapu (taboo) restriction. If the rules were broken the power would flow into the offender and destroy him. It would take elaborate ceremonies and heavy payments to bring about a cure, if it were possible at all. The power of mana was quite impersonal. It was not the vengeful action of a ghostly ancestor, but an inherent sanction: if the rules were broken the penalty would follow. Yet it was possible for a properly skilled *tohunga* or priest to lay a taboo on anything he wished, and thereby activate the power of mana.

Contagious Sanctity

A Maori chief would not blow a fire with his mouth; for his sacred breath would communicate its sanctity to the fire, which would pass it on to the pot on the fire, which would pass it on to the meat in the pot, which would pass it on to the man who ate the meat, which was in the pot, which stood on the fire, which was breathed on by the chief; so that the eater, infected by the chief's breath conveyed through these intermediaries, would surely die.

J. G. Frazer *The Golden Bough*

Power in Holy Places

A development of the idea of the protective power of mana was the common religious belief that some places were so inherently holy that only a few specialist individuals might approach them. An example was the Holy of Holies in the Temple at Jerusalem, where once a year the High Priest alone might enter and stand humbly before the Ark.

There are still places where mysterious power can be felt. Mostly they are anciently sacred places, chosen perhaps because of some natural force which could be sensed by visitors. They play their part in ceremonial activity, especially among modern witch covens, because of the possibility of concentrating and directing whatever energy has remained within them. Scientifically this is not a reasonable activity, but the traditions behind such holy places are so ancient that they compel respect, even if it is only some kind of telepathic contact which is made with the ceremonies of old.

It is impossible to give a satisfactory definition of mana, because the concept is diffuse. However, the Polynesians used the word to describe something which was perfectly understandable to them. It did not need any exact scientific definition because from their point of view its existence was an undisputed fact.

The psychologist C. G. Jung recognized in the mandala, the mystic circle used in Eastern magic and meditative practice, an archetypal image from the deeps of the mind expressing the soul itself

MANDALA

THE WORD MANDALA is Sanskrit, meaning 'circle'; it is used in Hindu and Buddhist ritualism to denote a mystical diagram, usually circular in outline, although it may occasionally be drawn in some other symmetrical figure, such as a polygon, square or geometrical pattern with the outer border 'concentred' about a fixed point. In all cases the circumscribing circle is there, even if invisibly, enclosing the pattern.

A mandala is generally represented physically, and may be engraved on metal, inscribed on ground specially cleared to receive the tracing, or marked on the floor of a room. It may be painted on cloth, or made by sprinkling coloured sand or pigment on a board. It may be used over and over again, or erased, washed off or burned after its temporary use.

But the mandala does not have to be drawn in actual fact. It may be memorized and traced mentally either on the ground, or better still in the air, and held in the mind's eye by meditative methods. It may even be danced, as the Bon priests of Tibet do in certain secret rites, hopping about this way and that as they demarcate the outlines and add the inner traceries of the pattern required in their particular rite.

The design of a mandala, whether simple or intricate, varies as its object and purpose vary. In certain magical rites the mandala

The mandala or circle is one of the most widespread of all symbols, found in religious art in all parts of the world. In the East its consecrated space may be regarded as charged with the presence of deities who have been housed within it *Above* The central figure of this Hindu mandala is Vishnu, seated upon the coils of the snake Shesha and surrounded by protective deities *Right* Nepalese mandala of the 16th century: the central figure is Vasudhara, the earth goddess of Buddhist mythology

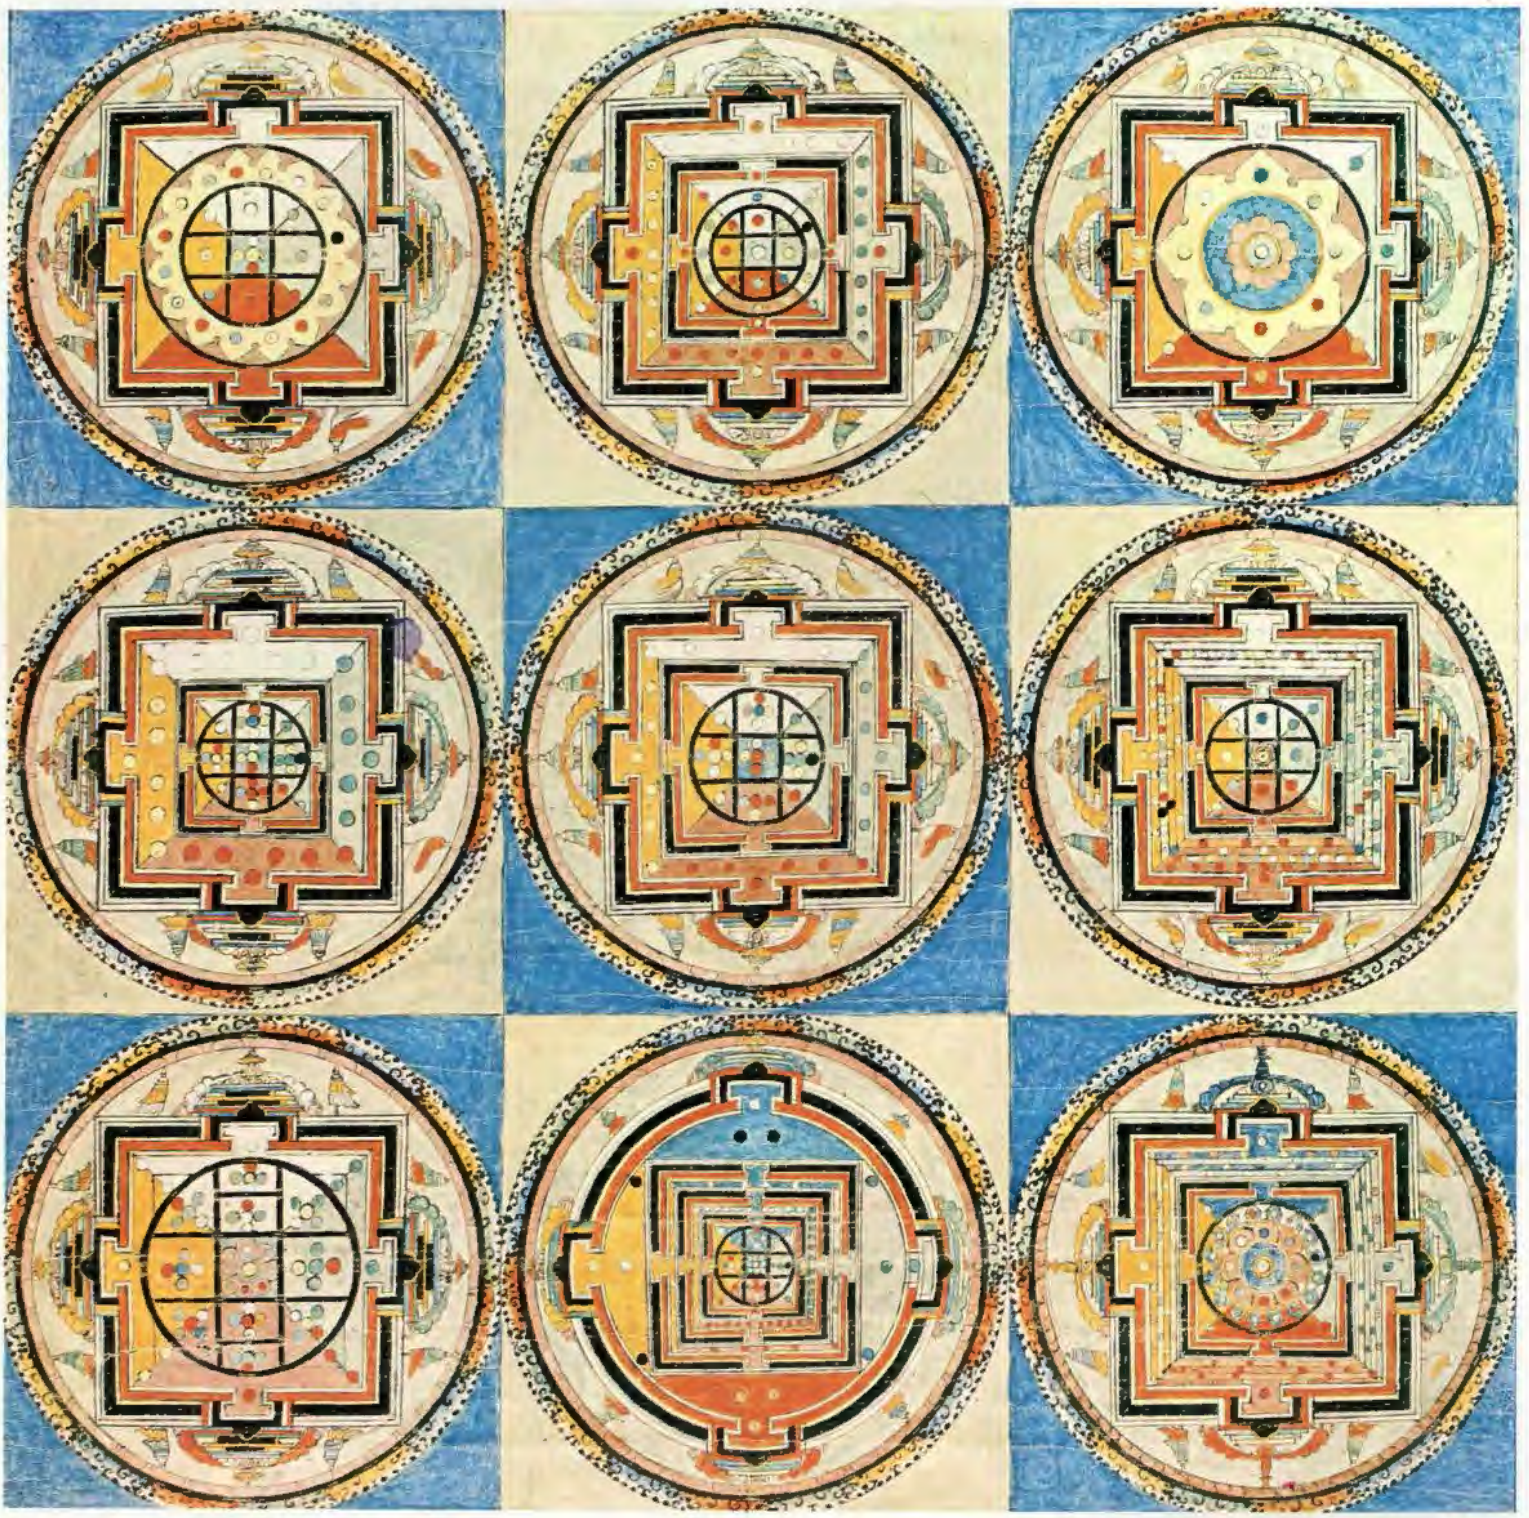
serves to circumscribe the territory in which the adept operates. The magician of the Western tradition draws such a protective magic circle before he invokes spirits or demons to appear before him. As long as he is within the circle they can do him no harm, and with this safeguard he commands them to do his will.

Engine of Power

In Eastern magical practice the mandala is employed to draw down and house the deities or, in the case of black magical rites, the demons. By means of spells, offerings and invocations the practitioner calls down spiritual beings to occupy a place assigned to them in the diagram and charge it with their presence. It now becomes a *yantra*, an 'engine' of power; every yantra differs according to the power of the occupying entities and the uses made of them.

In some cases the divisions of a mandala are given numerological significance and a mathematical pattern is worked out on this basis. In Tantric meditation (see TANTRISM) the yantra takes on a sexual character and is believed to represent the female organs of generation. Some yantras are thought to have talismanic properties and almost a life of their own, radiating a power that projects the qualities traditionally associated with them and for which they have been constructed. These qualities may be beneficent, healing, tranquillity-bestowing or on the other hand malicious, evil and destructive. Students of the subject say that drawing a mandala correctly and giving it vitality, so as to connect it with the unseen world, is a matter not to be undertaken lightly in a spirit of curiosity or dilettantism.

The mandala or circle is one of the most widespread of all symbols and is rich in meaning. We find it in a hundred familiar variations, but also in the more profound manifestations of religion and art. It represents the Infinite. The 17th century French theologian Blaise Pascal said that God is a circle of which the centre is everywhere and the circumference nowhere. But



Series of 19th century Tibetan mandalas from a temple wall: their elaborate designs, charged with occult significance, were used as aids to Tantric meditation

the circle also symbolizes the finite. It is both the boundless and the bounded; the divine and the human. Its symbolism overflows in many directions. Rayed, it is an emblem of the sun; spoked, it represents the wheel (see WHEEL). Divided by an S-shaped diameter it is the well-known Yang-Yin symbol of Chinese mysticism (see I CHING).

The circle pattern is found in the ground plans of great architectural creations ancient and modern, and appears in the traceries of magical designs in all parts of the world. It can be seen in the sand paintings of the Navaho Indians of New Mexico, in the stupas (dome-shaped temples) of India, in the calendar stone of the Aztecs, in the Paleolithic rock engravings of Rhodesia. It figures in the symbolical designs of the Voodoo cult, in ancient Chinese bronze shields and in the visions described by the Old Testament prophet Ezekiel.

An Expression of the Psyche

Sometimes the mandala is regarded as a map of hidden dimensions, and is then drawn in the form of a maze. Or it may serve as a means of activating a mental reflex and reproducing in the conscious mind the symbolism of our hidden selves. It has fascinated psychologists as an expression of the deeps of the mind, and C. G. Jung found in the mandala one of the great primordial images of mankind.

Often terrifying aspects are revealed in the figure. As a clock face it has a certain panic element in it, of man caught in the toils of time and space and unable to free himself from its limitations. Tibetan and Tantric forms of meditation on the mandala can evoke gruesome images, of skulls brimful of blood, decaying human entrails, human bones that do a *danse macabre* of their own. All such are regarded as phantom shapes emanating from our own minds and partial reflections of our inner natures. For in considering the mandala we are analysing the self.

FURTHER READING: C. G. Jung, *Archetypes and the Collective Unconscious* (Routledge, 1959); G. Tucci, *The Theory and Practice of the Mandala* (Rider, 1961).

Uprooting a mandrake was, according to popular belief, a dangerous business, for as the plant was pulled out of the earth it gave a shriek so fearful that anyone hearing it would die. The roots of this strangely humon plant became lucky mannikins, which were regularly washed, dressed and asked for advice

MANDRAKE

British Museum

Most of the superstitions about the mandrake had their origin in the supposed resemblance of the forked roots to the human body. If dug up, the plant was believed to utter a shriek fatal to the hearer; it was therefore recommended that it should be pulled up by a dog

FEW PLANTS have been credited with more fictitious attributes than the mandrake. It is difficult to suggest why this plant should have become so notorious: although it is an unusual one it is no odder than many others, and the forking or multiple root which is responsible for most of its associations with magic is to be found in such homely vegetables as the parsnip. Quite early in the British herbal record, writers may be found explaining how nonsensical the beliefs about the mandrake must be. For instance, in John Gerard's *Herball* of 1597 we find this denial of the plant's supposed attributes; it is perhaps worth quoting his description of the plant as well as his comments.

> The male Mandrake hath great broad long smooth leaves of a dark green colour, flat spread upon the ground: among which come up the flowers of a pale whitish colour, standing every one upon a single small and weak foot-stalk of a whitish green colour: in their places grow round Apples of a yellowish colour, smooth, soft and glittering, of a strong smell: in which are contained flat and smooth seeds in fashion of a little kidney, like those of the Thorn-apple. The root is long, thick, whitish, divided many times into two or three parts resembling the legs of a man, as it hath been reported; whereas in truth it is no otherwise than in the roots of carrots, parsnips, and such like, forked or divided into two or more parts, which Nature taketh no account of. There hath been many ridiculous tales brought up of this plant, whether of old wives, or some runagate Surgeons or Physic-mongers I know not, (a title bad enough for them) but sure some one or more that sought to make themselves famous and skilful above others, were the first broachers of that error I speak of.

Botanically the mandrake is *Mandragora officinarum*, and it belongs to the Solanaceae in company with henbane, belladonna, thorn-apple and tobacco. Its flowers are brighter than Gerard suggests, varying from pale to rich mauve-blue, sometimes in scores, sometimes only a handful. There are autumn and spring flowering forms, and the blooms are followed by odorous orange fruits looking like a nestful of eggs.

Like so many of its relations, mandrake is narcotic, the root containing an alkaloid similar to atropine. In ancient times it was used as a pain-killer and sleep-inducer; Pliny reports patients under operation chewing a piece of the root to anaesthetize themselves. A medieval English writer described its use in medicine: 'When the sick man is in anguish, this potion boiled from the mandrake his root will still the pain – nor will he suffer aught should the Leech probe his wounds, or e'en saw through his leg or arm, syn his nerves are dead while this potion lasteth.' According to William Turner, the 16th century herbalist, even the 'apples of mandrake, if a man smell of them they will make him sleep and also if they be eaten. But they that smell too much of the apples become dumb . . .'

Mandrake was administered to lunatics to quell their violence; other uses were to relieve convulsions, dull rheumatic aches and toothache, and against melancholia. It was known that large doses provoked delirium and eventual madness.

Other medico-magical powers are attributed to mandrake in early herbals; in company with periwinkle, it was useful 'for witlessness, that is devil sickness or maniacal possession', according to Apuleius Barberus, writing in about 1481. Flavius Josephus, the Jewish chronicler (1st century AD) had averred that mandrake's prime virtue was the expulsion of demons from sick people, because they could not abide its smell.

Plant in Human Form

The main mythology of mandrake concerned its forking roots, which were supposed to resemble the human body in form. The Greeks and Romans had noticed this, calling the plant *Anthropomorphon* and *Semi-homo* respectively. In the old herbals the plant is typically pictured with leaves, flowers and fruits emerging from the head of a bearded man or a long-haired woman; for there were supposed to be both male and female forms, depending on the plant's colouring and girth, sometimes called mandrake and woman-drake. Even the later, more accurate botanical drawings, such as those of Pierandrea Mattioli, drew attention to the two forms, and although not literally depicting a human body, made the roots of the plant resemble the trunk and legs of a man or woman.

This resemblance to the human body

naturally had sexual connotations. The earliest reflection of the belief in the value of mandrake as an aphrodisiac and an aid to conception is in the biblical passage (Genesis, chapter 30) where 'in the days of wheat harvest Reuben went and found mandrakes in the field, and brought them to his mother Leah. Then Rachel said to Leah, "Give me, I pray, some of your son's mandrakes." But she said to her, "Is it a small matter that you have taken away my husband? Would you take away my son's mandrakes also?" Rachel said, "Then he may lie with you tonight for your son's mandrakes." When Jacob came from the field in the evening, Leah went out to meet him, and said "You must come in to me; for I have hired you with my son's mandrakes." So he lay with her that night. And God hearkened to Leah, and she conceived and bore Jacob a fifth son.'

The Arabs refer to mandrake's supposed aphrodisiac properties by calling it 'apples of jan' or 'devil's apples' because of its supposed power to excite voluptuousness, and they also believe it to help the infertile. In England, it was known as 'love-apple', a name later transferred to the tomato.

It is clear that by Shakespeare's day mandrake's aphrodisiac attributes had brought the plant into some disrepute. Falstaff refers to Justice Shallow in *Henry IV* Part 2 as 'lecherous as a monkey, and the whores call'd him mandrake'.

Even in Pliny's time, when the root's valuable properties were already known, the collecting of mandrake was accompanied by special ceremony. The herbalist had to stand with his back to the wind, draw three concentric circles around the plant with his sword, pour a libation and then, turning to the west, dig it up with his sword. The plant would otherwise flee away.

Wellcome Institute

Deadly Shrieks

At some stage the mandrake became one of the Devil's plants, and to dig it up with the correct invocation meant having Satan at one's bidding. It was Josephus, apparently describing contemporary Jewish belief, who started the most notable superstition about mandrake (which incidentally it shares with the peony), which was that the root shrieked if dug up. This cry was fatal to its hearer, and the only satisfactory way of extracting the root was, after loosening the soil, to tie a cord around it, attach this to a dog, retire out of earshot and incite the dog to pull, so that the luckless animal would perish. In Bartholomew's herbal it is added that the digger should beware of contrary winds. Many accounts suggested that mandrake grew only under the gallows, where it sprang from the decaying flesh or even the dripping semen of hanged murderers.

Gerard, like Dr Turner, pours scorn upon all these tales, especially that of shrieking: 'All which dreams and old wives' tales you shall from henceforth cast out of your books and memory; knowing this, that they are all and every one of them false and most untrue; for I myself and my servants also have digged up, planted, and replanted very many . . .'

Mandrake was always a favourite ingredient of witches' potions, being specially valuable in clairvoyance and image-magic. The latter involved, to quote Coles in his *Art of Simpling*, making from a mandrake's root 'an ugly image, by which they represent the person on whom they intend to exercise their witchcraft'. A common procedure was to shoot missiles at the image, which was supposed to result in corresponding damage to the subject's anatomy.

Elf, Mannikin or Monster

In Germany the word *alruna* referred, in the time of the Goths, to both witch and mandrake, and it was the Germans who probably started the practice of making amulets or mannikins of the roots with millet grains as eyes, called alrunes and also puppets or mammets. These were carefully tended, being regularly bathed, dressed and undressed, and were consulted as oracles. Sometimes they were kept in a coffin or a secret cupboard. French peasants believed these amulet figures to be the home of an elf, called *main-de-gloire* or *magloire*. In other countries the spirit had a more

The mandrake was depicted in both male and female forms, with the long, broad leaves emerging from the head *Left* A kneeling figure holds his hands to his ears, as a female mandrake is pulled up by a dog tied to the feet: from a 15th century herbal *Right* Male and female mandrekes from a 16th century herbal: the horn is being sounded to attract the dog

Wellcome Institute

monstrous form, such as half chick and half man. If the elf or monster was fed and respected, it gave advice, multiplied riches and so on, but if it were neglected its owner would surely die.

In Italy a mannikin might be worth 30 golden ducats. Mandrake amulets were certainly imported into Britain in large numbers in the reign of Henry VIII. It was probably then that the practice began, only discontinued perhaps a century ago, of cutting fake mandrakes from the massive roots of white bryony, an English plant (see HERBS). Dr Turner mentions the practice: 'they are so trimmed of crafty thieves to mock the poor people withal and to rob them both of their wit and their money.' Lord Bacon also had something to say: 'Some plants there are . . . that have a mossy or downy root, and likewise that have a number of threads, like beards; as the Mandrakes, whereof witches and impostors do make ugly images, giving it the form of a face at the top of the root, and leave those strings to make a broad beard down to the foot.'

In some quarters to possess mandrake brought suspicion of witchcraft, and in 1630 three women of Hamburg were put to death for this reason. In 1603 the wife of a Moor was hanged at Orleans for having kept and fed a 'mandrake-fiend', said to be in the form of a female monkey.

Mandrake was one of the plants reputed to be able to open locks. Another myth about it, recorded by Josephus, is that the plant's leaves shine in the dark and, if one then tries to pick them, they fly away. To this day Arabs call the plant 'devil's candles', and Thomas Moore, in *Lalla Rookh*, wrote:

> Such rank and deadly lustre dwells
> As in the hellish fires that light
> The Mandrake's charnel leaves at night.

In the language of flowers, mandrake not surprisingly represents horror – but where would a nice Victorian maiden get one? (See also LOVE MAGIC.)

Manes

In Roman religion, the spirits of the dead; the name may be euphemistically derived from the Latin for 'good'; it came to be used for the spirit of an individual dead person but had earlier meant the dead as a collective group of divine beings, *Di Manes*; the dead had a festival in February, when they returned from the underworld to haunt the world of the living.

The Manicheans thought of themselves as 'living in the darkness of unconsciousness and matter, until the saving message of the doctrine appealed to them, revealed to them their real identity and so enabled them to return to the realm of light'

MANICHEANS

MANICHEISM was a gnostic, dualistic religion, founded by a Babylonian prince of Persian origin named Mani, who was born in 216 AD. According to the *Fihrist* of the Arabic author An Nadim, when Mani was 12 years old God sent an angel called at-Taum (twin) to him, ordering him to leave the ascetic sect to which his father belonged. When Mani was 24, this same angel appeared to him and told him that now the time had come to appear in public and proclaim his own doctrine. From Manichean sources, partly written by Mani himself, we hear more about this twin or familiar. He is said to accompany Mani and protect him. Even at the hour of death, Mani was gazing at this familiar, the one who waited for him always and opened before him the gate unto the height.

So Manicheism is based upon a special revelation, a personal experience of the founder. The 'higher Self' of Mani revealed himself to him, inspired him with the doctrine he had to proclaim to the world, protected him during his missionary journeys and awaited him at his death to bring him to the eternal realm of Light. Sometimes this Self is described in Christian terms: then it is designated Christ or the Holy Spirit. This is the case in Western sources, especially in the Coptic Psalms discovered at Medinet-Madi in Egypt, in 1931. The problem is whether we should interpret the experience of Mani in a Christian or in an Iranian perspective (as is supposed by G. Widengren and L. J. R. Ort).

The concept that man has a spiritual double or twin appears in the Greek author Lucian's *Dialogues of the Dead* (2nd century AD); according to him the 'shadow' *(eidolon)* of Heracles was his exact image and counterpart, his twin. In other sources it is stated that the 'daimon' or attendant spirit of a man is his image. This influenced the Jewish religion of the time, according to which the guardian angel was the *iqonin*, the image of the man to whom he belonged. (See also DOUBLE; GUARDIAN SPIRITS.)

Through Judaism the concept was integrated into Christianity, where we find it at a very early date, allegedly already in the community of Jerusalem (Acts 12.15). From there it seems to have spread in many directions, especially to the Syriac Christianity of Edessa in Mesopotamia. In the *Gospel of Thomas*, written there about 140 AD, the guardian angel is called ikon, image, the eternal counterpart of man. In the *Song of the Pearl*, contained in the *Acts of Thomas*, also originating from Edessa (c 225 AD), the encounter with the Self is described as the encounter with the eternal Garment, which is the mirror of its owner: 'for we were two in distinction, and yet again one in one likeness.' In the same *Acts of Thomas* the apostle Thomas is called the twin of Christ.

Mani seems to have known Christianity mainly in its Syriac form. He knew the *Gospel of Thomas* and he may very well have known the *Acts of Thomas*. From Syriac Christianity, which was strongly encratitic (prohibiting marriage, wine and meat) he may have taken his severe asceticism, according to which the fall of Adam was his intercourse with Eve, and marriage as such is sinful. So Mani's religious experience, the revelation of the twin, which is the Holy Spirit, can be understood in a Christian perspective.

Christianity in Edessa, however, was not exclusively encratitic. Before the sect of Encratites, Jewish Christianity had come to the city, possibly from Jerusalem (see EBIONITES). These Jewish Christians called themselves Nazorees or Nazarenes, as the Syrian Christians did later on. The Manichean *Kephalaia* preserves a debate of Mani with a Nazoree about the problem of whether God, as judge, is not necessarily bound to use evil when he punishes. The implication seems to be that, according to this Nazoree, God was the origin of both good and evil.

Mani's abhorrence of the doctrine that God creates evil was one of the sources, and possibly the main source, of his absolute dualism. According to Mani, evil was Satan or Matter, not a god, as in Persian religion (see AHRIMAN). This did not prevent Mani from taking over certain views of the Jewish Christians. During his trial, which ended with his death, he proclaimed solemnly that he had received his doctrine from God through the intermediary of an angel. So according to him, his twin and familiar, the Paraclete ('Counsellor') or Holy Spirit, was an angel. This of course is in disagreement with orthodox Christianity, but can be found in the very archaic *Ascension of Isaiah*. Similarly, in the *Manual of Discipline*, one of the Dead Sea Scrolls, the Angel of Light (possibly Michael) is called Holy Spirit and Spirit of Truth. On the other hand, Mani called Christ 'the right hand': this he must have taken from Jewish Christians, who used the same terminology. Of course, Mani took the designation Paraclete from St John's gospel (14.16) but the fact that he considers this Paraclete to be an angel seems to hint at familiarity with Jewish Christians in Mesopotamia.

Mani in India

Mani considered Buddha, Zoroaster and Jesus as his predecessors. He visited north-western India and during his missionary trips in the Persian Empire, favoured by King Shapur I, he must have become thoroughly familiar with the Iranian religion. If he died in prison (possibly in 274 AD) owing to the hostility of the official magians (fire-priests) who influenced King Bahram I, this does not mean that he did not integrate Iranian religious concepts into his system.

It is not quite clear which elements in Mani's religion are Iranian or Buddhist, mainly because it is not clear what these religions taught at that period. Later Buddhism of north-western India, mother of Tibetan and Zen Buddhism, had very little in common with original Buddhism and may have been influenced by western Gnosticism. But Mani was probably inspired by Buddhism to respect the suffering life of the particles of light mixed up with matter (see below), and perhaps drew the idea of reincarnation from this source. From Iranian religion he may have taken his absolute dualism, the opposition of light and darkness; this he combined with the gnostic dualism of spirit and matter, and equated with the opposition of God and Satan.

Yet all these influences do not explain the unmistakably gnostic character of Manicheism. It has been established that Mani was familiar with the views of the Mandeans, a baptist sect still existing in Iraq, most probably originating from Palestine and possibly already then living in southern Babylonia. It seems plausible that the sect of the Mughtasila (Baptists), to which Mani's father belonged, was a sort of Mandean or Proto-Mandean sect.

The difficulty is that the Mughtasila are said to have been strongly encratitic, whereas the Mandeans are not, and never seem to have been. Moreover it is not certain that the Mandeans, now a gnostic sect, were already then gnostic to the same extent as they are now. And Manicheism has certain gnostic elements which seem to be absent from Mandeism. The god of this world, the demiurge, is called in Manichean sources Saklon or Saklas. This goes back to Saklas (Aramaic for 'fool'), which is the name for the Jewish god and creator of the world in the gnostic Apocryphon of John (early 2nd century), but has no parallel in Mandean sources.

Man the Work of Darkness

This Saklas, the ruler of darkness, together with his subjects, creates Adam after the image of the primal man, created by God. In the same way, in the Apocryphon of John, Saklas and his powers fashion Adam after the idea of God, his image, also called first man, who revealed his reflected image in the water of chaos. It is even said, in Manichean sources and in the Apocryphon of John, that Saklas made Adam after the image of God and after the image of himself and his fellows, so that man is a microcosm of everything: 'Come! Let us make a man according to the image of God and according to our likeness.' This, of course, ultimately goes back to the *Timaeus* of Plato, where God contributes only the divine part of man, the soul, and leaves it to lower gods to fashion the mortal part of man. But the concept must have reached Mani through gnostic channels. (See also FIRST MAN.)

There must be some relationship between Mani and the various gnostic schools and currents of the 2nd century, quite apart from Mandeism. But at the moment we cannot be more specific, because the history of these sects in eastern Syria and Mesopotamia is almost completely obscure. This problem may come nearer to a solution when all the gnostic manuscripts found at Nag Hammadi in Upper Egypt have been published.

There is no doubt that Manicheism is a gnostic religion. It has a gnostic conception of man (as a divine spark), of the world (as

British Museum

Left **Though the Manicheans regarded all sexual relations as inherently sinful, women were not discriminated against but were eligible to join the highest ranks of the movement. Mani appears on the left of this 18th century Persian miniature** ***Right*** **Another miniature illustrates an incident in the life of Mani, a Babylonian prince of Persian origin and the founder of Manicheism. The glass cover over a water-tank was continually being broken by the women who came to draw water, so Mani drew attention to the glass by painting a picture of a dead dog on it**

a product of failure) and of God (as the suffering God), which is expressed in a systematic and consistent myth. Because this myth is so extremely complicated, even in the abridged form which we offer here, it is perhaps right to remember that according to Franz Cumont and Henri-Charles Puech the myth reflects and expresses the 'Self-experience' of Mani himself.

The Suffering God

From the very beginning, so the myth says, before heaven and earth and everything contained therein came into being, there were two principles, a good one and an evil one, the realm of light and the realm of darkness. In the realm of light dwells God, 'the father of greatness'. In Eastern sources he is called the 'four-faced God', because with his light, his power and his wisdom he forms a sort of quaternity.

In the realm of the dark dwells the king of the dark. He arose from his domain to invade the realm of light. Then God decided to go out and fight the battle against the invading forces. Thereupon 'the father of greatness evoked the mother of life and the mother of life evoked the primal man.' When God sends out the primal man, he is really going himself. The primal man and all the other light-figures of Manicheism are qualifications and manifestations of God himself. When the lost part of primal man, called Jesus patibilis (suffering Jesus), is said to hang on every tree, we should understand that it is God himself who is crucified in the world of darkness.

We have here a conception of God akin to, but not identical with, that of Christian theology. It is essentially gnostic. In the recently discovered *Gospel of Philip* it is said that the heavenly Christ saved his own soul, which he had lost since the beginning of the world. The idea of this Valentinian author is that the fall of divine wisdom (Sophia), through which this world came into being, is essentially a split within the godhead itself. The divine element is dispersed in matter and God, when saving man, is saving himself. This astonishing conception of the suffering God is not to be found in India, Iran or Israel. It seems to have its prototype in the Greek myth of Zagreus-Dionysus, who was torn in pieces by the Titans (see DIONYSUS; ORPHEUS).

It is this gnostic and ultimately hellenistic concept of God suffering in the world and in man which the Manichean myth tries to expound, in the following way. The primal man, in his glorious armour of the 'five bright elements', went forth to repel the forces of darkness. But this fight ended in defeat and the primal man was left in the darkness in a state of unconsciousness. On the other hand, it was a sort of divine sacrifice, for in this way the primal man could also serve as bait to catch the forces of darkness, so as to assuage them and to prevent their attack upon the realm of light. When the primal man recovered from his swoon, he entreated the father of greatness to come to his support. From above he received 'the call', conceived as a spiritual being. To this he gave 'the answer', also a spiritual being. Thereupon the primal man returned to the realm of light, but had to leave his armour behind.

The adventures of the primal man are described in great detail in the Coptic Manichean Psalms, which show us how this myth reflected the situation of every Manichean. They too were living in the darkness of unconsciousness and matter, until the saving message of the doctrine appealed to them, revealed to them their real identity and so enabled them to return to the realm of light. A similar conception of salvation, and a similar myth, is found in 2nd century Gnosticism, especially in the documents from the school of Valentinus.

Here, the perfect man is Jesus. He leaves his 'members' behind in the world, to be formed by their life in history and to discover their own identity. The end of the world-process is achieved when all spiritual elements have returned to their origin above. In the same way, the Manichean primal man

Mani expounding his theories: he considered Buddha, Zoroaster and Jesus as his predecessors, calling himself 'the apostle of Jesus Christ' and 'seal of the prophets'; gnostic influence is also evident in his teachings

returns to the realm of light, but leaves behind his armour, also called his members or his soul.

This shows that scholars (including G. Widengren and R. Bultmann) who interpreted Manicheism as a myth of 'the saved saviour' were right. They were wrong when they supposed that Mani took this idea directly from Iranian religion. Before him the Valentinian Gnostic had a similar conception, which seems inspired by St Paul's view that the Church is the body of Christ, and by a Jewish myth that Adam regained Paradise.

Seal of the Prophets

The elements of light which had been absorbed by darkness had still to be delivered. To this end, the world was created as a mixture of spirit and matter. The myth here becomes very obscure and obscene. By a strange mixture of generation and cannibalism Adam and Eve were brought forth by Saklon (the Jewish god). 'Jesus Splendour' aroused Adam from his sleep, so that Adam became conscious of himself.

This process was continued during the whole history of mankind. Ever and again, messengers were sent to remind men of the divine spark in them. Such apostles were Sethel (Seth, the son of Adam), Enosh, Enoch, Shem, the son of Noah; Buddha in the East, Zoroaster in Persia, Jesus in the West. But their doctrines were not complete and soon after their death were corrupted by their pupils.

Mani admitted that Jesus revealed himself in Palestine at the beginning of our era to reveal the gnosis to man, though the body of Jesus was not held to be material. He admired St Paul but he held the Church to have disappeared completely ('a tree without fruits') in his own lifetime. Therefore the Paraclete, the Spirit of Truth promised by Jesus, had been sent to Mani, who was called to reveal the definite and consummate gnosis. For that reason Mani styled himself 'the apostle of Jesus Christ' and 'the seal of the prophets'. He must have thought that he lived in the last generation of mankind, before the final separation of light and darkness. Then the 'earth of light', the abode of God and all the saved, would be healed of the wound inflicted upon it by the attack of darkness. The earth would be destroyed by fire, the powers of evil would be confined within their original domain, and unrepentant sinners would be compacted together in a great round clod, the *globus*. At last the realm of light would enjoy an eternal peace, no longer endangered by any attack of darkness. Dualism in the end will be permanent.

In order to realize the duality of man and his higher Self, Mani had to postulate a highly dualistic philosophy. And this is understandable, because the unity of the innermost man with his heavenly Self, according to Mani, is only possible when man is ready to reject everything material.

Manicheism spread in the West, where the young St Augustine was attracted to the sect, until it was completely suppressed by the combined forces of Church and State in c 600 AD. In the East, especially outside the Roman Empire, it flourished in spite of persecutions and remained for a thousand years one of the main religions of Asia. The medieval sects of the Bogomils and Cathars had much in common with Manicheism (see BOGOMILS; CATHARS). The Cathars owed much to the Bogomils of Bulgaria, who in turn originated from the Armenian Paulicians and perhaps the Syrian Messalians. Neither Paulicians nor Messalians were Manichees and we have no evidence that Manichees were active in the Byzantine Empire at the time the Bogomils entered history. But the 'medieval Manichees' were so similar to the 'classic Manichees', that perhaps in the future some missing link will be discovered.

(See also DUALISM; GNOSTICISM.)

(Since this article was written a Greek papyrus has been discovered, which tells us explicitly that to the age of 25 Mani was a member of the Jewish Christian sect of the Elchesaites in the south of Babylonia.)

An Indian invokes the manitous: scene from the film *A Man Called Horse*

MANITOU

MANITOU was the term used by North American Indians of the Algonquin group for spirit beings and for the supernatural and magical power contained in all the phenomena of Nature, 'the secret life of every created thing'. It was the business of shamans, or medicine-men, to make contact with the world of the manitous, and the Midewiwin, the secret society of shamans, was believed to have been founded by manitous (see ALGONQUIN INDIANS).

All sorts of beings, objects or forces could be classed as manitou. Among the Fox tribe, for instance, the term has been applied to spirits and heroes, snakes and plants, cars and trains, to the turtle dove because its calls resemble the voices of manitous, and to the dog, which is ceremonially eaten in order to get in touch with manitous. A manitou might also be the guardian spirit of a person, taking the form of an animal and revealing itself in a dream.

Perhaps as a result of Christian influence, there was also a belief in a Great Manitou or supreme spirit. He generally had little contact with men and, though always present in the background, was of less immediate concern than the lesser spirits who were involved in everyday life. The Delaware said that the Great Manitou founded the ritual of smoking the pipe of peace.

A conspiracy of the rich was the root of all evil and prevented humanity from living in material and spiritual abundance. This was the ideology of Mankind United, a Californian sect that flourished in the 1930s especially among those disenchanted with established religion

MANKIND UNITED

THE SOCIO-RELIGIOUS movement called Mankind United was the creation of Arthur L. Bell, an American businessman. Although little is known of his earlier career, Bell claimed to have been born in New Hampshire in 1900, to have grown up in poverty and to have completed only four years of school. Emigrating to California in his teens, he sold real estate and insurance during the booming '20s and became a Christian Science practitioner and a devotee of various theological and Utopian writings. He was badly hit by the economic crash of 1929, and subsequently divorced his first wife and married, at the age of 34, a fellow Christian Scientist – a wealthy woman in her early 60s.

Evil of Mad Ambition

Financially supported by his wife, Bell conceived the movement and at his own expense published its text, *Mankind United*, (1934). In its 313 repetitious pages, Bell sought to answer the ancient questions of why the world is dominated by war, poverty, greed and hate, when so many long for it to be otherwise; and how it might be changed so that everyone could live in economic abundance and happiness under the Golden Rule of Christ: 'Whatever you wish that men would do to you, do so to them' (Matthew 7. 12).

According to the text, on Christmas Day 1875, a small group of wealthy and humane persons had assembled to ask themselves these same questions. In their opinion, poverty, war and other evils were totally unnecessary since technology was capable of producing more than enough for all. These evils continued only because 'a worldwide organization composed of a small group of families in possession of fabulous wealth' was stifling the economic and moral well-being of mankind in order to bring it to total enslavement. In their mad ambition to control all wealth and power, these 'World's Hidden Rulers' or 'Money Changers' were the root of all evil.

Wanting to save mankind, this group pledged their fortunes and lives to overcoming the Money Changers and to instituting a world economy of equality and abundance. They called their organization The International Institute of Universal Research and Administration. Bell referred to them, more simply, as 'the Sponsors'.

In the following years, the Sponsors gradually expanded their numbers, spied upon the Money Changers and engaged in the development of fantastically advanced techniques of economic production. Since the World's Hidden Rulers would destroy the Sponsors if they knew of them, the latter had to work in secrecy.

By 1919, the Sponsors' research department had assembled exhaustive proof of the Money Changers' existence and nefarious aims, and had worked out a plan for a world-wide economy in which, working only four hours a day, four days a week, eight months a year, everyone could live in astonishing prosperity. Since then they had been waiting for the most propitious moment to make their discoveries and plans known, and to prepare for this 'unveiling' the Sponsors had formed a group called the International Legion of Vigilantes. Bell claimed that he was recruited to this organization when it was set up in 1919 and that by 1934 he had been working as a secret agent for 15 years.

30 Days of Proof

Recognizing that their claims might seem incredible to the public at large, the Sponsors planned a rapid 30-day programme 'during which time the Institute's well-guarded sixty years of discoveries and carefully prepared recommendations will be freely offered to the human race.' In two-hour programmes repeated day and night, 12 times each 24 hours, five days a week, irrefutable and exhaustive proof would be offered as to how the Money Changers worked and how Utopia was possible.

The book *Mankind United* was merely a 'bulletin' announcing the imminence of the 30 days of proof. It did not in itself offer

proof of anything, but was intended as an 'invitation' to those who saw it to take part in the 30 days, and at the end to vote on 100 recommendations. However, the Sponsors had determined that if the enormous power of the Money Changers was to be overcome, it would be necessary to have at least 200 million people listening and voting. Until that number had agreed to participate, the 30 days of proof could not begin. It was in order to register the requisite millions that a part of the Sponsors' secret organization had become public. Once the 200 million had voted for the Sponsors' programme, the Universal Service Corporation would be formed and would thereafter conduct all economic production and distribution. Membership in the corporation would increase rapidly and within a few years, the World's Hidden Rulers would be completely out of business.

Arthur L. Bell, the argument of the text continued, was selected by the Sponsors to be the first 'public' vigilante, and California was to be the first area in which registration was to occur. In his role as a mere functionary of a large and powerful secret organization, Bell disclaimed authorship of *Mankind United*, and the title page proclaimed that the book was 'published by the International Registration Bureau (Pacific Coast Division of North America)'.

Equipped with his wife's money, an ideology and an attractive physical presence Bell set out to build a movement. It was to have an active history of only 17 years (1934–51), but it provides an intriguing study in the ingenious responses of a leader to changing and adverse circumstances.

Promise of Utopia

From the middle to the late '30s California, deep in the depression, was overrun with salvationist schemes. Into this highly competitive but permissive market, Bell introduced Mankind United. Membership involved merely the purchase of the book, a promise to pass it on to friends, and a willingness to listen and vote during the forthcoming 30-day programme. In return for this minimal effort, members were promised a fantastic future gain. At the height of the movement's popularity, in 1938–39, frequent mass meetings were held throughout California and it is estimated that upwards of a quarter of a million West Coast citizens read the book, registered themselves, and attended at least a few meetings. Bell encouraged the formation of local clubs dedicated to promoting the book, and while this was not obligatory such clubs nonetheless flourished. As they grew in numbers, Bell organized them into an elaborate bureaucracy of dedicated workers. As many as 30,000 were actively engaged in the goal of registering 200 million 'educated and religious people' – precisely the people, Bell said, whom the Money Changers most urgently wanted to annihilate.

The bulk of the membership was drawn from the working and lower 'white-collar' classes, was primarily between the ages of 40 and 60 and had completed some secondary education. Females slightly outnumbered males. By and large, the members came from those worst hit by the depression – groups who were neither poor in 1929 nor sufficiently wealthy to weather the decade in reasonable comfort. More specifically, Bell sponsored his movement among those portions of such groups that were religiously inclined but disenchanted with established religion. His doctrines were as much economic as religious but his scheme to make 'do as you would be done by' a reality on earth was promoted among persons who were more religious than they were economically or politically sophisticated. For this reason Bell's economic claims encountered minimal resistance.

Levy of Half Their Income

When speculation about America's entry into the Second World War flourished in 1939, and again when war came to the United States in 1941, Bell condemned it as another of the Money Changers' plots to worsen mankind's situation. Communist, Fascist and capitalist leaders alike were merely puppets of the Money Changers, and the latter were pulling the strings to further their plan for world dictatorship. Already by 1939 the Federal Government had infiltrated the movement and Bell had begun to retrench by discontinuing sale of the book and by calling for the close screening of members of Mankind United.

As support for the policies of the American government increased, membership declined, and in response Bell instituted a series of measures designed to commit the remaining followers. A programme to train 'instructors' and 'election supervisors' to conduct affairs during the imminent 30-day programme was instituted. Initially this involved a payment of only $20 per member, but a variety of other monetary requests followed. These culminated in a requirement made in 1943 that members become part of the '50-50 fund' by giving 50% of their gross earnings to the movement. The successive demands were made in the context of extreme secrecy and urgency: the 30-day programme would begin at any moment, if only the latest monetary goal could be reached. But each time, Bell announced, the members failed and each time he sent them headlong toward a new financial goal which they had to achieve if the War was to be prevented (in 1940–41) or stopped (1942–43), and Utopia begun.

Urgent Mission

In pursuit of these elusive monetary goals and in scurrying about on a variety of additional and inexplicable 'missions' at Bell's bidding, the members lived with an inflated sense of self-importance and with a vivid sense of the urgency of their tasks. The extent of this 'urgency' was made clear in December 1942 when Bell and 16 leaders were arrested on charges of sedition. They were found guilty in May 1943 but, as a result of an appeal, the decision was reversed on procedural grounds four years later. None of them actually every served any time in prison.

The best defence being offence, in the face of declining membership and government prosecution, Bell adopted a bold but logical strategy to save and consolidate his movement. Late in 1943, he announced to the membership the 'literally unheard-of-opportunity' to become 'student ministers' in 'training schools' for those who would form the foundation of the forthcoming Universal Service Corporation. Incorporating a new organization, Christ's Church of the Golden Rule, Bell pressed his followers to give over all their wordly goods to the Church and to begin work in one of the large number of businesses he was in the process of acquiring.

Under two years later, by the summer of 1945, he had assembled more than 3½ million dollars worth of property in California, including a number of office buildings, hotels, ranches, laundries, garages and the like. Bell's following, however, was now down to about 850 persons, so that only part of these vast new holdings were run by members as Utopian 'Laboratories of Abundant living'. Bell gradually faded from public view. Members grew few and old, operating a few remaining businesses, among which was a laundry and a motel. By 1956, less than a hundred members remained faithful and the end of Mankind United was reached.

JOHN LOFLAND

MANNING, MATTHEW

THIS WELL KNOWN BRITISH PSYCHIC first became aware of having special powers at the age of eleven. He was at boarding school, and was the centre of such severe poltergeist (see POLTERGEISTS) disturbance that he caused quite heavy pieces of furniture to move about. On two occasions he narrowly missed being expelled.

At 16 years he found that he could write and draw automatically (see AUTOMATIC ART). He even wrote in languages he could not understand, such as Greek and Arabic. His automatic paintings were 'transmitted' to him in the style of Dürer, Goya, Picasso and Beardsley to name just a few, but at school he had never shown any aptitude for drawing and painting.

In 1974 he saw the famous Israeli Uri Geller (see URI GELLER) bending metal spoons on television. In common with other viewers, he tried the same feat himself, and succeeded. Manning has been very intensively tested by parapsychologists. In 1974 a group of 21 scientists examined him. When Dr George Owen measured his brainwaves on an E.E.G. machine, while Matthew was trying to bend a key, he saw that the machine registered a high level of theta activity. This is associated with deep sleep and extreme frustration and aggression.

The author Colin Wilson met Manning in 1976. He felt that in a similar way to Uri Geller, Manning derived his power from a kind of controlled poltergeist activity. The theta wave level would accord very well with that of an adolescent, around whom most poltergeist activity is centred. Wilson felt that as Matthew matured, he had instinctively learned how to channel and redirect the activity to more creative ends.

The essence of a spell or mantra lies in its sound; the vibrations that can penetrate into the inner layer of the mind and have power to 'create, sustain and destroy'

MANTRA

THE WORD 'SPELL' is perhaps the nearest approach to the meaning of the Sanskrit word *mantra*. It is a form of words or sounds which are believed to have a magical effect when uttered with intent. The term is related to an Iranian word which signifies a formula whose repetition dispels disease and brings blessings.

Essentially, the mantra is a sound. A sound is a vibration, and when we consider that the family of vibrations includes not only the things we hear but all material objects seen (which may be said to be patterns of vibrations), we can appreciate why the magician has always laid great emphasis on words of power. Sound is the foundation of all magic, and an armoury of mantras forms part of the equipment of the magician in all countries.

Mantras can create, sustain and destroy. The ancients believed that miracles could be performed by means of magical formulas, and they made extravagant claims for the powers of such formulas. The Latin writer Apuleius said that by properly intoning spells rapid streams could be made to flow backwards, the surface of the sea could be congealed, and the winds robbed of breath. An ancient legend tells us that the priests of the sacred city of On (Heliopolis, in Egypt) raised up the stones to build their temples with the aid of sound. Hindu manuals speak of mantras that can cause prepared sacrificial fuel to burst into flame or compel wild beasts to stop in their tracks.

Certain mantras have a long history. Some are traditionally held to be revealed by the deities themselves, whose name vibrations are latent within them, so that a god can be summoned, or at any rate his power drawn down, by uttering his particular mantra. The mantra in this case represents more than a sound, it is the vibration of the divine emanation; the deity is identified with it, and like the deity it remains eternal. A number of other Sanskrit mantras are said to be 'recovered' from the ether through the meditation of *rishis* (or sages). These are the vibrations governing the processes of Nature, and a knowledge of them gives one ascendancy over natural phenomena. Whenever such a mantra is uttered a Nature force is set in motion, vibrant with efficacy, and the mantra in this case is regarded as an entity in its own right.

Another class of mantras fall into the self-illuminating category and play an important role in initiation ceremonies, for they impart wisdom as soon as they are communicated. One legend relates that a pupil after long study was given such a mantra of initiation by his guru, to provide the final illumination to the teachings he had received. When the guru uttered the mantra a workman who happened to be busy in the next room overheard it. Unlettered and ignorant though he was, the workman was enlightened with the full understanding of the doctrine, just as though he had undergone the full discipline of the pupil.

Some Hindu and Buddhist mantras are regarded as extremely dangerous if uttered incorrectly or with misplaced intent. They are thought to create repercussions not only in the present life but in the future incarnations of the individual as well. Such mantras require a very precise knowledge of their pronunciation, intonation and timing, and frequently several days' preparation and purificatory rituals before they can be uttered.

In India there is a belief that every sorcerer is in possession of a mantra of terrible malignancy which is the source and focus of his success and power. Such a mantra can be known to only one person at a time, and it is this last bearer of the knowledge who possesses the power of the mantra. As the time of his death approaches it begins to build up a terrifying tension and becomes an unbearable burden on the mind of the magician, causing him untold anguish. It is said that the magician cannot die until he has passed on the mantra to someone else. Stories are told of magicians of great

repute dragging out their end in excruciating torment in a state of living death because they could not unburden themselves of the mantra, since they were unable to find anyone willing to accept the secret from them, even though it bestowed material benefits.

Mantras often appear to be no more than meaningless gibberish, which of course may only point to the fact that they are relics of an earlier language whose meaning is lost to the present users of the spell. Since the value of a spell lies in its antiquity, a meaningless mantra will be handed down in succession from master to pupil for generations as a treasured inheritance, and will never be altered. The Babylonians inherited certain magical formulas in Akkadian from earlier inhabitants of Mesopotamia. These formulas were couched in a 'dead' language, unintelligible to them, but were still handed down unchanged for centuries. Such 'barbarous names of evocation' as they have been called, are known even in the West. Abracadabra is one example (see ABRACADABRA). Indeed, the very word 'mantra' in colloquial Sinhalese means something very much like gibberish or hocus-pocus. It has long been believed that unintelligible or half-intelligible words in meditation help in creating a 'numinous' or transcendental mood, which makes its appeal to a hidden layer of our minds directly connected with some unknown force within ourselves that is tuned to another dimension. The real power of the mantra resides in its effect on the invisible world. A mantra repeated often enough can penetrate the dense barrier of the material sphere and draw power from the occult planes.

The most potent mantras are those embodied in a 'seed', or in monosyllabic form, and such seed mantras are held to be the quintessence of complex teachings. For instance, an elaborate doctrine of occult knowledge set forth in a work of 100,000 verses can be reduced by a rishi to a single short chapter; this may be further condensed into a single verse; and the verse finally concentrated into a single syllable. This syllable if correctly transmitted to a pupil can, it is thought, communicate to him the substance of the entire doctrine contained in the 100,000 verses.

Basically a seed mantra must be one that can be prolonged indefinitely when voiced, and because of this requirement such mantras are generally built around the vowel sounds or the humming sounds, such as 'm' or 'n', all of which can be sustained when uttered, unlike most consonants which can only be voiced in a single burst of sound. Vowel sounds seem to have been used in ancient Egypt and Mesopotamia, and the seven vowel sounds of their alphabet were used by the Greeks as a magic invocation.

Humming mantras are said to derive their potency from the cerebral intoxication induced by the vibrations of the sound. The constant resonances in the head chambers in this form of intonation lead to a kind of intoxication which results in trance. Such mantras are ideal for magical purposes. They are easy to remember, and when correctly intoned can set up reverberations in the cranium which continue long after the audible recitation of the sound has ceased. Those proficient in the art need utter a mantra only a few times for it to continue its overtones independently for hours thereafter.

Supreme among the seed mantras is of course the well-known monosyllable 'Om'. But its secret is so securely and tightly knit that it might take an aspirant more than a single lifetime of disciplined training to unravel and secure it for himself. Assiduous application, solitary meditation and superhuman concentration are prerequisites for its acquisition. It is said to contain the ultimate formula for universal knowledge and universal power.

(See also INCANTATION; VIBRATION.)

BENJAMIN WALKER

The Power of Repetition

Unlimited powers are said to reside in the shorter mantras, especially the mystic syllables known as *bijakshara* (monosyllabic) mantras, and great benefits accrue from their repetition. . . . The most powerful of all is the sound *Om*. There are, however, many other classes of short mantras. Many of the exclamations and ejaculations used during the sacrificial ceremonies have passed into the mantra class, such as: *svasti*, 'fortune'; *svadha*, 'oblation'; *svaha*, 'offering'; *vashat*, 'bravo'; *sam yoh*, 'all hail' or 'blessings'. The mantra *phat*, 'crack', is used by Buddhists as a weapon for driving off obstructing spirits . . .

MAORI

THE MAORIS are a Polynesian people whose ancestors arrived in New Zealand from eastern Polynesia, possibly in the 9th century AD. These population movements were not planned, rather they were accidental voyages made by adventurous seamen, defeated warriors or wind-blown fishermen. It is known that by the 11th century they had explored much of the east coasts of both main islands of New Zealand, which stretch over 1000 miles from the subtropical North Cape to the temperate southern tip of the South Island.

These early settlers ingeniously adapted their tropically derived culture to the colder and more varied New Zealand environment.

Left **Carved wooden panel at the entrance of a Maori assembly house; legend tells that the first carving of a three-fingered motif was brought from the home of Tangaroa, god of fishermen, on the bed of the ocean** ***Right*** **Detail from the beautiful carved lintel of a Maori house; the three-fingered motif is again present, while the protruding tongue is a sign of defiance against the incursion of evil**

Of their familiar plants, only the *kumara* (sweet potato) grew really successfully. The settlers brought with them the dog and the rat. They made their clothing from flax and their more durable tools from suitable local rocks, especially basalt, argillite, nephrite and obsidian. They were expert fishermen and cleverly exploited certain local plants for food, notably fern root, which became a staple ingredient of their diet. By the time Captain Cook first visited New Zealand in 1769, the tribes had evolved a sophisticated seasonal economy within the limited productive areas.

Traditional Maori religion can be seen as the means whereby the people perceived and came to terms with the varied environment of sea coast, forest, swamp, tussock flat and mountain that they encountered in New Zealand. They believed in a pantheon of numerous gods, which some scholars have divided into four groups. It is still sometimes claimed that at the head was a Supreme Being, Io, but the evidence is not very convincing. On the other hand, there

were a number of less esoteric gods, the children of Rangi (sky) and Papa (earth), the original parents. These were the gods of the forest, peace and agriculture, war, the ocean, wind and storm, uncultivated food, earthquakes, and also the god of evil. Through myth they provided the ultimate sanctions for human behaviour and attitudes. There were also lesser gods known only within a limited area, and usually restricted to one tribe, such as Maru, a war god. Finally there were tribal ancestral spirits, who were believed to have great influence over the affairs of their living descendants. The ordinary Maori commoner usually felt closest to the members of the last two groups.

Gods were approached by means of ritual offerings and incantations (*karakia*, which is also a generic word for magic). Here, for example, is a translation of part of a karakia used at the kumara harvest:

> This is the spade that descends,
> This is the spade that reverberates,
> This is the spade that resounds,
> Penu, Penu, the spade Penu.

This extract is typical in its reiteration of a particular phrase and in its reference to a phenomenon, in this case the spade, Penu, sacred in tribal tradition.

The major gods were consulted only on more important occasions, such as before war or in the preparations for building a canoe. These rituals were mostly left to priests (*tohunga*), who underwent intensive education during their youth in a *whare wananga* (school of learning). One meaning of the word tohunga is 'skilled', and the influence of the priest was often due as much to his practical as his esoteric knowledge. A tohunga of Tangaroa (god of fishermen) for example, often possessed much information about fishing techniques. As well as obtaining the favour of the god through ritual, he could advise the commoner on the best methods and places for catching different varieties of fish.

Because of his influence over supernatural forces, the priest was considered sacred or *tapu* (taboo). His sanctity was proportionate to his knowledge and to the relative importance of his particular god. When, as was often the case, the tohunga was also of high birth, his power and prestige could become enormous. He might also be skilled in sorcery (*makutu*).

Power Derived from the Gods

The significance of Maori religion and magic lies in its social context. Kinship was the most important organizing force in prehistoric Maori society. It was the basis for the family group (*whanau*), whose members, ranging through three or four generations, formed a residential unit. A number of whanau, with common ancestry, comprised a *hapu*, which controlled a definite stretch of tribal territory, with its own fishing and forest rights, and owning such valuable objects as canoes. Finally, each individual was a member of one out of about 50 tribes, all of whose members acknowledged descent from a common ancestor, sometimes a mythical hero with supernatural powers. In this way, kinship bound the individual to a series of groups interconnected both socially and symbolically.

Hapu chiefs (*rangatira*) were descended in a direct line from the founding ancestors and were thus tapu. They were believed to possess special inherited powers which endowed them with a strong influence over supernatural forces through ritual.

The concept of tapu was thus extremely important. The word can be translated as 'holy' or 'sacred', since the power of tapu was derived from the gods. All free men had such power, to varying degrees, the amount depending on status. Women, unless of high status, were only tapu during menstruation or childbirth. Tapu was regarded with reverence but also with fear, since infringement would resnlt in misfortune, even death, from outraged spirits. It could be transmitted by contact and so, for example, everything a chief touched shared his sacred qualities. It was dangerous, even disastrous, for anyone else to have contact with these things, unless he was equally tapu. A high-born Maori was surrounded by restrictions, lest he should endanger both his own holiness and that of others. The activities of the chief were particularly circumscribed. Contact with cooked food, which was regarded as profane, would make the food vessels unfit for general use. Any such contact would also threaten the chief's sanctity, since cooked food was often used in tapu-removal ceremonies. The chief was therefore fed by an attendant.

An interesting case is recorded of a high-born and powerful priest who could not travel by the public paths, in case he rendered the route unfit for others to use. There are also accounts by reliable European observers of death following accidental infringement. For instance, it has been reported that on one occasion a Maori ate some food which, unknown to him, was the remainder of a chief's meal. As soon as the man learnt what he had done, he was seized by violent convulsions and cramps, and died before sundown. This episode illustrates an interesting difference between Maori and Christian attitudes towards the wrongdoer. The Christian believes in the existence of hell. The Maori, although believing in an afterlife, had no such concept. Supernatural punishment was direct and often immediate.

Tapu customs imposed many difficulties on the Maori commoner. Not only did he live in physical danger of accidentally breaking certain forms of tapu, but he could also suffer quite considerable material loss. For example, the visit of a high-born chief to a settlement would be dreaded and his movements within it anxiously watched, in case his shadow happened to fall on a food storehouse. If this occurred, the house and its contents would have to be destroyed.

The practice of cannibalism is best understood in terms of the Maori belief that

spiritual powers could be transmitted by physical contact. In war, many of the defeated – men, women and children – would be killed and eaten. Normally death and the attendant funeral ceremonies (*tangi*) involved much tapu observance. But this attitude did not apply outside one's kindred. Thus, imbued with tapu, the successful warrior acquired further status by overcoming enemies of equal or higher status. Their tapu was reduced to nothing by the act of cooking their bodies as food. Usually, a corpse 'contaminated' its surroundings by its great tapu. By dismembering and eating the war dead the victors enhanced their own victory.

'The Land is our Father'

The tapu concept operated not only within society, but also directly in its environment. Most objects could be sacred. For example, the forests were protected. Birds were 'the children of Tane', the god of forests, and the fowler invariably observed numerous magical practices. Before hunting, he carried out a ritual at a special sacred post, and throughout the day he was careful not to use certain words connected with fowling, lest the birds be warned of his intentions. Neither feathers nor dead birds were left lying around, nor was cooked food taken into the forest, for these could pollute its resources. Similarly, trees were felled carefully and ceremoniously, for to cut or even chip a living tree without due ritual precaution was to invite misfortune. Similarly, when fishing, both men and their equipment were sacred, unable to be touched or even approached by unauthorized people, especially women and slaves.

The more elaborate items of equipment, such as canoes, storehouses and fishing nets, were treated with special care and reverence. Nothing, however, was more valuable to the Maoris than land. This was not only the main source of livelihood and prestige, but was also a tangible link between past, present and future generations, held in trust by the living with the consent of their ancestors for their mutual descendants. A chief who attended the signing of the Treaty of Waitangi, at the time of British annexation in 1840, expressed this view well: 'We are not willing to give up our land; it is from the earth we obtain all things; the land is our father; the land is our nobility; we will not give it up.'

The tapu rituals which accompanied cultivation, notably of the sweet potato, reflected this deep-seated attitude. From planting time to harvest, the kumara was surrounded by ceremony. Neither women nor cooked food were allowed on the plantations, and those working there were careful to observe stringent precautions to maintain the integrity of their sanctity. It is also interesting to notice that the Maoris invoked tapu restrictions to prevent over-exploitation of their food resources. If a patch of forest, a stretch of river or a fishing area showed signs of depredation, a chief would indicate that it was temporarily declared tapu by leaving some of his possessions, usually old clothes, in a prominent position nearby.

Tapu must not be regarded as an irrational superstition. It was a comprehensive expression of religious belief with a highly practical significance for prehistoric Maori society. It gave sanction to the leadership of the chiefs. It did much to ensure the proper use of food resources. In these respects, therefore, it contributed to the maintenance of law within the tribe. More broadly, it helped to 'place' the Maori securely within a physical and mental environment which had many interrelated points of contact with his numerous gods.

Conversion and Destruction

Christianity destroyed these traditional Maori beliefs, though this did not occur quickly. The first Christian sermon was preached by Samuel Marsden on Christmas Day 1814, in the Bay of Islands, North Auckland; an area more influenced by European contact at that time than any other part of the country. But progress was slow. As the historian Keith Sinclair says in his *History of New Zealand* (1969): 'It was nine years before the first Maori was baptized – a girl about to marry a European; eleven before the next and death-bed conversion. No substantial progress was made until the eighteen-thirties.'

After that, Maori attitudes changed relatively quickly. The traditional social order was destroyed, and with it the complex and all-embracing nature of Maori religion. After the British annexation of 1840, conversion was very rapid. The new world of the European trader, settler and administrator called for different attitudes. The previous changes in Maori society, following initial European contact, had been contained within its traditional framework. With the subsequent rapid growth of European settlement and its insatiable demand for land, the Maoris became defensive. While many adopted Christian standards of behaviour, local deviations began to occur. As early as the 1830s, a millennial cult, *Papahurihia*, emerged in the Bay of Islands, which rejected Christianity as such, but contained elements of the Old and New Testament.

Rather similar reactions to Christianity also occurred later in the 19th century, during and after the Maori Wars (1856–70), when the profound Maori-European antagonism over land took a particularly bitter form. In 1862 a resistance movement began to develop which was also a new religion, compounded of Christian, Jewish and Maori elements. Called the *Hauhau* after their rallying cry, they regarded themselves as chosen people, who through faith, and pitiless war on the settlers, would regain their traditional heritage. The main fighting died down by 1870 although guerilla warfare lasted until 1872, with much savagery on both sides. During this time Te Kooti, a notable rebel leader, founded the Ringatu Christian Church, which contained certain Hauhau features.

The Ringatu Church is not the only

specifically Maori Church existing today. In 1918 a faith healer called Ratana established a Church bearing his name, which particularly appealed to the rural and urban poor. It is interesting to note that he was opposed to belief in tapu. Both Churches have provided considerable moral encouragement to a people who took many years to recover from the effects of the Maori Wars in the context of a rapidly urbanizing society.

It is not surprising that so much Maori traditional ideology is now consigned to history. As J. E. Ritchie said in *The Making of a Maori* (1963): 'Only sickness and death, violence, and serious accident, waken responses from that past world of supernatural completeness, and then only for a few.' These 'responses' are most evident among the older people in rural areas where, for example, certain tapu practices in relation to eating and washing persist. But tapu observances remain strict at funeral ceremonies and probably the great majority of Maoris, even among town dwellers, still wish to be buried at their ancestral homes.

Like many other non-Western peoples, the Maori has had to live in two worlds at once. The strains induced by this conflict have resulted in cases of psychological disorder which have been interpreted, somewhat ambivalently, in terms of sorcery or as 'Maori sickness'. Sometimes treatment by a modern tohunga can be more effective than that offered by an orthodox medical practitioner. Therefore, although traditional Maori religion has been destroyed as a comprehensive system of belief, its vestiges affect the present character of Maori psychology, and contribute to the make-up of the specifically Maori urbanized culture now evolving with its European counterpart in New Zealand.

The fortunes of Babylon were for many hundreds of years entwined with those of Marduk, the High God. At the Creation, Marduk brought order out of anarchy and in return he was rewarded with supreme power

MARDUK

MARDUK BECAME the high god and patron saint of the city of Babylon, and eventually secured for himself an international prestige which went far beyond the natural confines of the Babylonian Empire.

The name first appears in about 2000 BC, at which time it was of little importance, but it seems possible that originally Marduk was a solar god, for later he was remembered under a Sumerian title, meaning 'the bull-calf of the sun', and indeed throughout his career Marduk was one of the gods of light. His ascent to fame, however, was first achieved under the Amorite Dynasty of Babylon which reached its peak in the reign of King Hammurabi, c 1792–1750 BC. On the famous diorite monument discovered at Susa, and inscribed with the text of the Babylonian 'code' of laws, Marduk is twice mentioned in the introduction. He had been allotted 'the divine worship of the multitude of the people', and thus before the end of Hammurabi's reign had become the Babylonian national god and patron, though perhaps not yet supreme. As administrator of justice Marduk was represented on the contemporary cylinder seals with the toothed saw that cuts decisions.

From that time onwards until the Seleucid era, beginning in 312 BC, the fortunes of Babylon were inextricably bound with those of Marduk, who, however, attained his greatest authority during the renaissance of the Babylonian Empire between the end of the 7th and 6th centuries BC. It is indeed apparent that when Marduk was down, Babylon's fortunes were at their lowest ebb and three historic events illustrate the point.

First, an inscription of the Kassite king, Agum II, recalls that he brought back the statues of Marduk and his wife, Sarpanitum, after they had been in exile in Khana for 30 years. This banishment had followed the sack of Babylon by the Hittite king, Murshilish I, in 1595 BC. Only with the triumphant restoration of these divinities did Babylon begin to rise again, but it took many centuries for Marduk to recover his prestige.

The renaissance appears to have occurred shortly before 1100 BC when the god's statue was once again recovered, this time from Elam, to the east of Babylon. The reign of Nebuchadrezzar I, who was responsible for the victory over Elam, thus marked a turning point in Mesopotamian religion. This was indeed a signal triumph, for Elam which had been a deadly menace to Babylonia, was thereafter quiescent for nearly three centuries and, doubtless, the credit went to Marduk.

A third historic event which marks once again a low ebb in the god's fortunes was the devastation of Babylon in the time of Sargon, King of Assyria, and the neglect of the god's sanctuary by Sargon's son, Sennacherib, in the years 705–703 BC. The New Year ceremonies were at that period several times suspended. But Babylon, which had suffered so much devastation under the early Sargonids, was restored to favour again by the superstitious Assyrian King Esarhaddon. Even after the conquest of Babylon in the 6th century BC by the Persian monarch Cyrus, the fortunes of Marduk waxed strong, though heresies in the form of worship were alleged to have been perpetrated by his predecessor, Nabonidus. Thus, Marduk's fortunes may be followed from historical records and are also attested by his fluctuating popularity as a component of personal names.

Victory over Chaos

Information about the character of the god comes to us from religious and magical texts. First comes the famous epic of Creation which was a long poem recited in the god's honour on the fourth night of the Neo-Babylonian New Year's Festival. It was known in antiquity as the *Enuma elish* from the first line which runs, 'when on high the heavens were not named'. There were seven tablets in all which varied in length between about 115–140 lines. They tell us about the creation of the universe, and proclaim the Babylonian belief that in the beginning the

first gods were generated out of the mingling of waters which had preceded the formation of the earliest Mesopotamian slime.

As the gods multiplied there was a schism in the course of which the respectable High Gods such as Anu, Ansar and Ea became divided against the detestable aboriginal dragon Tiamat representing chaos and supported by her evil myrmidons. The good gods, threatened with destruction, were saved from annihilation by the birth of Marduk, son of the magical god Ea, and destined to restore order to the universe. In agreeing to fight Tiamat, Marduk struck a bargain with his superiors and was promised the power to declare fates and work miracles. The magical 'appearing and disappearing' act of Marduk's garment is a notable forerunner of the conjurors Maskelyne and Devant. The saviour's destruction of Tiamat with the aid of the Seven Winds is a theme frequently illustrated on Babylonian seals, but we cannot recognize in iconography his creation of man out of the blood of Kingu.

Marduk's victory was celebrated by his reorganization of the heavens, by a drunken thank-offering banquet of the gods and by the decision to build Babylon, the shrines of Esagila and the ziggurrat, the great temple tower.

Ritual Humiliation

It is fortunate that a few tablets written in Babylon and elsewhere have survived to give us a fragmentary account of some of the ritual acts performed during the eleven days devoted to the New Year Festival.

The proceedings may be thought of as a Passion Play in which a ritual marriage between the king and the goddess (see ISHTAR) probably took place as well as many other symbolic performances; for example, the king had to give an account of himself before the god through a negative confession, or recitation of uncommitted sins. Most striking was the ceremony in which the king, standing before Marduk, was stripped of his regalia and had his face slapped by the high priest: it boded ill if the king did not shed tears.

Banquet of the Gods

At the end of the festival, Marduk led the great procession of gods which passed along the sacred way, flanked by enamelled brick reliefs of lions, and his personal symbol, the Musrussu dragon, to emerge at the *Akitu* temple where he entertained the divine assembly to a banquet.

The belief that in the course of this festival Marduk was entombed and resurrected is based on a misinterpretation of an Assyrian text and has no foundation. It has been shown that in two late texts the resurrected god was Nergal, king of the underworld, and that this emergence probably represented the victory of the sun after the winter solstice.

The cult of Marduk flourished in Assyria from the 14th century BC onwards, but in the 7th century he was displaced by the national god Assur: a late Assyrian text describing the capture of Marduk and his committal to the ordeal by water is a political tract designed to discredit the god. However, Marduk's popularity was due to his reputation as assistant magician to his father Ea in the rituals for alleviating sickness and misfortune, and as an exorcist. In a literary work named the *Ludlul Bel Nimeqi* Marduk appeared as the saviour of the righteous sufferer, who was a kind of Babylonian Job.

The power of the priesthood of Babylon over a dynasty of successful soldiers and notables, not of royal blood, ensured the glorification of Babylon and the rich endowment of the temples. However, the god's fame throughout the ancient world and for posterity derives from the imperial victories of Nabopolassar and Nebuchadrezzar II who rebuilt the city on a magnificent scale.

MARRIAGE & BETROTHAL

In England 150 years ago, a dissatisfied husband was popularly considered free to sell his wife, while in a certain Dutch village even today a courting couple will marry only if the girl becomes pregnant; along with the fertility magic and superstitions found in European marriage customs is a strong strain of earthy prudence

WHEN MARRIAGES were arranged for practical reasons, rather than for love, child brides were quite usual. St Elizabeth of Hungary, betrothed at the age of four to an 11-year-old bridegroom in 1211, was carried to his home in a silver cradle, and Mary Villiers, a ward of Charles I, was already widowed by the time she was nine years old; soon after her husband's death she was seen climbing trees in her black dress, pretending to be a bird.

Since the purpose of such marriages was to ensure the union of prominent families, children were sometimes betrothed soon after birth. Although betrothal, the binding promise of marriage, has little significance for us today, it was at one time an occasion for considerable ceremony. In Greek Macedonia, for example, it was conducted with prayers and exchange of rings, in the presence of a matchmaker, the priest, family and friends. The bride offered her married relatives the traditional formal refreshments – jam, coffee, alcohol – and presented the groom's parents and the matchmaker with socks she had knitted herself. They thanked her with the customary greeting: 'Mayest thou enjoy the kerchief in good health.' During Cheese Week, which immediately preceded Lent, the young man sent his betrothed sweet cakes, and on the eve of Easter she received gifts of a coloured candle and Easter eggs.

The nomadic Vlachs, a people scattered through the Balkans, arranged for a group of friends and relations, acting on behalf of the groom, to call at the home of the bride. There they found a low table covered with fine cloth and laid with three soup plates.

Jürgen Bisch

The Western concept of romantic love is not universal, and child marriage is still practised in cultures where marriages are arranged for economic and social reasons *Right* After the wedding of this Burmese child bride, the girl will be expected to go and live in her husband's house although she is too young for the marriage to be consummated

Axel Poignant

F. H. C. Birch/Sonia Halliday

Mansell Collection

Marriage means the transfer of one of the couple from one kin-group to another, and many marriage and betrothal customs are connected with this. In New Guinea (*top*) women of the bride's group stage a mock fight to prevent her from leaving. Elsewhere, the bride may be led to her wedding in brand new clothes and in ceremonial procession, as at this village in Cyprus (*centre*) *Below* At Dunmow, in Essex, a side of bacon is awarded to a married couple who can swear that they have not regretted their marriage for a year and a day

Two of these contained sweets. The third, which was empty, had to be filled with gold, sometimes made into a necklace. It is still a common Balkan custom for a woman to wear her betrothal gift in this fashion. When the groom's party returned, they threw flour over him, wishing him a long life with the words: 'May you grow white like this flour.' Meanwhile, the same custom was performed for the bride, by her family.

In 17th century Holland the betrothed couple were required to sit together on a bed and kiss each other in the presence of both families; the ceremony was ratified by exchange of rings. These were very big, sometimes engraved with suitable pictures, and sometimes, like the English gemmel ring, formed of two parallel circles. The halves, separated between the partners at the betrothal, were joined together as a wedding ring for the marriage ceremony. To pledge fidelity, the couple would cut themselves and drink each other's blood; or they might use the blood to make a written declaration. In England, halving a coin was a popular custom. A character in a play called *The Country Wake* (1696) says: 'I ask't her the question last Lammas, and at Allhallow's-tide we broke a piece of money.' The straw true-lover's knot was another token of fidelity, in use within living memory. A young man prepared two, one for himself and one for his sweetheart. If she pinned hers over her heart, this meant she had chosen him, and the couple wore the knots until their wedding day. The girl might also be presented with a sprig of the plant Lad's Love; if she threw it away, her lover had been rejected, but to smell it was a sign of acceptance.

A young man from the fens would present a fur tippet to his sweetheart. This was a narrow fur stole, prepared by the lover from animal skins, which he had obtained and cured himself. The couple stitched the hide to a silk lining, stuffed it with sheep's wool, and inside each end placed a sachet containing a little pubic hair: the man's on the right, the woman's on the left. When worn, the criss-crossed ends covered the woman's heart, and the little packets inside ensured a happy married life.

In many countries marriage is a social obligation, and anyone remaining single is frowned upon. The ancient Jews had no word in their vocabulary for bachelor, and

In the Calvinist village of Staphorst in Holland, trial marriage is still practised and custom decrees that a couple marry only when there is evidence of a pregnancy

the Poles used to ridicule anyone unmarried beyond the proper age. Nonetheless, it was not always so easy to obtain a wife, and a young man might have to earn her by working for his prospective parents-in-law: 'So Jacob served seven years for Rachel, and they seemed unto him but a few days because of the love he had for her' (Genesis 29.20).

This ancient custom persists today. Among the Eskimos of St Lawrence Island, Alaska, the boy works one year for his sweetheart's family, carrying water, gathering driftwood, chopping ice, assisting with hunting, and generally proving his willingness to work for them and his ability to provide for a family. But if the girl is already pregnant, the couple are usually married as quickly as possible.

Bundling and Handfasting

Anticipation of the intimacies of marriage was not so frowned upon in the past as one might suppose, since betrothal was often considered to be nearly as binding as marriage. The early 17th century Puritan settlers of New England practised bundling, a custom known variously in England, Scotland, Ireland and Wales, as well as Holland, Norway and probably elsewhere. The parents of a New England girl who was courting permitted the couple to spend the night together in her bedroom. The pair who were expected to behave with reasonable propriety, wore all their clothes and were occasionally separated by additional layers of bedding. This custom, which seems to have begun dying out in America during the 18th century, was still common within living memory in England in Cambridgeshire, where it was introduced by Irish labourers.

In 17th century Holland bundling was known as *queesten*. Suitors on Texel Island traditionally arrived through the window and, since this necessitated smashing the pane, few houses had all their windows unbroken. Although couples met in the girl's bed, it was again intended that propriety should be observed. The girl lay on the sheet, the boy between sheet and cover. Nearby an iron vessel and a pair of fire tongs were ready for her to sound the alarm if the young man became too bold. Parents usually approved of the custom since it was thought an honour for their daughter to receive these visits. The call might last all night, and if a pregnancy resulted the baby was taken along to its parents' wedding, concealed beneath the mother's cloak, though clearly visible for everyone to see. Today, in the Calvinist village of Staphorst, trial marriage is still practised and custom decrees that a couple marry only when there is evidence of a pregnancy.

The Scottish custom of 'handfasting' also provided a testing period. Young men and women chose a companion at a fair held annually in Dumfriesshire, and lived together as man and wife until the following year. If the experiment was a success, they married; if not, they were free to take another partner. A priest nicknamed Book-in-the-Bosom, perhaps because he carried a marriage register, arrived periodically to solemnize these weddings.

There is usually no difficulty about arranging marriage for an attractive girl or man, but it may be a problem in cases of deformity or physical defect. In Poland such a man was betrothed to a relative and the banns read out in church, not with any real intention of marriage, but simply to make it known that he was eligible.

Calling the banns is an important preliminary to marriage and the English language is full of dialect expressions for this custom. In Lincolnshire it was known as 'spurring'. If the banns had been read once, people said: 'Why thoo's gotten one spur on thee!', and two banns were 'A pair of spurs'. Sometimes a peal of bells, the spur peal, was rung on the day that the first hann had been called. 'Breaking a rib' was another usual phrase. 'He's gotten one rib broke', meant that the banns had been called once; 'fallen plump out of the pulpit last Sunday', was a Wiltshire expression. Generally speaking it was unlucky to hear one's own banns called: it meant that children of the marriage would be deaf and dumb. Similarly in Poland, should a girl hear her first banns, her pots will break after she is married.

Gifts are always an important part of any wedding, because of the exceptional expense involved, not only in setting up the newly married couple, but in the occasion itself. If a Manx couple were badly off, it was usual to place a sieve in the kitchen so that guests could drop in a coin to help with the cost of entertainment. This custom, known as a Penny Wedding, exists elsewhere in various forms. Bride-ale was for the same purpose; the bride sold home-brewed ale to the wedding guests, who paid her lavishly.

In Scotland and the North of England a 'Bride-wain' was arranged. This meant that carts and horses were taken round the houses of friends and relatives, who gave sacks of corn, meal, wool, and anything else they could spare. Sometimes there was a ceremonial procession from the bride's old home to the new one. A waggon, loaded with household articles and furniture, set out and, as it passed by, friends threw gifts upon the load. In Lancashire, among the very poor, everyone gathered together on the day of the wedding and built the young couple a house of clay and wood, which was known as the 'clay bigging'.

If a husband was wealthy, but nonetheless did not wish to inherit any earlier debts from his wife, there was a traditional remedy. Until about 100 years ago in England, it was commonly believed that if a bride arrived at her wedding dressed in nothing but a shift, her husband would be freed from any such obligation. Again, if the bride walked stark naked from her house to her future husband's, the same purpose would be served. During the last century a woman tried to do this at Kirton-in-Lindsey in Lincolnshire. She had intended starting out down a ladder from her bedroom window, but her courage failed her; she partially dressed while still standing at the top.

The idea of approaching one's wedding in a state of nakedness is echoed in the custom of removing old clothes and putting on a completely new set. A Vlach bridegroom would stand in a flat metal dish and strip, preparatory to donning his pristine wedding clothes. English brides too were freshly dressed from head to foot, though the requirements of the old rhyme: 'Something old, something new, something borrowed, and something blue' were carefully observed. Today the luckiest colours for a bridal dress are white, pink and blue. Green is thought to be especially unlucky and in parts of Scotland even green table decorations and vegetables were omitted from the bridal meal.

Food is an important feature of any wedding celebration, and certain items are essentially symbolic. Formerly in the Netherlands the bridal couple were offered salted cream sprinkled with sugar, a confection representative of the bitter and the sweet sides of

Camera Press, London

married life. English wedding-cake with its icing sugar and bitter almonds is said to possess the same significance. The rich mixture traditionally used in its preparation stands for fertility and abundance. Every guest must eat some and unmarried girls are supposed to sleep with a slice beneath their pillow in order to dream of their husbands-to-be. Yorkshire folk called this 'dreaming bread'. A sliver of cake used formerly to be passed nine times through a wedding ring to achieve the same result. This form of wedding divination has always been popular. Indeed as early as 1279 the Church in Poland was obliged to issue a decree forbidding its practice.

Baking and Breaking

Polish bridal couples wear pieces of cake tucked inside their blouses throughout the marriage ceremony; they must also share the first and last pieces together. Hence the ceremony of baking the bridal cake is very important. Women known to be happily married are invited to prepare the mixture, and the bride's mother receives them with vodka, sausage, ham, pickles and cake. Only women may be present, apart from the official matchmaker, and the cake is made without salt to signify that the young couple should live together without sorrow. If the cake rises well, it is a good omen. In Macedonia three maidens sift the flour, and three married women prepare the dough. They may put a hook and eye into the mixture, representing the male and female elements. Sometimes the bride wears two great ring-shaped cakes on her arms as she makes her way to the bridegroom's house. She breaks one when she is halfway there, and the other is broken on arrival. Women eagerly seize the pieces, which they believe will assist them in childbirth.

In parts of England it was usual to break a piece of cake over the head of the bride when she returned from church; in Ireland they used an oatmeal cake, in Scotland shortbread. This was generally done by the groom. Sometimes it was thrown over the head

In many societies to this day, a woman may be severely punished for infidelity, desertion or breaking up a marriage *Far left* This Yemeni woman claimed that an iron ring had been driven through her forearm as a punishment for deserting her husband *Left* Spiral brass collars worn by adult women of the Padaung people in Northern Burma, are removed, perhaps causing serious injury, if a married woman complains of her husband

of the bride, plate and all, and if the plate broke into many pieces, it was a good omen foretelling many children; if it failed to smash, someone quickly stepped on it to avert the unlucky sign.

When people were very poor, as in Ireland during the last century, the food for a wedding simply consisted of what was available; in this case, bruised potatoes, flour, oatbread and butter. More often it was representative of fertility and abundance. For this reason, on entering her new home, a Greek bride crushed a pomegranate – a popular symbol of fruitfulness in the East – and marked the doorpost with a butter cross. The couple ascended the stairs beneath a shower of sweets, coins, barley, chick-peas and rice. These ideas are present in our own wedding ceremonies. Confetti has largely replaced rice, which was thrown to ensure the fruitfulness of the marriage.

The symbolism of the cereals in wedding ceremonies arises from the fact that they are basic foods in the countries where they are used. At a Polish wedding feast a flat, plaited wheaten loaf called *kolacze*, which has been blessed in church, represents all bread. Good solid food is served: a traditional mixture of lentils and barley called *kasha*, peas, gravy, a bird, and *borscht*, soup made from beetroot or cabbage. Everyone cries 'The soup is bitter' until bride and groom have kissed each other. Since the wedding feast is said to represent the couple's future married life, there is always plenty of food. For the same reason, the fiddlers are fed by the bridesmaids so that they will not stop playing.

In Lowland Scotland it was the custom to serve a fowl. Afterwards, so that she and her husband would be happy together, the bride was given the small side-bone called 'hug me close'. In Sunderland, as elsewhere, the bridal pair were presented with hot pots after leaving the church; these were mugs of ale which were brought by local women as a compliment to the newly weds. A stranger to the district, taken by surprise at his wedding more than a hundred years ago, remarked: 'The composition in these mugs was mostly, I am sorry to say, simply horrible.'

On reaching the churchyard gate the bride might be required to jump, or be lifted over, what was known as the petting stone; on Holy Island the petting stone is all that

Axel Poignant

remains of a lost Saxon cross. Sometimes a decorated rope might be stretched across the road, and the groom had to pay a fine to obtain free passage.

Today when the ceremony and reception are over, bride and groom set off on a journey together. But this is a modern custom. Three centuries ago, in parts of Western Europe, the whole wedding party danced along with the couple to the bridal chamber, where the bride's mother was waiting to say goodbye. An English marriage, before the honeymoon came in vogue, concluded with the ceremony of 'throwing the stocking'. Bride and groom were expected to sit up in bed, fully dressed, while the bridesmaids took it in turn to stand at the foot of the bedstead and throw the bridegroom's stocking over their shoulder. The aim was to hit him on the face. The groom's men then aimed at the bride using her stocking. This was a form of divination: whoever succeeded would soon be married.

A post-marital custom recorded in 1792 in Ayrshire, was known as creeling. Two days after the wedding the married couple gathered together with their friends and filled a small basket, or creel, with stones. The young men were obliged to carry this in turns until released by a kiss from one of the girls. When the groom's turn came he was expected to carry the basket for a much longer period, until his bride had pity and kissed him, as a sign of her satisfaction with the marriage. Two days however is scarcely a fair trial period, and the real question was whether the marriage would stand the test of a longer time. At Dunmow in Essex the ancient custom survives of presenting annually a flitch of bacon to a married couple who can swear, kneeling on two sharp stones, that they have not regretted their marriage for a year and a day.

Infidelity, like marital harmony, used to be considered a community affair and the punishment inflicted on the offender was by no means good natured. A practice called 'rough music', known by a variety of names according to the district, consisted of a procession, generally at night, with the local men banging any suitable metal object they could lay their hands on, such as saucepans and kettles, and blowing improvised musical instruments. Verses were recited and life-size effigies of the offenders were publicly paraded. Rough music could be played for a variety of reasons, the most usual being some offence against the marital code, particularly adultery or incest. The punishment was effective; as a rule the persecuted couple had to leave the district.

Cost of a Secondhand Wife

In the event of a marriage being unsuccessful, it was once a common belief that if a man disliked his wife he could get rid of her by the simple expedient of selling her. With a halter placed round her neck, the wife would be publicly exhibited for sale for a sum not less than a shilling; the man who bought her would then become her husband. It was considered that he had done so, simply by virtue of the purchase. There are many recorded cases during the last couple of centuries. Some of these cases strike us today as bizarre. For example on 7 April 1832 at Carlisle, a farmer named Joseph Thomson put his wife up for sale after three years of marriage, complete with a straw halter. After waiting for almost an hour, he succeeded in getting 20 shillings and a Newfoundland dog for her. According to popular custom, this rough-and-ready form of folk divorce was legally binding.

It was commonly believed that the success of a marriage would depend upon the time at which it was celebrated. We know that the ancient Romans avoided May weddings because the month was a time of purification. The *Lemuria*, or Feast of the Unhappy Dead, was celebrated on the 9th, 11th and 13th of that month, and the poet Ovid says those who married in May would soon die.

There is a curious association of death and marriage in Jewish custom, perhaps explained by the tragedies of their history. The couple must be reminded of sorrow in the midst of joy and hence a glass is broken. The pieces used sometimes to be carefully saved and used to weigh down their eyelids in death. Numerous examples from different cultures of the ceremonial smashing of

objects at weddings are cited by E. Westermarck in his *History of Human Marriage*. Among the southern Serbs, for instance, it was the custom, after the bride and groom had returned, to throw a wine glass at their door, symbolizing the approaching loss of virginity. The guests, with a great deal of noise, were meanwhile busy smashing glasses, crockery and an egg in a sack. It seems likely, as Westermarck suggests, that the shattering of fragile objects was intended to ensure the consummation of the marriage, which might otherwise have been prevented by malevolent influences.

The Ashkenazim, the Yiddish-speaking Jews of Central and Eastern Europe, used to carry a hen and a rooster in procession with the bride and groom as symbols of fertility. For the same purpose was the custom among Spanish and Portuguese Jews of causing the bride to perform the Fish Dance. Russian and Polish Jews fed the couple on fish, and the woman might also jump over a bowl containing live ones.

Certain Jewish wedding customs, particularly among the Ashkenazim, were not dissimilar from those known elsewhere. Bride and groom were escorted separately to the synagogue in a gay procession, and on arrival were showered with wheat or barley. To make the significance of this ritual quite clear, the celebrants called out three times to the bridal pair: 'Be fruitful and multiply', while a wedding canopy, the *chuppah*, set out of doors, signified God's promise to Abraham: 'Thus shall thy children be, like the stars of heaven.'

Chanting hymns and beating the ground, the Salian priests prayed to Mars to promote fertility; the god's concern for the welfare of the community and of all animals and crops is as old as his better-known role as god of war. But it is in this virile, aggressive aspect that Mars appears in astrology

MARS

AMONG THE ANCIENT ITALIANS there was no greater god than Mars, after Jupiter. He was known by an unusual variety of cult names: Mars, Mavors, Maurs, Mamers, Marmar, Marmor, Mamurius, and the honorific compound Marspiter. Many Latin and neighbouring communities named a month after him, and our month of March preserves the memory of his veneration. The Roman month *Martius* embraced the spring equinox and by its season reinforced the god's oldest functions in agriculture. March marked the first month of the oldest-known liturgical year at Rome. Certain state priests promoted the growth of crops at the onset of the year, prepared for the new year by cleansings and otherwise marked what we today keep as the New Year. For a time 15 March opened the official year but later yielded to 1 January, which acquired from 1 March such customs as decoration with evergreens. However, March retained many ceremonies of the new year as well as the constant cult of Mars which was mainly entrusted to the Salians, priests whose title seems to be derived from *salire* 'to dance, leap'.

On fixed days in March the Salians proceeded along an established route where they would stop at certain points and perform rites that included the chanting of some of the oldest hymns in the Latin language, beating time on the ground according to the ritual three-step, and carrying outmoded spears in which Mars lurked, and shields, one of which was sent from heaven. Their dancing and beating of spear on shield was probably thought to advance the growth of the crops. However, the priests' military accoutrements and the regular resumption

of warfare in March always underlined the god's martial aspects. The surviving scraps of the Salian Hymns mention many Roman gods, and Mars himself in the form *Mamurius Veturius*, evidently the Mars of the old year. The hymns certify the Salians' concern for agricultural growth and the welfare of the infantry (armed with spears of a kind different from those which the priests themselves carried). Much of the Salians' intervention with their god was directed toward cleansing the community and its utensils.

Peculiar to Mars in Roman religion is the use of the horse. On 14 March a racing festival, *Equirria*, was kept for Mars on the Campus Martius, 'Field of Mars'. On the same ground every 15 October another race was run, after which a horse of the winning chariot team was sacrificed to Mars. The blood of its tail was dripped onto the hearth in the king's former residence, the Regia. The ashes were later compounded with the cremated remains of unborn calves sacrificed on 15 April and applied in the cleansing held on 21 April, Rome's birthday. The horse's blood may have been intended to ward off barrenness, while the cremated calves were sacrificed to invite fertility into the community.

A third race came in late February and presumably marked the end of the old year. The last month of the liturgical year was crammed with cleansing rites. The *Quirinalia* in February honoured Quirinus, an epithet sometimes applied to Mars. Both Mars and Quirinus had Salian priesthoods as well as their own *flamen*, a Roman priest peculiarly bound by religious restrictions (see JUPITER). Quirinus as a distinct god was an offshoot of Mars who acquired considerable prestige of his own. As a promoter of peace, Quirinus represents the willingness of Mars to cease warring and to accept terms from the enemy.

Leaping the Boundary

At the end of May another priesthood, the Arval Brothers, annually kept their agricultural cult by invoking the name of Mars thrice in three different forms, by thrice repeating the petitions and by dancing the ritual three-step (*tripudium*). No older prayer than the Arval Hymn fully survives to us. After asking help of the Lares (see LARES) and before and after inviting the seed gods, the Brothers begged Mars to prevent the invasion of blight and the collapse of growing grain, to leap the boundary and to remain on the land. This prayer was sung five miles from Rome, apparently at the border. The god's arrival by avoiding contact with the boundary itself demonstrates an irrational fear which still survives: brides are carried over the threshold lest their stumbling bring barrenness. Mars was expected to remain on the land, but not to import barrenness. His protection of Roman ploughland (*arvum*) is paralleled by old evidence from one Umbrian town where, like the Campus Martius, two fields belonged to the Martial woodpecker, where Martial Growth (*Cerfus Martius*) was hailed for cleansing the community and for damning foreigners, and where this Martial Growth controlled two divine powers, Protection and Fright.

The Umbrian ceremonies are attested earlier than an elaborate ritual for cleansing Roman farmland by circling it with a suckling pig, lamb and calf (*suovetaurilia*), with prayers and sacrifices to Father Mars who would defend and increase the land, its human and animal occupants, and all the vegetation. In another Roman ritual of the same era, Mars Silvanus, Mars of the Woodland, received sacrifice within the woods for the good health of the cattle. From its oldest survivals the cult of Mars shows a primary concern for the health and welfare of all living animals and crops.

The Avenger

Just as old but less clear at the outset is the Mars who was the god of war. The Salian priests certainly observed in part a cult of war. After it became a formal republican assembly of all citizens, the Roman infantry always met on the Campus Martius and never within the city's sacred boundary (*pomerium*). The Field of Mars held the oldest known altar to Roman Mars. At the only archaic temple to Mars, which stood over one mile from the city on the Appian Way, the cavalry formed for its annual parade into the town, and the infantry

Bibliothèque Nationale

Detail from an Arabian manuscript shows a red-robed Mars displaying the head of his victim; in astrology Mars is the 'rogue male' of the planets, both violent and brave

rallied at the outset of a campaign. Consequently it is often asserted that Mars was purposely kept from the city because he was bellicose. Indeed he was worshipped outside where the Romans expected him to promote growth. However, the Salians worshipped him only in the city and there, too, kept their shields and spears, which they addressed 'Mars, awake!' The early lack of urban temples does not prove that Mars was solely a war god in origin.

Some of the Martial temples may be of relatively late construction on sites where he did the greatest good, on the land. The Emperor Augustus greatly enhanced the god's material condition at the end of the last century before Christ. In 53 BC, the political and financial magnate Licinius Crassus had gone to Parthia (modern Iran) to seek military glory. Instead, Crassus was slain, his army routed and massacred, and his standards captured. Julius Caesar and Mark Antony vainly hoped to recover the first standards lost to an enemy within memory, but the former succumbed to death and the latter to Cleopatra. It was left to Augustus to recover the standards by diplomacy. Not only did he represent his success as a military victory by depicting a kneeling Parthia and a triumphal arch on his coins, but he also lodged the standards in one of the two urban temples he built for Mars Ultor, 'the Avenger'. Thus Augustus made Mars responsible for a real military victory over Caesar's murderers at Philippi, as well as for a revenge upon the invincible Parthians. The Avenger's temple in Augustus's forum attained such importance that the grand plaza gradually exchanged the Emperor's name for the god's. Until some 40 years ago the street of Christian Rome which ran above the Forum Augustum was still called Via Marforio.

The early equation of Italic Mars with the Greek Ares lent great emphasis to the literary role of Mars as war god. Ares appears in Greek poetry mainly as a divine personification of war and violence. Some argue that *Ares* means 'destroyer', which if true would explain his relative lack of cult. Ares enjoyed prestigious family connections in mythology, where he is represented as a most unpleasant god. In terms of divinity Ares cannot compare with Mars, but most of the mythology of Mars was borrowed from Greek poets. Two peculiarly Roman tales show the difference.

One explains why the month of Mars comes at the year's beginning. The god sought Minerva in marriage. The withered hag of a matchmaker, Anna Perenna, pretended to have gained Minerva's consent, but herself wed Mars. The festival of Anna Perenna (which means little more than the 'everlasting year') fell on 15 March when a riotous and promiscuous mob kept her holiday. The marriage of Mars marks the cycle of the year at the return of spring.

In another Roman legend Mars figures in the foundation of Rome, whose story abounds in Martial religion. Mars fathered the founder of the city on an unwitting virgin. The Romans believed this paternity foreordained Rome's unsurpassed glory in arms. However, many elements of the foundation legend remain obscure to us (see FOUNDING OF ROME).

British Museum/Michael Halford

Mars was concerned with both agriculture and war, and the Roman infantry always met on the 'Field of Mars'. He was equated with the brutal Greek war god, Ares, from whom most of his mythology was borrowed, including the story of his liaison with the love goddess ***Above*** **Mars on a Roman coin of the 2nd century AD** ***Right*** **Paolo Veronese's painting of** ***Mars and Venus United by Love***

Veiled Emigrants

Mars and Jupiter are the best known of the few oracular deities of the Italians. Through his special bird, the woodpecker (*picus Martius*), Mars could indicate future events. To be born in the month of Mars clearly distinguished a child and thus promoted the names Marcus and Mamercus. The Marsi of central Italy and the Mamertini of southern Italy are two peoples named after the god. The origin of the latter illustrates the double function of Mars. In prehistoric times a community troubled by want of food or by the scourge of a human enemy would vow all that was produced in a given spring to Mars and Jupiter. Jupiter received the animals born in that season. Upon reaching adulthood men born at that time were sent veiled (perhaps so that they could see no ill omen) from the boundaries of the dedicating community to found a new community. Such consecrated men were dedicated to Mars. Thus, we are told, the Mamertini earned their name.

An animal often led the consecrated emigrants. The Italic Hirpini were named after the wolf in these circumstances. The Picentes may have taken their name from the woodpecker. Although without any linguistic merit, the most famous of such names is Italus and its derivatives from *vitulus*, 'calf'. This belief originated among Greeks who remembered one band consecrated to Mars that was led by a calf. Accordingly, when her Italian allies broke with Rome in the late '90s BC, the Marsi had coins for paying troops of the Italian confederacy marked with the Italian calf trampling the Roman wolf, the Martial beast which had given fresh life to the infant Romulus and Remus.

(See also JANUS.)

R. E. A. PALMER

Mars in Astrology

The 'Rogue Male' of the planets, Mars is considered rather dangerous, and likely to be involved in any act of violence. The colour attributed to him is red, the colour of anger, appropriately enough, for the closer he comes to the earth, the more obvious is the planet's reddish colour. Although Mars is said to be baleful and can be harmful to either sex, to women he is the natural significator of men in general, and husbands in particular; he also signifies the active callings of soldiers, policemen, athletes, sportsmen and metal-workers. Even a scholar, if young or a husband, can be signified by Mars.

His character is impatient, tireless, excitable, easily moved to wrath but also readily appeased. He is neither subtle nor profound; if one assumes that a Martian is bluffing, one soon finds out one's mistake. In manner, the Martian is generally held to be rough and crude, lacking in refinement and uninterested in the arts. Learned men, however, need to have a good deal of Mars in their composition to persist in their often unrewarding and even tedious studies. Religious persons are frequently strongly influenced by Mars, for the religious need courage and tenacity.

The Gift of Energy

The greatest advantage of Mars is that he is never easily fatigued. He represents energy, and in consequence is never too tired to go on, and never too lazy to bother. He always insists on doing his work thoroughly. The man who does enough but no more is not a Martian, for a Martian enjoys labour and regards it with understanding, rather than as an imposition for which one is justified in exploiting one's employer. His pugnacious temperament will enable the Martian to fight his way through life, especially in the years of adulthood.

If Mars is the only dominant planet, there is a tendency for the rough and brusque manner identified with Martians to emerge; but there are four quarters of the horoscope in which planets can dominate, so there must be many Martian people in whom the wish to use their energy is not their sole and prevailing drive.

One very common personality defect of Martians is that, although they have plenty of energy, they may be content to use it in whatever way is familiar to them, and lack the imagination and vision to launch out in a different direction. Another defect of which Martians should beware is that often they cannot accept things as they are and feel they must change them at all costs. A Martian schoolmaster would be likely to administer punishment to give vent to his own feelings, rather than because he considered it for the good of the offender. But Mars is as courageous as he is hasty; although he does not deliberately take chances, he is never afraid to run risks and seems to be utterly fearless.

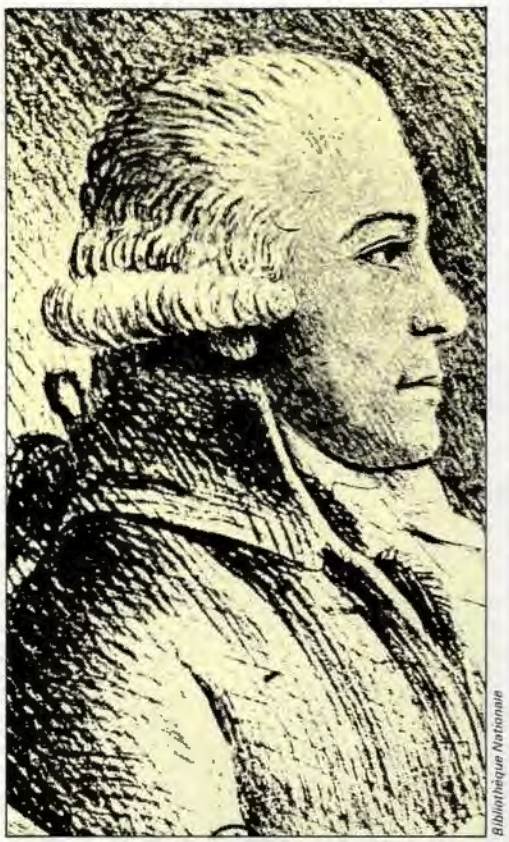
PAVLVS VERONENSIS F

MARTINISTS



Bibliothèque Nationale

'The Unknown Philosopher' Louis-Claude de Saint-Martin, secretary to Martinez de Pasqually, was responsible for classifying and interpreting his master's occult theories; he established his own personal school leading to the founding of a Russian Martinist order

MARTINEZ DE PASQUALLY, founder of the occult school known as Martinism, was born at Grenoble in 1710 and died in Santo Domingo (now Haiti) in 1774. His teachings were written down in manuscripts, most of which were never printed. He stated his general doctrine in his *Traité de la Réintégration des Etres* (Treatise on the Reintegration of Beings), several copies of which were written out by hand by his close friends, including his secretary Louis-Claude de Saint-Martin (1743–1803), who called himself 'the Unknown Philosopher'. Saint-Martin interpreted and clarified his master's theories in a celebrated work, *Tableau Naturel des Rapports qui unissent Dieu, l'Homme et l'Univers* (Table of Correspondences between God, Man and the Universe), but it is Martinez de Pasqually's own book which must be referred to for an understanding of genuine Martinism.

Martinez de Pasqually drew his ideas from Gnosticism, the Cabala, the Hermetica and the early Christian theologian Origen. His central teaching was that there are two essentials for human salvation (thought of in terms of the soul's ascent towards its original source in the Divine – see MACROCOSM; MAGIC). First, there must be a revelation which brings the knowledge of the soul's origins, of its descent into the lower spheres of the universe, and of the need to liberate itself. Second, in a magical ceremony the initiate must evoke and unite himself with his 'guardian angel', the 'higher self' which is a small fragment of the Divine Intelligence itself.

Before the beginning of the universe, so Martinez de Pasqually taught, God emanated or sent forth from himself certain beings, who came from the divine essence and who contained part of the divine power. They constitute four 'orders' or classes of spirits, infinitely higher and more powerful than the cherubim and seraphim, angels and archangels, which were created later.

These beings strongly resemble the 'aeons' (or patterns of thought) of Gnosticism. They existed originally only in the plane of Non-being, where God had left them free to act in accordance with their own impulses but where there was no danger of their producing the evil which some of them embodied. But they rebelled, left the plane of Non-being and entered the plane of Being, bringing into objective existence the evil which was part of their nature. It was this transfer to a plane which had been forbidden to them that constituted the initial revolt of these entities. Having rebelled, they tried to make themselves equal to God by sending forth spiritual beings dependent on themselves.

Fall of the Jailer

To prevent this threatened proliferation of evil, God created the world of matter, by a kind of condensation or 'densification' of the corrupted and rebellious beings, so that the world could be the stage on which these entities might act freely, exercising their own will-power and evil impulses. But this stage was also their prison, in which they were deprived of any form of communication with God himself.

To provide a jailer, as it were, for the prison-universe which he had created, God sent forth as an emanation from himself the primal or universal man, Adam, whose task was to oppose the evil entities now confined within the material world, to fight against them and keep them in check. Although he had emanated after them, he was their superior in power and glory. The angels and other secondary spiritual creatures were made helpers in the struggle.

The leader of the evil beings plunged the primal man into a kind of rapture, in which he tempted him. Adam contained within himself all human souls and he had the power to provide each of them with a 'glorious form', a garment which it would wear when it emanated from the totality. The Creator himself, however, had to provide the divine spark which would complete each human soul when it came into being. The Tempter persuaded Adam to carry out this creation by himself, making himself, in his turn, the 'first cause'. And Adam did so, breaking the spiritual bond which linked him with God.

As a result, Adam became spiritually degraded, as the evil entities themselves had, and he disappeared. Like a pearl necklace when the string has broken and the pearls roll about in all directions, so human souls roll haphazardly from one form to another, from one life to another, until a messenger from God, called the Mender, comes to receive them and lift them up in to the hands of a new Master of the World, who will remould them into a complete unit, identical with the first one.

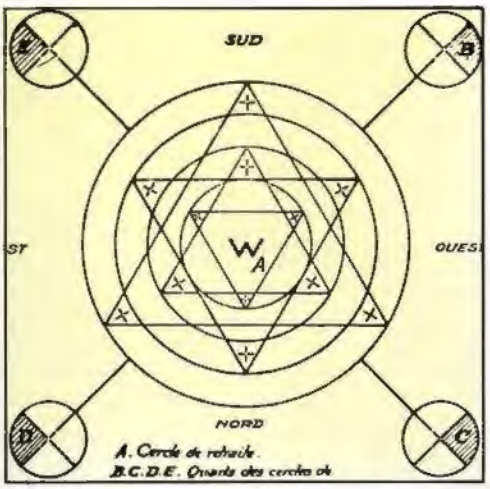
With the primal man, the whole of Nature fell and was overrun by evil. The angels and secondary spiritual powers were also affected, having lost their master, leader and protector. Martinez de Pasqually's 'universal reintegration' applies not only to the reconstitution of the universal man and the repentance of the evil spirits but to the re-establishment of the 'planetary and stellar spirits', the beings which animate the most distant galaxies. For this purpose, the Creator raised up ten Human Guides or 'Chosen Minors': Abel, Enoch, Noah, Melchizedek, Joseph, Moses, David, Solomon, Zerubbabel and Jesus. These beings remind men of the truths which, under Satanic influence, they tend to forget.

Magical Operations

The Christianity of the Martinists is decidedly unorthodox and their 'saviour', Jehoshua, the last of the Guides, is not necessarily the same as the Jesus of Nazareth of the Christians. After him come lesser and temporary Guides, or 'Regenerated Minors'. These are the adepts, the masters of spiritual doctrine, and this was the stage which could be reached by those who attained the highest degree, or rank, in the Martinist *Ordre des Chevalier-Maçons, Elus-Cohens de l'Univers* (Order of Knights-Masons, Chosen Priests of the Universe): the degree of *Réaux-Croix*, a term allegedly derived from Hebrew words meaning 'seeing' and 'messenger' or 'herald'. Lower than these are the 'Reconciled Minors', or initiates who have not yet attained the highest rank, and finally the 'Deprived Minors' or 'men of the Flood', the ungodly who are caught in the snare of gross desire, without spirituality.

The Order of the Elus-Cohen had three main divisions, in ascending order the Porch, the Temple and the Shrine, each consisting of three degrees. These were, in the Porch, the Apprentice Cohen, Fellow Cohen and Master Cohen; in the Temple, the Master Elus-Cohen, the Grand Architect and the Grand-Elus of Zerubbabel; and in the Shrine, the Apprentice Réau-Croix, Fellow Réau-Croix and Master Réau-Croix. (Apprentice, Fellow and Master are the three grades of Freemasonry. Cohen is the Hebrew for 'priest' and Elus means 'the elect' or 'the chosen'.)

It was only in the highest degree of the Shrine that evocation of entities belonging to the Divine Plane was carried out. The chief evocation was that of the Mender, Jehoshua, and the basic methods were those of the *Key of Solomon* (see GRIMOIRE), including the use of circles, names of angels, planetary hours and symbols. The magical operations of the lower degrees were intended to establish contact between the operator and the Invisible World. Lofty and beautiful prayers recalled the goal which the Order tried to attain. There were also exorcisms intended to strangle demonic influence in the universe and thwart its



The Martinist hope of 'universal reintegration' applied not only to man but also to the 'planetary and stellar spirits' which animate the galaxies: Martinist diagram, from the collection of M. Robert Ambelain

powers over men, and to combat black magic.

The principal initiation of the Order was the evocation and incorporation of an angelic entity which became permanently linked with the initiate. It acted as his 'guardian angel' and he was its 'vehicle' or 'agent'. From then on, the angel and the man strode forth along the path of 'reintegration'.

The Order's chief centres were its 'chapters' at Foix (established in 1760), Bordeaux (1761), Paris (1767), Lyons (1768) and other French cities, and those on Santo Domingo, including Port-au-Prince (1772); and 'temples' which ranked lower, founded at Amboise, Tours, Blois and Poitiers in 1767. After the death of Martinez de Pasqually the Order declined and in 1781 was allowed to lapse by the Order's then Grand Master, Sebastian de las Casas.

Jean-Baptiste Willermoz tried to perpetuate Martinist teaching in the secret degrees of the Order of the Holy City, founded at Lyons in 1778. Louis-Claude de Saint-Martin is said to have established a small personal school of his own in 1779. The Martinist Order which the French occultist Papus (see PAPUS) took over in the 1890s lacked any genuine initiatory connections with the original Order.

Martyrs

Those who suffer for a cause, especially early Christians who died rather than renounce their faith; the first Christian martyr was St Stephen, who died by stoning (Acts, chapter 7); from at least the 2nd century there were festivals in honour of martyrs; parents named children for them and pictures of them (St Laurence and the gridiron, St Catherine and the spiked wheel, St Sebastian riddled with arrows, and many others) became objects of popular devotion.

See SAINTS.

No special honour was accorded to the mother of Christ in early times, yet her exaltation to supernatural status increased steadily; later the cult of the Virgin Mary almost seemed to eclipse that of Christ himself

MARY

THE DEVELOPMENT of the cult of the Virgin Mary forms an interesting and significant aspect of Christianity. It reveals the interaction of theological speculation and the demands of popular faith. The latter factor is of special interest for both the comparative study and the psychology of religion. It demonstrates the importance of the female in the thought and feelings of ordinary people when expressed in religious faith and practice. Christianity in its original form, like the Judaism from which it derived, was masculine in character. It conceived of God in terms of 'Father', and Christ as 'Son'; there was no divine 'Mother'. The Virgin Mary came to fill this need.

The earliest records of Christianity reveal an interesting situation concerning the status of the mother of Jesus. The Epistles of St Paul, which were written about 20 years after the Crucifixion, contain no mention of Mary. This omission is the more remarkable in view of the later accounts of the Virgin Birth of Jesus. For Paul laid great stress on virginity, and it would surely have greatly strengthened his case to have cited the Virgin Birth, if he had known of it. The evidence of the next Christian writing, the gospel of Mark, is equally curious. It is silent about the Virgin Birth, and it represents Jesus as rejecting a suggestion that his mother had a special status (Mark 3.31–5); the later gospel of Luke (11.27–28) records an even more precise rejection. These passages would seem to indicate a kind of official discouragement of a tendency to accord special honour to Mary.

However, the gospel of Matthew (1.18–25) and also that of Luke (1.26–38), contributed powerfully to the presentation of Mary as a unique personage through their accounts of the Virgin Birth of Jesus. Luke, in particular, endows Mary with supernatural honour by recording the angel Gabriel's salutation: 'Hail, favoured one, the Lord is with thee', and Elizabeth's reference to Mary as 'the mother of my Lord' (1.28,43), as well as by the words of the Magnificat (1.46–55).

These two accounts of the Virgin Birth constitute a crux of New Testament research. They date from c 80–90 AD, and appear to be variants of a tradition that the birth of Jesus had not been a normal human birth. Since the Virgin Birth is not recorded by the gospel of Mark, which was written about 71 AD, it would seem that the notion had not by that date become an established tradition. How it did originate remains a mystery. Jewish rabbinical tradition apparently knew Jesus as 'Jesus ben Pandera', insinuating that he was the illegitimate son of Mary and a Roman soldier named Pandera, or Pantere. It is generally thought that this name was a corruption of the Greek word *Parthenos*, virgin, and that it derived from an early Jewish attempt to calumniate Jesus, by misrepresenting the Christian tradition.

Whatever the origin of the story of the Virgin Birth, it is certain that the idea was primarily intended to attest to the divine nature of Jesus, and not to exalt the status of his mother. So far as the New Testament evidence goes, Mary had no special position in the original Christian community at Jerusalem. The Acts of the Apostles only mentions the fact of her membership of that community (1.14), and the gospel of John records that the dying Jesus commended his mother to his favourite disciple.

The New Testament writings clearly indicate that Mary had other children; mention of Jesus being her first-born son occurs in Luke 2.7; Mark 3.32, 6.3; Acts 1.14. James, the brother of Jesus, became leader of the Church of Jerusalem (Galatians 1.19, 2.9; Acts 15.13, 21.18) doubtless because he was the chief male relative. It would seem that Joseph, Mary's husband, had died at an earlier date.

Emphasis on Purity

The evidence of the New Testament suggests, then, rather surprisingly, that Mary was accorded no particular prestige or status among the 1st century Christians, despite the marvellous story of the Virgin Birth. This situation continued in the Church until the 4th century, although

William Macquitty

Devotion to the mother of Jesus as the Queen of Heaven 'demonstrated the importance of the female in the thought and feelings of ordinary people when expressed in religious faith and practice', and veneration of Mary continues in Roman Catholic countries *Above* Late 15th century German wood carving of the death of the Virgin *Left* Figure of the Madonna in the Easter Procession at Trapani, Sicily

there were signs of a new interest in Mary that presaged her future exaltation.

In the 2nd century an apocryphal writing known as the Book of James or the Protoevangelium was produced. Its purpose was to supply an account of Mary from her birth until she bore Jesus. It was doubtless composed in response to a popular demand for more knowledge about Mary than the meagre statements in the New Testament gave. The Protoevangelium tells how the parents of Mary, Joachim and Anna, were divinely informed of her coming birth. Then, at the age of three, Mary is taken to the Temple, where she lived until she was 12 years old. The divine selection of Joseph, a widower, to be her guardian is next described, followed by a circumstantial account of the events that led up to the birth of Jesus. Throughout the work, supreme emphasis is laid upon the purity and virginity of Mary, thus anticipating that aspect of Mary which becomes a major theme of her later cult.

The great controversies of the 4th and 5th centuries concerning the divinity of Christ and the constitution of his nature increased the theological importance of Mary. The champion of orthodoxy, St Athanasius, designated Mary *theotokos*, 'God-bearer', because 'from the flesh of holy Mary the Son of God by essence and nature did proceed'. Thus, in order to refute the suggestion that Jesus was a man raised to divinity, the significance of the Virgin Birth was stressed, and Mary as the Mother of God was consequently exalted. The title Theotokos became the test-word of orthodoxy in the later struggle with Nestorianism, which maintained that in the Incarnate Christ there were two persons, one divine and the other human. The title was formally incorporated in the definition of the orthodox faith proclaimed at the Council of Chalcedon in 451.

The development of the doctrine of original sin, the taint of which was transmitted to each newly-conceived child through the sex act, led to increasing emphasis upon the Virgin Birth of Christ. St Augustine of Hippo, the great exponent of the doctrine, wrote of the Virgin Mary, 'her body transmits it not to the Body of Christ, which she did not conceive through concupiscence'. It was inevitable from the stress laid upon Mary's virginity when she conceived Christ, that the idea of her perpetual virginity (*aeiparthenos*) should emerge. The brothers and sisters of Jesus, to whom reference is made in the New Testament writings, were in consequence held to be the children of Joseph by an earlier wife. Jerome, the great 5th century protagonist of virginity as the superior form of the Christian life, wrote

Our Lady of Flowers

The association between divinity and plants is very ancient, and very early in mythological evolution plants, as well as birds and beasts, became attributes of divinities. One aspect of the primordial Great Mother, the primal originating force, is that of Our Lady of the Plants. The names of innumerable wild flowers reveal that they are proper to a Lady whose earlier names mostly are lost, but who is now called Mary. Lady's-bedstraw, lady's slipper, and so on, are Our Lady's. . . . Implicitly the Marian symbols include the whole world of plants, but her attributes are especially, besides the ear of corn that is also the attribute of the zodiacal *Virgo*, the lily of virginity, the violet of humility and the rose. Both in literature and in painting they are constant mediaeval references, as in St Bernard's exclamation: 'O Mary, thou art the violet of humility, the lily of purity, the rose of love.'

. . . The Virgin Mary's diadem of twelve stars derives from representations of Venus crowned with stars. And the ear of corn, which is the symbol of life springing up out of death, belongs also to the Great Mother Demeter (whom, as Cybele, the ancients garlanded with roses) and was shown, during the Greater Mysteries of Eleusis, at the sacred birth, when the immense proclamation was made: 'Our Lady has borne the Divine Child!'

Eithne Wilkins *The Rose-Garden Game*

Axel Poignant

triumphantly: 'Therefore the virgin Christ and the Virgin Mary have dedicated in themselves the first-fruits of the virginity of both sexes.'

Despite this increasing exaltation of Mary, no official sanction or encouragement was given to her cult. But popular enthusiasm could not be controlled, and for many ordinary Christians Mary took the place of the great goddesses of the Graeco-Roman world such as Isis or Cybele. It is in this context that Epiphanius, Bishop of Salamis (c 315–403), makes significant reference to 'certain women in Thrace, Scythia and Arabia' who worshipped Mary, offering to her a certain kind of cake, as was customary to pagan goddesses. Epiphanius condemned the practice, commenting, 'Let Mary be had in honour, but let the Lord be worshipped.'

The practice of invoking Mary's aid began to develop about this time. The earliest mention of the practice is made in the 4th century by Gregory Nazianzen, who commends the 'imploring of Mary the Virgin to come to the aid of a virgin in peril'. Such intercession quickly became established, and the Emperor Justinian (483–565) sought her help to govern and preserve the Roman Empire, while his general Narses turned to her for guidance in battle. Reference to the intercession of the Virgin also became an established feature of the liturgies of the Eastern Church and the Roman Mass. Festivals in honour of the Virgin were likewise instituted: those of her Purification (2 February) and the Annunciation (25 March) were originally feasts of the presentation of Christ in the Temple and of his conception; but Christian devotion changed their designations by concentrating on Mary's part in the incidents concerned. These festivals date respectively from the 6th and 7th centuries; festivals of Mary's Nativity (8 September) and *Dormitio* or 'Falling Asleep' (15 August) also began to be celebrated.

The last mentioned festival is of peculiar significance for the cult of Mary. It is more generally known as the Assumption of the Blessed Virgin Mary, and commemorates the belief that at her death she was assumed, body and soul, into heaven. The belief seems to have originated in Christian Gnostic circles in the 4th century; but it soon commended itself to orthodox devotion. In the Western Church it was formulated as a doctrine by Gregory of Tours (d 594). In the Eastern Church, the great theologian St John Damascene (c 675–749), endorsed its supporting legend that all the Apostles witnessed the death of the Virgin, but when her tomb was opened later it was found to be empty. St John Damascene designated Mary *mesitis* (mediatrix), a title significant for her future cult.

This exaltation and veneration of the Virgin Mary steadily increased during the Middle Ages until it became a veritable cult, at times seeming to eclipse that of Christ in popular devotion. Stories multiplied of the efficacy of Mary's intercession and of her miraculous intervention to save those specially devoted to her. The Venerable Bede tells how St Wilfrid of Ripon (634–709) at the crisis of what seemed to be a mortal illness, saw a vision of the Archangel Michael, who told him that he was sent by Christ to call him back from death, because of 'the intercession of His blessed and ever virgin mother Mary'.

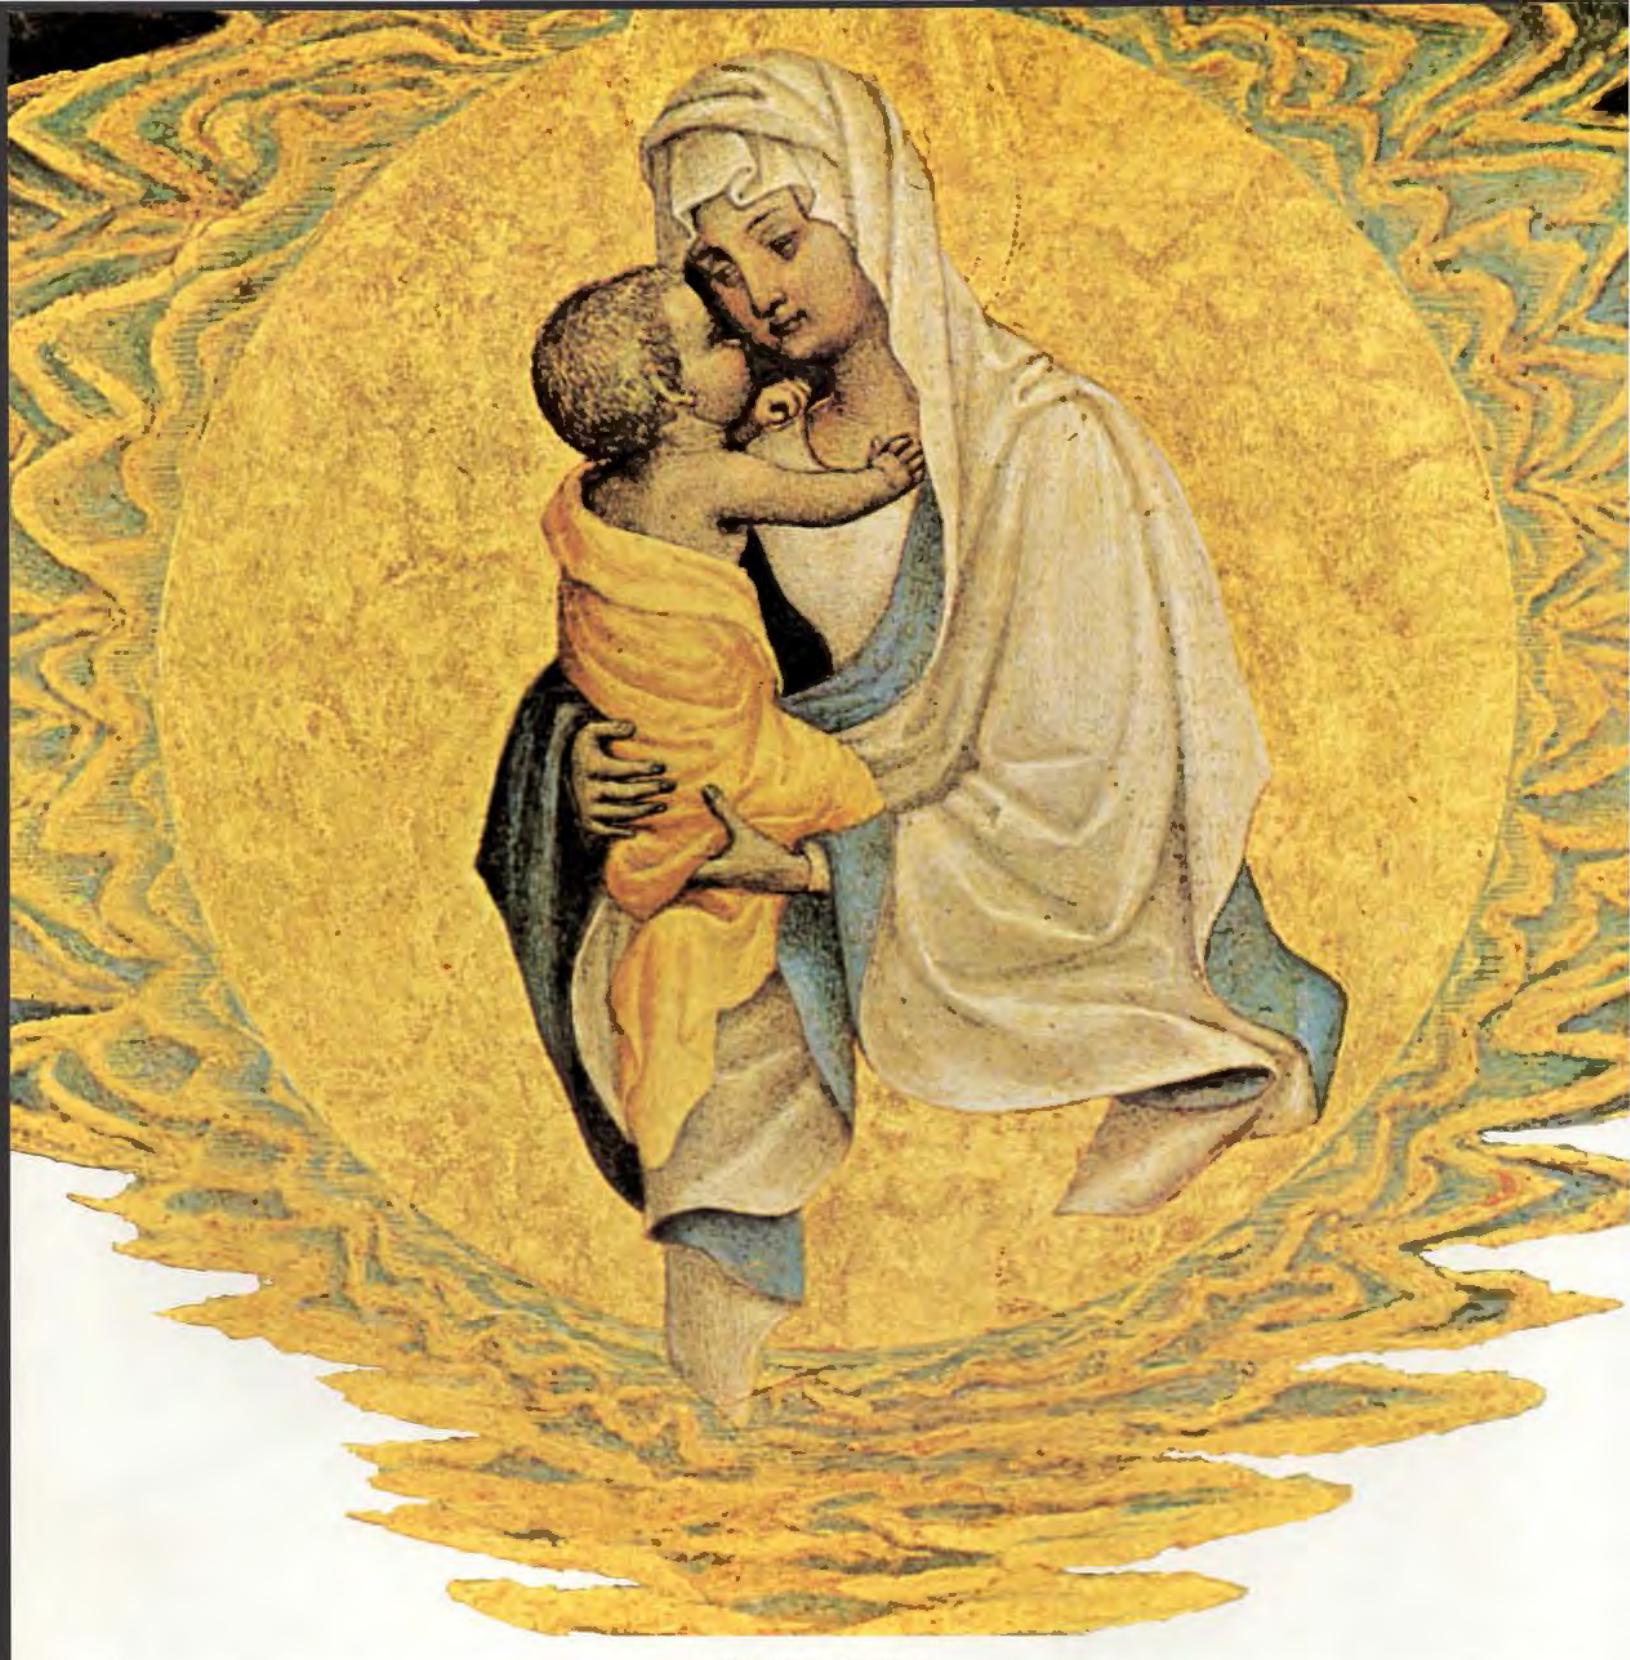
Queen of Heaven

Medieval cult of the Virgin embodied two major themes: her divinization and her role as mediatrix or reconciler. The theologian Peter Damian (1007–72) referred to Mary as *deificata* (deified), and described how Christ and his heavenly court had received her at her Assumption. Her coronation by Christ as Queen of Heaven was one of the major scenes sculptured over the portals of cathedrals and churches, many of which were dedicated to her. In contrast to the simple human portraits of the Virgin in the early Christian art of the catacombs, she was now presented in regal attire, enthroned and crowned like a Byzantine empress, as for example in the famous window in the great Cathedral of Chartres known as 'Notre-Dame de la belle verrière', (Our Lady of the beautiful stained glass window). She was even represented in some pictures with the Trinity revealed in her womb; sometimes she was shown seated side by side with God the Father and God the Son thus forming with them a divine Trinity of Father, Son and Virgin Mother. Theologians were careful, however, to distinguish between the worship due to the Father and the Son, and the veneration that might be accorded to Mary. They defined three orders of service: *latria* or worship, due only to God; *dulia*, the honour given to the saints; and *hyperdulia*, the veneration reserved to Mary. But this careful distinction could not be maintained in popular devotion, and Mary was often worshipped as though she were a goddess.

Mary's role as the mediatrix is significantly stated by St Bernard (1090–1153): 'If you fear the Father there is Christ the Mediator. If you fear Him, Who, though Man, is also God, there is His Mother, pure humanity. She will listen to thee. The Son will listen to her, the Father to Him.' It was at the Last Judgement that Mary's mediation was especially sought, and it became of an established theme of the medieval Doom (see JUDGEMENT OF THE DEAD). In what is known as the *Deisis*, Mary is shown, sometimes with St John, kneeling and supplicating the stern Christ, as he sits in final judgement on mankind, to have mercy on human frailty. A particularly interesting version of the theme occurs on the famous *Mappa Mundi* Picture (c1300) in Hereford Cathedral. The Virgin is there represented as exposing her maternal breasts and invoking her Son to spare sinful humanity.

The New Testament contains accounts of the Virgin Birth of Jesus but suggests that Mary enjoyed no particular prestige or status in 1st century Christianity. But later, 'for many ordinary Christians Mary took the place of the great goddesses of the Graeco-Roman world' ***Right*** **Virgin and Child: Italian, 15th century** ***Below*** **Our Lady of the Pines, a regal and bejewelled Madonna of the Canary Islands**

William Macquitty



National Gallery/Michael Holford

Mary was seen as the ideal of womanhood, beautiful, virtuous and merciful, who interceded for sinners. Theologians distinguished between the worship due only to God and the veneration to be accorded to Mary. The distinction was blurred in popular devotion: detail from *St Anthony and St George*, by Pisanello

The cult of the Virgin during the Middle Ages had many far-reaching effects. Its influence can be traced in the ideals of chivalry and in the poetry of the troubadours. She represented the ideal woman, both in beauty and virtue, and she inspired some of the finest creations of medieval art. An immense devotional and hagiographical literature grew up around her. In many places her alleged relics attracted crowds of pilgrims; in England, Walsingham was a notable shrine of her cult.

Mariolatry (worship of the Virgin) inevitably incurred the condemnation of the Reformers, and in Protestant countries the veneration of Mary abruptly ceased. In Catholic countries her cult has continued to flourish, with the foundation of famous new cult centres at Lourdes (1858 – see LOURDES) and Fatima (1917), in response to visions seen in these places. Papal authority has also erected two long established beliefs about Mary into dogmas of the Roman Catholic faith. In 1854 Pope Pius IX promulgated the dogma of the Immaculate Conception, which was a kind of logical corollary to the Virgin Birth of Christ. It maintained that, from the very moment of conception, Mary had been kept free, by divine grace, from all stain of original sin. The dogma of her Assumption, which had been a popular belief from the 4th century, was finally promulgated by Pope Pius XII in 1950, thus officially completing the supernatural cycle of the career of Mary of Nazareth, the mother of Jesus.

Fresh blood is one of the regular items of the Masai diet – appropriately, since the entire training of a boy of this tribe is geared to turning him into a fighter

MASAI

A NOMADIC PEOPLE occupying most of Central Kenya and Tanzania, the Masai once roamed freely all over the plains of East Africa with their cattle. Because they had to keep moving to find enough fodder for their herds, they had no sophisticated agriculture and no permanent settlements. They have never recognized any authority but that of their own leaders. According to their legends, there was nobody else who mattered except the Masai and their cows.

In appearance, they are a tall, well-built people, dark of skin but non-Negro in racial origin. They are easily recognizable as the men go practically naked, the heads of the women are shaved, the middle teeth of the lower jaw are pulled out, and their characteristic 'at ease' posture is standing on one leg.

The Masai's entire social structure, religion, tradition and myth, which are now threatened by the encroachment of civilization, are based on war and cattle-herding. The men do the fighting; the women everything else that needs to be done. Work is beneath a man's dignity, since all adult males are either serving or retired warriors. The young men spend all their time in the bush, looking for fights or gorging themselves on meat; the middle-aged men occupy themselves with animal husbandry; and the older men do nothing at all. Women and very young children keep the simple economy of the tribe working.

Two Masai women singing at a gathering: their shaven heads are marks of the 'crude masculine contempt' for women in a warlike, male-oriented society

At about the age of 13, the boys are taken from their homes and put into separate villages where they are schooled to become warriors. They are now subject to the strictest discipline. Smoking and drinking (the Masai are great drinkers of beer) are forbidden. Their diet consists only of meat,

the fresh blood of cows, and milk. The climax of months of severe training is the circumcision ceremony performed by the medicine-man with a stone knife. A boy who cries out or winces during this painful operation is deemed unworthy of becoming a warrior. Girls who undergo circumcision (clitoridectomy) are allowed to express their feelings.

After the circumcision ceremony, the boys are officially proclaimed Junior Warriors, and all those admitted to the ranks at the same time are said to belong to the same 'Age', or clan. They will be known collectively by a distinctive name which they choose for themselves, like 'White Swords', or 'The Invincibles'.

The Junior Warriors plait their hair into a pigtail and, except for a small skin thrown over their shoulders, go absolutely naked. They live in separate *kraals* with the unmarried girls of their own 'Age', with whom they are allowed to cohabit freely. These are girls who have not yet been circumcised, though once they have undergone this mutilation, they are expected to settle down as wives and mothers.

It is this clan of Junior Warriors that makes up the standing army of the Masai, a cadre of young, virile men who attack the enemy, conquer new territory for the wandering herds, and amuse themselves by going on lion hunts, allowing the rest of the community to live in peace and security.

At about the age of 25, the Junior Warriors move up into the class of Senior Warriors. These are the older fighters who now become the reserve troops in case of a serious war. But, in general, the Senior Warriors accept the fact that their period of active service is ended and they are now free to marry and devote their time to the management of their cattle. Senior Warriors as they grow older move up into the class of Junior Elders, a group which like the middle-aged in any other society begins to take life more easily and to think more of family affairs.

Masai women, on the other hand, have no rights and no status in this all-male military society and are regarded merely as the bearers of children and cattle-herders. In fact, the crude masculine contempt of the Masai for women may be measured by the barbarous practice of female circumcision, the shaven head, and the iron neck and leg bands which symbolize feminine serfdom.

Junior Elders in the course of time become Seniors who, by reason of their age and experience, become the counsellors of the community. But in the kind of pastoral society typical of the Masai, every man is king in his own domain, and there are few political or social problems to solve. A Masai proverb has it that 'Happiness is to lie on your back surrounded by many sons'.

Federico e Aldo Patellani

Medicine-Man and Surgeon

The nearest approach to a central authority is the *laibon*, or medicine-man, whose influence and importance derive from his powers of divination, prophecy and healing. He is responsible for the religious well-being of the tribe and their cattle, but it does not appear that the laibon enjoys any special relationship with the deity, since the Masai have no definite idea of God. They recognize a Supreme Being they call *Eng-ai* and two lesser gods, one Black and the other Red. The former is beneficent; the latter maleficent. The former sends rain; the latter droughts.

These gods, as in nearly all African religions, are so remote from ordinary humans that religion cannot be said to be a dynamic force in the life of the Masai. The medicine-man, therefore, acts as an intermediary, but relies on his own magical powers to deal with current problems and to forecast the future. He dispenses charms to the warriors when they go on raids; acts as high priest at tribal ceremonies; interprets dreams; makes rain; and serves as physician and surgeon.

His practices and procedures may strike the Western observer as the usual mixture of hocus-pocus and mumbo-jumbo associated with the witch-doctor of Victorian African travellers. On the other hand, he has a variety of herbal and magical (psychiatric) cures based on empirical remedies handed down by his predecessors over hundreds of years. His principal task is to attend to wounds in view of the many casualties among the warriors.

Another important function of the medicine-man is to supervise the trials by ordeal, the basis of the judicial system throughout pagan Africa. Trial by ordeal is practised whenever black magic is suspected and it usually consists of administering poison to those who may be guilty, the theory being that the innocent will be spared. But the Masai variety of this dreaded ordeal is relatively humane, since a suspect has only to say the formula 'If I have done this deed, may God forgive me', drink the fresh blood of a cow, and await the results. If he is guilty, it is firmly believed that he will drop dead. If he is not, no harm will befall him.

Because their animals need large tracts of land, the Masai have become a warrior race, with nothing else mattering to them but the protection of their herds. They neither engage in agriculture nor even in hunting, except for lions and beasts of prey which are a danger to their livestock. The warriors refuse to eat vegetables, fruit, and even game. Their staple diet is meat and the blood they draw off from the jugular veins of their cows.

Even during the British colonial period, the Masai managed to remain aloof and independent, despite the efforts of administrators, missionaries, schoolmasters, tax-collectors, and all those who sought to change their way of life. Today, their problems are the inroads of civilization, the shrinkage of available pasturage, and the determination of the new states to abolish the old tribal patterns of African society.

MASKS

Means to a Change of Identity

Put on a mask and you become a different person. In many primitive societies a mask is more than a means of changing your appearance; it is a link with the world of the spirits, a channel by which men can tap the force possessed by supernatural beings

SINCE PREHISTORIC TIMES masks or 'false faces' have been used for a variety of purposes, both religious and profane. Their distribution ranges widely over time and space. Whereas in some civilizations masks play an important part in ritual activities, there are regions of the world where the use of masks has never been known.

The earliest pictorial representations of human beings wearing masks occur in the cave paintings and rock engravings of the Old Stone Age of France and Spain (c 20,000 BC) where dancers wearing animal masks are depicted next to animals of the same species (see CAVE ART; ICONOGRAPHY). Comparisons with similar masked dances among present-day primitive peoples suggest that the dances performed by Paleolithic hunters were intended to bring bison and other game under their influence by magical means. There are also representations of masked men whose attire combines parts of several different animals. Disguise in animal shape may also have had a practical purpose. Dressed in the skin of an animal a hunter can creep unsuspected near to his prey, and this device is still used by such primitive tribes as the African Bushmen and was at one time common practice among many Indian tribes of North America.

Hidden Identity

In primitive societies of today, masks are used mainly for ritual purposes. The donning of a mask is believed to change a man's identity and faculties, for the assumed appearance is held to affect the wearer's inner nature and to assimilate it to that of the being represented by the mask. Thus a masked person is not simply a man or woman whose real identity is hidden, but he is an enigmatic entity standing outside the sphere of ordinary conduct and enjoying a freedom of movement and expression denied to ordinary men. As he has submerged his own identity by the wearing of a mask, other beings, such as an ancestor, a spirit or a totem-animal, are enabled to manifest themselves in his body and voice.

The material shapes of masks are of infinite variety. A moulded or carved surface representing the anterior half of the head and usually worn over the face of a person may be made of wood, metal, cloth, leather, clay or, in rare cases, even stone. A special type of mask, occurring in Melanesia, consists of part of a human skull combined with other materials to form a complete covering for the wearer's head and face. The transforming effect of a mask may also be achieved by applying thick layers of paste or paint to the face of a person, to which feathers and similar materials are then attached. Such mask-like disguises, usually combined with the painting of the entire body, occurred among Australian aboriginals and among the Fuegians of South America. In a highly-developed artistic form the practice of building up a mask on a human face, is used by the Katha-Kali dancers of south-west India.

The mask in the narrow sense, which covers the face of the wearer, usually forms only part of the disguise. Elaborate costumes, often of fantastic type, complete the attire disguising a person's normal appearance. Where masks represent supernatural beings, such as gods or ancestor spirits, the illusion of superhuman height is achieved by a structure supporting an artificial head and face, which surmounts the real head of the dancer or actor. A similar effect is achieved by fitting the wearer with stilts, which are often covered by long flowing garments. The great dance masks of Melanesia are enormous structures made of bark cloth stretched over bamboo and cane frames, which are carried by one or more dancers. Such masks are intended to impress and fill with awe the uninitiated who are made to believe that divinities and ancestor spirits manifest themselves in these gigantic structures. To achieve this deception it is essential that the human wearers of the masks are completely hidden and unrecognizable.

Repository of Sacred Power

According to their function masks can be divided into two categories, the religious and the profane; the former category, comprising a large number of sub-types, predominates in pre-literate societies as well as in several historic civilizations. Among the most striking and spectacular masks are those worn by dancers in the ritual performances of various West African tribes. The Dogon of the western Sudan commemorate the death of their first tribal ancestor by ceremonies which involve the use of a series of masks of different degrees of sanctity and of varying appearance. The vertical wooden rectangle of these helmet-type masks, surmounted by upright carved animal ears, represents the main form and by its crude shape and the painting in white, black and red creates a dramatic effect; such masks are used in connection with initiation rites, burial and other ceremonies.

The task of carving these masks, which attract great magical powers, was considered highly dangerous and the wood-carvers protected themselves by observing many taboos and performing a series of propitiatory rites. They first offered a sacrifice to the greatest of all Dogon masks, which represents the deified original tribal ancestor. The making of the masks was a common enterprise of all the dancers, who assembled for the purpose outside the village. Only the fully initiated members of a secret society could with impunity approach the mask and vessel of the divine ancestor. Every 60 years they arranged for a solemn rite in the course of which the supreme ancestral mask was renewed. It is from this central mask, representing the tribal ancestor, that all the other masks derive the power to retain in themselves the imperishable life-force of the animal or departed person whom they symbolize. The transmission of this force is produced by sacred rites laid down by tradition.

Among other West African tribes, such as the Kono of Guinea, the carving of masks is equally surrounded by elaborate ceremonial. The grand master of the tribal initiation rites is the supreme guardian of all the masks. His function is hereditary, and he controls the wearers of the individual masks. Each of these receives special instructions as to how to minister to the needs of the mask of which he is in charge. He is thought of as the host of the mask and the spiritual essence dwelling in its shape.

Although the masks are fashioned by human hand, they are believed to have an individual existence, independent of the craftsmen who gave them their material

shape and the dancers through whom they ultimately come to life. The myths never speak of the manufacture of masks but always of their discovery, and they are believed to have existed long before they came into the possession of men. In the mask resides the subtle spirit-substance which invests them with their latent power. The task of the sculptor thus consists in providing the mask – or rather the spirit of the mask – with a new vehicle when the old one has deteriorated and become unusable. The masks are the property and cult objects of the secret societies, which play so important a role in the tribal initiation rites.

Personifying the Supernatural

In Melanesia, another area where ritual masks have been widely used, the masks were mainly associated with the cult of ancestors. In the islands of New Ireland, New Britain, the Solomons and most of the New Hebrides, this cult has largely succumbed to contact with European civilization, but in some parts of New Guinea it has retained its importance. In all these regions the masks, carved of wood or constructed of bark cloth, and sometimes more than 15 feet tall, were produced and guarded by the members of secret societies or men's organizations. Among the Papuans of south-west New Guinea masks are employed in the ritual of death. This ritual aims at expelling from the village the spirits of the dead who might endanger the living, in particular the spirits of those who fall victims to headhunters. These spirits are personified in masked dancers, who should be kinsmen of the deceased. The manufacture of the masks very frequently extends over four to five months, and is surrounded by great mystery.

When the masks are completed they are stored in the ceremonial men's house until the day of the final rites. At that time the kinsmen of the recently deceased take the

In the Sepik region of New Guinea, masks combining human with bird or animal elements, give them an especially demonic and terrifying character

Wearing a mask, frequently with an elaborate costume as well, is a way of concealing and submerging your own personality and identifying yourself with a spirit or other supernatural character in dance or drama *Above left* This Nigerian dancer wears a mask of anonymity *Above* A masked figure named Gulliver appears in May Day celebrations at Minehead in Somerset *Right* Singhalese dance mask with grotesque figures

newly-made masks to the forest, and attach fresh green leaves to them and to their own bodies. Thus attired they emerge from the forest at dusk, and then dance for the whole night, imitating the movements of the cassowary, the bird associated with the sun. In the moment of sunrise, when the sun is believed to emerge from the land of the dead, the remaining men of the village attack the dancers and defeat them in a sham fight. Their victory symbolizes the successful struggle of the living over the dead. The dancers seek refuge in the house of ceremonies, and discard their masks. These are henceforth devoid of sanctity and ritual value.

In the Sepik region of New Guinea, masks carved with stone tools combined human with bird or animal elements. Their elongation and ambiguous animal forms give them an especially demonic and terrifying character. Some of these masks served in public harvest and initiation rites, others depicted the semi-supernatural founders of clans in ceremonies of a more secret nature. The uninitiated – women, children and strangers – were rigidly excluded from participating in these rites.

Masks representing supernatural beings, half-human and half-animal, occur also in other parts of the world, notably among the Indians of the north-west coast of America. Like many primitive peoples, these Indians believe that animals as well as humans are animated by souls and that the barrier between them is slight. Their sculptured masks depict strange creatures with human faces and animal horns, or beings combining the elements of men and birds. In the ceremonies of these Indians masks with moving parts played an important role. The carved and painted flaps of such masks were hinged; when closed they represented ravens

and concealed the image of a human face. At an appropriate moment in the recounting of a legend the performer pulled open the flaps to reveal a transformation from animal to man.

The Eskimo carve wooden masks in the likeness of fish and various sea animals. These masks are not intended to represent the animals themselves, but to symbolize the numerous spirits associated with animals. Of a different order are the masks of shamans – priests and spirit-media – who establish contact between man and the world of supernatural beings (see SHAMAN). The shamans of the Eskimo have masks representing their guardian spirits, and they believe that by wearing these masks they establish a mystic link with the spirit concerned and induce a state of trance and possession. Other Eskimo masks depict a face which is half-human and half-animal, and they are used in rites and dances designed to propitiate the spirits of certain animals in order to prevent them from shunning man and depriving him of the animals necessary for his subsistence.

Different in function and shape are the death-masks used to cover the face of the dead before or after burial. Such masks made of gold, silver, bronze, terracotta or stone occurred in many ancient civilizations including those of Mesopotamia, Egypt, Greece, Italy, the Crimea, the Danube valley and parts of ancient France and Britain. Death-masks of precious metal covered the faces of the embalmed pharaohs, and from Egypt the custom spread to Syria and Mycene. The ancient Etruscans also buried their dead with masks of thin bronze. In Southeast Asia gold masks were regularly placed on the faces of dead kings of Cambodia and Siam, and the Shans of Burma used a metal mask to cover the face of a dead chief. In ancient Mexico masks,

In Tibet it was usual for the spectators to prostrate themselves before the masked figures of gods, and to solicit their blessing

Some masks are surrounded by taboos and, though made by human beings, are believed to have their own individual existence, independent of the craftsmen who shaped them and the dancers who wear them: sometimes it is said that these masks are not 'made' but 'discovered'. Hideous, grotesque and terrifying masks, often combining human characteristics with animal or bird forms, may represent evil spirits, or the semi-human ancestors of clans or kin-groups, or ferocious guardian spirits which keep evil forces at bay; they appear in many different types of ritual ***Facing page*** **Devil mask from the Tyrol** ***(above)*****: Tibetan mask of a fierce protective spirit** ***(below)*** ***Above left*** **Horned mask from Bolivia, used in the performance of a devil dance** ***Above right*** **Beaked mask from Indonesia**

some made of jade and other semi-precious stones, were placed on the faces of prominent dead when the corpse was laid out in a grave chamber. They are without openings for mouth and eyes and represent faces of a great calm and beauty.

The Face of a God

In advanced civilizations masks have been mainly used in dramatic performances, both ritual and theatrical. One of the most notable examples of striking and elaborate masks are those worn by lama-dancers in Tibetan temple festivals. These masks, mainly of superhuman size, represent divinities, demons, spirits, historical personages and allegoric figures. They are usually carved of wood and painted in vivid colours. The masked dances are accompanied by the recitation of prayers and sacred texts.

The laymen see in the masked figures not so much lamas enacting gods and demons, but rather the mystic presence of the divinities and demons represented by the masks. In Tibet it was usual for the spectators to prostrate themselves before the masked figures of gods, and to solicit their blessing. The mystery play here assumes the character of an immediate interaction between man and supernatural powers.

Masked dances on the Indonesian island of Bali are also of ritual nature, but in other Asian countries, such as Ceylon, masks originally having religious importance are used in dramatic performances which are

The warrior wearing a mask symbolizing a superior power identifies himself with this force and is thereby fortified in spirit

given for entertainment by professional dancers. Yet, masks are used there also in rites of exorcism and curing, and in these cases masks represent the disease spirits from which the patient is to be freed.

Where the mask has lost its religious significance it can still survive in a secular role. Typical of this development was the role it assumed in the theatre of ancient Greece (see DRAMA). Originally animal masks had been used in the cult of Dionysus and Demeter, the Earth Mother. Later the mask found its way into both the comedies and the tragedies of the classical theatre, where it played an important role. The use of masks enabled actors to double and triple the number of parts they could play during any one performance, and male actors could convincingly play female roles.

Another example of the transference of the mask's function from the religious to the secular sphere occurs in Japan. There masks were originally widely used in religious ritual, and in the 8th century AD dancers in four-eyed masks were charged with the task of warding off demons from the royal palace. Later there developed the institution of court dancers, and out of this grew the classical drama of the *Noh* theatre, in which all actors appear in painted masks.

In Europe the use of ritual masks persists only in some folk customs observed in some remote valleys of Austria and Switzerland, where pagan practices have coexisted with Christianity in a reinterpreted form. The Carnival, celebrated widely in Europe and Latin America, provides an opportunity for the wearing of masks (see FOOL), but the fact that it is a survival of a pagan spring festival is forgotten.

Purpose Behind the Mask

Protection against supernatural dangers is a function of masks worn in certain ritual situations, such as at funerals to avoid recognition by the souls of the dead. Conversely masks are sometimes worn to enhance a warrior's image and to terrify opponents, and this idea underlies the war-masks and use of war-paint among many primitive peoples. The warrior wearing a mask symbolizing a superior power identifies himself with this force and is thereby fortified in spirit. This identification is part

Living Solid Face

Of all the masked gods the strangest and most engaging is that kindly, grotesque creation of the Delaware Indians which goes by the name of Misinghalikun – the Living Solid Face. When Egyptian priests appeared, as Apuleius pictured them, masked as Isis or Horus, they represented a deity that had his proper human form as well as his disguise as an animal. But the Living Solid Face is what it says it is – a mask, a living mask. When the Indians first saw Misinghalikun riding a buck, and herding the deer, it was simply a fir-clad figure with a wooden face, the right half red, the left black. Following a disaster, the Living Solid Face taught the Delawares to make a mask like his, and promised that when they wore it his spirit would go into it. Every year Misinghalikun appears at the ceremonies of the tribe, and on the third day sees them off upon a hunt, the twelfth night he dances in the Big House, where his face is carved upon twelve pillars. His mask, his black bearskin clothes, his turtle rattle, and his stick are kept by a family that burns tobacco before it now and then. The Living Solid Face is a bit of a moralist at the Big House meeting, and, when a parent finds his child weak, sick or disobedient, Misinghalikun is ready to attend. But his main function is general beneficent guidance over the tribe and the hunt.

K. MacGowan and H. Rosse
Masks and Demons

of the nature of masks, and it assumes enormous importance where people wear masks representing gods and other supernatural beings.

.Masks serve also as signs of distinction and classification. Thus all the ritual masks of men's societies have the function of emphasizing the position of the fully initiated members and in some societies distinctive masks are reserved for those who have achieved specific grades in the organization.

The masks of such societies have also the function of concentrating power in the hands of those who are in charge of the sacred objects. Thus they are linked not only with the representation of power, but also with its exercise. The human guardian and wearer of the mask partakes of the power of the divinity or spirit which the mask symbolizes and is thereby elevated above the common mass of the uninitiated. The mask is thus a link with the supernatural world and a channel by which men can tap the force possessed by supernatural beings. Thus masks are and always were primarily means of transformation and identification with the entities of a non-material sphere to which man has access only if he sheds his own identity and enters that of beings existing on a superior plane.

MASS

THE HEART of Christian worship, the most important ceremony of the Christian Churches, is the Eucharist (from Greek, usually translated 'thanksgiving'), Lord's Supper, Holy Communion or Mass. Almost all Christians celebrate it (though the Quakers, for instance, do not) but its meaning for different denominations has varied considerably. The difficulty and delicacy of recent attempts to find common ground indicate both the importance of the Eucharist and its complexity, the richness of ideas which it contains.

The earliest written reference to the Lord's Supper comes from St Paul in c 55 AD: 'the Lord Jesus on the night when he was betrayed took bread, and when he had given thanks he broke it, and said: "This is my body which is for you. Do this in remembrance of me." In the same way also the cup, after supper, saying, "This cup is the new covenant in my blood. Do this, as often as you drink it, in remembrance of me." For as often as you eat the bread and drink the cup, you proclaim the Lord's death until he comes' (I Corinthians, chapter 11).

The ceremony was evidently already important to Christians, who were following the instructions of Jesus at the Last Supper, the final meal which he ate with his disciples at Passover and which is described, with variations, in three of the gospels (Matthew, chapter 26; Mark, chapter 14; Luke, chapter 22). The Jewish Passover meal celebrated the liberation of God's people from bondage in Egypt. The Christian service celebrated the new 'covenant' or agreement between man and God, established through Christ, and the liberation from the bondage of sin and death made possible by Christ's death and resurrection.

The Eucharist was at first part of the *agape* or 'love feast', the meal which the Christians ate together, presumably as a way of keeping in close touch with each other, as a continuation of Christ's meals with his disciples, and as a mark of their faith, to 'proclaim the Lord's death until he comes.' But at an early stage the Eucharist became a separate ceremony.

A ritual meal is an important element of religions other than Christianity (and in the ancient world formal covenants were often ratified by a sacrifice and a meal). Bitterly contested attempts have been made to show that the Christians borrowed their communion meal from the mystery cults of the Roman world but what is more likely is that similar ideas flourished in a similar climate. Nor is it any discredit to Christianity if other faiths have shared some of its most powerful ideas and emotions (see also FOOD AND DRINK; MYSTERY RELIGIONS).

Bread of Life

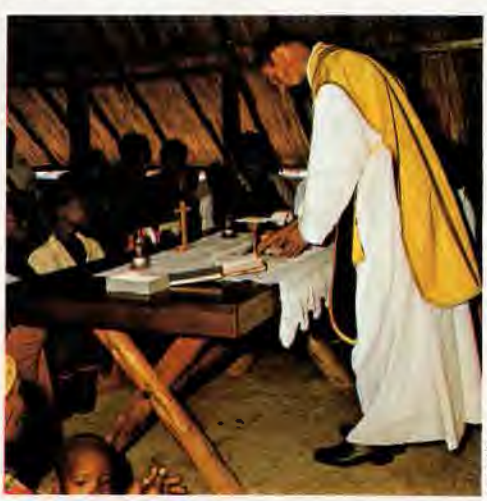
References to the Eucharist in early Christian writers are remarkably rare, presumably because of reluctance to unveil a central mystery of the faith to unbelievers. By at least the 2nd century, those who had not been baptized or who were otherwise regarded as unfit to share the communion were excluded from it. This secrecy prompted accusations of cannibalism from pagans who had heard that the Christians feasted on someone's body and blood.

That there was a mystery, that the eating of bread and drinking of wine were not performed simply 'in remembrance', is clear from St Paul. 'The cup of blessing which we bless, is it not a participation (or communion) in the blood of Christ? The bread which we break, is it not a participation (or communion) in the body of Christ?' (I Corinthians 10.16). And St John's gospel (chapter 6) quotes Jesus as saying: 'I am the bread of life; he who comes to me shall not hunger, and he who believes in me shall never thirst . . . He who eats my flesh and drinks my blood abides in me, and I in him. As the living Father sent me, and I live because of the Father, so he who eats of me will live because of me.'

The precise nature of the mystery, however, is in dispute. Most Christians would agree that Christ is in some way present in the Communion, that the ceremony is a channel of God's grace to the believer (the word Eucharist contains the Greek *charis*, 'grace'), and that through it the communicant gains at least a sense of closeness to Christ and to other Christians. Beyond this, the Communion may be thought of as primarily a commemoration of the Last Supper, or as a re-enactment of it, in which Christ is present with 'the two or three who are gathered together', as he was originally present with his disciples. Similarly, it may be seen as a commemoration of the sacrifice on the Cross, the breaking of Christ's body and outpouring of his blood which atoned for human sin, or as a re-enactment of it, a fresh offering of that sacrifice to God. The consumption of the elements (the bread and wine) may be regarded as symbolic, or as a spiritual feeding upon the Saviour, or as a physical consumption of the body and blood through which the communicant becomes one with Christ. And again, the sacrament may be the 'bread of life' or 'medicine of immortality' in a symbolic, a spiritual or a literal and physical sense.

The Roman Catholic doctrine of transubstantiation was officially adopted by the Fourth Lateran Council in 1215. The words and actions of Christ at the Last Supper, repeated by the priest assuming the person of Christ, change the 'substance' (the underlying reality) of the elements into Christ's body and blood, though the outward appearance (the 'species' or 'accidents') of the bread and wine remains unaltered. Many Protestants have denied this doctrine, often interpreting the 'real presence' of Christ in the sacrament in a spiritual or symbolic sense, and many have distrusted what they regard as superstitious adoration of the consecrated elements, including the practice of reserving the sacrament – placing the consecrated elements on the altar to be adored by the faithful. Protestants have also quarrelled with the Roman Catholic doctrine that in the Mass the sacrifice of Christ on the cross is re-presented to God.

The Mass, Holy Communion or Lord's Supper is the most important ceremony of almost all Christian denominations



G. Cubitt

Broadly speaking, the Eastern Churches have interpreted the Eucharist in basically the same way as the Roman Catholic Church, though their forms of service differ from the Mass in various ways. Most Protestant Communion services are based on the Mass, though with important differences.

Not surprisingly, the Mass came to be regarded as a powerful magical ceremony. Already in the 2nd century, St Irenaeus accused the Gnostic teacher Marcus of perverting the Eucharist to the worship of a female divinity called Charis (Grace), pretending to turn cups of wine into her blood so that those who drank believed that Charis flowed into them. In 694 the Council of Toledo condemned the practice of saying Mass for the dead in the name of a living man, with the intention of striking him dead (see also BLACK MASS).

From the early Middle Ages, the sacramental bread was made in the form of flat unleavened wafers called 'hosts' (from Latin *hostia*, 'victim') and the consecrated host, as the body of Christ and so the container of divine power, was thought to be a powerful weapon of sorcery. Witches were accused of stealing consecrated hosts for magical and Satanic purposes, and in fact all through Christian history churches have been troubled by thefts of hosts.

An important element of belief in the magical efficacy of the Mass was the fact that the Church itself put the ceremony to many uses. Masses were said for the souls of the dead, for the sick, for rain, for good weather, for the protection of travellers, over cattle or farm tools or fishing boats to bless them and bring a good yield. The doctrine that a priest could say Mass effectively even if he was in a state of sin (because he said it in the person of Christ, not in his own person) heightened the impression of the Mass as a ceremony containing magical power regardless of the motives and purposes for which it was used.

MASTERS

THE MASTERS of occult belief are adepts who have achieved the summit of perfection but who have chosen to remain on earth, usually unknown to the majority of mankind but guiding humanity in wisdom by inspiring gifted individuals. They include the founders of the great religions and they have a variety of honorific titles – Mahatmas, the Hierarchy, the Great Ones, the Secret Brotherhood, the Inner Government of the World, the Great White Lodge of Masters of the Wisdom.

'Although they have physical bodies (as a sort of fulcrum for exertion of energy),' Anna Kennedy Winner explains, 'most of the work of the Masters is said to be done at mental levels, sometimes while they are awake, but often also with their bodies in deep repose or trance. (This habit, combined with purity of life, enables them to use the same physical body for a longer than average number of years.) At any moment, a Master can focus his consciousness upon any spot of the globe, and enter into the inner consciousness of any living being, if he so desires. He can read the thoughts of any man, and if that man be sufficiently sensitive to impressions from his own higher self, the Master can impress certain ideas upon him. It is in this way that the great leaders of mankind . . . receive so-called "inspiration".'

H. P. Blavatsky and Annie Besant were both inspired by the Secret Brothers who lived in the Himalayas and Tibet (see BESANT; BLAVATSKY), and one of them, Master Koot Hoomi, inspired Alice Bailey, the celebrated occult author. Many of her books were dictated to her by another Master, Djwal Khul, and when he was dismissed as a figment of her imagination, she replied that he was the only imaginary person she knew who sent her parcels from India. She sometimes went to the annual meetings of the Masters in May, in a valley of the Himalayas, where Christ and Buddha presided and disciples came from all over the world – some in their physical bodies, some while their physical bodies were elsewhere.

The idea of the deathless adept and inspirer is not confined to the Eastern tradition, with its Mahatmas, Bodhisattvas and reincarnated Lamas (see BUDDHISM; LAMAS; MAHATMAS), nor are all the Masters believed to live in the Himalayas. The Hungarian Master, who lives in Europe, was the famous Count of St-Germain in the 18th century and had earlier been Sir Francis Bacon, and earlier still the philosopher Proclus (see ST-GERMAIN). The Master once known as Jesus is said to live in the Lebanon, and the Spiritualist movement is watched over by a Master of Crete who was formerly St Paul.

It is an old belief in the West that the great sage conquers death: Pythagoras and Apollonius of Tyana are examples. The alchemists sought the Philosophers' Stone which was also the Elixir of Life, supreme wisdom, perfection and immortality, and some of them were believed to have achieved it. The body of Christian Rosenkreutz, the legendary founder of the Rosicrucians, was said to have been found uncorrupted a hundred years after his 'death'. He had been initiated by certain Wise Men during a visit to the East, and in the 17th century the belief that there existed a secret group of adepts, the Brotherhood of the Rosy Cross, created great excitement. The tradition grew up that an occult Order should receive its ultimate inspiration from 'unknown superiors'. The Martinists believed in hidden chiefs of this sort. In England the visible head of the Order of the Golden Dawn was MacGregor Mathers but he claimed to receive his authority from Hidden and Secret Chiefs, who dictated part of the Order's rituals. He met them on occasion, and said that they were 'human and living upon this earth; but possessing terrible superhuman powers' (see GOLDEN DAWN). The great superhuman inspirers of more recent groups, including the Aetherius Society and Mankind United (see FLYING SAUCERS; MANKIND UNITED), fall into the same general category.

Living in an orderly, predetermined universe, the Maya believed that all events were tied to a rhythm of fate and must recur, whenever the calendrical factors were the same

MAYA

AMERICAN INDIANS speaking dialects of the Maya languages form the greater part of the Mexican states of Yucatan and Chiapas. They are also an important part of the population of British Honduras, Guatemala, Honduras and El Salvador. They are a short, thick set, brown-skinned people with the straight black hair of the American Indians. There is some mystery about them because so little is known about their existence before the early centuries of the Christian era, when they first began to erect stone buildings.

In all probability the Maya had settled in their homeland as groups of small farmers, cultivating maize, peppers, manioc, pumpkins, vanilla, cocoa and cochineal. They collected rubber in the forests, hunted jaguars, peccaries (wild pig) and alligators. Their domestic animals were dogs, pigs and turkeys. A thousand years earlier, about 900 BC, their neighbours, the Olmecs, had erected stone monuments and used a form of writing. For two or three centuries a Mexican colony at Kaminaljuyu in Guatemala had also carried a higher civilization with stone sculpture and another form of writing. Then suddenly, in the 2nd century AD, the Maya set out on the adventure of civilization.

They may have carved on wooden monuments before, but now their gods were made in stone, and finely carved stelae recorded dates in a complex astronomical calendar. The sacred courtyards within which these monuments stood, were surrounded by pyramids of stone on top of which fine houses were built in honour of the gods. These holy places of the Maya were not only carved but painted in brilliant mineral colours. Most of the 'cities' so far discovered seem to have been religious centres which served the people of surrounding farms and villages, but at Tikal in Guatemala remains have been found of mounds upon which wooden buildings once stood.

Archeologists think that the persistence of local art styles and small differences in the writing of calendrical dates show that the early Maya cities were mostly independent city states. Their level of civilization was high, since they had great artists, mathematicians and astronomers. Carvings show us that they could produce beautiful woven cloth, and dressed magnificently in garments and head-dresses which showed many grades of social rank. They invented a kind of paper on which they painted books inscribed in a syllabic script which included some 650 symbols. Yet this magnificent civilization was without the use of metals. Gold was sometimes imported in small quantities from Panama; copper and bronze remained unknown. Maya culture was supported by a simple Neolithic type of agriculture brought up to the limits of its efficiency.

The civilization was based on religion. The high priest of a city ranked equally with the *Halach Uinic* (ruler of men), who in his turn had been previously educated as an adept in religious magic. They worshipped a Creator who lived beyond the sky and who was both male and female. There was Mother Earth, usually depicted as a gigantic monster – alligator, toad and turtle combined – who swam around in the waters of the reedy marsh of Creation. Above her was the sky, with a layer for each of the planets, and spheres of movement for the sun and moon. Below her were the underworlds where the heavenly bodies passed when out of sight. All around her were the spirits of rain and thunder. She was attended by the deities of the food plants and animals. To the Maya all Nature was alive, constantly dying and being born.

The Five Temples

In general the Maya gods are rather colourless; we have little detailed information on their functions. The Spanish chronicler Lizana tells us that the city of Izamal in northern Yucatán possessed five temple pyramids, dedicated severally to the sun god, the rain god, the war god, and two separate manifestations of Itzamná. In the south temple Itzamna was honoured as a wise king of primeval times who had invented writing and who was consulted as an oracle; the west temple, where he was venerated as the healer of the sick and the waker of the dead, was a place of pilgrimage. The sun god in the north temple was called Kinich Kak Mo ('sunface fire macaw') because he was visualized in the shape of a macaw swooping down out of the heavens at noon to kindle the sacrificial flame. This is also the probable interpretation of the image of a descending winged being found in the temples of Tulúm. The east temple was dedicated to Chac in his capacity as god of lightning and patron of the priests who lived in the temple itself. The temple of the war god Hun Pic Tok, who was named after the 'eight thousand stone knives' which formed the points of the spears of his countless warriors, lay in the middle of the town and was 'the most important of all'.

Walter Krickeberg and others
Pre-Columbian American Religions

Poetry of Numbers

It was an orderly, fatalistic universe. The movements of the heaveuly bodies in their regular courses prognosticated the movements of fate. Each day had its fortune, each period of 20 days had an overriding influence. Each year had its agricultural magics. However, when counting long periods of time the Maya used a period they called a *tun* of 360 days. They multiplied the tun by powers of 20 (to 20 tuns, 400, 8000, 160,000 tuns and so on) in order to deal with astronomical calculations which in some way reflected the history of the gods both past and future. When they had to put these long calculations into practical terms of the agricultural year they had to use elaborate 'distance numbers' to find the exact day and season that they were writing about. Venturing into this complicated field it soon becomes clear that the Maya loved numbers and could express ideas through them almost as if they were making computerized poetry. They proved their accuracy by predicting eclipses, transits of Venus, and running a moon calendar.

A Maya priest, holding his ceremonial staff, stands over a man who is mutilating his own tongue by passing through it a cord set with thorns: stone relief of the early 8th century AD. The Mayans also offered human sacrifices to their gods, especially to the rain gods in an annual ceremony

Within such a framework of conditioned time, people find themselves in need of information from soothsayers. These specialists in times and numbers gave information of lucky days for any event, divined the causes of misfortunes, and acted as advisers in family affairs. The soothsayers used magic books painted with figures and dates like pictorial almanacs for their work. It was something like casting a horoscope, since one's fate on any day varied according to the correspondences between that day and the day of one's birth.

The Maya writings which have survived to the present day seem to be concerned simply with the passage of time and the changes of fate. So far nothing has been found which is clearly historical in nature. From the calendrical glyphs which are well known, and the phonetic glyphs which are partially deciphered, it seems that the Maya language has altered but not very greatly. The ancient civilization has, however, been entirely swept away.

Abandoned Cities

The first phase of high culture broke up suddenly and catastrophically about 900 AD. Archeologists are seeking a reason but not enough is known; maybe there was a terrible civil war, maybe a climatic change led to the rapid spread of the forests, or maybe a prophecy was followed and the people abandoned their homes at some predetermined date. There is little trace of physical damage to the abandoned cities. In some there were poor rooms of rough stone walling built a generation after the abandonment. But Maya culture in the highlands broke up and did not recover.

Meanwhile smaller Maya towns in the almost waterless limestone peninsula of Yucatan survived, and in the late 10th century, when underground streams were fully exploited the Yucatec Maya achieved a new importance. They were greatly influenced by an invasion of Toltec nobles from central Mexico at the end of the century. These refugees from the terrible war which had destroyed their old capital at Tula in Hidalgo settled down to build a new and even more glorious city in the Maya lands with the help of the local craftsmen. Although their city of Chichen Itza was very Mexican in style they quite soon abandoned their simpler picture writing for the more useful Maya system. Eventually the Toltec chieftains were involved in civil wars and the city was destroyed about 1200 AD. A new centre was founded at Mayapan, though it was far less magnificent than Chichen Itza.

Meanwhile the Maya cities continued on their way, developing in size and power. Unlike the older phase of Maya culture, these Yucatec cities placed the palace of the civil ruler in a position of equal importance to the temples of the gods. Each city was an independent state often at war with its neighbours, but they all gave respect if not obedience to the chief who ruled at Uxmal, the *Tutul Xiuh*. They preserved the old calendar in part, but were unable or unwilling to use the ancient counts covering vast distances of time. They reckoned in a series of periods known as *Katuns*, each of a little less than 20 years, which were numbered from zero to 12. These 13 Katuns, their longest time-cycle, covered about 260 years, which was sufficient for most practical purposes.

Apart from the architecture of their temples and palaces the later Maya were not very successful as artists; they were more historically minded than their ancestors, however, and each of the main cities held a Book of Chilam Balam (the Book of the Jaguar Priest). This gave very short accounts of the major events which occurred in each Katun of their time count, and projected the events into the future. They still believed that all events were tied to a rhythm of fate and must recur whenever the calendrical factors were the same.

While we have no historical record from the more ancient Maya cities, the books tell a little about the political struggles between Maya cities, of the development of Mayapan and the fall of Chichen Itza. This event was due to the oppression exercised by a tricky individual named Hunnac Ceel who concealed himself in the sacred 'well' at Chichen Itza and pretended to have received information from the rain gods. He used it to gain power; but later he was overthrown and the city declined.

The Maya offered human sacrifices, and the offering of victims to the rain gods was an annual ceremony at Chichen Itza. In the present century two expeditions have searched the great 'well' in the limestone rock. They have recovered bones of the victims together with a great treasure of gold, jade, images of rubber and carvings in bone which had been cast into the well each year, as an entreaty for the spring rains which would make the vital maize crop prosper. However although the Maya offered human sacrifices on other occasions they more frequently offered animals and plants to their gods.

Museum of the American Indian

Smoke Signal to the God

Most of the Yucatec temples were decorated with complex representations of Chac, the Lord of the Rains. His mask is easily recognizable with its projecting curled snout. He is often shown carrying his thunder-axe in the paintings on the books. A popular method of calling his attention was to burn 'Pom' incense, balls of raw rubber. The thick smoke rose up like storm clouds, and the god was supposed to see the signal and send his messengers with magical jars of water which they poured through the storm clouds.

People enjoyed the religious festivals which occurred once every 20 days. They came to witness the ceremonies which were mostly dramatic representations of the legends of the gods. It was all very glorious to watch the masked priests dancing in their feathered garments, to sing the chants, and to be present at the sacrificial ceremonies. Of course some of the occasions of human sacrifice were both fearful and exciting, and there were those mysterious moments when the ordinary people were not allowed to witness what the priests were doing in the dark houses on top of the temple platforms. There was an air of gaiety at festivals; people wore their best clothes, and often enough they became drunk on great quantities of fermented honey.

In these later days of the Maya there was a good deal of trade. Merchants accompanied by trains of carriers travelled from town to town by roads. They had maps painted on bark paper to help them. Many other merchants sailed from one coastal town to another in great canoes cut from the trunks of the enormous mahogany trees of the Maya country. They carried their trade far south to exchange fine cloth and precious stones for the gold of Panama, and northwards into Mexico from which they brought turquoise and silver, together with great quantities of small bronze bells. There was little love lost between Mexicans and Maya. The Mexicans thought the Maya were too fond of amusements and strong drink, the Maya thought the Mexicans were without elegance or any real culture.

Conquest of an Empty City

The arrival of Spanish ships in the beginning of the 16th century hardly disturbed the Maya cities. Some traded, some fought and were defeated; but the Spaniards passed on to the conquest of Mexico. After this the Maya chiefs must have waited in some trepidation. It was not until 1526 that the de Montejos, father and son, made two successive assaults on the Maya cities. The Yucatan peninsula was not easily conquered, but in 1537 the Tutul Xiuh surrendered and the Spaniards became the new rulers of Yucatan. However, there was still a Maya stronghold in the town of Peten Itza on the shores of Lake Tayasal, founded by the refugees from Chichen Itza. Here in the ancient homeland of the Maya they remained undisturbed for over a century.

Eventually in the 17th century occasional parties of Spanish soldiers, sent on exploring missions, and sometimes small groups of missionary friars came into contact with this last independent Maya city. Sometimes they were welcomed, sometimes they were killed. Finally the Governor of Yucatan decided that there must be an expedition to subdue the last Maya town. At first he was received with courtesy, but a later visit was met with a show of violent hostility. Apparently the Itza people were determined to hold out because of a magic prophecy in one of the Books of Chilan Balam. In 1702 the Spanish set out to destroy the city. They came around the side of the lake on foot, with some sailing boats armed with cannon on the lake itself. Suddenly a fleet of canoes set out from Peten Itza, passing through the Spanish lines peacefully so that few shots were fired, the Itza landed and vanished into the jungles. Unknown to the Spaniards this was the first day of a new Katun in which it was prophesied that misfortunes should once more lead the Itza to abandon their homes. When the Spanish army came to the city there was no one left. Fires still warmed cooking pots, cloth was abandoned on the looms, but not a human being had stayed behind. It took the Spaniards a whole day to break the idols in the houses and temples.

Nowadays the Maya survive in large numbers as citizens of Mexico, Guatemala, and other Central American countries. They still speak dialects of their ancient language, and are hard-working citizens who are all Catholic by religion, though traces of their ancient ceremonies survive. The ancient gods have become absorbed as kind-hearted saints in the modern world. In the forests of the Peten a few very primitive families of Lacandon Maya still survive. However the Katun wheel of fate suggests that in the near future their wanderings will end. It is to be hoped that they will be absorbed into the modern world in happiness. (See also MEXICO.)

MAY DAY

THE GREAT FESTIVAL of rebirth and renewal, May Day, the first day of May, was an occasion of great joy in the past among the common people of Europe. As a ceremonial day it was superimposed upon the ancient festival of Beltane, the inauguration of the second half of the Celtic year. But in the form in which it was observed by our forefathers it was a dramatized presentation of the union of spring and summer.

Very early on May morning, in the past, the young people of the community would rise from their beds and make their way to the woods. Here they would gather garlands of flowers with branches from the trees and, it is said, indulge in 'wanton dalliances'. As a symbol of rebirth, the greenery would be brought back to the villages and used as decoration for the doors and windows of the houses. This ancient rite of 'bringing home the May' was in effect a method of ritually conveying the fertilizing powers of fully awakened Nature into the human community.

The central figure of the celebration was the maypole or May tree; in England this was the white hawthorn, which possessed supernatural powers and symbolized the transition from spring to summer, while in America it was the evergreen arbutus. Like so many other magical objects the hawthorn was dualistic in character, being a force both for good and evil. As long ago as the 12th century its sinister aspect was recorded in Ireland, and in England the once beneficent May has become a flower of evil that must never be brought into the home (see HAWTHORN).

The election of a Queen of the May, one of the great May Day ceremonies, was no doubt connected with the ancient Scandinavian custom in which a mock contest was staged between two individuals, the one representing summer and the other winter, from which the former always emerged the victor. This ceremony which continued in the Isle of Man until early in the 19th century was described in the *Universal Magazine* in 1786 as a ritual contest between the Queen of Winter (a man dressed in woman's clothes) and a female Queen of the May. The same basic idea was also represented in the better-known ritual marriage between the May bridegroom and the May bride, which has been supposed to symbolize the union of spring and vegetation. A King of the May was also elected in former times.

The crowning of the May Queen, however, is integral in the surviving rite in the British Isles. This is accompanied by merrymaking and ceremonial dancing around the decorated tree or maypole.

On May Day it was once the custom for groups of young people to visit all the houses in the village bearing garlands of flowers and soliciting donations, in return for which they received the 'blessing of May' to bring them good luck for the coming year.

All the characters in the May Day rites embodied the power to endow crops and women with fertility and good luck. The maypole or May bush, originally a tree brought in from the woods, was only in later times set up as a permanent fixture on the village green. The famous maypole in London's Strand, which was 134 feet tall, was later transferred to Wanstead in Essex, where it was used to support the largest telescope then known.

One feature of the English ceremony

One of the great spring festivals, May Day was celebrated in Britain with the crowning of a May Queen with garlands of flowers: drawing by Randolph Caldecott

was the dance of the Morris men, the main characters being Robin Hood, Maid Marion, Will Scarlet, Little John, the Fool in cap and bells, Tom the Piper, and the hobby-horse, all symbolical of primitive ceremonial magic. The hobby-horses still play a prominent role in the May Day ceremonies at Padstow and Minehead in the West Country where they attract visitors from all over the world, but the other characters in the play have long since made their exit (see HOBBY-HORSE).

It was perhaps inevitable that the Puritans should have taken deep offence at the May Day ceremonies, detecting in the maypole obvious fertility connotations and also a close affinity with the Roman games dedicated to the goddess Flora, held on 28 April. To the English and American Puritan the sight of rustics capering about an upright pole was all too reminiscent of pagan worship.

The Puritans' hostility to the superstitions of May Day apparently did not extend to the prohibition of washing the face in May dew, the traditional recipe for a good complexion as well as for health and strength; presumably they were unaware of the custom in some parts of Europe for young girls to roll stark naked in the magical dew on May morning. It is on record that even the great Oliver Cromwell himself was not above making use of May dew on medical advice.

Inevitably the May Day celebrations, like many Christmas customs, were suppressed during Puritan rule, to re-emerge at the Restoration. Later they became part of that gradual decline to which all the elements of 'Merry England' were now subject. The May Day rites continued throughout the 18th century and into the 19th with May games on the village green, and with dancing chimney sweeps and garlanded milkmaids a common sight in the London streets. As the drab century of industrialism drew to its end May Day underwent a temporary metamorphosis as the festival of international labour, the hobby-horse and Morris men being replaced by processions of trade unionists marching behind banners. Today remnants of May Day celebrations survive only in rural areas.

MAZE

Centaur at the heart of a maze: the labyrinth has a long history as a ritual centre and symbol, possibly originating in the cult of the divine kings of ancient Egypt

THE SYMBOL OF THE MAZE or labyrinth is one of the oldest known to man; yet despite its appearance in widely differing places it is a symbol that has finally kept its secret. It occurs in two forms, both originally of magical significance, and both familiar today as an art convention; the 'spiral', with one uninterrupted path sweeping in to the centre; and the Greek 'meander' pattern, which is simply a rectilinear spiral cluttered with false turns, dead ends and multiple ways – the labyrinth of Theseus and the Minotaur. Both designs became popular in the eastern Mediterranean area when a pharaoh of the 12th Dynasty built a sprawling temple in Egypt, and a Cretan prince a similarly labyrinthine palace at Cnossus.

Few things can be stated with certainty about the labyrinth. That it was a ritual centre of paramount importance is not in doubt. That it was a place where a living king-god renewed his virility, where he 'died' and was 'resurrected' for the welfare of his people, is usually accepted. That as a symbol it linked the world with the afterworld, life with death, and death with resurrection is hardly questioned, any more than the fact that from its origin it was associated with the gods of the dead and the underworld. In Egypt, which most authorities see as the main source and cradle of the labyrinth, the god Osiris (see OSIRIS) was murdered, resurrected and then abandoned this world to become supreme god of the dead.

The labyrinth was a vital and bewildering compound of place, drama and dance, combined with the elements of sacred marriage, ritual death and ritual resurrection. In Egypt it was a complex of tomb and temple. The pharaohs of Egypt were king-gods, who ruled, lived, died and were buried as gods. On the well-being of the pharaoh's sacred person, alive or dead, depended the welfare of the nation. To secure this, a mortuary temple was attached to every pyramid or royal tomb, which was served by priests whose duty it was to ensure that all things were done to guarantee the dead pharaoh perpetual felicity.

The Egyptian temple was not only a religious centre, but an administrative one as well: a place of ritual, council and assembly, transcendentally and bureaucratically responsible for the welfare of the nation. Temple and tomb then, though not physically attached, were adjacent and this proximity is a key factor in the confused matter of the labyrinth. The internal plan of the pyramid was complex and it is presumed that the labyrinthine complexity of the tomb became attached, through proximity, to the temple, which in time was known by the name of labyrinth.

Some scholars consider that ritual rather than practical reasons account for the interior complexity of the pyramids, believing it to spring from the need to conceal the sacred body of the king-god from the malice of the powers of evil, rather than to preserve his treasure from tomb-robbers.

Plan of the Infernal Court

Coins, mortuary seals and plaques, scattered from beyond the Tigris to the Mediterranean, bear witness to the labyrinth in all its moods: from Sumerian seals featuring the killing of the king-god to others representing the sacred marriage. Frequently the labyrinth is shown circling the head of gods and goddesses, cult objects or animals – an association which endowed it with magical and protective value. Some of the most ancient, and curious, 'documents' concerning the labyrinth relate it to the underworld: tablets of Babylonian provenance, which are the presumed archives of priests and augurs famous for their practice of divination by the entrails of animals. Engraved with drawings of intestines accompanied by a series of spirals, the tablets are inscribed 'the Palace of the Intestines': in other words, the infernal regions deep in the bowels of the earth beyond the abyss. For the Babylonian augurs the underworld was reflected in the intestines, as heaven was in the liver, and the labyrinthine spiral was its symbol.

The great Egyptian labyrinth mentioned by Herodotus and other classical writers stood in the Fayyum; it was the vast tomb, mortuary temple and administrative centre of Amenemhet III (c 1850–1800 BC). According to Pliny, 'It was divided into districts and prefectures called nomes . . . It contained moreover temples to all the gods of Egypt . . . Some of the temples are so devised that those who approach the doors are greeted by terrific thunders from within . . .' Speaking again of Amenemhet's funerary complex, Pliny observes: 'There is no doubt that Daedalus took from this the pattern of his labyrinth, which he made in Crete. Although he copied only the hundredth part of it, since it contained . . . many entrances designed to produce misleading goings and comings . . .'

The story of the building of the Cretan labyrinth by King Minos to conceal the Minotaur, who was eventually slain by Theseus, is one of the most ancient of Greek legends (see BULL; THESEUS). It contains many 'labyrinthine' elements: a bull cult; a king-god slain in the form of a bull; a sacred marriage and fertility rites, and another wholly typical labyrinthine characteristic – Ariadne's thread which enabled Theseus to find his way out of the maze.

Excavations revealed no labyrinth at Cnossus, and it is now usually agreed that the word 'labyrinth', in Crete, derives not from the complexity of the palace, but from *labrys* (double-axe), the weapon with which the bulls were slaughtered for the sacrifice (see AXE; CRETE). Indeed R. W. Hutchinson (*Prehistoric Crete*) suggests that the word 'labyrinth' might never have acquired its modern significance of 'maze' but for the fact that the earliest palace at Cnossus and Amenemhet's funerary temple were more or less contemporary, and so invited comparisons between the two. The

Cretan palace was destroyed round about 1400 BC, the Egyptian labyrinth survived until Roman times and it is perfectly possible, as Hutchinson points out, that its maze-like intricacies 'confirmed and crystallized' the enduring folklore memories about the Minotaur and 'the maze-like building he lived in'.

Dance of Ariadne's Thread

No activity has proved more faithfully representative of the labyrinth and its ritual content than the dance (see DANCE). As a dance it has survived in many places, with nothing more substantial to express it than a slender cord held in the hands of the dancers – a cord which some identify with Ariadne's thread. Often, the labyrinth is symbolized by a spiral drawing on the ground – a magic hierogram – along which the dancers wind inward, left to centre in the direction of death, and out again right, in the direction of life. Cord and drawing alike link the world with the afterworld, life with death, and death with resurrection. The dance indeed expressed the labyrinth in all its ritual aspects: circling dances of lamentation, protective dances and vigorous fertility dances, all held to be magically effective, and the circling ones the most potent because of their protective value.

The city of Troy had a close relationship with the labyrinth, for it was consecrated to Hippolytus, son of Theseus, according to Pausanias. To this day Troy's name is associated with those enigmatic stone circles and maze-like earthworks strewn across Europe and far north into Iceland, which have been called 'Neolithic labyrinths'. Their origin and purpose remains hotly debated but frequently they are assumed to have been places of ritual practice and assembly. Debatable too is the question of how the name of Troy came to be attached to many of them – Walls of Troy; Troy Towns; Trogin; Trogenburg. It may have been brought by traders, or on the other hand it may have no connection with the city at all. One suggestion is that the name is derived from the root *truare*, a circular movement around a stable object.

Whatever the original meaning of the symbol of the labyrinth, it was sufficiently popular for the Church to Christianize it. Cryptic mosaics in the naves of medieval churches bear witness to the fact. In place of a pilgrimage to the Holy Land penitents used to make bruising progress on their knees along the swirling paths to gain indulgences by reaching the 'Supreme Centre' or the 'Heavenly Jerusalem' as it was sometimes called. The presence of a labyrinth in a church frequently coincides with the presence of megaliths outside it, they too often traced with spirals.

The 'labyrinth' today is a mere 'maze' – a decorative swirl of greenery, with no particular purpose apart from pleasure. The meanings of its multiple ways are forgotten, together with the Crusaders who brought the fashion for mazes back with them from the East. The leisured gentry who reanimated the fashion by furnishing their 17th and 18th century gardens with mazes did so purely for entertainment, to bewilder and astonish their guests: in short, to 'amaze' them – a word whose source some hold to be the maze itself.

MECCA AND MEDINA

THE CITY to which all Moslems are bidden to come and all others forbidden, Mecca is the birth-place of the founder of Islam, Mohammed (570–632 AD). The Mohammedan era dates from his flight from Mecca to Medina, about 280 miles to the north-east, in 622; this event is known as the Hegira.

Before Mohammed's time, Mecca was known mainly as a station on the 'incense route' between the Orient and the Mediterranean. The town had grown up in a winding valley in the chain of the Sarat, round the well of the Zem-Zem and the ancient sanctuary of the Kaaba. According to a Moslem legend, the walls of the Kaaba echoed to Adam's prayers after he and Eve had been expelled from Paradise. In the Koran, Abraham is named as the founder of the sanctuary. What is certain is that like other holy places on earth it served more than one cult in turn.

There was an annual pilgrimage to Mecca before Mohammed, and he did not institute the pilgrimage so much as to give it a new form and new significance. The *tawaf* – the walking round the Kaaba seven times – was one of the rituals for which Mohammed set the example when he made his own pilgrimage from Medina to Mecca in 630, but as no details have survived of the pre-Moslem pagan ceremonies performed at the Kaaba, it is impossible to say exactly how much of the Moslem practice is due solely to Mohammed. The spiritual significance of Mecca as the sacred city of Islam to which all Moslems turn when they pray is, of course, entirely the result of Mohammed's life and preaching.

The first of the principal rituals of the *hajj* or pilgrimage which all Moslems must make once in their lifetime, provided they have the means and the health, is the donning of the two white seamless sheets of the *ihram*, the state of the sacred taboo. While in the state of ihram the pilgrim must abstain from hunting, killing or any form of violence; from the use of scent or jewellery or any kind of luxurious gratification of the senses; and from sexual intercourse. These taboos, and the identical white robes worn by all serve to remind pilgrims that in the

eyes of God all men are created equal, and all will be accountable on Judgement Day.

The garments of ihram must be worn during the pilgrim's arrival in Mecca for the first tawaf, and while he performs the *sai*, or ritual running seven times between the hills of al-Safa and al-Marwa, which are also obligatory rites for the pilgrim. They must also be worn during the *waqfa*, or 'standing' before God in front of the stone mountain Arafat on the ninth day of *Dhul-Hijja*, the pilgrimage month, and early on the following day during the stoning of Satan at the place in Mina, near Mecca, where the Devil appeared to Ishmael, son of Abraham. Blood sacrifice is also offered at Mina, during the state of ihram.

Moslems are warned that Mecca is a city of this earth, peopled by men; that the water of Zem-Zem is simply water and not in itself divine; and that the sacred Kaaba is made of mountain stone and mortar, and that the large embroidered cloth, the *kiswa*, which covers it, and is changed every year at the time of the pilgrimage, is woven and decorated by mortal hands. Yet, as the British explorer Sir Richard Burton (1821–1890) – perhaps the only non-Moslem to make the pilgrimage – wrote: 'Few Muslims contemplate for the first time the Ka'ba without fear and awe'; and he describes how the Moslem pilgrims during his own visit clung weeping to the kiswa or pressed their beating hearts to the stone. The stone is the Black Stone built into the masonry in the eastern corner of the Kaaba which must be kissed, or at least touched by most pilgrims. It is said that Mohammed himself used to weep when he touched the Black Stone, and he declared that it was the place for the pouring forth of tears.

Every year thousands of Moslems make the pilgrimage to the shrine of the Kaaba in the holy city of Mecca: miniature in the Topkapi Museum, showing the Kaaba

Sonia Halliday

City of the Prophet

Medina – the Prophet's city – was known as Yathrib before Mohammed took up residence there. The dominant merchants in Mohammed's time were Jews, though he himself had distant cousins there of the Aus and the Khazraj tribes. The Jews were driven out soon after the Hegira and Medina became the administrative capital of the Islamic Empire, until 661, when it was superseded by Damascus. It is now the second sacred place of Islam, after Mecca, and like Mecca banned to non-Moslems, the limits beyond which only Moslems may set foot being marked by stone monuments. Mohammed's tomb is at Medina, and the Prophet's Mosque, which he himself helped to build, is also situated there.

In recent years, the number of Moslems making the pilgrimage has risen to over 300,000, and over one-third of these arrive in Jeddah, the port for Mecca by air. Other signs of the times are that the government of Saudi Arabia has built three model cities for pilgrims, with five concrete sunshades in pilgrim centres to accommodate from 3000 to 5000 pilgrims each. The present government has also built new mosques in Mecca and rebuilt old ones. The Holy Mosque, which can now accommodate 300,000 worshippers, is said to have parking areas for 4000 vehicles. But the bare-footed, white-robed crowds are much the same as they were in Burton's day, and their religious fervour and meticulous observance of ritual has not changed since the days of the Prophet. (See also ISLAM; MOHAMMED.)

In the East meditation has been seen as a means to union with the Absolute, while in the West it is the mystic's path to God; both routes are beset with perils which can only be countered by use of proven disciplines

MEDITATION

Spectrum Colour Library

'The next step is to empty the mind, slowly to eliminate from the consciousness every thought of a practical nature, domestic or business problem as it intrudes': bronze head of Buddha, 15th century, now in the Museo Nationale di Arte, Rome

ONCE REGARDED almost exclusively as a preoccupation of mystics, saints and hermits, meditation is today an established method of achieving concentration and calmness. Many sportsmen incorporate the technique into their training programmes – e.g. the tennis player Bjorn Borg, Wimbledon Champion from 1977–1980.

Though common to Hinduism, Buddhism and Islam, meditation has not played a particularly prominent role in the Christian tradition. Now, as a result of an unprecedented upsurge of interest in achieving states of mind in which the consciousness is expanded by various means, meditation is being rediscovered.

But why meditate? In a busy world is the time spent pondering on abstractions worth anything at all? Is it not just a futile pursuit, at best another 'opiate' with no practical benefit to recommend it? For the majority, the occasional periods of introspection are of little help. Men only become more confused by what emerges from their deeper reflections. Instead of the restorative relief they seek from the muddled complexity of their lives, they find themselves thinking about their problems more than ever.

Those who advocate meditation, however, say that if it is approached correctly, the exercise can be rewarding. For one thing, a short time devoted each day to the cultivation of a tranquil mind cannot be without its psychological benefits. Confusion only comes with wrongful methods. Meditation does not imply an escape from reality, nor a loss of consciousness; after all, there is little purpose in having experiences which one cannot recall having had.

The first requirement is a 'sanctuary', a room where one can perform the daily ritual in peace and quiet. A trained practitioner can meditate on top of a bus in the midst of the city's hubbub, but such surroundings are hardly conducive to meditation for the average person. Any room will do where one can sit undisturbed for at least 15 minutes at a stretch.

Relax and Empty the Mind

The best position is one of complete repose. One can meditate even while lying in bed, but there is a danger of falling asleep. Sitting in an easy position is therefore recommended in most Eastern systems. Having assumed a comfortable position, one should let the whole body relax. All the muscles must be loosened; all tension let go. Among the many aids used for inducing relaxation are rhythmic breathing; a gentle humming; a slight swaying of the torso while seated. Easiest of all perhaps, is mentally going over the parts of the body in which tension is likely to occur, starting from the feet; then the toes, knees, stomach, neck, hands, shoulders, face, jaws, forehead, eyes, the back of the head, the scalp; ensuring that each part in turn is free from strain. With the body relaxed, it becomes easier to achieve tranquillity.

The next step is to empty the mind, slowly to eliminate from the consciousness every thought of a practical nature, domestic or business problem as it intrudes. This, it might be objected, is easier said than done. But meditation requires patience and practice, and it is surprising how soon one can successfully fall into the routine.

One of the main problems confronting the beginner is to decide on a subject for meditation. Having put aside his worldly cares, what does he fill the vacuum with? Stray thoughts and day-dreams keep drifting in. It is precisely in order to prevent such aimless drifting that another factor is introduced at this stage: an objective device, a psycho-symbolic nucleus around which the thoughts are built up, or from which they are reflected or rebound. But the Mohammedan aspirant may not like to think in terms of Hindu symbols, nor the Christian of Buddhist. For that matter the agnostic or free-thinker may disdain any of the formulations of the theistic practitioner. The choice of a symbol to meditate upon therefore becomes of great importance. Just any symbol will not do, because the ramifications of every symbol can be traced by sub-conscious processes along lines traditionally inherited, or rationally accepted, by the practitioner. So each religion and each school prescribes its own meditative material. The following is a brief outline of some of the major disciplines and methods used in meditation.

Union With the Absolute

Perhaps the most detailed and systematic presentation of meditative techniques can be found in Hindu writings, as exemplified in yoga. The aim of yoga is 'union' with the Absolute, achieved by progression through eight stages of development The first two pertain to external and internal 'ethics', with stress on non-injury and the elimination of negative emotions like anger, acquisitiveness, lust, greed, and the practice of equanimity and peace of mind. After these two ethical prerequisites we come to the third stage, namely, bodily postures, to inure the physical frame to the various positions assumed during meditation, some of which are extremely difficult. Next comes breath control, control of the *prana* (see BREATH), which is held to be one of the basic potencies of the universe. The air we breathe contains it, and the yogi practitioner subtilizes the air for its prana content and sends it streaming through his subtle body. This is followed by control of the senses, that is, withdrawing attention from all external distractions, or, as it is called, 'silencing the traffic of the senses'. By the time this stage is reached the body should be properly conditioned, the emotions under control, and all the mental faculties ready to be directed to a single goal.

The sixth stage is devoted to concentration *(dhorana)* or holding the mind firm and steady. Here the student concentrates on a spot on a blank surface such as a wall; a point of light; the flame of a candle; a flower; the picture of a deity such as Krishna or Shiva; a letter of the alphabet. Yogis sometimes begin their meditation by concentrating with closed eyes on some part of their body: the top of the head; the space between the eyebrows; the tip of the nose. The picture of the yogi wrapt in meditation while contemplating his navel is not entirely fanciful. The navel can also serve as a focal point of concentration, for an important *chakra* (plexus, or centre of psychic energy) is situated near it.

Concentration itself must not be confused with meditation. The former implies an exercise of the will: the mind centres its powers on an object or idea till it yields its essence. Concentration brings mental energy to bear on a certain point so that with its conquest further doors are opened to the mind. Meditation on the other hand does not require any forcible harnessing of the will. It is not a smash-and-grab raid on the storehouse of the Infinite; it is something that emerges from the cessation of thought.

The seventh stage of yoga concerns contemplation *(dhyana)*, a turning within of the consciousness, a focusing of the mental faculties inwards. The eighth and last stage, called *samadhi*, is a state of super-consciousness, which is the supreme goal of yogic meditation.

Because of its stringency yoga can be a disheartening course for the average practitioner. The most that is generally attempted are elementary postures like the head-stand and simple exercises in breath control. Recent exponents have evolved their own variations on the theme, such as Transcendental Meditation, tailored to

the needs of an age which demands instant results. Most of these variations entirely bypass ascetic doctrines and world-abnegation, and permit and indeed encourage a two-way movement between spirituality and worldly life.

The ancient Chinese system of meditation is best exemplified in the Taoist teachings. Taoism seems to go direct to the heart of meditation by the paradoxical method of not even trying to get there. 'The movement of the Tao (Way) is an easy return to within oneself.' Any anxious pursuit of the Tao will cause an impenetrable veil to fall across the aspirant's path and make him lose his bearings. He must cease from aspiring and reduce all striving, study, discourse, discipline, ceremonial and concentration, attenuating them till he arrives at the state of *wu-wei*, 'non-striving'. 'Doing spoils it', says the Tao Master. 'Grabbing misses it'. 'Reaching out on tiptoe you are unsteady'. 'The mighty Way is easy but people still choose the difficult little paths'. There is, in other words, no attempt to stir up consciousness by exhausting techniques, but a natural quiet process of allowing the mental sediment to 'settle down', resulting in a spontaneous revelation of the clear depths within.

The Zen method, again, presents a middle way between the stern practices of yoga and the methodlessness of Tao. Meditation here is largely a matter of 'Shut up' and 'Keep still'. But it also provides by means of question, parable, short poem, paradox, riddle, silence, or even a clout over the ear, a means of sudden illumination called *satori*.

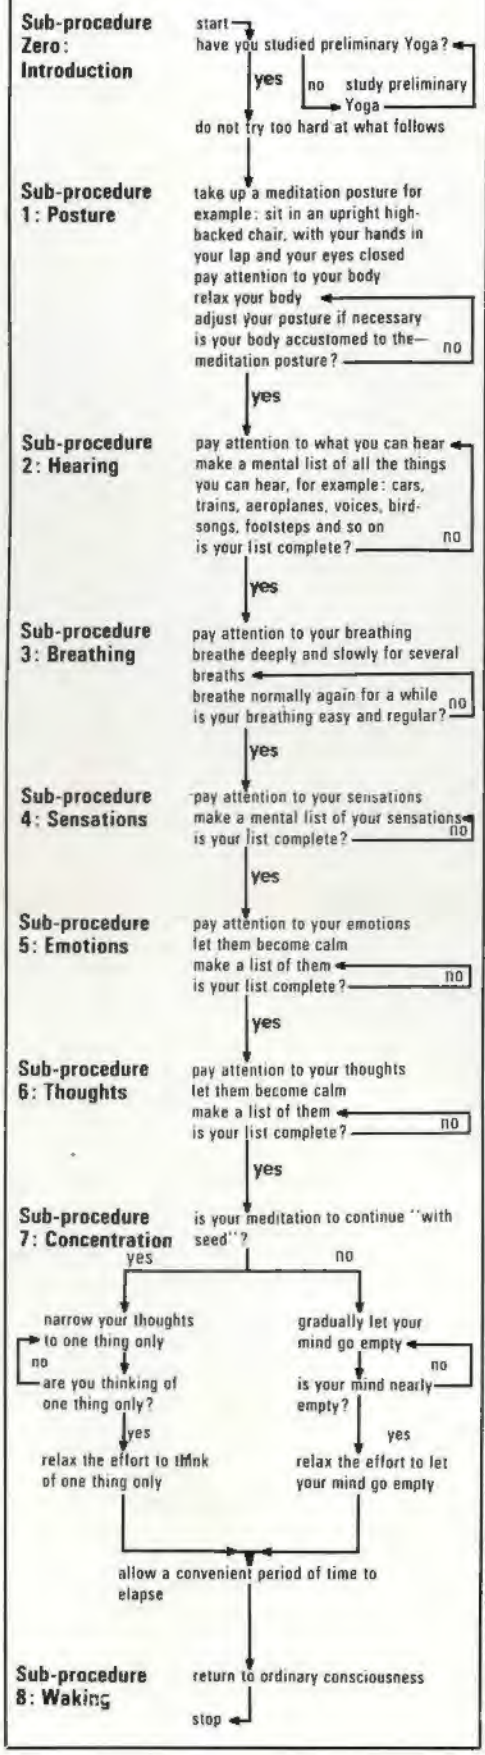
The Sufis, or mystics of Islam, also adapted their meditative techniques to suit their religious temperament. In Sufism there are several stages divided into two main groups: *maqam*, or man's effort, and *hal*, God's grace. It is said, 'Maqam is earned; hal is gifted'. Man's effort calls for all the rituals of religious observance, almsgiving, fasting, pilgrimages, prayers. It presupposes dedicated intention and demands effort. In due time external rituals are abandoned and one devotes oneself to the contemplation of higher things. 'When the mirror of the heart is polished by contemplation, the difference between the transient wealth of this world and the infinite treasure of heaven become manifest. It is then easy to reject the transitory and cling to that which abides.'

Repetition of the name of God plays an important part in Sufi mysticism. The Sufi sits in solitude and repeats without ceasing the name of Allah, letting his mind dwell on the mercy and glory of God. He must persevere until his heart takes up the refrain, and mind, heart and soul are suffused with the idea of God in the fullness of his mercy and power. Some Sufi teachers advocate progressive meditation during a period of retreat, every day of which is devoted to removing one 'veil' of the forty-fold veil covering the Face of God. The raising of the veils comprises graduated exercises in meditation, leading ultimately to ecstasy. The first step is 'watching the Watcher'; when one reaches the final stage of ecstasy, 'Everything perishes except his Face'.

Apart from these 'religious' methods,

THE FLOW OF MEDITATION

Instructions in the 'Yoga Aphorisms of Patanjali' (2nd century BC) have been formalized by Dr John H. Clark of Manchester University in a flow diagram of the type prepared for computers: adapted from Dr Clark's article in *New Society* magazine (23 July 1970).



By kind permission of Dr J. H. Clark and New Society

there exist a number of what might be called magical meditative techniques. Most of them involve recourse to a symbolic diagram. A common device employed by both Hindus and Buddhists is the *mandala* (see MANDALA), an elaborate symmetrical, usually circular design, representing the abode of certain occult potencies who manifest as deities. The latter are invoked by special ritual acts and the intonation of magic versicles or *mantras* (see MANTRA) and are believed to come forth to occupy the places assigned to them in the diagram.

Cosmic Crossroads

The mandala is regarded as a cosmic crossroads where the physical and spiritual worlds intersect. The procedure requires deep concentration on the mandala pattern, as a result of which its configuration is imprinted on the psyche of the practitioner and he can clearly see, with his mind's eye, the whole maze depicted outside. For those who might find this difficult an easier way is used. They may look at the mandala, then shut the eyes, and continue this a hundred or a thousand times, until the pattern is clearly visualized with the eyes closed.

The mandala is spoken of as a psychocosmogram, a picture of the universe conceived in diagrammatic form and projected on the screen of the psyche. The experiences undergone in this manner become intuitive visualizations of the meditator's own psychodynamic process. Without a long period of correct training there is every likelihood of the imagination running amuck. Even under controlled guidance the apparitions that he encounters in the journey through the intricate pathways of the mandala can be frightening enough. The demon-guardians and the fearful monstrosities that lurk in the dark recesses are ever ready to block his path and hack him to pieces.

Another system of meditation, often resorted to in the West is that of the Cabala (see CABALA), a Jewish mystical teaching evolved in the Middle Ages, although a much longer history has been claimed for it. Quite early in the course of its development this system was taken over by Christian scholars of the 16th century, and it is not always easy to distinguish the Jewish elements from the later accretions.

There are ten centres, called *sefiroth*, in the meditative device used by the Cabalists, arranged roughly like a tree. When inscribed on paper, the tree is depicted as if on a single plane, but in reality it is believed to be operative on four separate levels or 'worlds'. In the cabalistic technique the aspirant performs a series of meditative exercises, sometimes known as 'rising on the planes', in which he carries consciousness along a predetermined path that links the centres of the sefirotic tree. Each point is a gateway to a new world which has its guardians and its terrorizing demons. The pupil advances under proper tutelage from the simple to the more complex levels. He is conscious throughout his experience. This system is still practised but has achieved a certain notoriety as a result of its utilization by practitioners of the 'black arts'.

Meditation on the mandala and on the sefirotic tree represent the Eastern and Western systems which involve what occultists call the projection of the astral body (see ASTRAL BODY). In both the same general goal is sought: an attempt to make a journey into another dimension and to retain full conscious awareness of it on return. Whether we believe in the actual existence of the entities that are alleged to guard the zones or not, the fact remains that occultists of both schools, and practitioners of magic, black and white, have brought back vivid descriptions of their experiences while on such astral adventures. We may attribute them to the power of the imagination and the workings of a heightened faith, or dismiss them as hallucinations induced by some alchemy of the brain resulting from deep concentration on evocative archetypal symbols. But whatever the interpretation of such occult experiences might be, there can be no doubt that they are hazardous and can be injurious. The paths opened to the aspirant by encounters in a mandala trance, or on a limb of the sefirotic tree, are not to be ventured on lightly (see also PATHS).

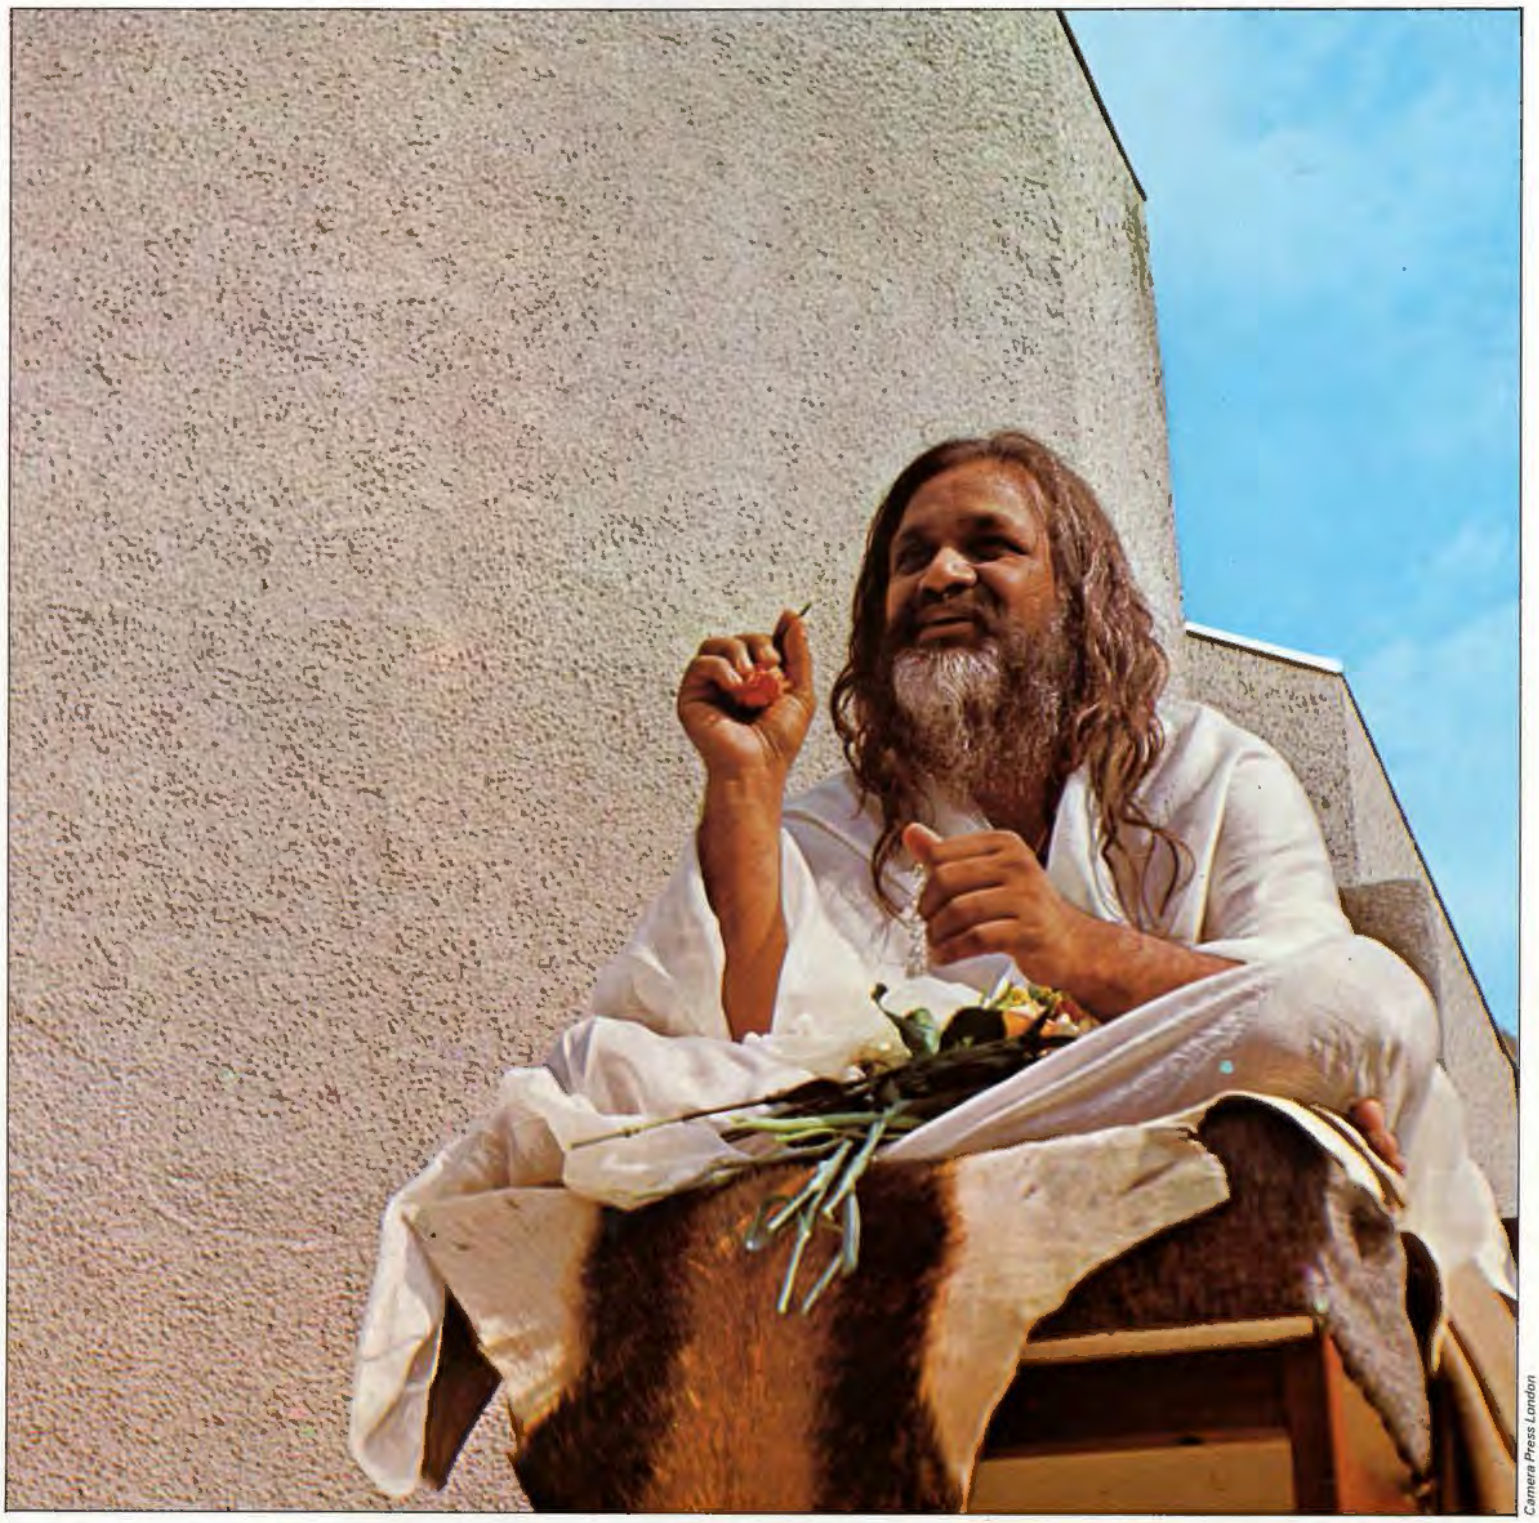
Buddhists, who practise meditation intensively, have been especially careful to emphasize the need not so much for meditation as for right meditation. This was thought to be of sufficient importance to be included as one of the eight fundamental principles of their religion. Misdirected or wrongful meditation can be worse than futile, it can be dangerous.

Meditation is being rediscovered in the West 'as a result of an unprecedented upsurge of interest in achieving states of mind in which the consciousness is expanded by various means': Maharishi Mahesh Yogi, one of many missionaries from East to West

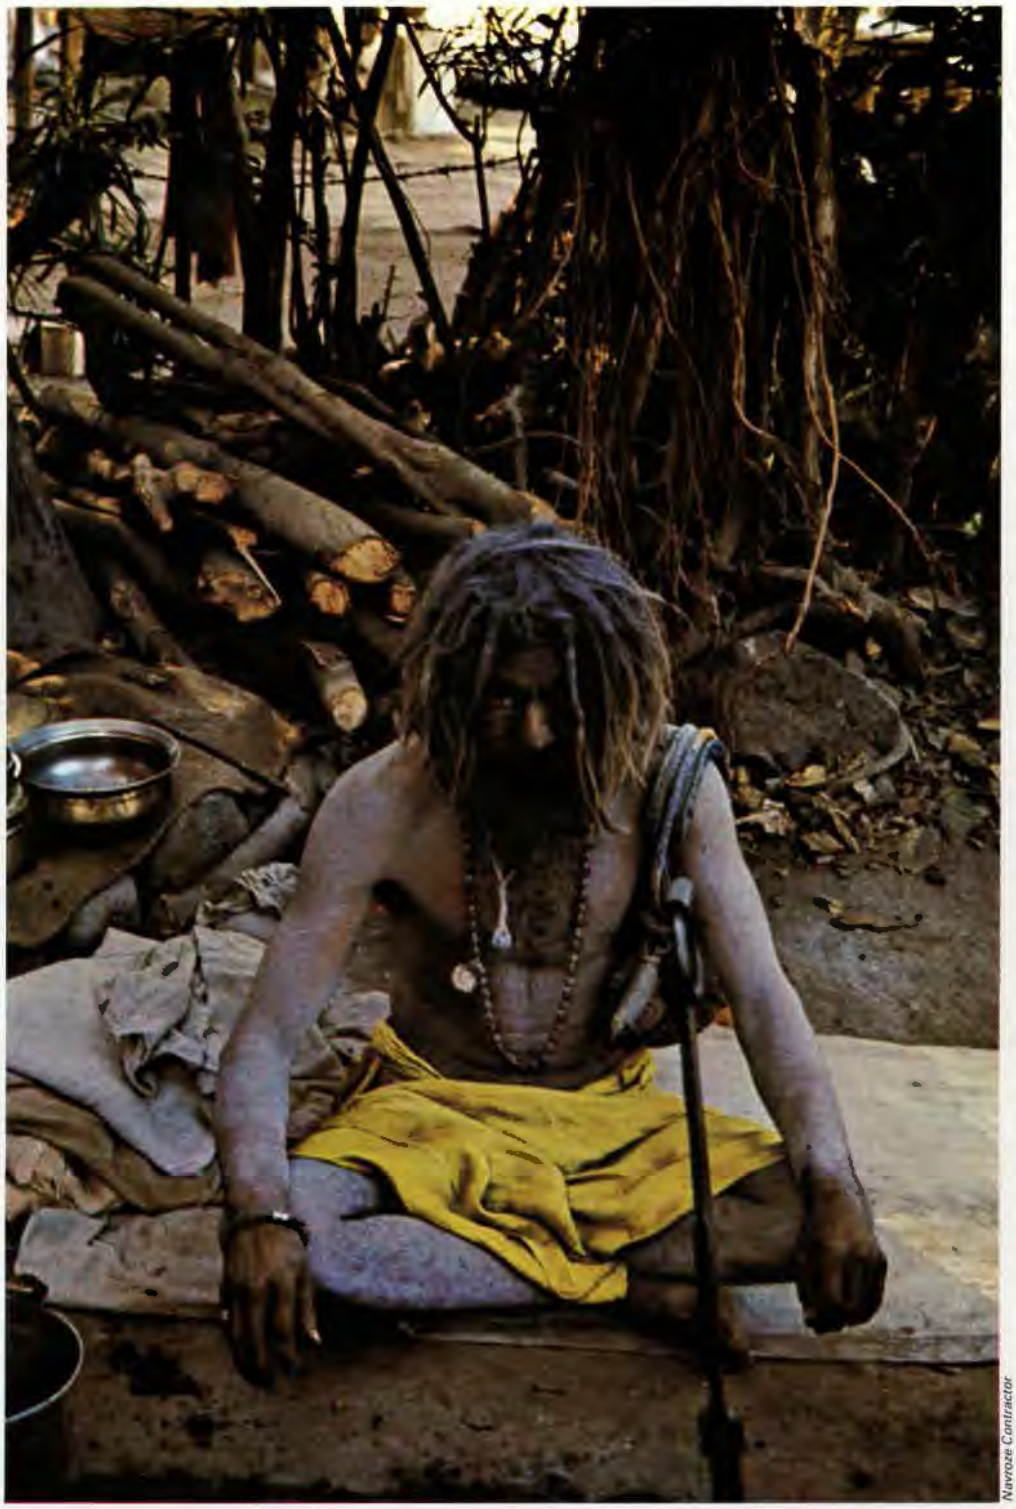
Perils on the Christian Path

Against the background of all these methods that men have employed in their effort to attain enlightenment, beatitude or unity with the Absolute, it might be felt that the absence of a meditative regime in Christianity for the common man is a drawback to the contemplative life.

In fact, Christianity does not lack a



Camera Press London



Navroze Contractor

Indian saddhu, or holy man, in deep meditation, supported by a crutch. In yoga, meditation involves numerous highly disciplined techniques, including breath control, bodily postures, control of the senses, concentration and contemplation, 'a focusing of the mental faculties inwards'

tradition of the kind found in many other religions. First derived from ancient Greek and Jewish sources, this tradition developed along its own lines. Meditation was practised by the early monks who dwelt in the desert regions of Egypt and Syria from the 3rd century AD. Their disciplines were at times so severe as to be scarcely credible today, and their experience with 'temptations' by the Devil and elemental creatures are as vivid as any brought back by occultists from the astral planes. A system somewhat akin to yoga, with emphasis on breathing and concentration on the plexuses, was followed in Greece by the Hesychast monks in the Middle Ages. Many of the saints of the Roman Catholic Church, among them St Francis of Assisi and St Teresa evolved their own meditative disciplines. The *Spiritual Exercises* of St Ignatius of Loyola outlines a stringent procedure in a contemplative process that has led many to spiritual exaltation. Countless Christian mystics have experienced the sudden transports that betoken the touch of the Divine Breath, and their written works are replete with meditative aids.

But all such methods are meant primarily for the recluse. The Church, it would seem, does not normally advocate meditation for the layman, apart from the periods of retreat set aside for the purpose in the religious calendar, such as the days between Good Friday and Easter Sunday. Perhaps it is considered desirable to withdraw from general sanction the use of any 'device' that might bring one inadvertently into contact with what St Paul refers to as the 'Principalities and Powers, and the rulers of darkness in this world'.

For even the orthodox method can be a staggering experience for the untrained soul. Among mystics, one persistent phase in the more advanced stages is a period of spiritual privation that afflicts even the highest aspirants. St John of the Cross described it as the 'Dark Night of the Soul', St Teresa called it 'the great dereliction', and Mme Guyon 'the mystic death', while others referred to it as 'the descent into Hell'. These perils on the way are not easily borne, and the passage of meditation often lies through some such stage of black despair. When the untried student meditates he is cautioned to do so only on the acceptable patterns provided by long experience.

Some Christian denominations, among them several Quietist sects (see QUIETISM), practise various kinds of group meditation, where a number of persons gather together during service and sit in silence. In some cases a verse is read out from the Bible and the assembly simply bow their heads and meditate independently on its meaning. Something may or may not emerge from the group silence, but those who have attended such meetings have spoken of its beneficent influence in recharging the mind and spirit with dynamic power.

The Christian equivalent of finding God by 'paths many and devious' and by 'vain repetition' of his name, is through faith, homage and prayer. The real discipline is the one expressed in Christian conduct in daily life; what one mystic has spoken of as 'the practice of the Presence of God'. God does not have to be sought by difficult techniques, but is there for all who care to find him. Such at any rate is the mystical view. The psychologist C. G. Jung in his old age had a strange inscription carved over the door of his house. It was his final confession of faith: 'Called or Not Called, God is Present'.

The posture of meditation for the Christian is not face to face, implying equality with the Creator, but on bended knees with head bowed in humility. For the ordinary Christian meditation is almost synonymous with prayer: in the words of the psalmist: 'Let the words of my mouth and the meditation of my heart, be acceptable in thy sight, O Lord my strength and my redeemer'.

MEDIUMS

John Freeman

In controlled conditions, mediums have produced phenomena for which no orthodox scientific explanation has yet been found; the author of the first article, on mental mediumship, suggests that at the least it merits study for the sidelights which it throws on the subconscious levels of the mind; physical manifestations are discussed in the second article

MEDIUM IS THE NAME given by Spiritualists to a person whom they believe is able to act as a medium of communication between the living and the dead. Modern Spiritualism arose in 1848 among more or less unsophisticated people in the United States, when the relatives of the Fox sisters claimed that these two young girls could communicate with the spirits of the dead by means of raps. Successors to the girls multiplied exceedingly on both sides of the Atlantic, which was hardly surprising at a time when the Darwinian theory of evolution was undermining the traditional religious view of man as an immortal spirit. Apparent demonstrations by mediums that the dead were not only still in existence but could actually communicate with the living were welcomed by many people with natural, if somewhat uncritical, joy. It must be remembered that some mediums did produce very apt messages purporting to come from beyond the grave, and the idea that a nearer source for those messages might be a subconscious level of the medium's own personality was not an easy one to envisage in the days before Freud had forced on our attention the fact that such levels existed.

This situation provided a delectable opportunity for the crooks who are always on the alert to exploit human credulity. Fraudulent mediums sprang up right and left, and even today they have many successors whose activities cast an unjustified slur on honest people who genuinely believe in their own mediumistic gifts, and who do on occasion produce phenomena in controlled conditions for which no scientifically orthodox explanation has yet been found. As fraudulent mediumship does not differ in essence from other forms of deception, it will not be discussed here.

Mediumship divides roughly into two types, physical and mental. A mental medium is a person who claims to be able, in certain states of consciousness, to see and talk with the dead, to transmit messages from them to the living and even, at times, to hand over his own body to discarnate (or disembodied) persons who can then communicate directly with the living. From the evidential angle this claim provokes two main questions: firstly, what alternative mundane sources can be found for statements purporting to come from the dead? And secondly, are there any occasions on record where all such alternative sources appear to be ruled out and a discarnate source for a particular statement seems overwhelmingly likely?

Looking at mediumship simply as a psychological phenomenon, the questions it calls for are different: for instance, what is the psychological process involved in such experiences? What brings them about? Why does a person become a medium? How does mediumship relate to other psychological states? It should perhaps be said that some persons who are mediumistically gifted do not always believe that the communications they receive necessarily come from the dead, and a more neutral name for mediums which includes such people, and is often used, is 'sensitive'. In our culture more women than men are mediums, so from now on they will be referred to here as feminine.

Increasing Dissociation

The first impression gained by a neutral observer when watching an honest medium at work is likely to be that the verbal or written utterances she makes to her sitters (a sitter is the name usually given to a person who visits mediums) are welling up from subconscious levels of her own psyche. Very often these utterances show

Previous page **Experiment with a ouija board at the Benson Herbert Paraphysical Laboratory in Wiltshire; it is likely that the 'messages' received in this way arise in the subconscious minds of the people concerned but, as with the utterances of a medium, the information appears to come from an external source. In both cases it is possible that contact is made with the subconscious level of the psyche**

Above **Participants in a seance in the 19th century: physical phenomena sometimes take the form of telekinesis when objects, in this case a chair, move through the air apparently without any force being applied**

A good medium appears to make meaningful contact in some unknown way with remote events and personalities, and, on the face of it, even at times with the dead

every sign of having originated within her psyche, but not always; on occasion a good medium will impart relevant and specific information to an unknown sitter which she apparently could not have obtained by normal means, and which is too detailed to be reasonably attributed to a series of lucky guesses. In fact it gives the impression that at the least she has made subconscious contact with events distant in time or space, or time and space, in some unknown and possibly extra-sensory fashion.

There are many stages of mediumship and each successive stage seems to imply an increasing degree of dissociation, in which communication with the subconscious gets progressively easier. When dissociation is slight and a medium not far from her normal waking state, she usually behaves as if fleetingly aware of various discarnate presences whom she describes as friends or relatives of persons present to whom they wish messages to be given. As a rule these messages are vague and they could apply to any one of a number of people. Some mediums can induce a state of dissociation so deep that it reaches trance level and at this point their normal personality is replaced by quite a different one, whom Spiritualists accept as a discarnate human being who has taken over the medium's body and whom they call a 'control'. Variants of this phenomenon have, of course, been known throughout history, but the control is not always looked on as human. For the Witch of Endor it was a familiar spirit, for the Cumaean Sybil it was the god Apollo, for Neoplatonists a beneficent daemon, for the early Christians, as a rule, a devil, and in Voodoo today it is thought to be a god.

On the whole modern psychologists tend to look on 'controls' as split-off facets of the medium's own personality and point out that similar 'splits' can occur apart from mediumship and may be hysterical symptoms or dramatizations of repressed tendencies. But one should perhaps bear in mind that the dissociation of mediumship does not seem very different in kind from that experienced by the rest of us. We all go into daydreams in which the outer world is forgotten. We all find that a forgotten name or tune, or even the solution to a problem which consciously we have failed to find, will float into our minds unexpectedly from 'nowhere'. And reports by creative persons of unexpected 'upwellings' of material from the subconscious are legion.

Many such creative upwellings take the form of images and symbols, in much the same way as mediums often claim to receive their information. Sometimes, for instance, new ideas emerge in visual symbols, as on the occasion when the chemist, Friedrich August Kekule, while dozing by the fire, had a vision of a snake eating its own tail which led him to envisage the circular form of the benzene molecule. Or new ideas may come in the form of automatic speech. Dante declared that as he was pondering how to begin a poem, 'my tongue spoke as though by its own impulse'. Other poets and writers may feel as if a work were directly dictated to them. Blake claimed this of a major poem and said that he could praise it because 'I dare not pretend to be other than the secretary'.

But it is not necessary to be a genius or a medium to bring up material from the subconscious, independently of the conscious mind. A number of people can do it by automatic writing, but what they write is usually, though not always, fragmentary, incoherent and of little interest. Others, from medicine-men to palmists, do it by some such technique as 'reading' cards, hands, bones, tea-leaves and so on; others again by the use of dowsing twig or pendulum. Subconscious material can also emerge through collective action, such as spelling out words on a ouija board or making a table tilt when a group of people place their fingers on them.

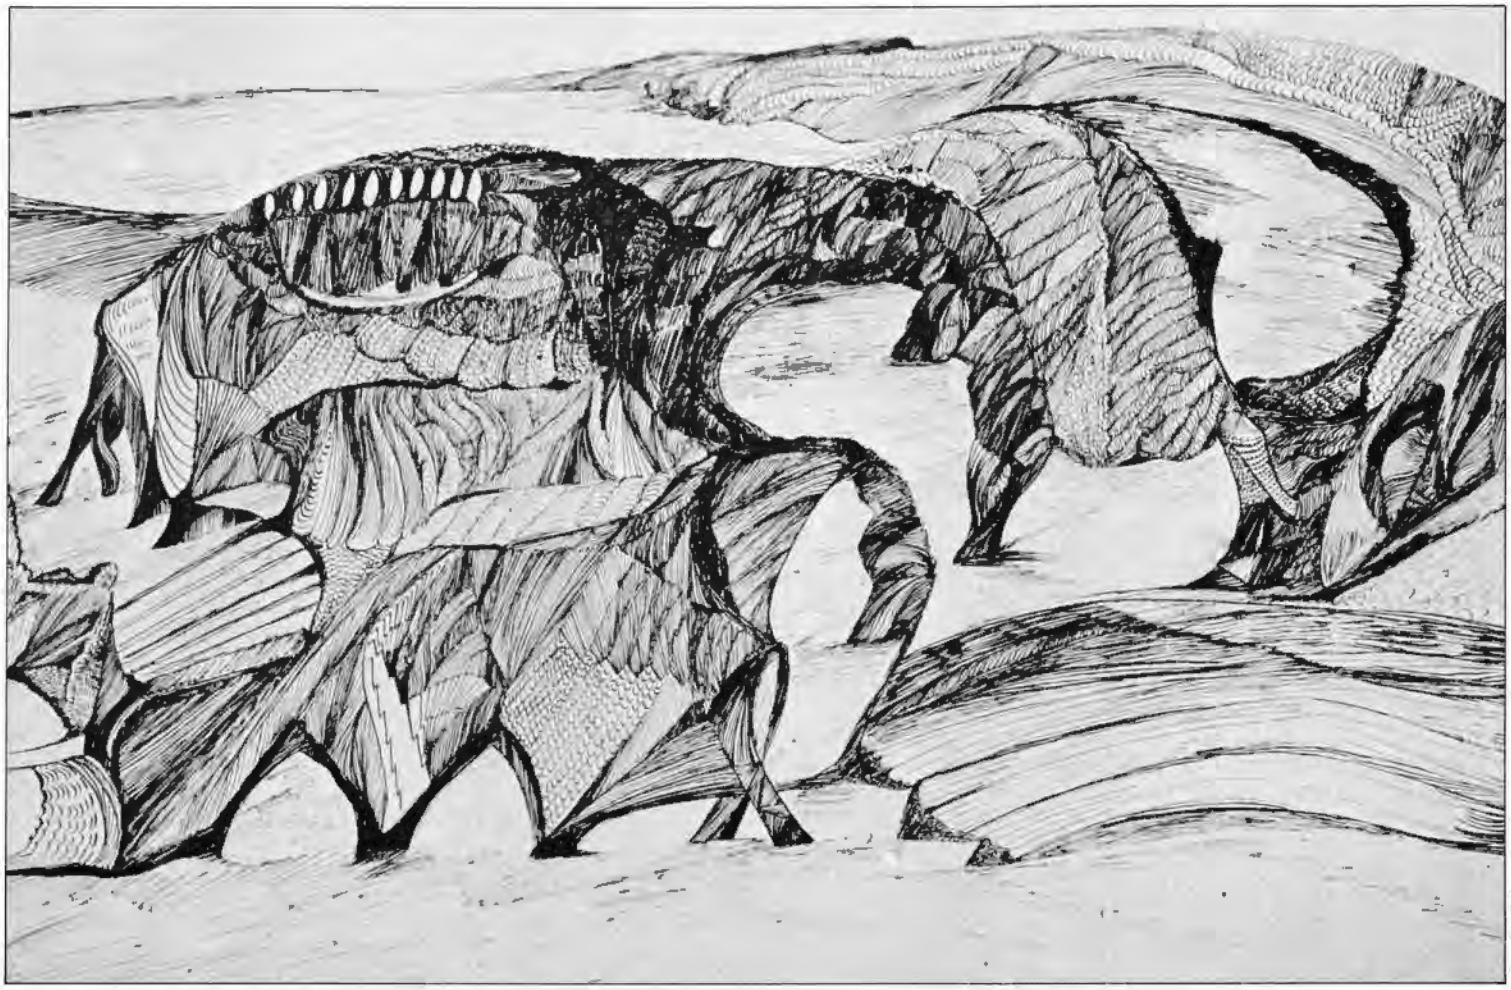
It will be noticed that all these procedures have one thing in common with control mediumship; any information given appears to the performer to come from a source exterior to himself. He 'sees' it in the cards or the bones or the hand. The pendulum or the dowsing twig moves independently of his conscious will. Each owner of the fingers which rest on a ouija board or table can assume that if any pushing, conscious or unconscious, is being done, it is by one of his co-performers, not himself. All such exteriorizations, however foolish they seem, may in fact serve a useful purpose by releasing the conscious mind of the performer from a sense of responsibility for what is said. This would reduce tension and in this way, perhaps, facilitate contact with the subconscious level of the psyche which appears to be able to receive what, for want of a better term, may be called extra-sensory 'signals'.

The quality of mediumistic utterances varies enormously, and to some extent in relation to the intellectual level of the medium. They are usually banal and fragmentary and in most cases seem almost like the product of a kind of dream state; nor need they be true to fact. One well-meaning trance medium implored me repeatedly on behalf of my dead husband to cease my excessive mourning for his loss, and she was not deterred by my assurances that he was alive and well. To her trance personality all grey-haired women must, so it seemed, be sorrowing widows. But although mediocre and even dishonest mediums exist, this does not alter the fact that on occasion a good one appears to make meaningful contact in some unknown way with remote events and personalities, and, on the face of it, even at times with the dead.

'Like Diving into Dark Fog'

Before seeking to discover what in fact happens on such occasions, one must be clear as to what appears to happen. Take for example a sitting with a trance medium. It usually opens with the medium remaining quietly seated in a chair for a short time with her eyes closed. Then, as a rule, she begins to breathe heavily, perhaps gives a groan or two and falls into a deep though restless sleep. Shortly afterwards she wakes up as the control, whose voice, mannerisms and whole personality seem quite different from her normal one. Controls range from childish characters of either sex to 'Red Indian' chiefs, Arabian physicians and Chinese sages – but they are all liable to make childish mistakes about the countries in which they claim to have lived on earth. Most mediums have only one control, but others have two or even three. One of the regular controls turns up at every sitting, the claim being that its task is to safeguard the medium's welfare and to regulate the many attempts made by discarnate spirits to communicate through her. Even so, a purported intruding 'spirit' sometimes manages to break in, and occasionally makes unexpected statements which are found to relate to a sitter not present at the time.

As a rule the control begins by reporting the presence of discarnate 'communicators' who wish him to transmit messages from them. Sometimes sitters say that they recognize these communicators and sometimes they do not. The communicators are usually



Peter Goodliffe

given a name such as John or Mary, though occasionally a good medium will get hold of an improbable name which is correct. Sometimes, with a familiar sitter, the control will allow a communicator, as he puts it, to take over the medium's body directly, and when this happens a second marked change may come about in her voice, speech and vocabulary; there have even been occasions when reliable and intelligent sitters felt that the personality who purported to talk through a medium's lips had mannerisms resembling those of the deceased friend or relative it claimed to be.

These communicators often complain that the process of making contact with mundane conditions through an unfamiliar body is hard, painful and depressing – one compared it to diving into a dark fog – and they account for the triviality of many commuuications by saying that to get through more than distorted fragments is extremely difficult. Nevertheless, and in spite of the mass of inapposite and dream-like material which even the best mediums are liable to produce, at times a communicator's performance is too lifelike and convincing for a dispassionate inquirer to feel comfortable about rejecting its authenticity out of hand. Something which is not cheating and appears inexplicable on any known hypothesis is certainly going on. Even so, it is obvious that all thinkable alternative explanations to communication with the discarnate must be envisaged.

It has often been observed that an entranced medium will serve up, as coming from the discarnate, snippets of information which could, unconsciously as well as consciously, have been guessed or inferred from a sitter's behaviour, age, sex, wedding ring or unwisely revealing remarks – but no more. Many, but not all controls, will fish or grope for information from the sitter, which is natural enough, but inexperienced sitters are liable to give away more than they realize and then take it as coming from the discarnate when it is returned to them later. It should also, in fairness, be said that some sceptical sitters are so determined to give away nothing that they create an atmosphere as cold and silent as a winter's night at the North Pole, and this is unlikely to encourage any type of skill or sensitivity. The conscious self of an honest medium should not be blamed for the deception or evasiveness of the trance personality, for even if she realizes what has been said, which she usually does not, she may have no idea that its source was her own subconscious observation or inference. Mediums do not know the actual source of what floats into their minds, however much they believe their own interpretation of it.

A medium's ignorance of the source of her information is shown by another possible alternative to certain apparent contacts with the dead – unconscious memory. A well-known member of the Society for Psychical Research, Mrs K. M. Goldney, went to a public demonstration of purported spirit communication at which the medium said that two spirits, Alec and Bessie White, had come for her. Two years earlier Mrs Goldney had had a private sitting with that medium, who while in trance had given her the same names. Although they had meant nothing to her at that time she had pretended to recognize them, in order to see whether they would again be given to her later on. By the time of the public demonstration she had forgotten this incident and was only reminded of it when she subsequently found the names in her notebook. It looks here as if her presence at the public demonstration had stimulated a latent memory in the medium.

Latent memories can also emerge in non-mediums, through a ouija board or in automatic writing, for instance. There are in fact many hints that the subconscious never forgets. If so, a medium's statements can never provide watertight evidence, even of mundane ESP, unless it is certain that she could not have had normal access to the information she imparts.

Subconscious Histrionics

When trying to assess the authenticity of a purported communicator, a further complication is that in all human beings, not mediums alone, the subconscious is a great dramatizer. Dreams make that clear enough. Professor H. H. Price once pointed out in a broadcast that the more one is inclined to reject the survivalist explanation of mediumistic phenomena, the more one is bound to emphasize this power of subconscious dramatization. In a good sitting, as he says, one can have a real conversation with a communicator, who may make suitable replies, agree or disagree, answer questions . . . 'If all this is just subconscious dramatisation

John Webb

Mediums and automatic artists believe that they are the instruments of some unseen force ***Facing page*** **and** ***Above right*** **Automatic drawings created by Helen Weir while in a trance; she claimed to be guided by an Egyptian control** ***Above*** **One of many designs drawn automatically by Emily Tallmadge of New York, she believed her drawings were inspired by spirit guides: by permission of Mrs Harold Hunt**

on the medium's part,' said Professor Price, 'it is comparable to Ruth Draper at her best.'

But whatever the real nature of controls or communicators and however much a medium may subconsciously dramatize, the fact still remains that on occasion she appears to obtain information by some unknown and apparently extra-sensory means. What alternatives are there to the belief that this information has been given her by the discarnate? Single 'hits' can in theory be attributed to a lucky coincidence, but when a complicated series of similar apt statements are repeated by several mediums independently, as in the Vandy case to be quoted later, this explanation appears fanciful. Excluding, then, chance coincidence and knowledge obtained by recognized sensory means, the simplest paranormal explanation would seem to be telepathy from somebody present at the sitting; the next, telepathy from some distant living person. A further paranormal, but still mundane, alternative is that the medium could have perceived clairvoyantly some document of which the existence was not known at the time, such as a letter written by a dead person, which was only found after the sitting (as in Mrs Leonard's book tests). That telepathy and precognition do occur has been experimentally demonstrated to the satisfaction of a number of eminent scientists, and the indignant denial of others.

Here is a first-hand example of apparent telepathy from the sitter which led the medium to believe she was in genuine communication with the dead. I had been asked to test a medium I had never seen. I went under an assumed name, looking like a very unworldly country cousin, but in my bag, which I kept tightly clutched under my arm, I carried a recent letter from a well-known actor. When the medium was in full flight, describing quite aptly my personal problems, I slipped my hand into the bag, which was out of her sight, took hold of the letter and thought of the actor. Immediately she paused, looked at me in a puzzled way and said in a tone which I felt did credit to my country-cousin outfit, 'Have *you* anything to do with the theatre?'; she then described the actor and in no time was producing messages for him from the lately deceased Ivor Novello. These, rightly or wrongly, I ascribed to a natural association of ideas since the two were not particular friends.

Now take a much quoted case of apparent precognition which on the face of it looked like communication with the dead. It was reported to the Society for Psychical Research by Dr S. G. Soal, a lecturer in mathematics at London University, and well known for his pioneering work on experimental ESP. Gordon Davis, a childhood friend whom Dr Soal thought had been killed, purported to communicate through a medium whom he was testing. 'Davis' reminded Dr Soal of many childhood incidents and then gave a detailed description of a house, and some of its contents, in which, so he said, he had lived before his death. Dr Soal thought little of this description, but he did note it down at the time and had his notes witnessed. That was fortunate for three years later he heard by chance that Davis had not been killed but was living in Southend. On visiting him Dr Soal found to his great surprise that the house was just as the medium had described it, including a number of ornaments which Davis had not possessed until he had moved into the house about a year after Dr Soal's sitting with the medium.

Continuing Sense of Purpose

But mediumship can produce greater puzzles than this, including some which actually suggest continuing intention on the part of individuals who have survived bodily death. In some of these cases, the only alternative explanation, apart from collective cheating or a fantastic series of chance coincidences, seems to be that several mediums have performed the extraordinary feat of collecting snippets of information telepathically from various living persons whom they did not know, and then combining and dramatizing them into wishes expressed by a discarnate spirit.

It will be obvious that it must be very rare for such cases to occur in apparently watertight conditions, because most sittings with mediums are not undertaken by investigators

University of London/Harry Price Library

who have taken precautions against all sources of leakage, but by bereaved persons who are usually ready to jump at the slightest hint that they can communicate with those they have loved and lost. Fortunately a few exceptionally gifted mediums, particularly Mrs Piper, Mrs Leonard, and Mrs Willett, have provided a number of such cases, since they allowed themselves to be studied over long periods by expert investigators. To the neutral observer their work makes it clear that there is something, produced in all honesty, to be explained.

A good example of complex mediumship is the case of Edgar Vandy which has been exhaustively analysed by Professor C. D. Broad. Vandy was a clever engineer, who was in process of designing a new type of machine to reproduce lettering and so on by electro-mechanical means, when he was drowned at the early age of 38. One Sunday morning a friend of his, N.J., had taken him by car to visit an estate in Sussex, where N.J's sister was secretary to the owner who was away at the time. The day was hot, and the two men decided to bathe in the swimming pool which, being fed from a stream, was somewhat cloudy and slippery. Edgar was a poor swimmer and could not dive. He and N.J. undressed behind some bushes, and N.J. stated later that Edgar was ready about three minutes before him, and went off to the pool which was out of N.J.'s sight. Edgar was later found dead in the pool.

At the inquest the essence of N.J.'s evidence was that on reaching the pool he had seen Edgar lying face downwards on the water, splashing and fluttering his hands. N.J. jumped in, but Edgar was sinking by the time he reached him and he could not keep a grip on him. He went for help when Edgar finally sank. The doctor's view of the medical evidence was that Edgar had dived in, struck his jaw, lost consciousness and so drowned.

But Edgar's two brothers, George and Harold, were not satisfied. Edgar could not dive and they could not understand why attempts to help him should have been so unsuccessful. Although George did not believe in survival, he was a member of the S.P.R. and he thought it possible that by some form of mundane ESP, trance mediums might throw light on the manner of Edgar's death. To this end he arranged for a series of six strictly anonymous sittings with four different mediums. One of these was to be a proxy sitting, taken by a Methodist minister, Mr Drayton Thomas, with the famous medium, Mrs Leonard. A proxy sitting is one in which a stranger, who knows no details about the deceased, represents the person interested. In this case Mr Thomas was told no more than Edgar's name and that the relatives were in some doubt as to the cause of his death. The other five sittings with three other mediums were taken by George and Harold separately, under assumed names. George sat with all three of them, Harold with two.

Two main topics were mentioned by all four mediums: Edgar's death and the machine he was working on. As regards the death, Professor Broad points out the remarkable fact that two themes were common to all six sittings: first, that Edgar fell and his head was hit and injured, and second, that one or more persons were present, that it might be thought that they had failed to save his life through cowardice or incompetence and that he wished to shield them from blame. In five of the sittings there were references to water and drowning, and to Edgar's death being a strangely unlucky event which could easily have been avoided. In four, the mediums said that it was not due to suicide or culpable carelessness and that there was a feeling of dizziness connected with the accident. In three, there were references to a large scar which Edgar had said would always identify him.

In three of the six sittings and also at a later one taken by Harold Vandy there were a number of references to a machine, to something that Edgar had invented. Some of these were inaccurate, others correct and even specific to an extent surprising in women who knew nothing about engineering.

To demonstrate the improbability of chance coincidence being an explanation for the many 'hits' made by the four mediums, Professor Broad asks three questions: firstly, what proportion of the male population of England are drowned each year in open-air swimming pools, after falling mysteriously and getting a crack on the head; secondly, what proportion of them are skilled technicians devoting themselves to inventions in general and to the type of machine being designed by Edgar in particular; and thirdly, what proportion of them fall into both these categories? Professor Broad appears to think

The American stage performer Annie Eva Faye was suspected of producing fraudulent physical phenomena, but there were occasions when it was impossible to prove that she was guilty *Far left* and *left* Pictures of Annie Eva Faye with her equipment *Right* An observer holds her while she produces manifestations and (*far right*) her hands are tied by a member of the investigating committee

fraudulent collusion between the experimenter, George Vandy, and the mediums equally improbable – and indeed, all their successes did not convince Mr Vandy of survival.

In this case, then, it seems hard to avoid some kind of paranormal hypothesis. Professor Broad thinks that the minimal one to fit the facts would he that the mediums acquired the various items of information by telepathy from a number of living persons, and dramatized them subconsciously as coming from the dead. In that case, he asks, why did certain very relevant items which would presumably have been in N.J.'s mind fail to appear? The maximal paranormal hypothesis, he suggests, would be that Edgar Vandy's personality had survived the death of his body and was deliberately communicating some of its thoughts and feelings telepathically to the various mediums. (In these sittings the mediums' bodies were not taken over by any control.) Professor Broad does not pass judgement either way.

Supernatural Crosswords

All four mediums in this case spoke as if it were the intention of a surviving Edgar Vandy to shield his friends from undeserved criticism. Signs of intention and even of planning on the part of the dead seem to be the best evidence for survival at present available.

A long-term instance of both can be found in a complicated series of mediumistic utterances known as the Society for Psychical Research cross-correspondences (see CROSS-CORRESPONDENCES). As more of these were written than spoken, for convenience they are usually all referred to as scripts. They were produced over a period of about 30 years by some educated amateur English sensitives and one professional American medium, Mrs Piper – about 12 in all. Some of the sensitives were widely separated (Mrs Fleming, for instance, Rudyard Kipling's sister, lived in India) and some of them never met each other; yet their scripts, which ran into thousands, showed every sign of being interrelated. The story is long and complicated, and without details loses much of its impressiveness, but no description of mediumship would be complete without some indication of its elaborate interrelationships.

The first cross-correspondence scripts were automatically written in 1901 by Mrs Verrall, a Cambridge Lecturer in Classics, shortly after the death of the last of three distinguished Cambridge scholars, Henry Sidgwick, Edmund Gurney and Frederic Myers, who had all been founder members of the S.P.R. and who were all deeply concerned to establish whether or not some component of a human being could survive the death of his body (see GURNEY; MYERS). Mrs Verall's scripts were followed by others, mainly written by women who were not classical scholars, yet many of them referred to abstruse classical subjects about which few people except erudite scholars would ever have heard. The scripts were usually signed 'Myers' or 'Gurney'.

They were fragmentary and apparently meaningless when taken separately, and it was only after it occurred to an investigator at the Society's headquarters to try to fit them together that it was found that the fragments were apparently complementary and that when they were fitted together coherent meanings emerged. Sometimes a clue as to what such a meaning would be was given in one script in advance. Eventually a group of expert scholars, in particular the second Lord Balfour, who studied the scripts over many years, were driven to the conclusion that the elaborate verbal puzzles they contained showed every sign of having been designed by somebody. The question was, by whom?

An intriguing aspect of this story is that the scripts took an enthusiastic part in investigating themselves. For one thing they insisted that the various automatists must not see each other's work, for they claimed that the verbal puzzles the scripts contained had been designed by the surviving Myers and his friends as evidence of their continued existence and power to plan. There was in fact an excellent reason for such a circuitous procedure. During their lives the founders of the S.P.R. had learnt the hard way that to demonstrate survival by means of mediumship – or indeed by any other means – is extremely difficult. For a purported communicator merely to announce his identity is obviously no proof at all. To remind the sitter of past events is little better, for even when the medium could not have heard of them by sensory means, she could, in theory, have discovered them telepathically from any living person to whom they were known. But here, claimed the scripts, was evidence of many complicated designs which were not known to any living person. So where could they have come from except the dead?

The alternatives to this claim seem just about as startling as the claim itself. One is that all the elaborate patterns and interrelationships came about by chance. A second is that investigators such as Lord Balfour, and sensitives such as Mrs Verrall, Dame Edith Lyttelton, Mrs Coombe-Tennant ('Mrs Willett'), and other equally well known and respected figures had got together to perpetrate a long-term fraud, which took a lot of time and trouble and brought them no gain but rather, mockery. A third alternative is that the whole plan might have originated in the subconscious mind of that sternly upright scholar Mrs Verrall, and that over many years she had led a *subconscious* telepathic class of other equally upright women, some of whom she had never met, to make fools, not only of their friends and the public, but also of their own conscious selves. One weakness in this explanation is that the script puzzles went on after her death, when no one seemed to be left with her knowledge of the classics, personal contact with the dead scholars, and interest in the subject of survival, to carry on such an elaborate hoax.

The present position regarding the evidence for survival provided by mediumship appears to be something like this: it is extremely hard to ascribe the best material provided by the best mediums to chance, or fraud, or to information obtained by sensory means and subconsciously remembered. If these explanations are excluded there seem to be two alternatives: either mediums can obtain information from the discarnate, as they themselves believe, or they get it by means of ESP of mundane events, which is more efficient and widely ranging than has ever been observed in other situations and which they then dramatize subconsciously to fit a particular case.

Some aspects of the psychology of mediumship may have been glimpsed in the foregoing sketch of the evidence it claims to provide for survival, but one further aspect should be mentioned as it gives an interesting clue to the oddities and limitations of both mediumistic utterances and certain spontaneous ESP-type experiences. In both cases, information which has not come through one of the known senses appears to have been received at a subconscious level,

The phenomena produced by physical mediums often took the form of materializations, figures which ranged from scarcely visible wisps to fully formed and clothed bodies that apparently grew out of ectoplasm *Above left* The face of Raymond Lodge (actual photograph inset) son of Sir Oliver Lodge, a pioneer of psychical research, appears in the ectoplasm issuing from a medium's nose *Centre* Katie King was a feminine spirit allegedly materialized by the medium Florence Cook *Right* Photograph of ectoplasm exuding from a medium's ear

and it has often been noticed that subconscious material, whether it has originated in an individual's own psyche or has penetrated it from outside, sometimes has difficulty in rising to the surface in a straightforward manner. It seems as if some kind of censorship has to be evaded. A similar impression is often given by dreams. Hence, information which appears to have reached the subconscious in some paranormal fashion from an exterior source, whether mundane or not, is liable to emerge disguised or distorted, or obliquely by means of an associated idea or a symbol. Then it will have to be interpreted, and here both medium and sitter can make mistakes.

Thinking in Pictures

A few examples may clarify the pattern. Take the following case of associated ideas leading towards an item which helped to identify a purported communicator. Topsy, the control of a well-known medium, Mrs Warren Elliot, who allowed her work to be studied by serious investigators, seemed to be groping for the identifying fact that in life a certain communicator had much enjoyed rice pudding. She spoke of India, then of some hot place with dark people, then of palms, then bananas, and finally she said, 'He laughs and shows Topsy a lot of rice. There must be a joke about rice – lots and lots of rice – more rice, never tired.'

Conversely, associated ideas in a sitter's mind may lead a medium along a trail towards no particular goal. After a small dinner, at which three scientists were my fellow guests, a medium who was known to none of us was brought in to demonstrate his gift of ESP. On this occasion he made no claim to communicate with the dead, but merely to perceive images which he left to us to interpret. His first image was of me hastily putting in order a mass of sheets of typescript. This was a bull's eye, for, unknown to anyone present, the day before I had been hurriedly putting together the untidy scattered sheets of the carbon copy of the manuscript of a book, because my publisher had unexpectedly telephoned for a second copy to be sent urgently. From this impression the medium passed on to two incidents mentioned in the book, an old manor house connected with one of them, three pictures in that house, including a Romney, in which I had delighted as a child, and so on. None of these linked items were in my conscious thoughts, but all were correct and there appeared no point in mentioning any of them.

A medium's impressions frequently emerge by means of symbols and these often take the form of visual images, which is natural enough as the subconscious, like primitive man, seems to think in images rather than in the verbalizations of the highly educated. Topsy once deduced, for instance, that a couple had been 'nearly married and then not married', because a communicator had shown her a wedding dress and then let it fall. Similarly one of the cross-correspondence sensitives, Dame Edith Lyttelton, told me that she had become aware of her pianist grandson's death in action by 'seeing' his grand piano covered with a Union Jack.

Mrs Leonard's control, Feda, whose personality, like Topsy's, was that of an artless young girl, said that she got her information in several different ways. She might seem to herself to hear words or other sounds, or to see written words or imitative or symbolic pictures. She said that impressions came more easily in the form of symbolic visual images than in words but, partaking of Mrs Leonard's extreme honesty, she admitted that she often found it difficult to interpret them. She sometimes claimed to have feelings of, say, roughness or coldness. Incidentally, some mediums seem to pick up the type of pain a purported communicator had suffered from in life, and actually experience the pain themselves.

Both the cross-correspondence communicators and Feda's insisted that from their point of view communication with the living was very difficult. Professor Broad has summarized the description by Feda's communicators of the various methods they could use to convey information to her. One was by actually speaking to her, the other by telepathy, and of this, they said, there were several modes. Suppose, for instance, that they wanted telepathically to convey the idea 'horse'. The simplest way was to create an auditory or visual image of the word in Feda's mind; or an image of the horse itself; or a symbolic image of, say, a jockey with a whip. Or they might convey the idea without an image of any kind. One

Voices speaking from 'nowhere' and raps and bangs on floors and tables are other phenomena that have occurred during physical seances *Above left* Ectoplasmic hand produced by Margery Crandon, a famous medium during the 1920s; the controversy that developed around the physical phenomena she produced deeply divided the SPR in the United States *Centre* Mme Eugene Picquart, a French medium, impersonating Mephistopheles *Right* Medium tied to a chair; trumpets and various musical instruments are part of the physical medium's stock-in-trade

of them drew an interesting distinction between himself projecting an idea or image into Feda's mind and her playing the active role and reading his. In that case she might take up some quite unimportant thought which had nothing to do with what he was trying to communicate.

An important factor in mediumship is the relation between individual mediums and sitters. Some sitters evoke interesting material from a medium, others by their chilling attitude will reduce her to a state of numbed inhibition. But even with good sitters, one will stimulate one medium more than another, and another sitter will do the reverse. A third, however open-minded and sympathetic at a conscious level, will never get any results at all. It is as if there were some subconscious interaction between medium and sitter of which, so far, nothing is understood.

Mediumship has received less psychological study than might have been expected, seeing that it is a phenomenon which arises in all cultures. This may be due in part to distaste for the credulity with which much of it is surrounded and to the prevalence of fraudulent and mediocre mediums, and in part to the widespread acceptance today that survival after death is out of the question. Yet, even if that were so, good mediumship would merit study for the interesting sidelights it appears to throw, not only on subconscious levels of human personality, but on subconscious interaction between the living.

ROSALIND HEYWOOD

Physical Phenomena

Throughout history physical events have been reported that do not accord with current scientific notions of what is possible. These events may be classified under two heads: firstly, those that arise spontaneously, appearing to be associated with some definable place, time and circumstances; secondly, those that appear to centre around a person, who is then observed under more or less controlled conditions with a view to inducing further manifestations of a similar character. When the inducement is reputedly successful, the person will be known to psychical researchers as a physical medium, and the effects produced will be described as physical phenomena, usually taking the form of materialization or telekinesis.

Materialization is the term applied to figures, ranging from barely visible wisps to fully-formed and clothed bodies, that are said to grow, sometimes before the observer's eyes, out of a substance known as teleplasm or ectoplasm that allegedly issues from the orifices of the medium; it must be said that it often bears an unfortunate resemblance to muslin or cheesecloth. Telekinesis is the projection of objects through the air without any known force being applied, and the levitation upwards of objects, and sometimes people, sometimes with contact but without upward pressure, and sometimes without any contact at all (see also PSYCHOKINESIS).

Other typical phenomena are raps and bangs on floors and walls, touches from invisible hands, voices speaking from nowhere, writing or objects appearing without explanation (so-called 'apports'), the playing of musical instruments by 'no one', and gusts of cold air. In some cases these manifestations have been combined with other phenomena more typical of spiritualistic seances, as where an allegedly materialized figure purports to embody someone who has died, or where voices appear to speak to sitters through a large metal cone that floats in space, and is known as a 'trumpet'.

Although one of the by-products of the Spiritualist movement has been a massive history of fraudulent mediumship, the second half of the 19th century being studded with materialized figures of dubious authenticity, there have been many cases in which it has been impossible to prove that the medium concerned was guilty of fraud. This would be true of at least some of the effects produced by mediums such as Herne, Williams, Florence Cook, and even the suspect American stage performer, Annie Eva Fay, who was tied to her chair 'with a current of electricity' in the presence of Sir William Crookes (see CROOKES), Sir Francis Galton and Sir William Huggins, all Fellows of the Royal Society. While in this condition, she apparently caused a disembodied hand to rove round Crookes' library handing out suitably chosen books to the sitters in the adjoining room.

Until comparatively recently the question of fraudulent *experimenters* was not canvassed as a possibility, and in the 1920s,

'Return of Charles Dickens'

Spiritualists believe that dead authors have sometimes returned and dictated posthumous works through mediums. One such case concerned Charles Dickens, who died suddenly leaving unfinished his last novel, *The Mystery of Edwin Drood*. Four years later there was published a completion of the story, supposedly written automatically by the medium T. P. James, an uneducated mechanic of Brattlehoro, Vermont. The style was in many ways an excellent parody of Charles Dickens, and though there were passages that were flat and uninspired, there were others that were successful. Spiritualists hailed the 'return of Dickens' with enthusiasm. If true, it was certainly remarkable that an uneducated man could produce such a good parody of the great author's style . . . It so happens that there is some direct evidence to show that the Spiritualist interpretation is unsound. Many years after Dickens's death, a manuscript was discovered containing a later portion of the story of Edwin Drood. This portion does not feature at all in the James version. Moreover, Dickens's intentions as to the end of his story were very definite and well known to his son, Charles Dickens the Younger, and to his illustrator, Sir Luke Fildes. There are many indications in the completed portion of the novel that he was sticking closely to his declared plan. In the James version the plot is rather clumsily changed, and no use is made of various pointers to the solution of the mystery that Dickens had incorporated in the first half of the book.

D. J. West, *Psychical Research Today*

the heyday of vigorous controversy over the reality of physical phenomena, it was only the competence of the researcher that was attacked. If poor observation and inaccuracy in reporting were the only charges laid against the evidence it would be difficult to resist the conclusion that physical mediumship is a fully proven reality, and it is not surprising that the possibility that the experimenter is not a fool but a knave has become entrenched in the modern mind.

It may be remarked that the men impaled on these unattractive twin horns have in many cases been of excellent reputation and sometimes of outstanding quality in their field. Professor Morselli, after his own investigation of the medium Eusapia Palladino, reproached 'scientists who have remained deaf and blind before all the affirmation, not of credulous sectarians, but of serious and worthy observers such as Crookes, Lodge and Richet.' (Sir Oliver Lodge was a Fellow of the Royal Society and Professor Charles Richet was a physician, physiologist and Nobel prize-winner.) It must be fair to say that in no other field of study has the unequivocal testimony of so many witnesses of the highest calibre been discounted and written off as crass stupidity, or worse.

Ghostly Accordion

Rev. W. Stainton Moses, a man of irreproachable character, must be accounted one of the more extraordinary figures in a field where extraurdinary figures abound. He was primarily, in his own estimation, a mental medium; initially he was inclined to speak sceptically about physical phenomena, so he may well have been surprised, after some months of investigation, to find himself levitated onto a table, according to his own report.

He always took the view that physical effects emanated from rather 'low' spirits, but his own experiences, recorded in private notebooks presumably for his own reading, relate a series of miraculous events including direct writing and the passage of objects through closed doors. It seems impossible to believe that his entire life was permeated by a continuous series of deliberate frauds, and a limited form of insanity (not perceived by any of his contemporaries) seems a more acceptable explanation. But if insanity is to be imputed to Moses, then it must also be imputed to Edward Cox, a shrewd and wealthy Serjeant-at-law who was one of the principal witnesses to Moses' mediumship and who seems from his writings and career to have been entirely normal but for the nature of the events he attests.

There exist independent accounts by Moses and Cox (both published in full in *Light*, Spring, 1967) describing a table levitation that took place in the most unlikely circumstances. There are minor discrepancies, pointing to non-collaboration rather than to common invention, but both agree that the two of them were sitting on the evening of 2 June 1873, in Cox's dining room; Cox was opening or reading his letters, and Moses was reading a paper. Suddeuly loud raps came from the heavy mahogany table, which presently quivered, swayed violently, and moved forward. Cox records: 'I then suggested that it would be an invaluable opportunity, with so great a power in action, to make a trial of *motion without contact*, the daylight, the place, the size and weight of the table, making the experiment a crucial one. Accordingly we stood upright, he on one side of the table, I on the other side of it. We stood two feet from it, and held our hands eight inches above it. In one minute it rocked violently. Then it moved over the carpet . . . seven inches. Then it rose three inches from the floor on the side on which my friend was standing. Then it rose equally on my side . . .'

If Moses suffered from delusions, then so obviously did Cox. And so, by the same hypothesis, did Crookes and his wife, for three independent accounts exist, one by Crookes and one by Lady Crookes, of a D. D. Home sitting at which Cox was also present, when a phantom glided across the floor playing an accordion, and deposited it on the floor as it sank into the boards up to the armpits and vanished. When faced with the choice of multiple delusions and accordion-playing phantoms it is tempting to affirm that the phantom is the more improbable. It is worth pausing here to check a fallacy; for whereas the likelihood of apparently sane and competent scientists, lawyers and clergymen having shared delusions can be assessed by reference to normal experience, the likelihood of a phantom materializing (whether musically gifted or not) cannot be assessed in this way. We are here dealing not with the improbable, but with the impossible, and it is notions of the possible that stand to be corrected if there is sufficient evidence.

Returning to matters that can be properly assessed, such as the all-important creditability of the witnesses, the older testimony is at a disadvantage in that it becomes more and more difficult for us to think ourselves back into the state of mind of a person born, like Stainton Moses, in 1839. In more recent times another medium, Kathleen Goligher, who was born in 1898, was investigated extensively during the years 1913 to 1921 by Dr W. J. Crawford, Lecturer in Mechanical Engineering at Belfast University. It must be said at once that Crawford's methods were entirely unsatisfactory, since he worked alone most of the time with a circle composed of the medium and six other members of her family, and in very dim light. In his three books on the Golighers he described the most amazing events in the most phlegmatic style, and resolutely applied plain mechanical principles to the caprices of table levitation. After weighing the medium, and finding that the weight of the levitated table had transferred itself to her, Crawford concluded that 'psychic structures' must emanate from the body of the medium, raising the table by a cantilever effect. At a later stage he photographed something strongly resembling shreds of cloth tied to the legs of the table or the medium. E. E. Fourner d'Albe, a researcher who went to Belfast after Crawford's death to continue work with the circle, put in an adverse report.

The testimony of two witnesses of Crawford's work who later identified themselves, however, is very striking. A letter dated 31 December 1913 from Sir William Barrett, a former President of the Society for Psychical Research, to Sir Oliver Lodge records: 'I have just returned from Belfast and had one remarkable sitting with Dr Crawford and his young medium, a girl of 17 . . . The physical phenomena were amazing, in sufficient red light to see all the sitters with clasped hands sitting round, and some 2 feet distant from a small table, I saw the table rise about 18 inches and made all the sitters hold up their hands which were clearly visible whilst the table remained suspended. Then I was allowed to

South American Press Photo

The belief that a medium's normal personality is replaced by quite a different one when he or she is in a state of trance has been known throughout history. Spiritualists call this a control, and accept it as a discarnate human being who has taken over the medium's body, but in other cultures the control has been regarded as a familiar spirit or a god; a Brazilian medium dressed in the clothes supposedly worn by his control during his lifetime as an Indian chief

go within the circle and try to force the table down which was impossible, I sat on the table and could not force it down. The table then of its own accord turned upside down and I was allowed to try and lift it but it was impossible the top seemed riveted to the floor . . .' Barrett was a difficult man, and was quite unable to punctuate, but it has never been suggested that he was the sort of person to be deluded into thinking he was wrestling with a suspended table.

The other witness, W. Whately Smith (later Carington) was said to be a heavy drinker in later life, and if it seems plausible for him to have had an alcoholic hallucination on the same lines as Barrett's sober report, this may be grasped at as the explanation of his report in the *Journal* of the Society for Psychical Research (Volume 30), describing experiences very similar to Barrett's at a sitting on 9 December 1916. It is difficult to see how Barrett and Carington could have been deceived, but Carington himself sounds a proper note of caution by saying 'I am well aware that a single sitting, however satisfactory, is not sufficient evidence for the formation of *final* judgments, especially on so precarious a subject'.

Another amateur medium operating in Europe at the same time as Kathleen Goligher was Marthe Béraud, also known as 'Eva C'. Eva's usual practice was to sit in a 'cabinet' with a curtain in front of it; when she claimed to have created a hand, or face, or other materialization, from her ectoplasm, she would draw the curtain aside and display her product. This type of mediumship is always open to the gravest suspicions, and it should be mentioned here that the fraudulent medium Laslo, who produced similar phenomena, later confessed that before the sitting he had drawn his faces on gauze rolled in goose fat, rolled it into a small pellet, placed it in the pocket of Professor von Schrenck-Notzing, a leading psychical researcher, and had extracted it in the dark after he had been searched.

Eva's creations gave rise to furious controversy, and there is no denying that they appear fraudulent. Nevertheless, when investigated under fairly rigorous conditions by a somewhat hostile committee set up by the Society for Psychical Research in 1920 (she was stripped, searched, sewn into a catsuit, and had her hands held or continuously watched throughout), she produced phenomena that if not genuine could have been due only to regurgitation of fabric and other materials, combined with a certain amount of skilled conjuring with the teeth.

A white strip a few inches long, which proceeded from one of Eva's thumbs that was under close observation and held by a member of the English investigating committee, tends to lend some weight to the following description by Professor Charles Richet of the materializing process observed in this medium. 'I have also . . . been able to see the first lineaments of materializations as they were formed. A kind of liquid or pasty jelly emerges from the mouth or breast of Marthe which organises itself by degrees, acquiring the shape of a face or a limb. Under very good conditions of visibility, I have seen this paste spread on my knees, and slowly take form so as to show the rudiment of the radius, the cuvitus, or metacarpal bone whose increasing pressure I could feel on my knee.' Richet was a physiologist, and a man of robust mental constitution, whose normality and general common sense can be confirmed by an inspection of his almost life-long correspondence with Sir Oliver Lodge. It is also worth remarking that, like Richet, two other observers of Eva's materializations, Geley and Schrenck-Notzing, were physicians, men trained in observing the processes of the body.

At the same time it must be said that the medical and academic background has not always resulted in meticulously presented reports of flawless procedures. In their account given in the *Revue Métapsychique* (in 1921 and subsequent issues) of sittings with the medium Franek Kluski, Geley and Richet contented themselves with asserting that the medium was controlled from start to finish, and that all possibility of fraud was utterly excluded; but experience shows that whatever the reputation of the informant a mere assertion that he was satisfied by the conditions should not satisfy anyone else.

Drop in Temperature

Some of the most carefully described and well-instrumented experiments were carried out not by scientists but by Mr Harry Price in 1923, and reported in his book *Stella C.*, published two years later.

A number of these sittings were attended by council members of the Society for Psychical Research; and while lying on the floor gazing through the legs of the medium, the Society's research officer, E. J. Dingwall was fortunate enough to see 'a white egg-shaped body beginning to draw towards the centre of the floor under the table . . . To the end nearest the medium was attached a thin white neck like a piece of macaroni. It advanced towards the centre and then rapidly withdrew to the shadow.' The reported phenomena included raps, bangs, flashes, playing of musical instruments, table levitations, and the movement of objects enclosed in a cage or imprisoned under a large chemical bubble, the surface of which remained unbroken.

Abnormal psychology and mediumship are inextricably linked, and there is reason to suggest that there may be a connection between physical mediumship and thwarted sex

Another interesting feature of these sittings is careful reporting on the subject of cold breezes. These are commonly reported at sittings, and have sometimes been thought to be merely subjective sensations. In the Stella C. sittings drops in temperature were recorded on thermometers, and it was found that 'when telekinetic action was particularly strong, the mercury fell many degrees below that recorded at commencement of sittings'.

The sittings took place by the light of 'a 60-watt lamp in an ordinary photographic ruby well-glass,' and Price says that it was possible to see plainly the limbs and features of the sitters. No vestige of fraud has ever been imputed to the medium, who received no payment beyond a rate appropriate to her profession as a hospital nurse and dispenser. The work of Price in other connections has been heavily attacked and, more recently, strongly defended in the *Proceedings* of the Society for Psychical Research; whatever his merits as a ghost-hunter, his work on Stella C. is an important document, and his correlation of temperature drop with telekinetic activity was confirmed a year later by Dr Christian Winther, the Danish researcher, in his experiments with another medium, Anna Rasmussen.

In a series of sittings in strong light, starting in 1922, Anna Rasmussen caused one of a pair of pendulums suspended from hooks and enclosed in glass to move, change direction, accelerate or slow down, independently of the other. In 1924 Winther found, like Price, that there was a paranormal drop of temperature correlating with the telekinetic movements.

The last medium of this 'golden age' is Stanislawa Tomzcyk (the Hon. Mrs Everard Feilding) a Polish medium whose phenomena somewhat resemble those of Nina Kulagina, the only contemporary physical medium known today to have put herself at the disposal of researchers, now being studied by certain Russian and Czech investigators. Mme Tomzcyk caused small objects, such as matchboxes, to rise up into the air between her two hands held some few inches away from the object on either side. Four professors of different nationality were entirely satisfied that this was not done with wires, cotton or hair. On the contrary, they asserted that between her two hands ectoplasmic threads (which were photographed) would materialize, and that these 'rigid rays' supported the levitated objects.

It is, of course, possible for four professors to be not so reliable as they seem. Professor J. C. F. Zoellner, of Leipzig University, published a report in 1887 on sittings with the 'slate-writing' medium Henry Slade, in which he pronounced that he, and three other named professors, were all 'perfectly convinced of the reality of the observed facts, altogether excluding imposture or prestidigitation.' In a report on Spiritualism published later that year, however, it emerged that 'Zoellner was of unsound mind at the time, and anxious for experimental verification of an already accepted hypothesis; another, Fechner, was partly blind, and believed because of Zoellner's observations; a third, Scheibner, was also afflicted with defective vision, and not entirely satisfied in his own mind as to the phenomena; and a fourth, Weber, was advanced in age, and did not even recognize the disabilities of his associates. None of these men had ever had experiences of this sort before, nor was any one of them acquainted with the ordinary possibilities of deception.'

Link with Repressed Sex

Enough is known at least about Moses, Crookes, Cox, Barrett, Carington, Richet, Schrenck-Notzing and Harry Price, to name a few, to know that they were not senile, blind or apparently insane at the time when their reports were made. There is never any answer to the assumption that all psychical researchers are fraudulent, except to point out that up to the moment of death, every important researcher in this field has maintained his belief in the reality of the phenomena reported by him.

Before rejecting the more fantastic reports out of hand, it is worth pausing to consider why researchers, generally anxious to be accepted as sane, careful investigators, put their reputations in jeopardy by issuing reports that are almost bound to be disbelieved. In describing a little materialized woman who danced naked on the palm of her hand before shrinking to nothing, Madame Bisson (the researcher associated with Eva C) apologetically stated that she reported this astonishing thing because it happened.

The question that is prone to stick in the mind is why physical mediumship appears virtually to have died out in the last 30 years, at least in Europe and the United States. The answer given by Spiritualists is that the powers 'out there' have turned their attention to healing, a sphere in which it is almost impossible to be satisfied that any result is unequivocally paranormal.

It may not be too fanciful to postulate that physical mediumship arises as a result of a psychological state common among middle-class persons who passed their adolescence in the early part of the century, but is not commonly found among later generations. Abnormal psychology and mediumship are inextricably linked, and there is some reason to suggest that there may be a connection between physical mediumship and sex. In days when it was quite possible for an adolescent to be ignorant of sexual matters that today would be common knowledge among primary schoolchildren, the young may have suffered unexpressed terrors, anxieties and feelings of guilt that had to find expression in some abnormal manner. If this is a well-founded speculation, it might account for the rarity of this form of abnormal expression in these days when the young are encouraged to bring out into the open problems that might have been thrust down into the darkest corners of the mind earlier in the century.

MEDMENHAM MONKS

THE NOTORIOUS SOCIETY commonly known as the 'Hell-Fire Club' which met at Medmenham Abbey in Buckinghamshire, and perhaps afterwards in the High Wycombe caves, resulted from the meeting of several eccentric minds; but it was also very much a creature of its century. If Satanism was indeed practised by members of the club this was not unique in 18th century Europe. The Age of Reason was also the age of shadows: beside the logical discourses of the philosophers babbled less reputable speculators on man and the universe.

The 'friars' who gathered in the judiciously ruined abbey erected beside the Thames by Sir Francis Dashwood came from the highest reaches of society, and were in one sense merely carrying on the traditions of the early 18th century Hell-Fire clubs of London, with which they have been confused. Such clubs had specialized in the choicer aspects of blasphemy: Philip, Lord Wharton, who was President of one of these societies in 1720 was known to call in London taverns for a 'Holy Ghost pie'. But at Medmenham the debauch was more tasteful, ordered in the Italian fashion then in vogue, and spiced with Devil-worship. The prime movers in the Medmenham brotherhood were all rakes, aesthetes, and politicians; their Satanism was conducted in the most elegant surroundings. Inspired by fashionable visions of gloom, decay, bats and ivy-covered walls, Dashwood had leased Medmenham Abbey and made such alterations – cloisters and a ruined tower among others – as would turn it into his personal palace of delights.

Dashwood found one half of his inspiration in his debauches with a friend of his, Lord Sandwich; the other came from the notably odd personage of George Bubb Dodington. Born plain George Bubb, this gentleman had inherited a large fortune and an ambition to rise in the world. His capacity to fawn and ingratiate himself was matched only by his talent for appearing ridiculous – most notably when he burst his breeches kissing the hand of Queen Charlotte. In the Jacobean house at Hammersmith in London which he named 'La Trappe' after the great Cistercian abbey at Soligny la Trappe in France, Bubb held court: his guests were known as 'monks' and would sometimes dress up in monastic habits.

To this house came Dashwood, who was obviously inspired by the surroundings and atmosphere; here also came others who were to foregather at Medmenham: Paul Whitehead, who had escaped a life of debt by marrying a rich and ugly half-wit; Thomas Potter, the rich son of the Archbishop of Canterbury, whose debaucheries quickly reduced him to a scurvy-ridden, gouty and palsied wreck, whilst leaving his considerable intelligence unharmed; and Potter's friend, George Selwyn, who had a habit of attending executions disguised as an old lady. Bubb, Dashwood, Sandwich, and Whitehead were all connected with the Opposition party in the House of Commons, as was another member of the Medmenham group, the Marquis of Bute.

From 1750 until 1762 these public figures gathered in Sir Francis Dashwood's ruined abbey for a fortnight each June. With several of the local gentry, they formed a 'Superior Order' of 12, each with an adopted name; Dashwood was 'St Francis'. There was also an 'Inferior Order' of 12, composed of guests and neighbours who were not allowed to take part in the special festivities of the brotherhood.

Only members of the Superior Order were allowed to enter the chapel of Medmenham, where pornographic pictures and parodies of conventional church furniture provided the setting for a rather rudimentary form of Satanic ritual. A new member of the brotherhood might indeed be baptized to Lucifer, and the orthodox liturgy mocked; but how far the ceremonies went in their 'Satanic' practices cannot be discovered.

'Divine Milk-Punch'

The escapade lasted for 12 years until the notorious John Wilkes decided to expose the whole apparatus of secrecy surrounding Medmenham. Wilkes, famous for his championship of the mob, had perhaps been less acquiescent than most in the Satanic ritual of 'St Francis'. One day, into the middle of the Satanic ceremony bounded a devil in very truth, and fastened on to Sandwich, who fell to the ground screaming for mercy. It proved to be an ape, which Wilkes had concealed in a box whose gate he could open with a string; the beast had been equipped with horns and a long black cloak.

Whether or not this encouraged enmity between Sandwich and Wilkes, by 1762 the majority of the Medmenham monks were in political power, with Wilkes and his friend Charles Churchill, also a member of the brotherhood, on the other side of the fence. Bute was Prime Minister, the impossible Bubb Dodington was in the Cabinet, and Dashwood was Chancellor of the Exchequer. Wilkes and Churchill exposed the Medmenham proceedings in an issue of the *North Briton*. Medmenham was now an object of curiosity and could no longer be used; and the brotherhood was in any case dispersing. Dashwood tried to resurrect the festivities in the caves under Wycombe Hill, on top of which he built a most secular church, complete with wine bins and surmounted by a golden ball in which he would sit with a bottle of his 'divine milk-punch' and roar parodies of the Psalms.

But age wearied the appetite of the company for diversion; death pruned their numbers. Bubb Dodington died falling down his own stairs. The ghost of Paul Whitehead, former steward to the brotherhood, appeared at West Wycombe Park to presage Dashwood's own death. 'St Francis' was no doubt unconcerned: one of his last acts before he died in 1781 was to publish an abbreviated edition of the *Book of Common Prayer* in collaboration with Benjamin Franklin the American statesman and scientist. His Satanism was in any case more a matter for the sexual pathologist than for the priest.

Behind the old Melanesian way of life, with its headhunting, cannibalism and human sacrifice, was belief in the supernatural power known as mana; even today, magical ways of thinking have survived the islanders' contact with 'civilization'

MELANESIA

A GROUP of Pacific islands lying south of the equator, Melanesia includes New Guinea and Fiji, and the Admiralty, Solomon, Santa Cruz, New Hebrides, New Caledonia and Loyalty islands. In this area it is possible to pass, in not much more than an hour's flying time, from a centre where most traditional beliefs have been discarded for a generation or more to an outpost among people whose life has been only superficially influenced by contact with Europeans. In discussing the Melanesians, therefore, it should be remembered that the use of either the past or the present tense can be misleading: what is true of one section of a tribe may no longer be true of another.

When first seen by Europeans the Melanesians were at a cultural level equivalent to the Neolithic period of Europe. They used tools of stone or shell, finished by grinding, and most of them still live by gardening, growing mainly tropical root crops. Social and political units are usually small and democratic, hereditary chieftainship being unusual, and warfare was endemic. This general cultural uniformity accompanies an extraordinary diversity in language and considerable physical variation, reflecting a complex ethnic history.

Afterlife Inside a Shark

Their world is thickly populated by spirits, which are everywhere, in trees, river pools, in the sea, in animals, and which affect human life at every turn. They are of two kinds: the ghosts of the dead, and spirits that have never inhabited human bodies. There is no concept of great gods in charge of activities such as fishing, craftsmanship or war, still less of an ultimate Creator. Religion is a strictly practical matter and consists basically in making contact with a spirit who will befriend and help a human. The two sorts of spirits exist side by side, but their relative importance varies. Ancestral ghosts are always venerated, though in some parts it is the spirits of non-human origin that have the real importance. But spirits can move from one group to the other, for after a time the human origin of a powerful ghost may be forgotten.

In the central and southern Solomon Islands important ghosts, called *tindalo*, often enter an animal, and the place associated with the creature becomes sacred. A man may announce during his life what creature he will enter, sharks being especially favoured. A notorious man-eating shark may become associated with a famous ancestor, and a man who escapes from it will be thrown back out of fear and respect for the spirit. Sea spirits are believed to shoot the living with magical arrows in the form of flying fish, and a man struck by a fish as it skims above the surface will therefore be likely to die. On the other hand sea spirits send shoals of bonito (a fish which is an important item of diet) and help the living in other ways. For this reason, in the Solomon and Santa Cruz groups figures of ancestral spirits often have some attributes of fish or are depicted holding them.

Spirits are much concerned with the observance of custom, any breach of which angers them and brings misfortune to the people. The fear of such consequences forms the sanction which upholds native morality and the delicate balance of society, and its breakdown has been one of the most unfortunate results of European contact.

At the basis of Melanesian religion and magic is the concept of *mana* (see MANA), supernatural power which has been compared to a charge of electricity; although it can be controlled and directed to human ends it is always dangerous. Inanimate objects can have it, possession of it being indicated in many cases by an unusual appearance or quality. Men too have mana: outstanding success or exceptional force of personality prove that it is present. This power, however, always derives ultimately from a spirit, at least in eastern Melanesia; it seems to do so less clearly in New Guinea.

The belief that mana can be transferred helps to explain three practices which occurred widely though sporadically in Melanesia: headhunting, cannibalism and human sacrifice. Headhunting often seems to be connected with the notion of acquiring mana from an enemy group. The Marind-anim of southern West Irian (Indonesian New Guinea) believe the capture of a head to be necessary before a boy can be given his adult name, though on the other hand the peoples living near the estuary of the River Fly, not far away in Papua, state that the head is regarded merely as a trophy (see also HEAD). Cannibalism seems to have a similar ritual basis, not always acknowledged; but the fact that peoples as far apart as the Kukukuku of New Guinea and the Fijians believe that it is dangerous to handle human flesh, and used special implements when eating it, shows that it is not regarded merely as another sort of meat.

Human sacrifice was less general. Where it occurred, as in the Solomons and the New Hebrides, it was usually connected with an occasion on which mana was required, such as the launching of a war canoe or the performance of the culminating ceremony in a great cycle.

An object which is dangerous because it has mana is taboo. The place associated with a spirit is therefore taboo, or a chief, by virtue of his mana, can impose a taboo on the produce of a garden or the use of a certain path.

Except in Fiji there are no orders of priests. A man who has a special relationship with a powerful spirit may profit considerably from the demand for his services, but he continues to lead a normal life as a gardener, fisherman or craftsman. An important element in his expertise is often a knowledge of the correct form of words to use in invocation of the spirit; and in connection with the invocation small sacrifices or offerings are frequently made.

Masked Spirits

In most parts of Melanesia there are, in addition to such personal approaches to individual spirits, ceremonies in which the whole community participates. These are often to honour a group or class of spirits. Among the Elema at the head of the Papuan Gulf such ceremonies formed a cycle which took years to complete. Masks of painted bark cloth represented the spirits, and the celebrations included feasting, drumming and dancing. The people of northern New Ireland periodically perform

Melanesian religion consists basically of making contact with spirits who will help and befriend humans; the approach may be a personal one made by an individual, or ceremonies may be held in which whole communities participate ***Facing page, left to right*** **Ancestral tablet or board found in a men's cult house in the Papuan Gulf region: ghosts of the ancestors are always venerated; New Guinea cult figure: ceremonial dancers hold these in their hands; ornament for a canoe prow, representing a guardian spirit: malanggan, an elaborate carving used in ceremonies held in honour of the recently dead** ***Above*** **Chimbu man wearing a feather headdress takes part in a ritual dance before visiting a pig-killing ceremony** ***Above right*** **Carved and painted figures representing clan spirits, in a men's ceremonial house in New Guinea**

ceremonies in honour of the recently dead, for which elaborate masks and carvings known as *malanggan* are prepared.

Masks representing spirits are made in many parts of Melanesia. Their significance, like their style, varies from place to place. Often they are worn only by initiates and may not be seen by others. Women and uninitiated boys sometimes believe (ostensibly, at least) that the masked figures are in fact spirits, or that the sounds of special instruments such as bamboo flutes are their voices. The men, though conscious of the deception, yet feel a mystical identification with the spirits which they represent.

Initiation rites are widespread. In some places initiation is undergone by all boys at a certain age, usually about that of puberty. In others there is a series of ceremonies. The rites admit boys into the responsibilities and privileges of manhood. The secrets of the cults and of the cult objects are revealed to them, the myths are recounted, food taboos may be lifted, and where the men's house is an institution boys move to it and leave the company of women; for there is often a feeling that femaleness is dangerous to men. The rites often include physical ordeals, such as circumcision, the piercing of the nasal septum (the cartilaginous division of the nose) and beating with stinging or thorny plants. In parts of eastern Melanesia initiation is not automatic. It may be by purchase, and then confers privileges. Sometimes the initiate is regarded as being ritually reborn, and his rebirth may be enacted.

Though in principle the distinction between religion and magic may be clear, in practice it is apt to become blurred. The Rev. R. H. Codrington, a missionary in eastern Melanesia a century ago and a very acute and accurate observer, has discussed the way in which a prayer, the outcome of which is uncertain, merges into a spell (a magical procedure) when it is believed that the words automatically produce the result. Magic permeates Melanesian life, and belief in it is very persistent, surviving conversion to Christianity and even a high degree of sophistication.

Magic is white or black – good magic or sorcery – but here too the distinction is not always clear. Harmful magic directed against a fellow-clansman is bad, but directed against a man of a hostile tribe it is wholly admirable. Sorcerers are greatly feared. Their methods vary in different parts of Melanesia. As a generalization it is probably true to say that the sort of magic which depends on obtaining some substance closely connected with the victim – nail parings, excreta, a morsel of food – is more typical of eastern Melanesia. A form widely feared in the northern parts of Australian New Guinea is called, in pidgin, *sangguma*. It is believed that the sorcerer has the power to introduce a sharp object into the victim's body without leaving a visible wound. The Tifalmin, near the source of the Sepik River, believe that the sangguma men – always from another tribe – shoot their victims with magical arrows. If the arrows are not removed by an expert, who works by manipulation and massage, the victim dies. In the Banks Islands a length of bamboo was filled with magical ingredients, including a relic of a dead man, and directed at an enemy, the end being covered with a thumb until he came into view. Codrington relates instances when the wrong person crossed the line of fire.

White magic can serve many purposes: healing, promoting success in important activities, averting or bringing rain. Healing procedures can be, from a European viewpoint, both medical and magical. The Tifalmin massage a painful place with the flat bone of a river turtle which is found only at lower altitudes. The bone is a magical object, and the treatment is accompanied by

Left **White magic in Melanesia can serve many purposes, such as promoting success in important activities, bringing rain, or healing the sick; from a European point of view healing procedures can combine both medical and magical elements: witch-doctor treating a patient** ***Right*** **Cult house decorated with magical objects including chains, tassels and the figures of birds**

muttered spells, but clearly the massage itself may be beneficial. Every Tifalmin man possesses charms which bring luck in his activities. Nearly all are obtained by trade with peoples who live in the foothills. These charms are of kinds which do not occur in the Tifalmin valley: fossils are in great demand, and also bones of animals not found in the mountains. The power of the dead is illustrated by the practice of temporarily burying in a garden, to ensure a good crop, the jaw bone of an ancestor who was a famous gardener.

First Men Resembled Pigs

The differences in belief and in social and political structure between Melanesia and Polynesia are reflected in their mythologies. Some resemblances to the Polynesian system can be traced in eastern Melanesia, but Melanesian myths contain nothing similar to the creative activities of the Polynesian pantheon (see POLYNESIA). It is true that certain heroes of the Banks Islands and the New Hebrides – Qat and Tagaro – stand head and shoulders above the minor spirits.

According to one account Qat at first made men and pigs in the same form, but later made pigs go on all fours and men upright to distinguish between them. In another he made men and women of wood and brought them to life by dancing in front of them. But Qat himself had a mother and companions. Tagaro resembles Qat in many ways. He is probably the Polynesian god Tangaroa adapted to a Melanesian cosmogony.

There are some resemblances between Melanesian and Australian views of the origin of things, but their significance should not be over-estimated. Like the Australian aborigines, many Melanesians believe in a time before men existed when supernatural beings were active, often forming the natural features seen today (see AUSTRALIA). Totemism, so highly developed in Australia, is more vaguely conceived in Melanesia, but there are many traces of it.

Many stories concern the origin of men. In some New Guinea myths the first people came out of a tree or from the ground. Sometimes the 'first man' finds women on earth, or stories of the 'first people' refer to other people apparently already existing – an inconsistency which does not worry the tellers, for the myths really explain the origin of a clan or a tribe rather than of all mankind, a reflection of the fragmentation and isolation of many Melanesian groups. Peoples living as far apart as central New Guinea and the Solomon Islands have stories of descent from snake-ancestors, or from women who married snakes.

Myths concerning the release of the sea from the ground and the separation of the lands are widely-spread. Often the sea burst out as the result of the foolishness, curiosity or greed of someone who failed to do as instructed.

A number of stories centre round the origin of death, for it is widely believed that at one time people lived for ever. A common group of tales, current as far apart as New Britain and the New Hebrides, tells that once people sloughed their skins when they grew old, and appeared young again. For various reasons a woman re-assumed her old skin, in one version because her child did not recognize her and cried; since then people have died.

It is believed everywhere that the soul or spirit survives after death, though it may be only for a time. Usually there is a land of the dead, on a distant island or mountain or under the ground, and there is often a prescribed route which the dead must follow. Commonly they have to pass a spirit guardian who tests them in various ways. If they fail to satisfy him or outwit him they may be destroyed and cease to exist.

The destination of the dead does not depend on their moral conduct during life. There is no equivalent to heaven and hell. What matters is the performance of rituals by surviving relatives, the observance of custom, the status of the dead man. If he was a great warrior, an orator, a leader, people will remember him and will call on him for help, and he will survive in the spirit world. If he was a nonentity in life he will be a nonentity after death and will

Axel Poignant

Axel Poignant

soon disappear. In Malaita the ghosts of such people turn into ants' nests which are eaten by the great ghosts, but when those latter are finally forgotten they too turn into ants' nests and are eaten.

Consumer Goods from Spirits

No account of Melanesian religion would be complete without some mention of 'cargo cults' (see CARGO CULTS). Such cults have arisen all over the world but they have been more fully recorded, and perhaps more common, in Melanesia than elsewhere. They seem to arise when contact between a higher culture and a simple one has been too sudden, and the influence of the former too powerful, for the latter to assimilate and adapt to changed patterns. The cargo cult is in the nature of a counter-attack, an assertion of native pride and values against the intruder, but incorporating acquired knowledge and ideas.

The wealth and power of Europeans proved that the Christian god was a more powerful spirit than any native one, and many Melanesians were converted because they believed that they would then share the good things which Europeans had in such abundance. They were disappointed. Few consumer goods are manufactured in the islands. Europeans, as Melanesians saw them, did no work but received inexhaustible supplies of goods which came by ship or later by aircraft (hence the term 'cargo'). It seemed obvious that these goods were sent by the spirits. But why were they sent only to Europeans? Because Europeans had by some means obtained control of goods which were meant to be shared by all. Old myths adapted, or new myths based on old beliefs, sometimes provided explanations of how this could have happened.

So prophets arose, preaching that the people should have their fair share of the riches provided by the spirits or the ancestors, and telling what they should do to obtain them. Many have been men with some mission education, or who have served as policemen or plantation labourers. Many cults owe much, at least superficially, to Christianity. They have taken various forms. Sometimes customary law has been deliberately set aside. Property has been declared common, sexual restrictions abolished, traditional leaders ignored, sacred objects destroyed. Pigs have been killed and gardens laid waste in expeetation of the imminent arrival of a 'cargo'. Ecstatic possession, speaking with tongues, and visions have been common features. There has been some violence, but little loss of life. Undoubtedly mass hysteria has been a major factor, and undoubtedly certain men have manipulated the movements for their own ends, but the sincerity of most of the adherents cannot be doubted.

'Marching Rule'

Inevitably some cults have had a political content. The 'Marching Rule' of the Solomon Islands, which arose after the war as a direct result of wartime disruption (though it has its origins in earlier cults), became a nationalist and revolutionary movement which nevertheless retained millenarian elements. For a time it controlled large areas.

Taking a long view, these cults can be regarded as the growing pains of a new form of Melanesian society. From a shorter view, they reflect an unfortunate insensitivity on the part of some Europeans to the feelings of peoples whose world has collapsed around them. Perhaps the fact that there has not been more violence speaks well for both parties. (See also NEW GUINEA.)

Mendicants

Holy beggars: from the Latin verb *mendicare* 'to beg': in Christianity, certain orders of Friars who live solely on alms; they are sometimes known as Begging Friars, and include such orders as the Franciscans, Augustines, Carmelites and Dominicans; they take a vow of absolute poverty, renouncing all possessions and refusing to handle money.

Samuel H. Kress Collection/Portland Art Museum

Mennonites

A Protestant sect, originating in German-speaking parts of Europe in the early 16th century; named after its founder Menno Simons; many of its followers were forced by persecution to seek refuge in Russia, and later in the United States, Canada and South America; a pacifist sect, they follow the simple principles of the Bible and practise adult baptism; the Old Amish, a branch of the Mennonites, still retain many 17th century customs and mannerisms.

Dr H. Hack

MENSTRUATION

BELIEFS in the harmful potency of a menstruating woman are common in one form or another all over the globe. In country parts of Europe to this day, girls are taught by their mothers not to attempt to make mayonnaise or jam during menstruation, for it is thought that the eggs will certainly curdle and the jam refuse to set. In the Kasai, a part of the Congo, a woman believes that if she were to enter the forest during her monthly period, the men's hunting would fail. Even more widespread in Africa is the idea that at such times a woman must not stir the cooking pot or poke the fire, lest any one eating the food cooked on it fall ill. These are straightforward magical ideas, and should be interpreted like other magical ideas which suppose that normal bodily states are dangerously contagious.

When dangerous magical powers are supposed to inhere in the body, it is usually not difficult to recognize the deep concerns which the beliefs underline. If contagious magic is associated with the reproductive functions, it is very likely that sexual relationships are the object of concern. Since there are very few societies in which there is no attempt to regularize sexual behaviour, so there are very few in which menstruation is not surrounded with magical beliefs. The onset of puberty opens the period of sexual maturity. Menstruation is the sign that a girl has reached the age of child-bearing. Wherever people attach importance to having children, their interest is naturally focused on physical maturity. We may like to think that the treatment we give to physiological puberty is entirely scientific and objective, but much of it is purely ceremonial, intended to teach the child her adult role and to impress her responsibilities on her mind. In the same way the female puberty rituals of tribal society, together with their magical ideas, are all part of the local feminine mystique.

Women who read this may remember the secrecy and embarrassment with which this particular fact of life was revealed to

them. They may even have wished that they could have grown up in the carefree innocence of a primitive society where bodily functions are taken naturally. In practice, they would have to pick their tribe carefully. There are some which make no celebration of a girl's coming to womanhood. Others have very uncomfortable arrangements, some stressing the dangers to the girl, others turning the event into a long and difficult session of lessons and examinations. The private instruction of European mothers might come somewhere near the middle of a scale we might draw of tribal reactions which can vary from joyful congratulation, through solemn teaching to intense preoccupation with danger.

People's ideas about menstruation are part and parcel of their general ideas about how the relations between the sexes should be governed. If they take a very relaxed attitude to premarital sex and to family size, they are not likely to think of menstruation as dangerous. For if no one minds one way or the other whether the girl is going to bear her husband a male heir, have many children or none, or have them in or out of wedlock, why should they bother to make first menstruation into a chance for sex education? These people are not going to hedge menstruation around with magical rules to underline the solemnity of the event. But tribes whose laws of property and status turn rigidly on the well-defined married state treat the puberty of girls as being a very serious matter.

When menstruation is celebrated as a big public event it is usual to make an initiation ceremony for several girls together. It is impossible to fix a date for the initiation of several girls at once which coincides with the actual time of first menstruation. So collective puberty rites for girls tend to be before or after their physiological puberty,

Menstrual blood is widely believed to be extremely powerful, and in many primitive societies the blood from a girl's first menstruation is thought to be able to ensure fertility in barren women. The first menstruation is an important social event as it marks the emergence from puberty into womanhood. Here, young girls among the Amaaiura Indians of Brazil celebrate their puberty in formal dances.

University Films

and if the rite is not held every year then big girls who were not ready last time and much smaller girls who are holding it in advance will all go through the rite together. Very often the ceremony includes a mock marriage with a ceremonial bridegroom who is not necessarily the future husband of the girl.

Through large parts of Central Africa puberty ceremonies are held in this way for the training of girls. Audrey Richards, in *Chisungu,* describes how older women of the Bemba tribe enjoy the authority and respect of being instructresses. They put the girls through a series of tests which read like Victorian parlour games. The girls must be still without moving, or crawl through hoops or hop over logs, or drink beer from a hole in the ground. They make clay models of proverbs about the lazy wife, the good cook, the early riser, and so on. The girls learn about the dangers of adultery, especially the magical risk to small children who have eaten food cooked on a fire contacted by either an adulteress or a menstruating woman. The fiancé of each girl stands by, and receives congratulations on her performance. This tribe has a system of matrilineal succession. Women and their daughters and daughter's daughters are expected to be the steady core of the village population. The existence of the village depends on their being able to attract and hold their husbands. A public initiation both teaches and advertises the new generation of women in the village and gives everyone a chance to praise and flatter the young husbands who will be its mainstay.

Among the Nayars of Malabar in south India, girls' initiation and ritual marriage before puberty were part of the high caste Hindu tradition of early marriage. Each Nayar lineage had partner lineages which helped with each others' girls' puberty rites, providing 'husbands' for the girls. The ceremony expressed the partnership of the lineages by tying the girl and boy together in a marriage bond which was ended with the end of the ceremony. After this the little girl counted as a mature married woman. None of the magical dangers or social disgrace of premarital sex could fall now on her kin through any subsequent sexual liaisons (so long as her lovers were of suitably high-caste birth). The Nayars were a powerful, rich warrior caste and men spent much of their manhood on military service. The Nayar girls never married again so formally as on the day of their puberty rite. They were free to take lovers (or husbands, depending on how you define their relation) and to dismiss them, to keep one or several at a time. All their children traced descent through their mother and the social role of father was almost non-existent. At any given time, the home contained these women, their female children, and young boys in training for military service. As to men, there would also be soldiers on leave, and old men retired from fighting were in charge of political, financial and other affairs. In a system so well-adapted to specialized military functions, the puberty of girls was made the occasion of cementing alliances between Nayar lineages and paying tribute to Hindu ideals of female chastity.

These two examples show what a wide net we should cast to understand attitudes to first menstruation. The social structure sets the pattern of dominant concerns. If these relate to sex and marriage, we can be sure that they will be given some expression in current beliefs about human reproduction. We must examine the social structure minutely before we can interpret people's beliefs about menstruation.

A Symbolic Language

Reproductive disorders have their physical causes. They also can have psychosomatic causes. That is to say, with humans at least, the reproductive system is very sensitive to psychological states. Menstrual disorders (such as excessive loss of blood, continuous menstruation, or a total stop in menstruation) are often a response to emotional shock or tension. Tribal societies which publicly celebrate a girl's coming of age have refined for themselves a set of symbols for thinking about women's personal attitudes to their role. Among the Ndembu, as Turner relates, there is no shyness about bodily secretions. When they celebrate a girl's first show of blood they contrast menstruation with the blood of childbirth: the first is barren, the second fruitful. Female loss of blood is again contrasted with male blood-shedding, the dangerous deed of homicide, the noble act of killing game animals in the hunt.

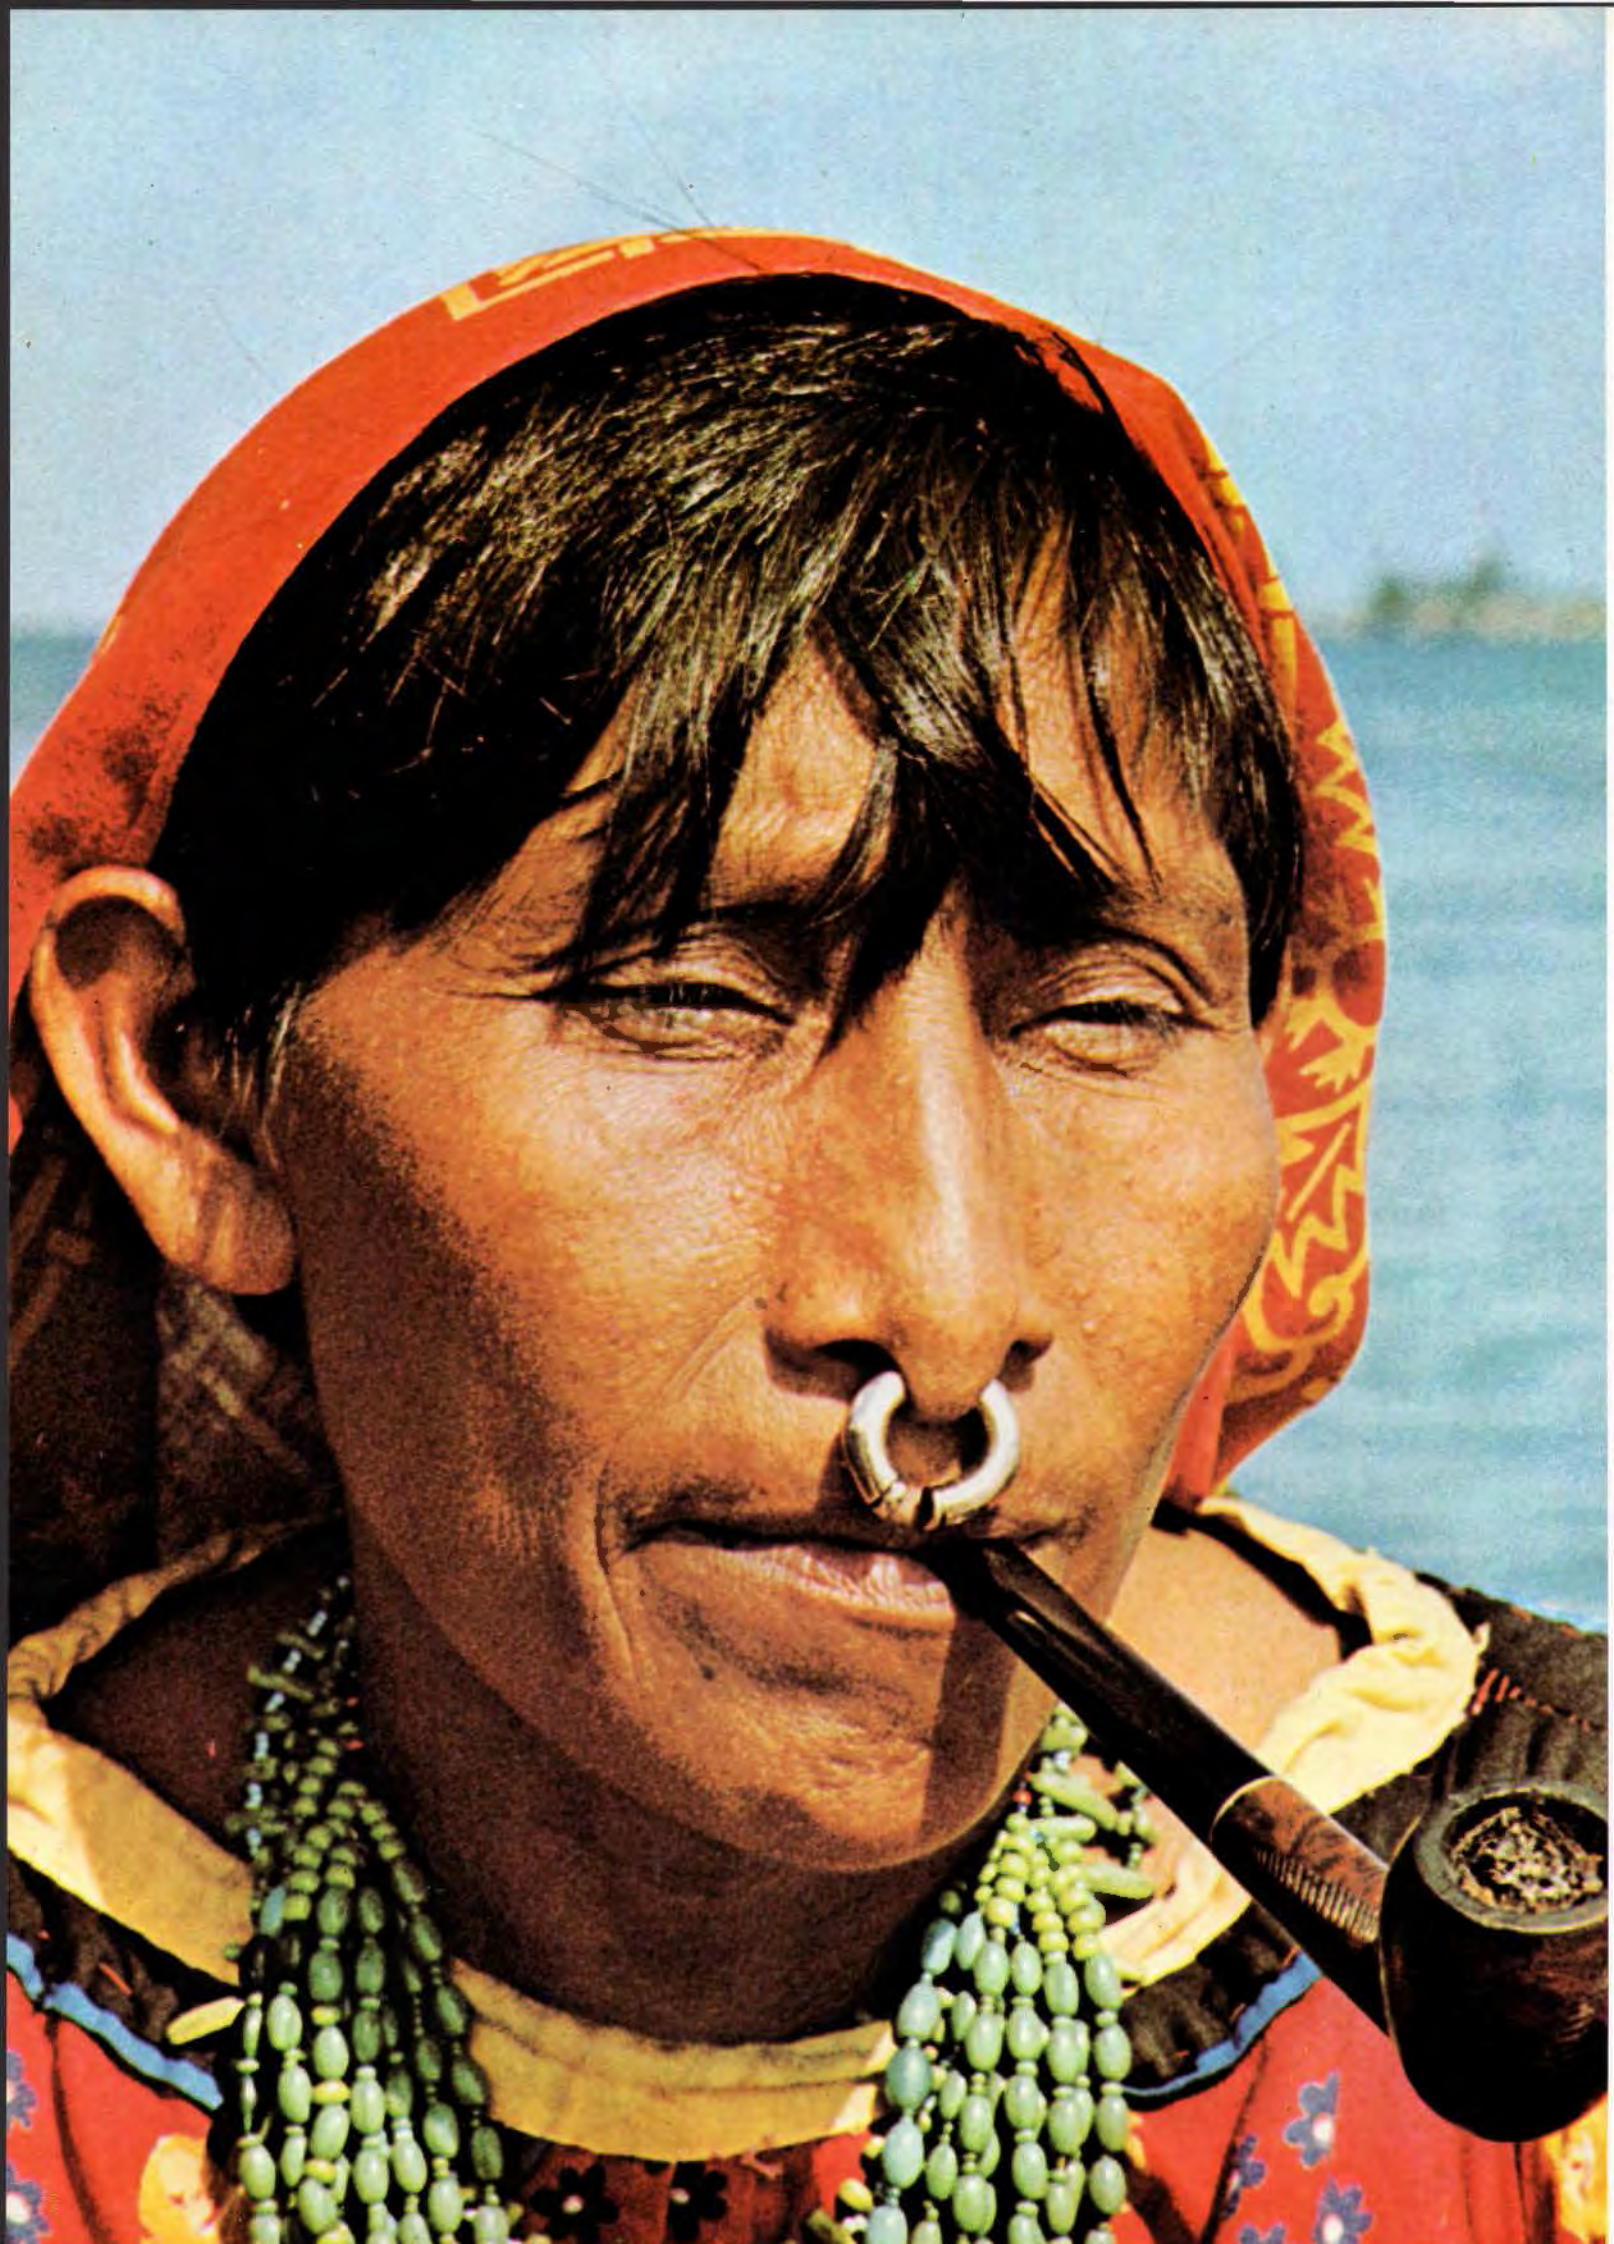
With these four kinds of red blood and their different associations, the Ndembu philosophers develop a complex pattern of good and bad symbols in which red blood can be variously combined with white milk and semen, or black bile. Starting from the body and its juices they spin out a theory of the universe according to the three colours, white, red, black. In the inanimate world there are red clays, white clays and black earth. In vegetation there are trees which have red gums, milky saps and charred black wood.

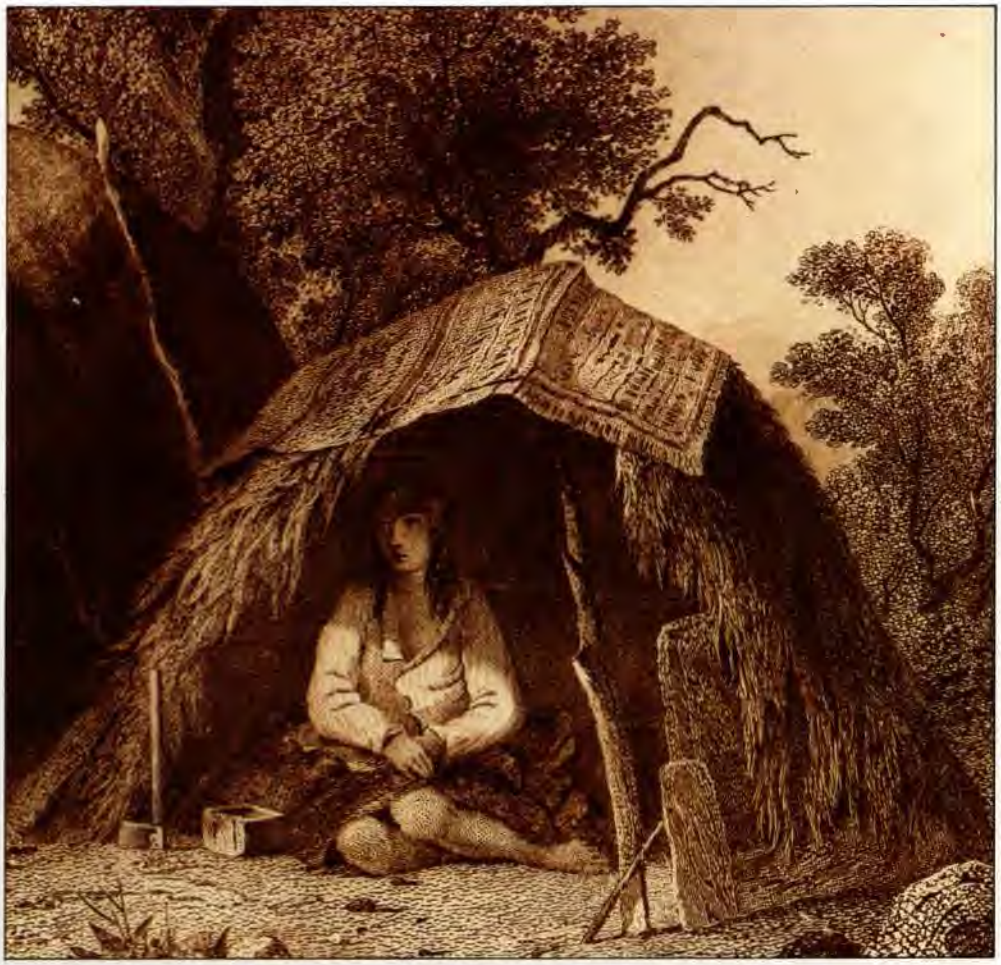
From these symbols they develop a medical dictionary, as it were, which enables them to make a very expressive ritual for almost any personal event. Everyone witnesses these ceremonies, everyone knows the dictionary meanings. Then if a woman is barren and they think she needs to change her whole attitude to her marriage, the symbolic language is there to hand. The ritual for curing barrenness consists in making red and white signs over the patient.

John Moss

Left **Much of the ritual surrounding a girl's first menstruation is purely ceremonial, and is intended to teach the child her adult status and to impress on her the responsibilities of womanhood; puberty rites vary from ceremonies that emphasize the potential dangers of the girl's new status through occasions for solemn instruction to joyful celebrations: dancers in the Aruana puberty dance in Brazil wear masks expressive of fertility** ***Right*** **Menstrual blood is sometimes regarded as useless and even sinister in contrast to the blood of an animal killed in hunting or as a sacrifice: goats sacrificed by the Bhil tribe of India**

Navroze Contractor





Left The onset of menstruation means that a girl has reached the age of child-bearing, and in parts of the world this important development is marked by a change in costume and appearance; among the Cuna of the Republic of Panama girls have their hair cut short and wear a gold ring in their nose after their first menstruation *Right* American Indian women were isolated in special huts during menstruation and men were forbidden to have contact with them: illustration from *The Redman of America* (1856)

She is dressed as a man, given the red feather of a chief, made to dance the hunter's or homicide's dance. The wrong kind of red blood tells her that deep inside herself she is rejecting her female role. The right kind of red blood, the blood of childbirth is needed, not menstrual blood month after month. Such a ceremony, when the patient fully understands the symbols used, and knows how to relate them to her problems, is likely to be effective in certain menstrual disorders, where our own doctors are at a loss to prescribe.

Roman businessmen formed societies in honour of their patron, Mercury, which were not unlike the Rotary Clubs of today; in astrology, those born under this planet often display the quick-wittedness and glib plausibility which are the salesman's stock-in-trade

MERCURY

THE NAME of the Roman god of trade derives from the Latin words for 'goods' and 'payment'. His worship thrived at the meanest level among tradesmen and shopkeepers. Unlike many Roman deities, he enjoyed no great state cult and priesthood. From first to last Mercury quickened business and fostered general prosperity. The Roman god of commerce was likened to the Greek Hermes who made him a literary gift of many attributes unknown to the Mercury of the true cult.

Rome's only temple for Mercury was dedicated in 495 BC on the Aventine Hill; its foundation accords with the major religious event at the beginning of the Roman republic. The Aventine region and its cults were especially important to plebeian politics. A famine in 496 was followed by the dedication of a temple on the Aventine to Ceres, Liber and Libera in 493. Although the trinity bear Latin names, they are in fact the Greek Demeter, Dionysus and Kore (see DEMETER; DIONYSUS; PERSEPHONE), honoured with a temple built by Greeks and paid for with Roman money at the instance of the Sibylline Books of Destiny which contained the ecstatic utterances of the Sibyl, and which were a constant source and inspiration of Greek and Etruscan religion to the Romans.

Sometimes it is assumed, perhaps correctly, that Mercury's temple belongs to the influx of Greek religion and that it rose before the others in hopes that trade rather than growth itself, Ceres, might have alleviated the dearth of grain. Whereas the temple to the trinity was destined to become an important religious and political centre for plebeian political aspirations in the face of patrician exclusion, Mercury's solitary temple never acquired great glamour despite its obvious popularity.

Every May, on the anniversary of its

R. Cundy

founding, the temple became a meeting place for Roman merchants. Like many another club this guild met the businessmen's need for a religious association and for an expression of solidarity. (Craftsmen met under the protection of Minerva and had their own guilds.) The month of the dedication and the annual meeting seem purposely chosen to honour the Greek Hermes' mother, Maia. Since the Roman Mercury had no such mother, the Roman state and its merchants were apparently influenced in worship by Greeks, even down to mythological details.

The temple and its cult were entrusted to a board of *Mercuriales* who were drawn from the second rank of society, in contrast with the social eminence of other Roman priests. In two cases membership on this board was combined with membership on the board of *Capitolini*, who were in charge of the Capitoline Games held in honour of Jupiter (see JUPITER). One man boasted that he was the elected leader of the Capitolini, Mercuriales, and the residents of the Aventine district; this priest had made his career first in the Roman army and later in the lower rungs of the civil administration under Augustus.

Clubs of Mercury sprang up wherever Latin-speakers went. These businessmen's associations sometimes styled Mercury *Felix* and thus retained the older sense of the word, 'productive, prosperous'. Despite the paucity of temples, Mercury was frequently honoured in Rome and other business centres with altars, statues, murals and even small roofed shrines set especially at urban intersections.

The neighbourhoods worshipped him beside their ubiquitous Lares, guardian spirits (see LARES). Augustus took a keen interest in fostering his lowly cult; accordingly, Mercury assumed the epithet Augustus which recalled not merely the Emperor's devotion and benefaction but equally that title's derivation from the verb *augere*, 'to increase'. Before the time of Augustus neighbourhood Mercuries acquired such peculiar titles as *Malevolus*, 'Ill-willing', in the case of one who faced no shop, and *Sobrius* where he was honoured by a milk libation in a district without a tavern. In contrast to the latter is a guild of wine merchants who were incorporated as the Club of Father Liber and Mercury. Liber was the Roman god of vine and wine.

In poetry Mercury always reflects the Greek Hermes. In one Roman poem he is made to sire the Roman Lares, who earned this prestigious parent through the humble association of neighbourhood religion.

The smallest of the planets, in astrology Mercury is inevitably associated with children and their qualities. Despite this, simplicity was never a characteristic of the planet which is also thought to influence trade and the whole field of learning: illustration from a 15th century English manuscript; Mercury holds a purse in one hand and his staff in the other and around him are shown some of the occupations that are traditionally connected with this planet

Mercury in Astrology

The planet Mercury is seldom seen with the naked eye, for it is never more than 28° from the sun, and therefore does not often emerge from the golden glow of dusk or dawn. Because it is the smallest of the planets, and closely dependent on its parent, it is inevitably associated with children. Childish vices – lying, fraud and thieving, for instance – as well as childlike virtues such as ingenuous charm, are also attributed to Mercury. It is possible that masochists, using the word in a general sense to describe people who enjoy being treated severely as if by a stern parent, may be under the planet's influence.

Despite its childish qualities, simplicity was never a characteristic of this planet, for it was thought to influence the entire field of education, including all types of learning. Intellectual brilliance, quick-wittedness and scholastic ability are therefore typical of people born strongly under Mercury.

Mercury rules trade and commerce and those born under this planet are always intrigued by technical skills, and are often knowledgeable about trades such as carpentry and engineering. A Mercurian will always have an answer for any question; and although it may not always be correct, it will at least be glib and convincing. Although not all Mercurians are plausible rogues, the plausible rogue will almost always be a Mercurian.

The shy, timid and tongue-tied people of

The Roman god of commerce, Mercury was the patron of businessmen, and was frequently honoured in the trade centres of the Roman world *Right* Pottery urn in the shape of a face, with a dedication to the god around the base, 1st century AD *Far right* Bronze statue of Mercury holding a purse

this world need the Mercurians to speak up for them, and a discussion about whether or not the time is ripe for wages to be raised often turns out to be an argument between two Mercurians. It is likely that neither of them will become heated, for Mercury often appears to be rather cold and aloof, even in sexual affairs; unlike many people, Mercurians think of these as just a part of the glorious game of life. When they marry, many of them do not really take their partners 'for better for worse, for richer for poorer . . . till death do us part' as they think that if necessary the game can be played with a different partner.

Among typically Mercurian professions is that of the journalist, for instead of being directly involved in life he is mainly concerned with viewing it objectively. A person born under Mercury may succeed in any learned profession, or as a schoolmaster who may have a wide general knowledge without being an authority on any one subject, or as a doctor. When a Mercurian is connected with the arts, it is often possible to discern a lack of the heavy, thorough-going seriousness which some artists seem to feel is the least that life deserves.

C. M. Dixon/British Museum

This elusive liquid metal was once considered to be of primary importance, for it was believed to be present in all substances; for the alchemist, mercury stood for the fugitive qualities of matter, without which Nature would remain static

MERCURY ☿

SINCE THE RENAISSANCE there has been one fundamental teaching in alchemical books: that matter is composed of the three 'philosophical elements' of mercury, sulphur and salt. This theory had a very considerable influence.

The idea of what constitutes an 'element' has undergone various changes since the days of early science. The universe was at one time conceived of as a composite of tiny particles which had specific qualities. According to the teachings of Greek philosophers including Aristotle (384–322 BC), and also the early alchemical writings, the primary qualities are those of fire, water, earth and air (see ELEMENTS). These four 'essences' found their completion in the 'quintessence', the spiritual.

Many systems of correspondences (see CORRESPONDENCES) were constructed on this basis. For instance, certain elements had an affinity for certain colours, planets, tastes and 'humours' (the four liquids present in the body, differing combinations of which determined one's temperament and physique). This kind of systematizing was very important at a time when empirical science was considered to be less important than the cultivation and refinement of the old tradition; but in this form it dealt only with what we would call physical states of matter. It soon became clear that there were differences in Nature which could not be totally explained simply by taking into account the differing combinations of physical particles; that there were also chemical differences in the modern sense.

Following the philosophical dogma that the multitude of phenomena must be reduced to fundamental and simple elements, the early alchemists taught that all matter finally consisted of two different kinds of components: 'mercury' and 'sulphur'.

The alchemists began by dealing with the theory of metallic transformation. They thought that metals such as lead could be reduced to 'mercuric' and 'sulphuric' components when treated in the right way. The differences in weight, appearance and so on, were explained by a different composition of these two elements. The principal theory of alchemy was that the natural maturation of metals, from 'immature' or base substances to 'noble' and precious metals like silver and gold, could be artificially set in motion. They therefore experimented with methods that seemed likely to change the proportion of the combined elements. However, with the growth of scientific knowledge in the Middle Ages it soon became apparent that this simple theory did not really work.

Paracelsus, the great Swiss scholar, enriched the old theory by introducing a third 'philosophical element' – that of salt. The wealth of natural phenomena could now be explained more satisfactorily. According to this theory, salt is the element of palpability, tactility, tangibility; it represents uninflammability and fixity. It is because it contains salt that matter has weight.

Mercury, or quicksilver, stands for the fugitive qualities of matter, for its spiritual element, for mobility, and for the property of some material things to become liquid, so enabling the elements to influence each other. So without the spirit of mercury Nature would remain motionless and unchangeable. We can easily understand the great importance the concept of mercury had in the teachings of alchemy, whose basis is the artificial induction of evolution from the 'impure' to the 'noble'. It was said that the nearer a metal came to the ideal of 'golden nobility', the more mercury it contained. In many alchemical treatises, therefore, 'mercury' also stands for the *materia prima*, the First Matter of the Philosophers' Stone, and sometimes also for the Stone itself. Care must therefore be taken when reading alchemical texts not to confuse these various meanings of 'mercury'.

Sulphur is the element which gives natural things the quality of combustibility. No matter, according to the alchemists, could ever burn without containing a certain percentage of sulphur. One example, often cited in the writings of the Paracelsists, is a good illustration of what is meant by this

theory of three elements: if wood is burnt, the flames are nourished by its content of sulphur. That which flies up into the air as smoke and smell is the fugitive mercury. Salt is what remains in the ashes.

Such an all-embracing concept could also be extended to the philosophical sphere, giving alchemy its two aspects, the 'chemical' and the 'spiritual'. Man, being a microcosm himself, a miniature reflection of external Nature, was also composed of three elements: body, soul and spirit, corresponding to the three elements in the rest of Nature.

SAL salt	CORPUS body
SULPHUR	ANIMA soul
MERCURIUS mercury	SPIRITUS spirit

When the alchemists wrote of transforming material things by rearranging their proportions of salt, sulphur and mercury, a real chemical change could be meant, but the text could also have a hidden meaning; it could really deal with human transformation, thus misleading those who were greedy only for material wealth.

Of the three Paracelsian elements mercury is the one which is mentioned most often; it corresponded to everything that was regarded as belonging to the sphere of spirit. But again, 'mercury' could designate different things. *Mercurium nostrum*, 'Our Mercury' is often described as being different from ordinary mercury or quicksilver, which has the property, unique among metals, of remaining in a liquid state at normal temperatures. If this metal is dropped it forms into tiny elusive silver balls. The ancient scientists did not know whether quicksilver should be regarded as a metal or as a liquid. The German encyclopedist Johann Heinrich Zedler (1732–1754) describes it as:

> A mineralic or metallic sap or humour *(liquor)* which is very heavy, liquid and volatile and looks like a silvery fusion. It is a liquid which does not moisten, forming compounds with all metals, especially accepting gold eagerly, mixing and amalgamating with it; and it can be separated from it by a hot fire, but at moderate heat forms a compound again that never can be separated. Mercury is so piercing that – as Sir Kenelm Digby (1603–1665) says – 'if you put it on the great toe of your foot and take a ducat in the mouth, it will get a whitish surface' . . . It is regarded as the mother of all other metals which, depending on their different mixture with metallic salt and with sulphur, and depending also on the different influences of the celestial forces, are said to grow in their different ways.

In the early part of the 18th century the doctrine of Paracelsus was evidently still very much alive.

'Our mercury' is what is otherwise referred to as the First Matter (that is, the original matter) of the substance which is to become the Philosophers' Stone. George Starkey, an English alchemist writing at the turn of the 16th century, in his book *The Stone of the Philosophers: Embracing the First Matter and the Dual Process for the Vegetable and Metallic Tinctures* says:

Roger Picture Library/E. P. Goldschmidt & Co. Ltd.

In alchemical treatises the term 'mercury' may stand for the First Matter which is to become the Philosophers' Stone; but it may also describe matter undergoing transmutation and even the product itself: symbolic representation of the origin of the Philosophers' Stone, from Elias Ashmole, *Theatrum Chemicum Britannicum* published in 1652

> All true philosophers agree that the first matter of all metals is a moist vapour, raised by the action of the central fires in the bowels of the earth, which – circulating through its pores – meets with the crude air and is coagulated by it into an unctuous water, adhering to the earth, which serves it for a receptacle . . . If it is sublimed leisurely through places which are hot and pure, where the fatness of sulphur adheres to it, this vapour (which the Philosophers call 'their Mercury') is joined to that fatness and becomes an unctuous matter, which . . . where the earth is subtle, pure and moist, fills the pores of it – and so gold is made.

The term mercury may stand for the First Matter, but in the paradoxical language of the alchemical treatises it may also designate the matter undergoing transmutation, and finally the product itself, the mysterious Philosophers' Stone. C. G. Jung the great Swiss psychologist, showed that it may also designate water, fire, the spirit of the air, spirit in general, or the soul.

Because of the medieval doctrine that postulated the existence of two elements, mercury and sulphur (before Paracelsus added salt), only two components of matter are mentioned as being important for 'the great work' in most of the old texts: something red and something white, or – in the language of poetical allusions – a red and white rose, which are to be combined in the 'alchemical marriage' to form the supreme unity of the Philosophers' Stone. Alternatively, alchemists speak of a male element, the red lion, and of a female element, the white eagle or the lily, which find their bridal bed in the retort in order to bring forth something new and potent.

Modern chemists have often tried to follow the alchemical prescriptions literally and have for instance, said that the red lion must be antimony trisulphite, the lily silver chloride, and so on – but one can hardly believe that the mysterious Stone would not be something more important and powerful. So we have to be content with thinking of 'sulphur' and 'mercury' or of soul and spirit, in whatever sense, as being combined mysteriously in order to bring forth the final stage which makes it possible to transform impure metals to gold, and to heal all diseases by making the elixir of life (see ELIXIR OF LIFE).

The assumption of an original dualism of the two elements leads us back to the days of Alexandrian alchemy in Hellenistic times, when the gnostic systems exerted a powerful influence. Secret doctrines of all kinds and ages often speak of the two opposing principles which must be united in order to form again the divine integral unity as it must have existed before the Creation tore it asunder (see OPPOSITES).

Dualism means tension, opposition, multitude – and so a dynamic universe is created; but the two halves, despite their different qualities, tend to be re-united in varying proportions of the components. In the language of alchemy, the element of sulphur and the element of mercury are found in different proportions in all natural things, and in order to stimulate their evolution it is necessary to separate them, to lead them back to their original simplicity, and then to unite them in the perfect way. This union of the two pure elements is the 'alchemical marriage' of 'spiritual sulphur' with 'spiritual mercury'.

The idea of this marriage was conveyed in a variety of allegorical forms in alchemical manuscripts; such allegories expressed the necessity of combining the opposites, normally referred to as sulphur and mercury, in order to take part in the creative plan. The important thing was to know the right degree and proportion.

In a psychological sense we could assume this to mean leading the spirit (mercury) along the right path so that it is able to accept the soul (sulphur), and also the 'burning' sphere of instincts and desires, in a creative embrace which would bring forth a unified whole, a mature personality. But this view would be too incomplete and theoretical if we were to forget the third principle, the bodily element of 'salt', which makes it possible to shape a system able to reflect the wholeness of human nature, into which the material process is involuntarily projected. Only by this means could the 'great work' of the alchemist become the perfect mirror of what the 'philosophers' wanted to see when beholding their furnaces and alembics.

(See also ALCHEMY; PHILOSOPHERS' STONE).

HANS BIEDERMANN

MERLIN THE MAGICIAN

MERLIN

ONE of the special features of the Arthurian legend is its peculiar blending of Christianity with non-Christian motifs. Its orthodox medieval chivalry has an alien context. A haunting strangeness overhangs the Round Table and the Holy Grail. Behind both, and behind King Arthur himself, stand shadowy presences. The elements of magic and myth are not downright evil, as such things tend to be in Christian romances; yet neither are they baptised into a fully Christian condition. Merlin, Arthur's court wizard and prophet, is the character who chiefly embodies them.

He first takes literary shape in the work of Geoffrey of Monmouth (see ARTHUR). Toward 1135 Geoffrey published some alleged prophecies, dealing in a riddling style with English and Welsh affairs over several centuries. He ascribed them to a British prophet whom he called Merlin, and soon afterwards inserted them in his *History of the Kings of Britain*. This famous and influential book supplies Merlin with a sketchy career, in the setting of the same largely bogus history that enshrines King Arthur. About 1150 Geoffrey wrote a Latin poem entitled *Vita Merlini* (Life of Merlin), adding further particulars.

As formed by Geoffrey of Monmouth, the character combines two old Welsh traditions, which originally concerned two different men. The real Merlin, so far as such a person ever existed, was a bard and seer named Myrddin. He flourished late in the 6th century AD, in what was then still a Cymric borderland near the Solway Firth. Fragments of obscure Welsh poetry by him and about him survive, and a certain Lailoken, who figures in Scottish legend, may be the same man. A piece of trouble-making by Myrddin among the British chieftains is said to have caused the battle of Arderydd near Carlisle, fought in the 570s. As a supernatural punishment, it is further said, a vision in the sky unbalanced his reason, and sent him wandering and raving through the forest of Celidon in the Scottish Lowlands.

If Myrddin ever met Arthur at all, he can only have done so as a youth in Arthur's old age. For literary reasons, however, Geoffrey of Monmouth wanted a Myrddin who was older than Arthur instead of younger. Also there was an awkwardness about his name. In the Latin used by Geoffrey it would have become Merdinus, suggesting *merde* (dung). Geoffrey therefore altered the name a little; and to plant the prophet in the period where he wanted him, he adapted a separate legend preserved by Nennius (the monk of Bangor, who gives the oldest account of Arthur). Nennius's legend was about magical serpents and a mysterious 'boy without a father'. The boy was originally Ambrosius, who grew up to be a British leader of the 5th century. But Geoffrey retold the story making 'Merlin' its hero instead, thereby shifting his birth back to somewhere about 450.

In spite of the prestige which Geoffrey's *History* acquired, medieval experts on Welsh matters did notice the difficulty over dates. One was the writer Giraldus Cambrensis. Rather than accuse Geoffrey of outright fiction at this point, Giraldus argued that there must have been two Merlins, Merlin Ambrosius in the 5th century and Merlin Sylvester or Celidonius in the 6th. For the purposes of romance, however, the composite character held the field, and few cared to analyse him.

It will be clear that Merlin, from his very beginning under that name, is a product of imaginative synthesis. There would be little point in looking for a single 'historical Merlin' to go with the 'historical Arthur' who emerges dimly to view around the year 500. Merlin's interest lies in the themes which various authors develop through him, either in pseudo-history or in stories with no serious factual pretensions.

Merlin and Stonehenge

In Geoffrey's *History* Merlin makes his entry as a boy in Carmarthen, with a cryptic birth-story about the impregnation of his mother by an invisible demon, and a long prophetic outpouring. Some years later, at the request of King Aurelius, he uses magic to help transport Stonehenge from its supposed original site in Ireland to Salisbury Plain. At his last appearance, he enables King Uther to achieve access to the lady Igerna, and father Arthur on her, by giving him a magical likeness to her husband.

The first and third of these exploits show Merlin as a prophet and wizard. The second is more remarkable. It connects the character with a remote British past, and not merely fancifully. Professor R. J. C. Atkinson has shown that behind the invented marvels, Geoffrey may well have tapped authentic traditions about Stonehenge and the transport of megaliths from the west, which had survived orally. If so, Merlin is in some degree a projection of a Britain older than Christianity – older, indeed, than the Celtic population which produced Arthur and the mythology surrounding him.

After presiding over Arthur's conception, Merlin fades out of the *History*. In the *Vita Merlini* Geoffrey draws on material about the actual bard Myrddin. He hints at a fate which becomes explicit in later romance, Merlin's seduction by the enchantress Vivien or Nimue (sometimes identified with the Lady of the Lake – see LANCELOT), who traps him in a magic prison.

Geoffrey's Arthurian work was developed along romantic lines by Wace and Layamon. Both of these poets reduced Merlin's importance. But he proved too fascinating to stay reduced. He took root in folklore, becoming associated, like Arthur himself, with places and stones and even trees. His prophecies were taken seriously. They are said to have been quoted by angry Welsh against Henry II. Studious commentators tried to make sense of them. In some medieval legends Merlin appears outside the Arthurian cycle, becoming more sinister.

Within the cycle he recovered from his early setback and rose to new prominence. Romancers gave him a major role in the education of Arthur, in the foundation of the Round Table, in the mysteries of the Grail. His curious birth was enlarged upon: it was told how the powers of hell had tried to bring about the conception of a Satanic child to serve their ends, but the scheme miscarried, and the chosen mother bore an ambiguous being who went his own way.

The 'real Merlin' was a Celtic bard, some of whose poetry survives: the legendary Merlin was said to have transported Stonehenge to Salisbury Plain by magic *Previous page* Illustration from a French history of Merlin, 13th century *Right* Merlin at Stonehenge, from a 14th century manuscript

The French Vulgate series of Arthurian tales, completed toward 1230, includes a *Story of Merlin* later adapted into English in *Arthour and Merlin*, a long metrical narrative. Sir Thomas Malory puts Merlin's importance on a firm basis. The seer arranges Arthur's birth, gets the sword Excalibur for him, aids him in war and foretells events. But Malory's habit of pruning away excessive magic prevents Merlin from dominating the scene quite as much as he does in the earlier accounts.

Fairly soon, in fact, he drops out. His foreknowledge of woes to come depresses his spirits. He falls disastrously in love with Nimue (or Nyneve, as Malory calls her). She goes with him on a journey through Cornwall, hoping to learn his arts, but never accepts him as her lover. Finally she grows tired of him, and turns one of his own spells against him to imprison him in a cave. Like the Arthur of folklore, he remains in the cave and goes on living indefinitely. Unlike Arthur, he is not destined to return.

Remembering the Future

Romance of the kind written by Malory petered out during the Renaissance. Its themes lingered on to inspire poets, such as Ariosto and, partly through him, Spenser. The latter's *Faerie Queene* presents the Arthurian world in a new guise. He introduces Merlin, but as a rather colourless sage, more or less rationalized.

Attempts to rationalize Merlin continue in more recent authors. Tennyson's notes for the work which became the *Idylls of the King* show that he meant at first to turn the magician into a symbol of Science. He did not actually go so far. The Merlin of the *Idylls* remains pre-eminently a Wise Man, very august and very cryptic, with superhuman powers. He utters oracular verses and is believed to know unrevealed secrets about Arthur's origin. The partly rationalized sage reappears in Edwin Arlington Robinson's poem *Merlin* (1917).

The fully-fledged magician has been revived, in violently contrasting ways, by two other modern authors. T. H. White's *The Sword in the Stone* (1938) takes up the neglected topic of the boyhood of Arthur and Merlin's role as his tutor. The treatment is a very personal mixture of high comedy and high seriousness. Merlin's prophetic gift takes the form of remembering the future and forgetting the past. In *The Sword in the Stone* itself, his non-consecutive time is largely a joke. In the sequels, making up the tetralogy *The Once and Future King*,

British Museum

it becomes thematic. Arthurian England is a country of the imagination where the whole of the Middle Ages is happening simultaneously. Merlin's own break with conventional, chronological history is pervasive and final.

C. S. Lewis's *That Hideous Strength* (1945) is a fantasy influenced by the poetry of Charles Williams. Its setting is in the 'near future' of science fiction. An organization which purports to be scientific, but is in fact diabolic, plans to unleash genocide in the name of progress. Normal human ideals – including the Christian ones of the author himself – prove incapable of inspiring effective resistance. The menace is defeated through a resurrection of Merlin. He has the power, as no modern man has, to open the door to spiritual forces from a lost antiquity, and enlist their aid on the side of life.

Lewis's serious point – which could be supported from the records of Dark-Age Christianity in Britain and Ireland – is that the figure of Merlin corresponds to a 'both-at-once' state of mind, Christian-and-pagan. Such a state was possible in the days of Arthur, but gradually ceased to be possible as distinctions hardened. The Merlin of *That Hideous Strength* is a Druid, with roots still farther back in the lore of Atlantis. Yet he is also a helper to the Christians, a guardian of the Grail, and in no sense a sorcerer. Lewis links him with 'neutral' spirits, neither angel nor devil.

Though presented through fiction, Lewis's insight into the character may well be sound. Particularly in the Stonehenge chapters of Geoffrey of Monmouth, with their marks of a genuine tradition, Merlin may put us briefly in contact with remote and formative phases of the human spirit which we can no longer think ourselves back into. Before the traditions came to focus in him, most of the keys had been lost and only rumours survived.

'In her going down they saw her tail which was like the tail of a porpoise, speckled like a mackerel . . . from the navel upwards her back and breasts were like a woman's': this 17th century description has been paralleled in many other accounts of mermaids

MERMAIDS AND MERMEN

THE MERMAID, a beautiful girl to her waist but a fish from the waist down, and her male counterpart, the merman, are still among the most popular of legendary creatures, and mermaid lore is part of the living world of the romantic child. In 1961 the Manx Tourist Board, promoting an angling week in the Isle of Man, offered a prize for the capture of a live mermaid.

The mermaid of tradition is a seductive and dangerous enchantress, who personifies the beauty and treachery of the sea, and especially of the shoals and rocks of the coastline. She is also closely associated with the moon (the ruler of the tides), which is represented by the mirror she holds in her hand. Her long hair is said to be composed of green seaweed, or perhaps of the rays of the sun as they fall upon the water. In European folklore the menacing green-haired water spirit appears constantly in strange legends of lake, river and sea. For a sailor to see a mermaid is almost always a portent of danger and disaster.

Some gods and goddesses of the ancient world were associated with fish, and some appeared in the form of fish (see FISH). The Mesopotamian god Oannes, who showed himself on earth each day and disappeared into the sea each night, was evidently connected with the sun and was sometimes depicted with the tail of a fish. There was also the fish-tailed Philistine god Dagon, of whom Milton wrote in *Paradise Lost*: 'Dagon his name, sea monster, upward man and downward fish.' Fishes were sacred to Aphrodite, who was born from the sea, and to other love goddesses, one of whom, Atargatis or Derceto, had a fish-tail. Among the predecessors of the medieval and modern mermaid are the Sirens, who lured sailors to destruction, though exactly when and why they changed from bird-women to fish-women is uncertain (see SIRENS).

A Victim a Year

The mer-people were supposed to dwell in an underwater world of great splendour, to which the mermaids lured their victims and where they kept their souls close prisoner in their kingdom beneath the waves. This theme occurs again and again in the lore of the sea, with a constant emphasis on the presence of a mermaid as foreshadowing some calamity – storm, shipwreck, drowning.

On the other hand, you could always obtain power over a mermaid if you could get possession of her cap or her belt. There are many tales in which a human being brings a mermaid on shore to be his wife. In 'The Little Mermaid' by Hans Christian Andersen, a mermaid takes human shape so as to acquire a soul, which will allow her to be near the man she loves for all eternity. There are also many stories of marriages between mermen and human women.

In the Gironde, in France, mermaids had two tails. In Brittany, the Morgans or sea women were extremely dangerous to men. The fisherfolk of the Channel Islands believed in a strange sea creature called the King of the Auxcrinier, whose presence was feared as the forerunner of storm. In Norse folklore the Havemand is a merman who has a black beard and green hair. The Estonian Nakk is someone who has drowned, and may appear as man, woman, child or animal.

Below left **The Little Mermaid of Hans Andersen's story changed her tail for legs in order to follow the mortal man she loved. Her statue now overlooks the approach to Copenhagen *Below right* Among the marvels reported by seamen and explorers of the 16th and 17th centuries were men and women with the tails of fish. Occasional sightings have continued up to the present century**

His lovely singing entrances people and he swallows them in his giant mouth. A Nakk maiden is very pretty, combs her long locks with a golden comb and sometimes has the tail of a fish. The Nakki of Finland are very similar, and their women have gleaming white bodies and breasts so long that they can throw them over their shoulders.

The nixes or nixies of Germanic lore are spirits of fresh water. Green-haired and lovely, they can transform themselves into old women, in which form they venture on land on market days. They lure their human victims to drowning in treacherous waters, and must have at least one victim each year.

In 1403, it is said, a mermaid was found becalmed in shallow water at Edam in Holland. She became accustomed to life on land but never learned to speak. She lived for some 15 years after her capture, and was given Christian burial.

The Sea-Maid's Music

In 1560 several supposed mermaids were caught by fishermen in Ceylon. They were dissected, and it was reported that they possessed organs like those of human beings. An early 17th century tale from America reported an attack on a canoe by a fierce merman whose arm had to be severed with a hatchet because he would not release his grip. The famous explorer Henry Hudson reported a sighting of mermaids in 1608, near Novaya Zemlya in the Arctic Ocean, north of Russia. He described one of them as being 'as big as one of us, her skin very white and long hair hanging down behind, of colour black. In her going down they saw her tail which was like the tail of a porpoise, speckled like a mackerel . . .' and 'from the navel upwards her back and breasts were like a woman's.'

Among many curious legends once current in the British Isles is the tale of the mermaid who swam up a subterranean channel from the River Mersey at sunrise, seated herself on a church bell and began to sing. In Cornwall, the mermaid of Zennor lured a lovelorn youth into the sea by the charm of her voice, and for years afterwards his voice could be heard singing from deep beneath the waves.

According to John Shaw, author of *Speculum Mundi*, published in 1635, the song of the mermaid was not as tuneful as

Danish Tourist Board

John R. Freeman

Axel Poignant

Maori carving of an eel-shaped creature with the head of a man. Apart from the coastal waters of Europe, with which they are mainly associated, supernatural sea creatures are said to inhabit many other parts of the globe, including the New World and the Far East

was popularly supposed. 'But above all the Mermaids and Men-fish seem to me the most strange fish in the waters. Some have supposed them to be devils or spirits in regard to their whooping noise that they make.' But this contradicts the older tradition, expressed by Shakespeare in *A Midsummer Night's Dream:*

> Since once I sat upon a promontory,
> And heard a mermaid on a dolphin's back
> Uttering such dulcet and harmonious breath,
> That the rude sea grew civil at her song,
> And certain stars shot madly from their spheres,
> To hear the sea-maid's music.

There is a tradition that the people of Machaire in Ireland are the descendants of mermaids. The Irish thought that mermaids were originally pagan women, transformed into mermaids by St Patrick and then banished from the Emerald Isle forever.

If Ireland managed to dispose of its mermaids, as well as its snakes, Scotland did not. Till the close of the 18th century it was a common belief in Aberdeenshire that mermaids inhabited the caves of the rocky coastline. As late as the 1890s a mermaid was said to have appeared on two occasions in the Orkneys.

The Scots also populated their inland waters with spirits. It was a certain portent of drowning to see a kelpie, a mischievous and evil creature which lived in a stream or a lake and appeared in the form of a horse. He would lure people to climb on his back, and then drown them in the water. The Welsh equivalent is the ceffyl, or water horse. In northern England many lakes and ponds were tenanted by a sinister siren known as Jenny Green Teeth, a green-haired monster with a taste for drowning young children who ventured too close to her domain.

The Mermaid of Morwenstow

With the passing of the age of magic, dedicated rationalists attempted to discover in natural history the true source of the mermaid legend. Manatees and dugongs have been considered likely candidates. Both are sea mammals (of the order Sirenia, found in coastal waters of the Atlantic and Indian oceans) and they suckle their young, holding them with their flippers in the manner of a woman with a baby. The walrus and the seal are other candidates. One naturalist commented: 'I have seen many plain women but never yet one quite so plain as the face of a dugong.'

The Roman writer Pliny, the first naturalist to discuss mermaids at length, would have been intrigued by the amount of evidence for the existence of mermaids which came to light in Europe from the 16th century onwards, in the shape of fish-tailed sub-humans, most of whom found their way into fairground booths or were exhibited at inns. In 1830 a mermaid was on show at the Egyptian Hall in London, and in the 1870s Phineas Barnum's 'Greatest Show on Earth' included a mermaid. Until the Royal College of Surgeons was bombed in the Second World War, two stuffed mermaids were kept in a showcase there.

The great upholders of the mermaid myth were the Japanese, who during the last century became adept in the manufacture of synthetic mermen and mermaids, using stuffed monkey skins sewn onto fish-tails. They exploited the fears of seamen, who wanted to secure a specimen but were afraid that the purchase would bring calamity, by selling each of their customers a photograph of a mermaid as a lucky charm giving protection against mermaid magic.

A fierce blow against belief in mermaids was struck by the Reverend Robert Hawker of Morwenstow, a celebrated practical joker. About the year 1825 he decided to test the power of the mermaid myth by swimming to an offshore rock near Bude, on the north coast of Cornwall. Naked to the waist and with a shining tail of oilskin wrapped about his legs, he combed his tresses of seaweed, preened himself in a mirror and began to sing, all in the light of the full moon. Large and awestruck crowds gathered to watch this remarkable phenomenon, which continued for several successive nights until finally, wearying of his performance and discovering that he had a sore throat, the Mermaid of Morwenstow suddenly burst into the strains of 'God Save the King' and, plunging from the rock, disappeared into the sea.

Comb and Glass

In heraldry the mermaid is a symbol of eloquence. She also appears in churches. At Lincoln Cathedral, for instance, there is a carved mermaid with plaited hair, and the prevalence of carved mermen and mermaids in Cornish churches has been ascribed to the strong belief in the mer-people of Cornish fishermen.

The motif also appears in the theatre, in opera, ballet and poetry. Laurie Lee's poem 'Song of the Sea' returns to the theme of disaster in the tale of the lover who rushes into the mermaid's embrace:

> Oh suck me down to your weeds and fates,
> Green horizontal girl.

The mermaid is a well-known character in popular ballads, and in the days of sail seamen sang:

> Twas Friday morn when we set sail,
> And we were not far from the land,
> When the Captain he spied a lovely mermaid
> With a comb and a glass in her hand.

Sightings of mermaids, of one sort or another, have still not ceased. In June 1857 the Shipping Gazette reported the appearance off Britain of a mermaid with 'full breast, dark complexion, and comely face.' In 1937 a mermaid was reported in the Far East. In 1956 at Accra an African bank cashier was persuaded to hand over more than £500 from his till to a confidence trickster disguised as a mermaid, who offered to double his money for him.

ERIC MAPLE

Our understanding of hypnosis still remains negligible but increasing knowledge of it is likely to shed light on such matters as hallucination, ecstatic states, faith healing, hysterical possession and the mediumistic trance

MESMER

Caricature of 'animal magnetism', the influence through which Mesmer believed he achieved his startling cures

THE ORIGINATOR of 'mesmerism' and, indirectly, of much else, Friedrich (sometimes Franz) Anton Mesmer, seems to have been born in Austria, in 1734. He graduated in medicine at Vienna some 30 years later. A believer in astrology, he conceived the idea that the planets affect human beings through an influence resembling magnetism, and he began to treat patients by applying magnets to their bodies. However, before long he decided that the magnets were unnecessary, since the curative influence (he claimed some striking cures) emanated strongly from the hand and nervous system of the operator. To this curative influence he gave the name 'animal magnetism', because of certain supposed analogies with electromagnetism (see MAGNETISM). Mesmer believed that the influence could be transmitted to objects held in or stroked by the hand, and could then be discharged through a suitable conductor.

In 1778 Mesmer came to Paris, where his fame or perhaps notoriety had preceded him. He speedily attracted a number of pupils and a great many would-be patients. In order to cope with the throng of patients, he devised the celebrated *baquet*, a wooden tub, filled with water and iron filings, and containing a large number of bottles of 'magnetized' water. From it protruded iron rods which could be applied to diseased or damaged parts of patients. Mesmer himself, clothed like a magician, moved among the company to a background of soft music and mysterious lighting. Many cures of various kinds of diseases were reported, often precipitated by a 'crisis' of convulsive movements, and although in 1784 Royal Commissions from the Academy of Sciences and the Royal Society of Medicine reported that the 'magnetic fluid' was a myth and the cures due to 'imagination', the faithful were not dismayed. A grateful patient exclaimed: 'If it is to illusion that I owe the health I believe myself to enjoy, I humbly beg the learned gentlemen, who see so clearly, not to destroy it.' Mesmer remained in France until 1789, when he fled from the Revolution. He died in 1815.

The most influential of Mesmer's pupils was the Marquis de Puységur (1751–1825). Puységur, who disliked the convulsive crises which accompanied Mesmer's cures, discovered that patients could be put by 'magnetization' into a sleep-like or 'somnambulic' state in which cures could equally well be effected. Patients in this state showed themselves unusually responsive to the commands of the mesmerist, and could be made not merely to perform actions suggested by him, but to feel prescribed emotions or entertain delusory beliefs. Ordinary faculties might be heightened, and quite novel faculties seemingly be induced. For example, in the somnambulic state patients would often diagnose and prescribe for their own ailments, and sometimes they would do the same for other people by means of alleged clairvoyance. Upon awakening, the patients commonly showed no recollection of what had passed.

Puységur's explanation of the phenomena which he observed was, at any rate to begin with, similar to Mesmer's. He was impressed by the fact that 'magnetized' objects could send subjects into the 'magnetic sleep', and thought in terms of an effluence capable of collection and storage. But he emphasized, as Mesmer did not, that the magnetic fluid or therapeutic energy might be directed by the will of the operator upon the body and nervous system of the subject. A receptive subject might be swayed by the operator's changing wishes and commands, much as a magnetic needle is influenced by variations in the magnetic flux playing upon it.

Puységur's ideas were, in many ways, more influential than Mesmer's. Thus it was the somnambulic state or 'magnetic trance', often with accompanying 'clairvoyant' diagnoses, and not the baquet and the crisis, which figured most prominently in the rapid spread of the mesmeric movement across Europe. By the time of the French Revolution there were mesmeric societies throughout France, and in Germany serious studies were being undertaken by reputable physicians. The Revolutionary Wars interrupted progress, but it was resumed after 1815, and there was hardly a country on the continent of Europe where some interest in the subject was not shown. By the end of the 1820s most of the phenomena subsequently thought characteristic of hypnosis – including the induction of hallucinations and of anaesthesia, and the responsiveness of normally awake subjects to commands given them in a previous somnambulic state – had been observed, and the first surgical operation upon a subject in trance had been performed. In the 1830s and 1840s the movement spread more extensively to Great Britain and the United States. In Britain the hostility of orthodox medicine was extreme, and the leading mesmerist, John Elliotson (1791–1868), was forced to resign his teaching position at a London hospital. In the United States orthodoxy was less entrenched, mesmeric treatment became common, and a large corps of itinerant demonstrators and quacks grew up.

The Hypnotic State

In most countries the great majority of interested persons could at this period be divided into two camps, those who believed in the phenomena and accepted some version or other of the fluidic theory, and those who thought that all the phenomena could be set down to fraud by the operators and shamming by the subjects. Of those who adopted an intermediate position, the most noteworthy was perhaps James Braid (1795–1860), a Manchester surgeon of Scottish descent. Braid became interested in mesmerism (or 'hypnotism' as he called it, from the Greek *hypnos*, 'sleep'), and from 1842 employed it in his own practice with successful results, especially in disorders which were functional rather than organic. Braid was able to demonstrate that the mesmeric efficacy of magnetized objects depended not at all on whether or not the objects concerned had in fact been 'magnetized', but solely upon whether or not the subjects believed that they had. He reached the conclusion that the hypnotic state is simply a state in which subjects are abnormally responsive to suggestions made by the operator, including ones not directly addressed to them and ones which are merely implicit.

Braid encountered considerable hostility both from orthodox physicians and from believers in the mesmeric fluid, but gradually his views came to command attention and respect, and it was from their adoption and enlargement in France after 1860, especially by the 'Nancy School', A. A. Liébault, H. Bernheim and their followers, that the modern approach to hypnotism is derived. The hypnotic state is looked upon as an abnormal, but not pathological, condition whose leading feature is the increased suggestibility of the subject. The 'hypnotic trance', which is readily brought on in many persons by repeated suggestions or commands combined with monotonous sensory stimulation, seems to be both a symptom of this suggestibility and a tool for further heightening it. How far the trance can be regarded as a phenomenon possessing its own unique characteristics not directly or indirectly dependent upon the subject's beliefs and expectations is perhaps not altogether clear. But it does seem well-established that in suitable subjects (who are by no means rare), there may be induced

a state of heightened suggestibility, often preceded or accompanied by trance, in which the commands of the hypnotist may produce a variety of remarkable effects.

These effects may occur immediately, or at some subsequent time specified by the hypnotist ('post-hypnotic suggestion'), and they include: the production of sensory hallucinations and of heightened sensory acuity (or at least heightened powers of observation and attention); anaesthesia sufficient for major operations; the performance of complicated and even ridiculous actions; impersonation with outstanding dramatic flair of some character named by the hypnotist; the acceptance of totally delusive beliefs; remembering of events not normally accessible to recall; the induction of laughter, tears, and groundless emotional states; the stopping of bad habits, such as smoking; the cure or alleviation of neurotic or obsessional states; heightened muscular power; the improvement of skin complaints, such as eczema and even warts; and the production of blisters and other marks upon the surface of the skin.

Many of the more startling phenomena were for the most part reported by practising psychiatrists, and were sometimes regarded with a certain suspicion by laboratory psychologists (such as C. L. Hull, whose *Hypnosis and Suggestibility: an Experimental Approach* was published in 1933). However, many of these phenomena have now been confirmed by laboratory investigation, and few of the earlier findings are more striking than S. Black's recent experiments showing the total obviation by hypnosis of normal allergic responses, or E. R. Hilgard's demonstrations of the hypnotic suppression, not just of intense pain but of its usual physiological accompaniments.

Mesmerist and patient: the mesmeric movement spread rapidly and by 1830 most of the phenomena now thought characteristic of hypnosis had been observed

Faith Healing and Possession

In addition to the numerous clinical and laboratory observations of hypnotic phenomena, there are on record many instances of persons not deliberately hypnotized falling spontaneously, or under

Mary Evans Picture Library

the influence of emotional excitement, implicit or self-administered suggestions, or a perfervid imagination, into states closely resembling hypnosis. The best-known of these states is of course ordinary somnambulism or sleep-walking, in which responsiveness to suggestion has occasionally been observed. The ecstasies into which profoundly religious persons have sometimes fallen as a result of intensive meditation and prayer may be characterized by insensitivity to pain, hallucinations, muscular spasms, and the production of organic changes such as stigmatization, for all of which hypnosis can provide analogies.

In some cultures monotonous ritual drumming, dancing and chanting seem to be used to produce rather similar effects (see DANCE). Responsiveness to suggestion (whether the suggestion be explicit or implicit) is, as every stage hypnotist knows, enhanced by the sight of other people capitulating, for that sight itself constitutes a powerful implicit suggestion that resistance will be in vain. Thus if one person, swayed by a belief current in his culture, writhes and dances, sees angelic beings, imagines himself possessed by a god or demon, or 'speaks with tongues', the chances will be increased that other persons in the immediate vicinity and holding similar convictions will be likewise afflicted. In these terms we may perhaps understand the affinities between hypnosis and certain extreme manifestations of religious enthusiasm or of superstition (see ECSTASY; ENTHUSIASM; POSSESSION). Similarities between the techniques of stage hypnotists and those of revivalist preachers have often been commented upon, and many of the problems of faith healing, cures by 'laying on of hands', and so on, also belong here (see FAITH HEALING; LOURDES).

Theories of Hypnosis

To relate the various phenomena just described to hypnosis is not in any way to explain them, for our theoretical understanding of hypnosis itself is negligible. The old notion of a magnetic fluid has been abandoned by all but a tiny residue of supporters. Psychoanalytic explanations invoke entities and mechanisms scarcely more plausible or better evidenced than the magnetic fluid. The theories that hypnosis consists in either heightened suggestibility, or heightened powers of attentiveness, or dissociation of part of the stream of consciousness, amount to no more than redescriptions of some of the phenomena to be explained. The view put forward in the last century by Heidenhain, and refurbished in this by the school of Pavlov, is that hypnosis results from an inhibition of the higher brain centres caused by monotonous sensory stimulation. This has at any rate the advantage that its recent protagonists have felt able to advance simple experiments on animals, rendered cataleptic by nembutal or even by decerebration, as throwing a possible light on the subject. All in all it seems most unlikely that our understanding of hypnotic phenomena, involving as they do an infinitely subtle interplay of the verbal commands of the hypnotist, the suggestions that are perhaps merely implicit in his demeanour, and the background beliefs of the subject, can possibly improve until the psychology of language, thought and concept-formation has enormously progressed.

One of the great obstacles to the testing and even formulation of any theory of hypnosis is that what does and what does not take place as a result of hypnotic suggestion may be profoundly influenced by the subject's own beliefs about the nature and limitations of hypnosis. For example we cannot even say with complete certainty whether the so-called hypnotic rapport – the tendency of a hypnotized person to act only upon the commands of the hypnotist, ignoring suggestions made by others – is or is not a special feature of the hypnotic state. It is widely reported to this day, but it can readily be countermanded by the hypnotist, and its occurrence very probably reflects no more than the fact that it is widely believed in by hypnotic subjects.

The Mind-Cure Cults

Two major religions, or rather groups of religions, have their roots in the mesmeric movement of the 19th century. The first is constituted by the various 'mind-cure' cults, especially Christian Science, and the second by modern Spiritualism in all its forms and phases (see CHRISTIAN SCIENCE; SPIRITUALISM). The link between the mesmeric movement and Christian Science is the American mesmerist and healer, P. P. Quimby (1802–1866). A clock-maker by trade, Quimby lived most of his life in Maine. About the year 1838 he became interested in mesmerism, which was then becoming widely known in the United States, and found that he was himself a capable operator. In a youth named Lucius Burkmar he discovered an excellent somnambulic subject, and for some years they gave popular demonstrations, and diagnosed and treated disease. Quimby's usual method was to throw Burkmar into rapport with the patients, and obtain from him clairvoyant diagnoses and prescriptions. Later Quimby discovered that he had himself the gift not only of clairvoyant diagnosis, but of directly apprehending the contents of a patient's mind. As a result he came to see that the physical ailments from which the patients suffered were a direct consequence of the erroneous ideas which they entertained. In order to correct the physical conditions it was therefore only necessary to correct the erroneous ideas and ways of thought. These doctrines Quimby called 'The Science of Health' or sometimes 'Christian Science'.

Quimby's most famous patient was Mary Patterson, later Mary Baker Eddy, the founder of Christian Science (see EDDY). She came to him in 1862, when his thought along the lines just indicated was well advanced. That Mrs Eddy was indebted to Quimby for some of her leading ideas is undeniable, though in later life she was reluctant to acknowledge the fact.

Links with Spiritualism

The link between the mesmeric movement and modern Spiritualism is more complex but not less strong. Quite early in the development of the mesmeric movement stories were heard of mesmerized persons exhibiting clairvoyance and other paranormal powers. Subjects in the somnambulic state would frequently proffer clairvoyant diagnoses of other peoples' ailments, and cases were not infrequent in which they allegedly saw when blindfolded, read the contents of sealed packages, and correctly visualized distant scenes as if from an appropriate vantage point ('travelling clairvoyance').

Now if it is indeed the case that in the mesmeric trance certain gifted clairvoyants can correctly perceive distant scenes, presumably without the aid of the physical senses, one might well ask to what other regions this eccentric sensitivity can reach. It was not long before somnambules began to retail accounts of the next world and of personages from it. A number of such accounts were received quite early in the history of the mesmeric movement; the first case to become famous was that of Frederica Hauffe, the 'Seeress of Prevorst', whose physician, Justinus Kerner, published a book about her in 1829. In the somnambulic state Frau Hauffe saw and held conversations with the spirits of deceased persons, some of whom apparently gave her verifiable information about their alleged earthly careers.

In France A. Cahagnet published as *Arcanes de la vie future devoilés* (1847–8) various somnambulic revelations as to the next world and its inhabitants, and a similar work, Dr J. Haddock's *Somnolism and Psycheism*, was published in England in 1849. Both Cahagnet and Haddock were interested in the teachings of Swedenborg, which were in many ways similar to those later characteristic of modern Spiritualism, and the revelations of their subjects have a pronouncedly Swedenborgian cast (see SWEDENBORG). It must, however, be added that both Cahagnet's and Haddock's subjects showed remarkable instances of apparent clairvoyance. Also tinged with Swedenborgianism were the doctrines of the American seer, Andrew Jackson Davis, whose *Principles of Nature* was published in 1847 and quickly became famous.

Thus when, in 1848, the modern Spiritualist movement started its career, its likely public had had time to become accustomed to the idea that certain gifted persons might, when in an unusual psychological state, be able to make contact with the spirits of the departed, and bring back information about the next world. The 'mediumistic trance' evolved out of the 'mesmeric trance', and the doctrine of a mesmeric fluid directed by the operator into his subject so as to control the latter's movements was soon extended to include 'control' exercised by the spirits. The mesmeric movement in every way set the stage for the Spiritualist movement, and was to some considerable extent absorbed by it.

MESOPOTAMIA

The Sumerians initiated a cultural revolution which gave the world writing, cities, and a corpus of religious practices and concepts

The Sumerians and their successors in Mesopotamia developed both a complex pantheon of deities and a complex system of demonology and magic

IN THE ANCIENT WORLD religion was not a distinct or optional activity but the attitude to life which gave it cohesion, meaning and pattern. Mesopotamian religion, like Hinduism, had its roots in prehistory and was not attributed to a specific founder. Despite the three thousand years over which the evidence extends, and the several distinct groups of peoples concerned, there is a sufficient continuum to justify treatment of the whole of the evidence as belonging to one cultural stream, and to speak of Mesopotamian 'religion' rather than 'religions'. Some distinction can be seen between the systematized theology of the scribes, which provides the bulk of the evidence, and the popular religion, but since evidence of the popular religion appears only incidentally and allusively, little specific can be said of it.

Mesopotamia here means the pre-Christian cultural area approximating geographically to the modern state of Iraq. In the context of ancient times the southern part of this region is known as Babylonia, the northern as Assyria.

The earliest evidence of the occupation of southernmost Mesopotamia comes from c 5000 BC. By 3500 BC this region was settled by the Sumerians. This ethnic group, of unknown origin, initiated a cultural revolution which gave the world writing, cities, and a corpus of religious practices and concepts. From their original area of settlement in southern Babylonia, where their city states flourished during the third millennium, Sumerian cultural influence permeated as far north as the area later known as Assyria, but was less marked there than in the south.

The period 2750 to 2500 BC saw considerable immigration into Babylonia of peoples from the Arabian desert, speaking the Semitic language Akkadian, who in the course of their assimilation to the higher Sumerian culture profoundly modified it, not least in religion. Further Semitic immigration brought about, by c 2000 BC, the disappearance of the Sumerians as an ethnic or cultural entity, and in the north overlaid the aboriginal inhabitants of Assyria with a mainly Semitic culture.

The beginning of the second millennium was marked by the rise of a number of Akkadian-speaking city states, of which Babylon under Hammurabi ultimately achieved supremacy. Before 1000 BC political supremacy had passed to Assyria, which with brief intermissions remained predominant until shortly before the fall of Nineveh in 612 BC.

The Sumerians and their successors employed as their principal writing material tablets of clay, inscribed by impression with a stylus. Such tablets, virtually indestructible, have been found in hundreds of thousands. Many of them contain texts directly or indirectly related to religion, myth or magic, one of the principal sources being libraries collected by Assyrian kings, particularly Ashurbanipal (668–629 BC) at Nineveh.

Ancient man saw the universe in the form of conscious forces, which were conceived of in some specific shape. Such personification was originally not necessarily in human shape, since some of the most primitive concepts of divine powers invested them with animal aspects. Some aspects of the forces active in the world, certainly those thought of as universal gods, must have been personified by the Sumerians before their settlement in Mesopotamia. In addition, each early Sumerian settlement had its own local deity (sometimes identified with a universal deity), with attributed characteristics depending on the dominant features of the locality and community. As society developed, the deities of different settlements were brought into relationship, whilst additionally specific aspects of agriculture and technology (for example, corn or brickmaking) became personified in a deity. Thus arose a considerable pantheon, the names of its members being compiled in god lists before the middle of the third millennium. Genealogies of the gods (theogonies) were developed to explain the relationship between deities.

The Great Gods

In one group of theogonies Enlil is the first god, deriving from several generations of vaguely defined primeval beings. In other theogonies, this role falls to An (Akkadian Anum), with Enki (Akkadian Ea) as his son. These two concepts were theologically combined, so that heading the pantheon in its

The stele of Naram-Sin, c 2300 BC, shows the Akkadian king facing a stylized mountain, his foot resting upon the bodies of his enemies; behind him soldiers climb a mountain path. The gradual infiltration of Babylonia by Semites in the 3rd millennium BC led to modification of the ancient Sumerian religion

developed form there stood a triad of universal gods: Anum, the sky god and king of the gods; Enlil, 'Lord Wind', originally a wind and mountain god; and Enki (Ea), god of wisdom, originally 'Lord Earth'. Though Anum was nominally king of the gods, executive power was in the hands of Enlil, who often in practice usurped the supremacy. In the mythology of historical times the sphere of Ea's activity was the cosmic sweet waters (Apsu) beneath the earth, probably as a result of the Sumerian Enki absorbing the attributes of a divinity of an earlier stage of religion.

A second group of deities comprised the moon god Nannar (Sin); the sun god Utu (Shamash); Venus, known in Sumerian as Innin or Inanna, 'Lady of Heaven', and in Akkadian as Ishtar; and the weather god, who was of less importance in a purely Sumerian context than to the Semites, amongst whom he was called Adad. These four gods, manifestly related to the diurnal period, are specifically described as sleeping during part of the day. Since in the latitude of Babylonia the crescent of the new moon is seen on a level axis like a boat, Sin was said to ride across the sky in a holy ship. Though, like the other great gods, thought of also anthropomorphically, he bore the epithet 'Brilliant Young Bull', and in a myth took that form to impregnate a cow.

The sun god rode across the heavens in a chariot drawn by mules. It was to him that prayers were addressed by those who lived by the ancient pre-agricultural pursuits of hunting and fishing, although all civilized

Praise to Ishtar

From an Akkadian hymn to Ishtar, translated by Ferris J. Stephens

She is clothed with pleasure and love.
She is laden with vitality, charm,
and voluptuousness.
Ishtar is clothed with pleasure and love.
She is laden with vitality, charm,
and voluptuousness.

In lips she is sweet; life is in her mouth.
At her appearance rejoicing becomes full.
She is glorious; veils are thrown over her head.
Her figure is beautiful; her eyes are brilliant.

The goddess – with her there is counsel.
The fate of everything she holds in her hand.
At her glance there is created joy,
Power, magnificence, the protecting deity and
guardian spirit.

She dwells in, she pays heed to compassion and
friendliness.
Besides, agreeableness she truly possesses.
Be it slave, unattached girl, or mother, she
preserves (her).
One calls on her; among women one names her name.

Who – to her greatness who can be equal?
Strong, exalted, splendid are her decrees.
Ishtar – to her greatness who can be equal?
Strong, exalted, splendid are her decrees.

She is sought after among the gods;
extraordinary is her station.
Respected is her word; it is *supreme* over them.
Ishtar among the gods, extraordinary is her station.
Respected is her word; it is *supreme* over them.

British Museum

Imdugud, the sacred lion-headed eagle, spreads his wings protectively over two stags. This large copper relief probably ornamented the entrance to a Sumerian temple

men bowed to him at his rising. Seeing all that happened on earth, he became god of justice and the divine lawgiver, and also controlled omens. He was sometimes thought to pass through the underworld at night.

The importance of Adad, the weather god, increased as one left Babylonia, a region watered almost wholly by irrigation, and moved north-westwards into areas dependent upon rain. Because of the sound of his voice in thunder, Adad was associated with the bull: he was also represented by the lightning symbol.

Inanna-Ishtar, a very complex figure, Queen of Heaven and Earth, the only prominent goddess of historical times, seems to have personified the vital forces of the crises of life. She could be felt as the loving mother who had suckled the king, or as the goddess controlling sexual powers, or as goddess of battle. She was also associated in myth and popular religion with a consort Dumuzi (Tammuz), a fertility deity who was annually lamented when absent in the underworld (see ISHTAR; TAMMUZ).

Other deities of major significance included Marduk, originally an aspect of the sun god. As god of Babylon, he ultimately achieved supremacy in the Babylonian pantheon, assimilating the characteristics of Enlil; he was also equated with a god Asallukhi, in which context he was god of magic (see MARDUK). Nabu, god of Borsippa, the nearest city to Babylon, was (probably for this geographical reason) regarded as Marduk's son; he was also patron of the scribal profession. The latter function had earlier been attributed to a Sumerian goddess Nisaba, and the conflict between the two concepts was resolved by Nisaba being (by the first millennium) regarded as Nabu's wife. In Assyria it was Ashur, originally the Assyrian tribal god, who ultimately usurped leadership in the pantheon, bearing the title 'the Assyrian Enlil'. Another god who became of particular significance in Assyria was the warrior god Ninurta, son of Enlil.

Though there are indications in mythology that a number of female deities originally held a significant place in Sumerian religion, from the beginning of the second millennium the only goddess of independent significance other than Inanna (Ishtar) was Ereshkigal, Queen of the Underworld, and even in her case a myth describes how she gained a dominant spouse, Nergal. Each of the male deities had a nominal consort, sometimes a pale reflection bearing the feminine form of his own name, sometimes an old Sumerian goddess who originally served an independent function in the pantheon or even existed before the developed pantheon.

The great gods, whilst regarded as being concerned with the life of Babylonia and Assyria as a whole, might at the same time be thought of as having their abode particularly in a certain city or cities. Anum lived in Erech or Der, for instance, and Shamash in Sippar or Larsa. The deities were in no sense tied to these places but if the proper rites were performed, an aspect of the deity might take up residence in an image, which then represented the god's presence and became a focus of the cult, although the god was not theologically thought of as bounded by the visible statue. A considerable

The deities, in the form of statues, might make journeys from one shrine to another; their accidental movements on such occasions were of great significance as omens

wardrobe of clothing, insignia and jewellery would be available to dress and adorn the god's image. Daily food offerings were made, and privileged persons, including the king, might be permitted to eat the food remaining from the god's meal table. The deities, in the form of the statues, might upon appropriate occasions make journeys from one shrine to another, either by ship or upon the shoulders of bearers. Their accidental movements on such occasions were of great significance as omens to bystanders.

There is some ambiguity about the relationship felt to exist between Mesopotamian man and the great gods. On the one hand, the great gods were concerned not with the individual but with the maintenance of cosmic and political order and the course of Nature. On the other hand, there are indications that the relationship between a worshipper and a god might be felt as a very intimate one. In the third millennium Gudea, a city ruler, says to his god: 'You are my father, you are my mother.'

In general, the gulf between the worshipper and the great gods was bridged by the concept of the 'personal god', a minor deity rather like a guardian angel, who could bring the supplication of the ordinary man before the major deities. It seems probable that only a king would have a major deity as his personal god.

Defeated Gods

Behind the deities prominent in historical times there are traces of an earlier stage of religion, hinted at in the genealogies of the gods, and represented in myths and incantations which mention divine beings thought of as slain, defeated or suppressed. Whilst the deities of historical times are primarily anthropomorphic, some of the divine powers of the earlier stage were conceived in animal form. Anzu (or Zu), a divine being who once challenged the great gods, had the form of a bird, whilst Tiamat, the primeval being from whom in one myth the gods originated, was sometimes represented as a dragon, and another proto-deity whose attributes were absorbed by Ea may have been thought of as an ibex. The supersession of the earlier stage of religion is reflected not only in the various combat myths, but also in the fact that the victor gods bear the characteristics, and sometimes the names or titles, of those they overcome. Thus Ea not only overcame Apsu, the primeval waters, but bore the title 'the Ibex of the Apsu' and is even identified with Apsu. Ninurta not only defeated Anzu, but had applied to him the name Imdugud, elsewhere used of Anzu. Marduk not only subdued Tiamat's marshal Kingu, but could actually be called Kingu.

The number of deities in the pantheon was ultimately much reduced by identifying one deity with another or with aspects of another. For example, one hymn specifically states that a number of great deities are incorporated in the god Ninurta. Such a process would logically have concluded in monotheism. The claim has been made that this was actually achieved in Babylonia, but this remains questionable.

Like a Thrusting Bull

Myths, either as long literary productions or embedded in fragmentary form in incantations, ritual texts or hymns, are known in both Sumerian and Akkadian. The value of myths for the understanding of Mesopotamian religion has been variously estimated, one extreme view being that they primarily reflect primitive stories from the remote past rather than anything in the religious experience of Mesopotamian man of the second or first millennium. Against this, whilst their origin was certainly (in most instances) very ancient, their use until a late period in incantations indicates that they were still felt to have some relevance to the supernatural forces affecting mankind.

The main themes of myths concern (with variations between Sumerian and Akkadian examples) the creation and organization of the physical universe, the creation of the gods and their functions, the creation of man, the origin and prehistory of the existing order, the origin of disease and healing, and stories of the Flood and the underworld.

A Sumerian myth of creation offers an insight into the concept of the relationship between the gods and mankind. The composition begins with an account of the difficulties confronting the gods in obtaining their food. Their complaint is brought before Enki, god of wisdom, who describes to his mother how to make servants by moulding clay in the image of the gods. Theologically, this reflects the view that mankind exists primarily to serve the gods. When the creation of man has been successfully achieved, Enki and his mother, having become intoxicated in celebration, proceed to make seven abnormal beings, this part of the story being an attempt to explain the occurrence of malformed humans.

The myth of 'Enki and the World Order' described how Enki produced the features of the world as known to the Sumerians. He it was who had given cattle to the nomad 'who builds no city, who builds no house', and he it was who had decreed for the various lands their characteristic products, and who had instituted the various aspects of agriculture. A typical passage described how in the manner of a bull he impregnated the Tigris, giving it fertility, and making its water available for irrigation.

> Like a thrusting bull he stood proudly,
> He produced an erection, he ejaculated,
> He filled the Tigris with clear water . . .
> The water he produced is clear water . . .
> The grain he produced . . . the people eat it.

Some Sumerian myths reflect very early cultural advances or changes. The earliest Sumerian settlements were in the extreme south around Eridu, but the cultural centre subsequently moved north to Erech; this situation is reflected in the following myth. Inanna, goddess of Erech, visited Eridu, whose patron Enki, god of wisdom, had in his charge a collection of objects basic to civilization, called in Sumerian *me*, and representing features of civilization which in modern terms would mainly be thought of as abstract concepts, but which the Sumerians, conceiving them as embodied in their symbols, could regard as physical entities. They included such aspects of Sumerian life as kingship and royal insignia, various priestly offices, sexual relations and prostitution, musical instruments, truth and falsehood, various crafts, peace and victory. A feast ensued at which Enki, generous in his wine, made these functions over to Inanna. Subsequently repenting of his generosity, Enki dispatched monsters to intercept Inanna on her voyage home, but failed in his attempt.

One of the most striking myths, centred on Inanna (Ishtar) and extant, with variations, in both Sumerian and Akkadian versions, describes the visit of the goddess to the underworld, for reasons which are not made explicit but which some scholars have suggested (on little evidence) was to gain possession from her older sister Ereshkigal. Inanna's descent took her through seven

By 1000 BC political supremacy had shifted from Babylonia to Assyria and northern gods, such as the warlike Ashur, consequently achieved greater prominence: relief from the palace of the Assyrian king Sennacherib, showing a pile of heads of defeated enemies

gates, at each of which the gatekeeper removed part of her garments and insignia. Emerging through the final gate naked, she encountered the deathly glance of Ereshkigal and the judges of the underworld, and became a corpse.

Anticipating disaster, Inanna had left her vizier, Ninshubur, with instructions to seek help from various other deities, if she did not return within three days. After unsuccessfully visiting Enlil in Nippur, and the moon god in Ur, Ninshubur went to Enki in Eridu. Enki created two sexless creatures (possibly a reflection of the occurrence of eunuchs in the cult of Inanna) and sent them to Ereshkigal, from whom after they had ingratiated themselves, they were to beg the corpse of Inanna as a gift. The creatures then restored Inanna to life, but the rules of the underworld permitted her to leave only if she provided a substitute. Her return to the earth was therefore in the company of ghouls, serving as wardens. At the first two cities Inanna visited, she found the city god in mourning for her, and in gratification exempted them from being taken as substitute. At the third town, a suburb of her own city Erech, she found the god Dumuzi, her own spouse, rejoicing instead of lamenting. In chagrin she handed him over to the representatives of the underworld who, despite desperate attempts by Dumuzi to escape, finally took him prisoner, to Inanna's ultimate grief.

Amongst myths preserved only or primarily in Akkadian the best known is the relatively sophisticated Creation myth *Enuma elish* ('When above'). Recited at Babylon during the New Year festival, this began with a description of the origin of the universal deities Anum and Ea from a chain of beings descended from the primeval Tiamat and Apsu, the cosmic ocean and sweet waters. Eventually the bustling activities of the younger gods disturbed the primeval beings, and conflict ensued. After Ea had overcome Apsu, Tiamat herself entered into hostilities.

The other gods proving powerless to challenge her, Ea's virile son Marduk appeared as champion on condition that he should receive supreme power in the pantheon. With this granted, he fought and defeated Tiamat, splitting her body like a shellfish, and spreading it out as heaven and earth. From the blood of Kingu, leader of

British Museum

the host of Tiamat, Marduk created man, and imposed on him the service of the gods. In gratitude to Marduk the other gods built him a shrine in Babylon.

This myth reflects theological ideas concerning the origin of man (created to serve the gods but yet containing a divine element), and also concerning the reason for the political supremacy of Babylon.

The myth of 'Adapa', the ending of which is missing, concerns the limitations of human beings in the face of the gods. A fisherman, Adapa, was summoned to heaven for breaking the wing of the south wind. After Anum had forgiven him, he had immortality within his grasp when the supreme god offered him the bread and water of life but – falsely advised by Ea – Adapa rejected these gifts.

In the relatively late myth of the pestilence god Erra, datable in origin to the end of the second millennium, Erra is represented as offended by mankind's neglect of his cult. He therefore came to Marduk, god of Babylon, to pick a quarrel. By this period Marduk had acquired attributes originally belonging to Anum, and was called 'king of the gods'. For reasons which are not clear, Marduk had to leave his city to go to the underworld, and conciliated Erra by allowing him to take charge during his absence. Breaking trust, Erra proceeded to devastate Babylonia, including the capital itself. Finally Erra's anger was calmed by his vizier, and he confessed himself at fault. This may represent a mythological explanation of an outbreak of plague in Babylon, possibly during the New Year festival, when on the human level the city was dangerously crowded, and on the mythic level Marduk was, for part of the period, absent. The epilogue states that the presence of this myth in a house will give protection against plague, and it is known that extracts from this myth served as amulets.

The Prowling Dogs

The great gods were probably of less immediate concern to the ordinary man than the demonic powers with which his imagination peopled the world. Spirits were of many kinds, including both ghosts of humans who had come to a violent or tragic end – 'a man lying dead in the open country, uncovered with earth', 'a weeping nursing mother' – and non-human devils, amongst others the

'Croucher', the 'Seizer', the 'Ghoul', Lilith and Lamashtu, a female spirit which preyed upon women in childbirth and upon infants. Such spirits lurked in corners, in graveyards and in the desert. They were likened to prowling dogs, and their motion could be so rapid that they were said to flit past like shooting stars. They could get into houses by many means:

> A door cannot exclude them,
> A bolt cannot turn them back;
> They slither through the door like a snake,
> They blow in by the hinge like the wind;
> They bear off the wife from a man's embrace,
> They snatch the son from a man's knee.

A vast corpus of magical incantations and rituals grew up to deal with them, some collected into series which developed a standard form. Amongst these the principal are *Utukku limnutu*, 'Evil Spirits', and *Asakku limnutu*, 'Evil Disease-demons'. Typically these contain incantations and ritual instructions represented as derived from Enki (Ea) and his son Marduk, god of magic. These were used by the exorcist, who spoke in the name of Enki:

> I am the man of Enki! . . .
> The great Lord Enki (Ea) has sent me;
> He has put his pure spell to my spell;
> He has put his pure mouth to my mouth;
> He has put his pure spittle to my spittle;
> He has put his pure prayer to my prayer . . .
> By the magic of the word of Enki (Ea),
> Those evil ones will be taken away.

Some of the incantations in these series contain fragments of ancient myths. Others were strictly limited to a ritual and an incantation. For example: 'If dead men keep appearing, it is "Hand of Ishtar". To drive the dead men away, you shall mix vinegar with river water, well water, *mundu* water (uncertain meaning) and ditch water. You shall fill an ox horn, and you shall raise the horn in your right hand and a torch in your left hand and say thus: "My (personal) god, turn to me! My (personal) goddess, look on me! Let your angry hearts be calm; let your ire be appeased; set forth well-being for me."'

Magic, which in the hands of the exorcist could protect Mesopotamian man from the attack of demons, in the hands of sorcerers (male or female) could be directed against humans. Such anti-social use of magic is widely attested from the beginning of the second millennium, being legislated against by the Laws of Hammurabi. The typical technique in witchcraft was making an image of the victim which was then destroyed, often by burning, but anything closely connected with the intended victim could be used to gain magical power over him.

Evil persons might also make use of the magical properties of spittle. When one spat, the decent thing to do was to rub it out with the foot, but a worker of black magic might deliberately omit this, in order to gain power over the person walking over it. Sorcerers themselves could be counter-attacked by magical means. Thus we find a cylinder-seal employed against a witch. The seal was twirled to the accompaniment of a suitable incantation – 'O witch, like the twirling of this seal (of green stone), may your face spin and turn green' – whereupon the witch was herself 'put into a spin'. The principal incantations and rituals against witches and sorcerers were collected in a series known as *Maqlu* ('Burnings'), so called because the typical rituals involved burning images of the sorcerer or witch or related demonic powers, to the accompaniment of an incantation to the fire god.

Extraction of Curses

Not only the deliberate activities of witches and sorcerers but also the commission, even accidentally and unwittingly, of certain tabooed acts, could bring evil supernatural influences upon a man. Curses (not necessarily spoken words) were regarded as physical things which could enter a man's body and by suitable means could be extracted again.

Troubles of this kind were dealt with by another series of incantations, called *Shurpu* (a term also meaning 'Burnings', but in a

British Museum

The patient was handed an onion, a date, a piece of matting, and tufts of wool: each of these he had to pull apart and throw into the fire

different sense from *Maqlu*). The victim was diagnosed as suffering from one of an undifferentiated list of offences, including both deeds which would in terms of modern thought be taken as ethical offences and those which were simply accidental breaches of a taboo. Thus the sufferer might have:

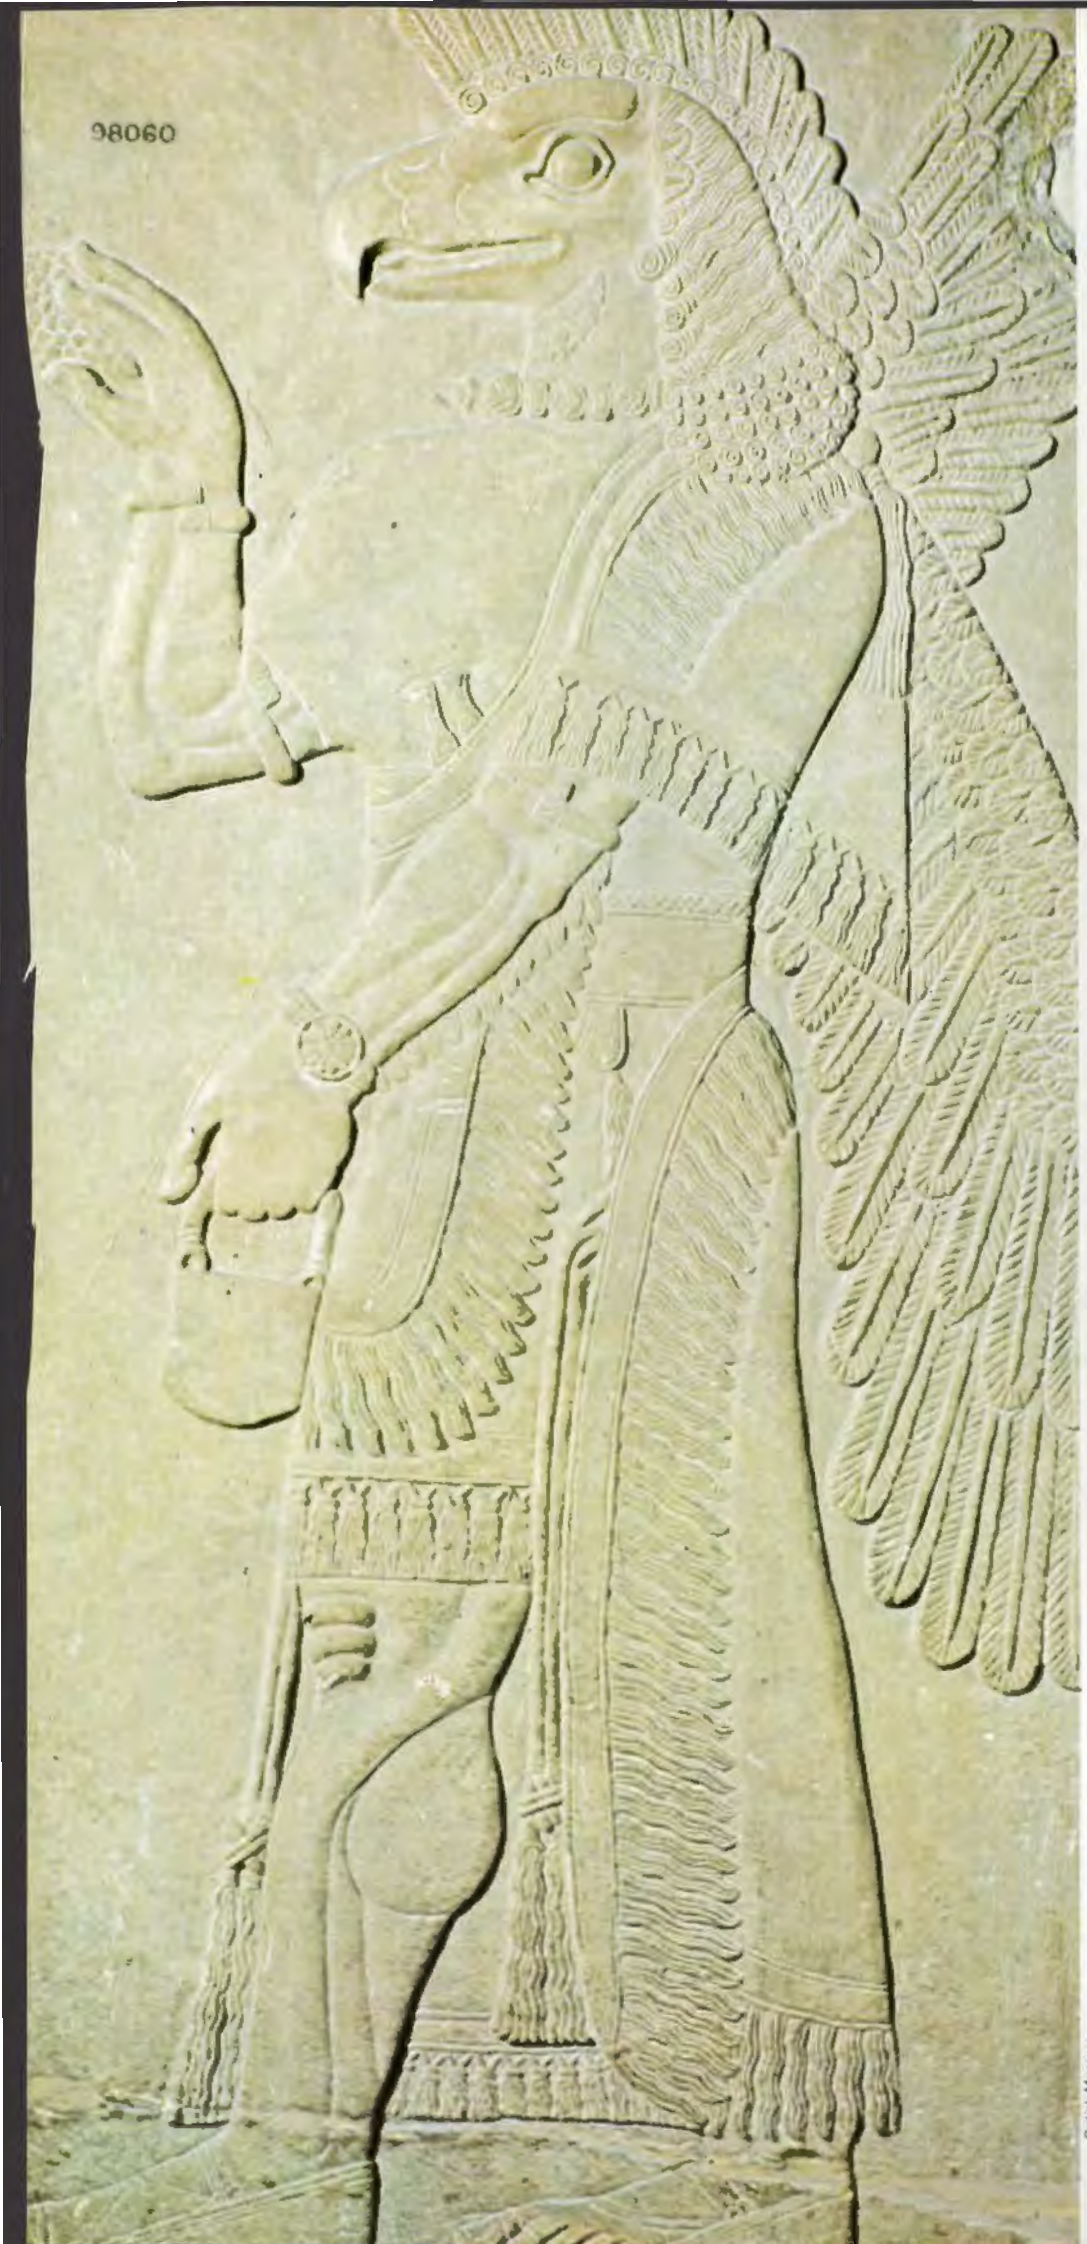
> Eaten what is taboo to his god,
> Estranged son from father, father from son,
> Despised his parents, offended the elder sister,
> Said 'There is' when there was not,
> Had intercourse with his neighbour's wife,
> Shed his neighbour's blood,
> Slept in the bed of a person under a curse.
> Drunk from the cup of a person under a curse.

The remedy for all these was of the same kind. Incantations were recited by the exorcist and the patient was then handed an onion, a date, a piece of matting, and tufts of wool. Each of these he had to pull apart and throw into the fire. Accompanying the destruction of each was an incantation of the following type: 'Like this onion which he peels and throws into the fire . . . so may oath, curse . . . pain, weariness, guilt, sin, wickedness, transgression, the pain which is in my body, my flesh, my sinews, be peeled off like this onion.'

Another procedure used to dispose of evil influences was to absorb them into some substance or animal. The following simple example describes the method of calming a feverish child by transferring the evil contagion to a dog: 'You shall place a loaf on the child's head; you shall recite a (previously specified) incantation three times; you shall wipe (with the loaf) from the (child's) head to his feet, you shall throw that loaf to a dog. That child will be calm.'

The threat of evil powers, in the form of demons, witchcraft, and other forces released by breach of taboo, came to a climax in relation to the king himself. Many rituals and incantations and a vast corpus of taboo were designed to protect him, and the land whose wellbeing resided in him, from such perils. He might even resign his throne temporarily to a substitute to escape the dire consequences when particularly grave evils were foretold (see KING).

The gods were thought to determine in advance the details of a man's life, or



British Museum

The practical affairs of the Mesopotamians were thought to be controlled by minor deities: these were of two kinds – benevolent guardian spirits and evil demons. One of the former, a winged eagle-headed genie bearing offerings, appears on this alabaster bas-relief of the 9th century from the palace of Assurnasirpal

events relating to the future of a city or nation. By using proper means, men could obtain a glimpse of these 'destinies'. Many forms of divination developed to this end, some available to the common man, others restricted to the king and matters of statecraft. Amongst the principal techniques were exstispicy, observation of animal behaviour, interpretation of dreams, and astrology.

Exstispicy involved the slaughtering of a lamb and the examination of its internal organs. A question having been previously put to the sun god, his answer could be read by the experts in the configurations and markings of the organs, particularly the lungs and liver.

Omens could be obtained in simpler manner from random events, in particular the behaviour of animals, and there arose large compilations listing these. If ants were seen fighting, this foretold 'approach of the enemy; there will be the downfall of a great army.' If a white dog cocked its leg against a man, hard times would follow, though if it were a brown dog, the man would receive happiness.

For the interpretation of dreams, to which much importance was attached in later Assyria, a 'Dream Book' existed, giving the interpretation of some hundreds of dream incidents. Astrology, also important in imperial Assyria, used meteorological or celestial phenomena to predict matters relating to the king or the state. For example: 'During the night Saturn came near the moon. Saturn is the "star" of the sun. This is the solution: it is favourable to the king, (because) the sun is the king's star.' This divination technique was used many centuries before the development of horoscopic astrology, applicable to a particular individual, which, although it also had its origin in Mesopotamian civilization, did not arise until the latest stage, at about 400 BC.

Douglas Allen

The Abode of Love, at Spraxton near Bridgwater, was the headquarters of two self-styled messiahs, Henry James Prince and John Hugh Smyth-Pigott: after Prince's death in 1899, Smyth-Pigott inherited both title and position

Many men have claimed to be, or have been hailed as, divine saviours: messianic movements of the modern world include the Dutch Loumensen, the Abode of Love in England, the followers of Father Divine in the United States, the Nazareth Baptist Church in South Africa, and the Ras Tafarians in Jamaica

MESSIANIC MOVEMENTS

THE DISTINCTION between a messiah, or saviour, and a prophet who foretells doom and offers ways of escaping it, is not always easy to draw, but in the strict sense the term 'messianic' is confined to movements whose leader claims to be God or a representation of God, or which arise in firm anticipation of such a god-man's appearance. The term is often used loosely for religious movements which expect the end of the world and the establishment (usually for believers only) of a new dispensation of peace, plenty and pleasure. These are more accurately called millennial movements but some movements, of course, are both messianic and millennialist, when the messiah's role is to lead the faithful into the millennium. Early Christianity, and all movements expecting the Second Coming of Christ (see SECOND COMING), can properly be called messianic but current usage tends to restrict the term to groups whose messianic beliefs are outside the Bible.

Claimants to messiahship were common in Jewish history before Christ, and were by no means uncommon in the Middle Ages among Jews, Christians and Moslems. In modern times, the messianic figures who have commanded the greatest following have appeared in non-Christian countries or among underdeveloped peoples. An example is Hung Hsui-chuan, the son of a Chinese peasant household who emerged as a visionary, after repeatedly failing the Civil Service examinations, and inspired the Taiping rebellion which began in southern China in 1851 and lasted until 1864, with Nanking as its capital for most of this period.

Younger Brother of Christ

Hsui-chuan had been influenced by an American missionary and the content of his visions was in many respects Christian, but he became convinced that his destiny was to restore the true faith to China, and that this would be achieved only with the overthrow of the Manchu imperial dynasty. Thereafter Ta'i-p'ing t'ien kuo, the heavenly kingdom of great peace, would be established. The name *ta'i-p'ing* had been used to describe an era of peace in the Chinese past, but the rest of the title was coined to express the Christian concept of a heavenly kingdom. Hung Hsiu-chuan did not make outright claim to be God, but rather to be the younger brother of Jesus; however, some scholars believe that he produced, in place of a trinitarian system, a fourfold concept of the deity. His followers were seen as a Chinese version of the children of Israel seeking the Promised Land.

As the movement grew and drew around it more conventional rebellious elements, Hung Hsiu-chuan's role was overshadowed by more militant and political leaders. He had been the early focus of attention for many who were discontented in southern China, where the peasantry had been reduced to the status of tenants, where population growth had produced new pressure on arable land and where, in Hunan province in particular, famines and catastrophes had been frequent. Hung Hsiu-chuan's ideas were alien to Chinese thought, and this has been seen as a factor which may have limited the support that he commanded. His message combined the unreconciled elements of Christian eschatology, promising both a new kingdom on earth with resurrection of the dead, as well as the prospect of salvation in the otherworld. He is reputed to have dwelt very much on sin and to have made men anxious about its consequences, demanding regular prayer for forgiveness, and obedience to the Ten Commandments. In the early days of his activity some of his followers had ecstatic and convulsive experiences. In spite of the unfamiliarity of these things, the new ideology mobilized an effective following who rose in armed rebellion on an impressive scale, until the movement suffered defeat largely through the agency of General Gordon.

Gordon's role in life seemed destined to be that of opponent of messianic claimants,

Sheila Kitzinger

for he is linked more intimately in the public mind with the struggle against another modern messiah – Mohammed Ahmad, the Mahdi who inflamed the Sudan in the 1880s. Despite the rigorous monotheism of Moslems, messianism has played a powerful role in Islam. Ahmad proclaimed himself the Imam, successor of the Apostle of God, the expected saviour, the chosen one who would reconquer the Moslem world and restore the community that Mohammed the prophet had brought into being. He took the title Mahdi, the 'guided one', although, since the Sudan was of the Sunnite division of Islam, he did not claim to be the Hidden Imam, long awaited by Shiite Moslems. Ahmad was widely accepted, and his personal piety and high reputation made plausible his claim to be the Mahdi. He quickly built up a new state which was a theocratic despotism, the success of which lasted for more than a decade after his own death in 1885, even though there were strong tensions between the different groups among his followers. (See also MAHDI.)

'Why Shouldn't God Smoke?'

No other messianic figure of the last century can equal the Mahdi in terms of worldly success, but there have been many men who have claimed to be God both in underdeveloped countries, where they have been more successful, and among more advanced peoples. In modern society, where rational bureaucratic systems regulate life, and where there is heavy reliance on technical skills and well-defined roles, claims to superhuman competence are far less credible than in the more personal world of simpler societies. Miracles are not believed in by people who are used to explanations of a scientific and strictly causal kind, and successful modern religious figures, in America and Europe, tend increasingly to claim to be 'scientific' rather than to be workers of miracles that defy the laws of Nature. Where technology is less advanced, where rational principles of organization are less understood and, above all, where abstract concepts and empirical inquiry are less developed, the messianic claimant can still gain a hearing among those who dream of personal saviours who will solve men's problems. But messiahs have arisen from time to time in advanced countries, not only among underprivileged ethnic groups, in culturally retarded areas or among severely isolated and unworldly groups, but among much less easily identified groups of the population including well-to-do and educated members of society.

One of the most colourful of these was Lou, who was born Louwrens van Voorthuizen in north Holland, and who spent the middle years of his life as a fisherman. Lou, as he preferred to be called, declared himself to be God in 1950, and drew around him a small and somewhat contentious body of followers, *Lou-mensen*, who were united essentially by their complete devotion to him. Lou maintained that his role was the equivalent of that of Christ, but whereas Christ had won a spiritual victory over the Devil, he, Lou, would defeat the Devil in the body.

Lou rejected conventional moral obligations, as having no relevance for salvation. (He made much of his liking for cigars: 'Why shouldn't God smoke?' he asked.) Salvation was to be attained only through him. His followers were to regard themselves as the sons and daughters of God, and needed no wills of their own. They should surrender themselves gratefully to Lou, God. The Bible was entirely superseded now that God was on earth again incarnate, and in the pamphlets which some of his middle-aged women votaries sold on the streets of Amsterdam, Lou derided both the Bible and the clergy who preached it. He preached that the time of the end was at hand, when all his followers would triumph over death. Despite the claim to immortality, Lou died in 1968. For a time his followers continued as a group, but recent inquiries at their address have not been answered.

A figure about whom even less is generally known is Georges Roux, the Christ of Montfavet, near Avignon in France. Roux was a postmaster who had practised as a faith healer for some time when, in the early 1950s, he announced that he was Christ. To read his works in simplicity of heart, it is claimed, is to accept his mission as the reappearing Christ. Roux's followers, whose churches take the name *L'Eglise chrétienne universelle*, are reputed to number more than 5,000, principally in Paris and southern France.

The Abode of Love

The 19th century produced the most spectacular recent claimants to messiahship in Britain. Among these were two men, one of whom 'inherited' this claim from the other. Such a transfer of a status as unique as that of messiah must be unprecedented (short of a belief in the transmigration of souls) and yet the group known as Agapemonites, brought into being in the 1840s by an Anglican priest, Henry James Prince, accepted after his death a new immortal messiah in the person of John Hugh Smyth-Pigott. Prince had been renowned at St David's, Lampeter, where he had studied for the Anglican priesthood, as a particularly pious student, and soon after taking up his first curacy at Charlinch in Somerset, he gained a reputation for powerful sermons and strong personal magnetism, particularly for women. Believing himself to be possessed of the Holy Spirit his sermons became increasingly heretical, and after some time his relations with the Church of England became strained, and he opened his own chapel in Brighton. With donations from his supporters, among whom were a number of wealthy women, he bought a large house and grounds and a farm at Spraxton in Somerset, and there established his community, the Abode of Love. He had set forth his teachings in a number of tracts, and styled himself 'the Beloved One' and 'the Messiah'.

At Spraxton Prince assumed complete control of his followers, making it clear that his will was the will of God which none

Ceremonies in which traditional dancing plays an important part link the Nazareth Baptist Church with the tribal past. The founder of the movement was in his lifetime deified by his Zulu followers and his son, John Galilee Shembe, has inherited his claim to messiahship

must question. Some of the women who joined the community bestowed all their property on Prince, and well-wishers in Brighton, Weymouth and elsewhere contributed to its support. From the beginning a luxurious style of life was adopted, with emphasis on recreation (the chapel itself was furnished with a billiard table). Prince drove a carriage with footmen, and was later remembered as having driven through the neighbouring town of Bridgwater with his footman sounding a trumpet and announcing him as the messiah. The most distinctive feature of Agapemonite life was Prince's teaching of 'spiritual wivery'. Surrounded by 'sisters', he took a bride of the Lamb from among his following, declaring that 'in me you see Christ in the flesh, in my flesh'. The successive sexual adventures of Prince, undertaken in the name of the highest spirituality, caused some of his followers to withdraw, but those who stayed at Spraxton, other than his own paramours, led chaste and upright lives. The teaching which allowed Prince to affirm that he was above sin, no matter what he did, was a teaching for the leader not for the following.

Messianic Succession

Prince fathered several children and also found himself involved in a number of lawsuits when female adherents sought to recover their surrendered property. Although his practices were exposed in these proceedings, and although Prince was unfrocked as an Anglican priest, the community continued; undoubtedly most of its members had implicit faith in their messiah. Prince preached that he and his followers were immortal and deaths within the community were explained as the consequence of lapses into sin. His own death, in 1899, might have been expected to see the collapse of the Agapemonites: instead it produced a new messianic claimant.

Shortly before his death, Prince had sponsored the building of a church in Clapton, London, known as the Church of the Ark of the Covenant. This development was all the more surprising since in Prince's later years the Agapemonites had done little in the way of evangelization. It is uncertain whether the founding of this church, at which non-resident sympathizers of the Spraxton community occasionally met, had any direct connection with the choice of Prince's successor, or whether Prince had any interest in the continuance of his sect after his death. But it was at this church that, in 1902, John Hugh Smyth-Pigott declared himself to be the messiah.

Smyth-Pigott had been ordained an Anglican clergyman in 1882 and for a time had been curate at St Jude's Church, Mildmay Park, not far away from Clapton. In the period following Prince's death he was leading a mission in Dublin. By some means he came, or had come, into contact with the Agapemonites, and after his pronouncement at the Church of the Ark of the Covenant was accepted by them as their new leader. Some among them came to believe that he had been specifically designated as such by Prince himself – improbable, in the nature of messianic claims, as that must seem. At Spraxton, Smyth-Pigott quickly established himself over the community, continuing many features of Prince's regime. He retained the division of the community into three classes: the lowest comprised those who were the domestic servants of the rest, and the highest were the most spiritual group from among whom he would choose his soul brides.

Young women were still recruited to the community, and in 1904 Smyth-Pigott brought in a 'chief soul bride', a Miss Ruth Preece. He had three children by Ruth. His wife, who had borne him no children, appears to have accepted the situation with equanimity as indeed did most members of the community. The local Anglican bishop, however, eventually felt constrained to have the Spraxton messiah unfrocked. Producing illegitimate children, rather than the well publicized claim to messiahship, was what finally brought the Bishop of Bath and Wells to have Smyth-Pigott's case brought before a Consistory Court. In later years, the messiah took other brides and Ruth was displaced at an elaborate ceremony, for disobeying the messiah's will.

The numbers at Spraxton, sometimes reinforced by visitors from a Norwegian sister house which Smyth-Pigott frequently visited, steadily declined, and the messiah's death in 1927 reduced the numbers further. Without a leader the community slowly dwindled, until in the 1950s Sister Ruth also died and within a short time the community disappeared (see also PRINCE).

Movements that arise around a self-styled messiah are, in the modern age, unlikely to be revolutionary movements in any militant sense. The legal monopoly of coercive force in the modern state virtually precludes the possibility of a messiah actively fulfilling the implications of his claims to supernatural and omniscient power. In effect, therefore, the messianic leader operates more as if he were simply a wonder-worker. His miracles tend to be small miracles, tokens of power rather than manifestations of power in anything like the dimensions in which it is claimed. The reputation for small miracles is often enough for the faithful, and on such miracles rested a great deal of the reputation of one of the best-known of modern messiahs.

Father Divine

Like many other claimants to messiahship, Father Divine had behind him a career of active religious evangelism before he accepted the title of God. As George Baker, he had been a missionary among Negroes in various parts of the United States, but in 1930 at Sayville on Long Island, New York, Baker took the suggestive title, Father Divine. It was one among a number of such names assumed by Negro revivalists ('Daddy Grace' was a contemporary rival of Baker's). At Sayville he established the first of his Peace Missions, communities which became known as 'heavens' for those who lived in them. They were organized along co-operative lines, and to them were attached members who were non-resident but who joined the residents for religious services. Father Divine conceived the idea of

a well-organized social service for his adherents. He found jobs for the unemployed and cared for the poor, and since many of those who joined the sect were incapable of much organization on their own part, there was a very real sense in which Father Divine was their saviour, in this world if not in the next. Like most messianic leaders, Divine had no developed eschatology: salvation was indeed here and now, since God was here and now. In common with other messiahs, he taught that his members should not and would not die, and death was a shameful thing within the movement and not to be spoken about. Nor had Father Divine much use for the Bible, which was clearly a superseded book. Since God was available to speak for himself, the written record of his acts long ago and for a remote people was of little specific interest.

The Peace Mission espoused a rigorous ethical code and this may in itself have been part of its formula for success. Members were weaned away from those habits which caused debility and degeneracy among large sections of the population. Smoking and drinking were prohibited. Honesty was a strict requirement. Sexual continence, even between those who were married, was rigorously enjoined and the ill consequences of a large progeny were in this way avoided. Father Divine taught his followers to accept his will as their supreme good, and he forbade them to accept government welfare or to take out insurance policies. He himself could work all the miracles that they needed. He gave lavish banquets on a scale and in a style far beyond the previous experience of his adherents, and since they did not pay for these directly, his provision appeared as a miracle. He could pour innumerable cups of coffee from one small coffee pot, so it was frequently affirmed of him. His followers believed that anyone who spoke or acted against him would surely suffer, and took this as certain evidence of his divine power.

It is not easy to assess the numbers who believed in Father Divine when he was on the tide of success in the late 1930s, but there were perhaps hundreds of thousands, almost all Negroes. After the Second World War the movement seemed to have passed its peak, as more militant forms of Negro religion, in particular the Black Muslim movement (see BLACK MUSLIMS), displaced the essentially peaceful Father Divine cult. The movement may have suffered after Divine took a white second wife towards the end of his life, and because he was gradually less and less disposed to appear in public. He died in 1965, but the movement continued, although at a less impressive level than formerly.

Black Christs

Much more propitious circumstances for claimants to deity exist in Africa than exist even among the least educated and poorest groups in advanced societies, and it is there that the most dramatic among modern messianic movements are to be found. Belief in a personal and visible God is much more acceptable to illiterate natives, lost between tribal and urban styles of life, than in any other community. Black Christs have emerged from time to time, most notably in the Congo, but in South Africa, too, there has been no shortage of claimants to the role. Edward Lekganyane is a contemporary self-styled messiah who commands the devotion of between 40,000 and 80,000 followers from his headquarters at Zion City, Moria in the northern Transvaal.

Lekganyane was one of two sons of the leader of a religious movement known as the Zion Christian Church. Although the brothers quarrelled after their father's death in 1949 or 1950, a large proportion of the movement followed Edward. His capital is a village of about 300 persons in which strangers are not welcomed; from here he rules the movement, which has churches as far away as Johannesburg and Pretoria. Lekganyane's precise claims are difficult to discover, but his followers believe that he has power to prevent or create unemployment, to work miracles of healing, to destroy his enemies, and that he will soon have nations bowing down before him. His power is thought to destroy witchcraft, and in part he acts as the traditional witch-purger. But he

is also the focus for intense hatred of white men, and it may be in the anticipated victory of Zion over the world that his messianic quality is most significant.

As with other African religious movements, a mixture of traditional and Christian ideas prevail in Zion City, together with some innovations of unknown origin. Followers must not take medicines, since that would be to accept rival claims to power. They are to abstain from alcohol and tobacco. They are forbidden to eat pork, a taboo which may stem from the Old Testament influence of the Protestant 'Zionist' sects which formed missions among South African natives at the end of the last century. Paper which Lekganyane has blessed is burned as a way of liberating its potent virtue against witchcraft and illness. The ceremonial adopted at Zion City is like that connected with an African chief, and part of the appeal of the movement may be its function as a substitute for tribal identity among peoples who have become detribalized. Since chiefs have little power, messianic claimants who behave like chiefs but who, from the point of view of the authorities, do not pose an overt political threat, are the most powerful native figures in South Africa, exercising authority in the one sphere in which Africans are permitted considerable freedom – religion. Lekganyane combines the appeal of the traditional chief, presiding over ceremonies in which dancing, drumming and processions are all significant, with that of the modern tycoon, living in a modern house, dressing like an army officer and maintaining two Cadillacs and other cars.

In some ways a not dissimilar movement is that of John Galilee Shembe, whose organization is known as the Nazareth Baptist Church. This Church, too, was founded by the father of the present messiah, and the father was in his own lifetime also deified by his Zulu followers. The present messiah is in some respects a reluctant messiah. He is a man who has had a university education, who maintains in the name of his Church active business interests, and who finds himself not wholly at home in the role he has inherited. Some of his followers see J. G. Shembe as the god of the blacks, just as Jesus was the god of the whites, and others regard him as the incarnation of the Trinity. Shembe himself tends to refer messianic claims to his father. The ethical and ritual code of the movement is based largely on Old Testament precepts: pork is tabooed; circumcision is practised. Before the great festivals of the sect's year, sexual abstinence is to be practised between spouses. Beards are worn by men, and women are forbidden to cut their hair. All medicine is to be avoided, since illness is attributed to witchcraft, from which Shembe alone can rid his followers. Healing is in many ways a central concern of the movement, but Shembe is an undramatic person and his 'laying on of hands' tends to be undertaken in a perfunctory fashion, whilst he attends to other business.

The final defeat in 1898 of the followers of Mohammed Ahmad, the Mahdi: the theocratic state which he had established in the Sudan had lasted more than a decade after his death

Radio Times Hulton Picture Library

He holds mass healing sessions when the Holy Ghost is enjoined to effect healing.

In many respects the Nazareth Baptist Church resuscitates the richness of Zulu tribal and ceremonial life. Shembe is often referred to as a chief, and has in the modern world more prestige than any of the actual Zulu chiefs, some among whom worship in his Church. Ceremonies are extremely complex, and traditional dancing in elaborate costume is practised. Like a chief, Shembe receives tribute from his followers, who are largely uneducated people. They have good reputations as workers and as orderly and law-abiding people. For them the movement provides community, offers possibilities of healing and fertility (a strong preoccupation among African women), and provides some type of security for individuals who feel endangered by life in the towns. It gives them a sense of belonging to a powerful deity who can protect them, and maintains strong links with the dignified tribal life of the past. A tract of land is maintained at which principal festivities are enacted and this serves, at least symbolically, as a type of tribal homeland for the Shembe-ites.

Lion of Judah

Not every messianic movement arises round a self-styled messiah. Some are anticipatory, and others select as their god an individual who makes no such claims on his own behalf. One of the most extraordinary movements of the latter sort is the Rastafarian movement of Jamaica. Like some other movements in less-developed societies, the Rastafarians are not a distinct sect with a coherent organization, but a collection of groups of greater or lesser degrees of permanence, centred around a number of spasmodically emerging leaders, who proclaim a broadly similar set of beliefs. These leaders have often been rivals, and there have been sharp differences between them, but their central ideas, and in particular their faith in an unwitting messiah, are common ground. Their common candidate for messiahship was the former Emperor of Ethiopia, Haile Selassie. Their central theme is hatred of the white men who have dominated, first politically and still economically, the life of the West Indies. In Haile Selassie they acclaimed a saviour who would bring black men into their rightful heritage – the ownership of the African continent – and who would help to win black supremacy.

The reason for such faith in Haile Selassie is a curious one. Many Jamaicans were impressed, during the period following the First World War, by the pronouncements of Marcus Garvey, a militant pro-Negro Jamaican who was active in the United States. Garvey declared himself an avowed racist and fascist and he wanted to be the political saviour of all black people. He openly avowed his preference for organizations like the Ku Klux Klan to Negroes who collaborated with whites. His brilliant but abortive attempts to establish American Negroes as a power independent of their white compatriots included a pronouncement that Negroes should 'look to Africa when a black king shall be crowned, for deliverance is near'. Not long afterwards, in

Mansell Collection

The Mahdi, caricatured in a British cartoon, was to his followers the expected saviour, a messiah who would reconquer the Moslem world

1930, Ras Tafari, as the Crown Prince of Ethiopia was known, became Emperor, and West Indian Negroes, recalling Garvey's prophecy, became excited about the future.

The Italian attack on Ethiopia in 1935 inflamed the enthusiasm of the Rastafarians in Kingston, for this clearly represented a struggle of black men versus white, the worshippers of a living God against the worshippers of a dead God. Christian ideas were now completely abandoned by the various groups of supporters of Ras Tafari, and the movement became a semi-political religious belief in the power of a black saviour, Haile Selassie. Different local leaders elaborated their variants on this theme in different ways. Some were more avowedly religious and maintained services of worship. Others were more explicitly political. Some, the most extreme groups, withdrew to the plantations, grew 'ganja' (marijuana) and established a colony of militant anti-whites. Later a number of leaders arose who traded on the bizarre fantasies of some of the believers, promising that airplanes would arrive on specified dates to take them all to Africa and making a great deal of money by the sale of worthless 'passports'.

Long-Haired Niyamen

Despite such trickery, belief in Ras Tafari persisted. Some groups rejected European titles and some came to reject food cooked by anyone but a true believer. They became distrustful of hospitals, and in particular of birth control propaganda which was seen as an attempt by white men to destroy the black people. For similar reasons they condemned blood transfusions. The most extreme group of Rastafarians usually called themselves Niyamen, used ganja and grew their hair into long spiky locks, which were known as 'dreadlocks'. The intention was to imitate African warriors. The name Niyamen appears to have been adopted during the Italian-Ethiopian war, when a newspaper article appearing in Jamaica described a secret organization, said to be led by Haile Selassie, the aim of which was the total destruction of all white men in Africa. A movement had existed in Rwanda and Uganda some years earlier, known as Nyabingi, which had had something like this aim, but the imputation to Haile Selassie of leadership of such a movement (which had no connection with Ethiopia and which had been extinct for years before the Italian-Ethiopian war) was no doubt an embellishment of Italian propaganda agencies. Nonetheless the article had a powerful effect on the Rastafarians, who were well disposed to believe it. The Niyamen swore an oath promising death to the white oppressors and to all those Negroes who collaborated with them. It is this group of extremist Rastafarians that have come most to public notice, although the periodic craze for a ship or a plane to take Jamaicans to Africa has also brought the cult into the public eye.

Towards the end of British rule in Jamaica, there was an incident which made it evident that some Rastafarian leaders were using the movement to foster political revolution on the island and, in a skirmish with one of these leaders, two British soldiers were murdered in the late 1950s. There was evidence that this particular Rastafarian, the Rev. Henry, had been in communication with the government of Fidel Castro in Cuba. It may well have been that the religious aspects of Rastafarian practice were, in this instance, a front organization for a political group. Other groups of cultists have remained quite explicitly religious however. Some settled on the rubbish dumps outside Kingston and rejected white ways by deliberately being dirty, scavenging, periodically insulting tourists, and coming into riotous conflict with the police. Others are described by their fellow cultists as those who 'go tidy', who lead orderly peaceable lives and observe traditional dietetic taboos (the rules of the Old Testament for the Jews again apply, and there is conscious identification with the children of Israel in bondage). Some of these sectarians are described as good craftsmen and model citizens, who wait patiently for the airlift to Africa, which is the Utopia to which their messiah will deliver them.

A government inquiry into the activities of the Rastafarians in the late 1950s, led the newly independent government of Jamaica (to which the Rastafarians were as much opposed as to the whites) to permit a delegation of Rastafarians to visit Africa. They visited Liberia, Nigeria and Ethiopia, and were received by Haile Selassie, who gave them a token plot of land in his country. The Rastafarians were, however, disappointed by the possibilities of migrating to Africa

John Hillelson Collection

and seem to have received no positive encouragement from any of the governments they visited. In 1965 Haile Selassie paid a state visit to Jamaica and this very much excited the Rastafarians. He received some of them at a formal garden party, where they mixed with official guests, despite their dirty conditions. Although the messiah of their choosing gave medals to these would-be subjects, it appears that little or nothing could be done to satisfy the Rastafarian dream of settling in Ethiopia.

Haile Selassie's reign in Ethiopia ended in 1974, when he was overthrown by a military coup. He died in 1975. By this time the cult was well-established both in Jamaican society, and amongst the Jamaican immigrant population of Great Britain. New cult heroes emerged such as musician Bob Marley, a prominent and devoted Rastafarian, who died in 1981, and was famous for his distinctive 'reggae' sound.

The militant and ecstatic type of messianic movement is probably a waning phenomenon in the modern world. Whilst in countries undergoing dramatic social change from primitive to modern technological conditions, such outbreaks may still occur, in advanced societies social disorder is likely to arise differently.

Metals

Seven metals are traditionally linked with the seven planets known in antiquity, and each metal was long thought to develop in the earth under the influence of its planet: alchemy was the art of 'perfecting' metals and was partly based on ancient metallurgical techniques: smiths, dwarfs and other real or legendary metal-workers were thought to possess powerful magic.

Metamorphosis

Change of form or shape, a common occurrence in myths, legends and folktales; the gods may adopt temporary human or animal forms; witches turn their victims into loathsome forms; Lot's wife was punished by being turned into a pillar of salt, and Actaeon by being transformed into a stag; werewolves are human beings who turn into wolves at night; there are many stories in which rival magicians in combat change rapidly from one shape to another.

See SHAPE-SHIFTING; WEREWOLVES.

Axel Poignant

Metempsychosis

Or transmigration, the passage of a human or animal soul into a new body after death; the new body may be of the same species or a different one; in India and Greece the belief developed that souls pass from one form of life to a higher or lower one as a result of their conduct in each life; in many other parts of the world, the human soul may be reborn into the same kin-group or may become an animal, bird, insect or vegetable.

METEORS

Mansell Collection

A meteoric stone found at Ovifak in Greenland. Now preserved as curiosities, in the past such stones often became cult objects: meteorites were revered at Delphi and at Rome, while the famous Black Stone at Mecca, which was worshipped long before the time of Mohammed, is almost certainly a meteorite

The words meteor and meteorite both come from the Greek *meteora* (literally, 'things up in the air'), a term used by Aristotle in the belief that meteors were what we would call atmospheric or, using the word in another way, meteorological phenomena. Indeed, we do see these objects only when they enter our upper air. They are lumps of wandering interplanetary matter, varying in size from a mass of many tons to less than a grain of sand, which blaze by atmospheric friction just as do the ablation shields of returning space vehicles. A *meteor* is such an object, seen as a shooting star, that is burned up as it falls; a *meteorite* is one that survives its plunge and actually hits the earth. Shooting stars are often seen in showers at regular times of the year. This is thought to be because they are the debris of a disintegrated comet, scattered along its orbit round the sun which the earth crosses annually. These showers can present a remarkable sight and must have seemed especially portentous in former times.

In ancient Japan, meteorites were given to the temple of the goddess Shokujo, the patroness of household skills, since it was believed that they were the stones used by the divinity to steady her loom. Eskimos and the inhabitants of the Aleutian Islands have worn them as lucky charms. There are also several known or recorded cases of individual meteorites that came to be regarded as cult objects. The most famous is the Black Stone – almost certainly a meteorite – in the Kaaba, the sacred shrine of Mecca (see MECCA). One was kept in the temple of Apollo at Delphi and, in ancient Rome, a piece of iron from the sky was guarded by a special order of priests. According to legend, this object fell during the reign of Numa Pompilius, the philosopher who reluctantly agreed to succeed Romulus, the founder of Rome. Numa declared that it was a heavenly shield, upon whose safekeeping the security of the state depended. But the most intriguing of all (partly because an object now in the Liverpool City Museum may actually be it) is the *diopet*, the 'Zeus-fallen thing', that lay in the head-dress of the statue of Diana at Ephesus. Many believe the diopet to be not a meteorite but a neolithic implement. However, the Ephesians honoured it as a stone from heaven (see DIANA).

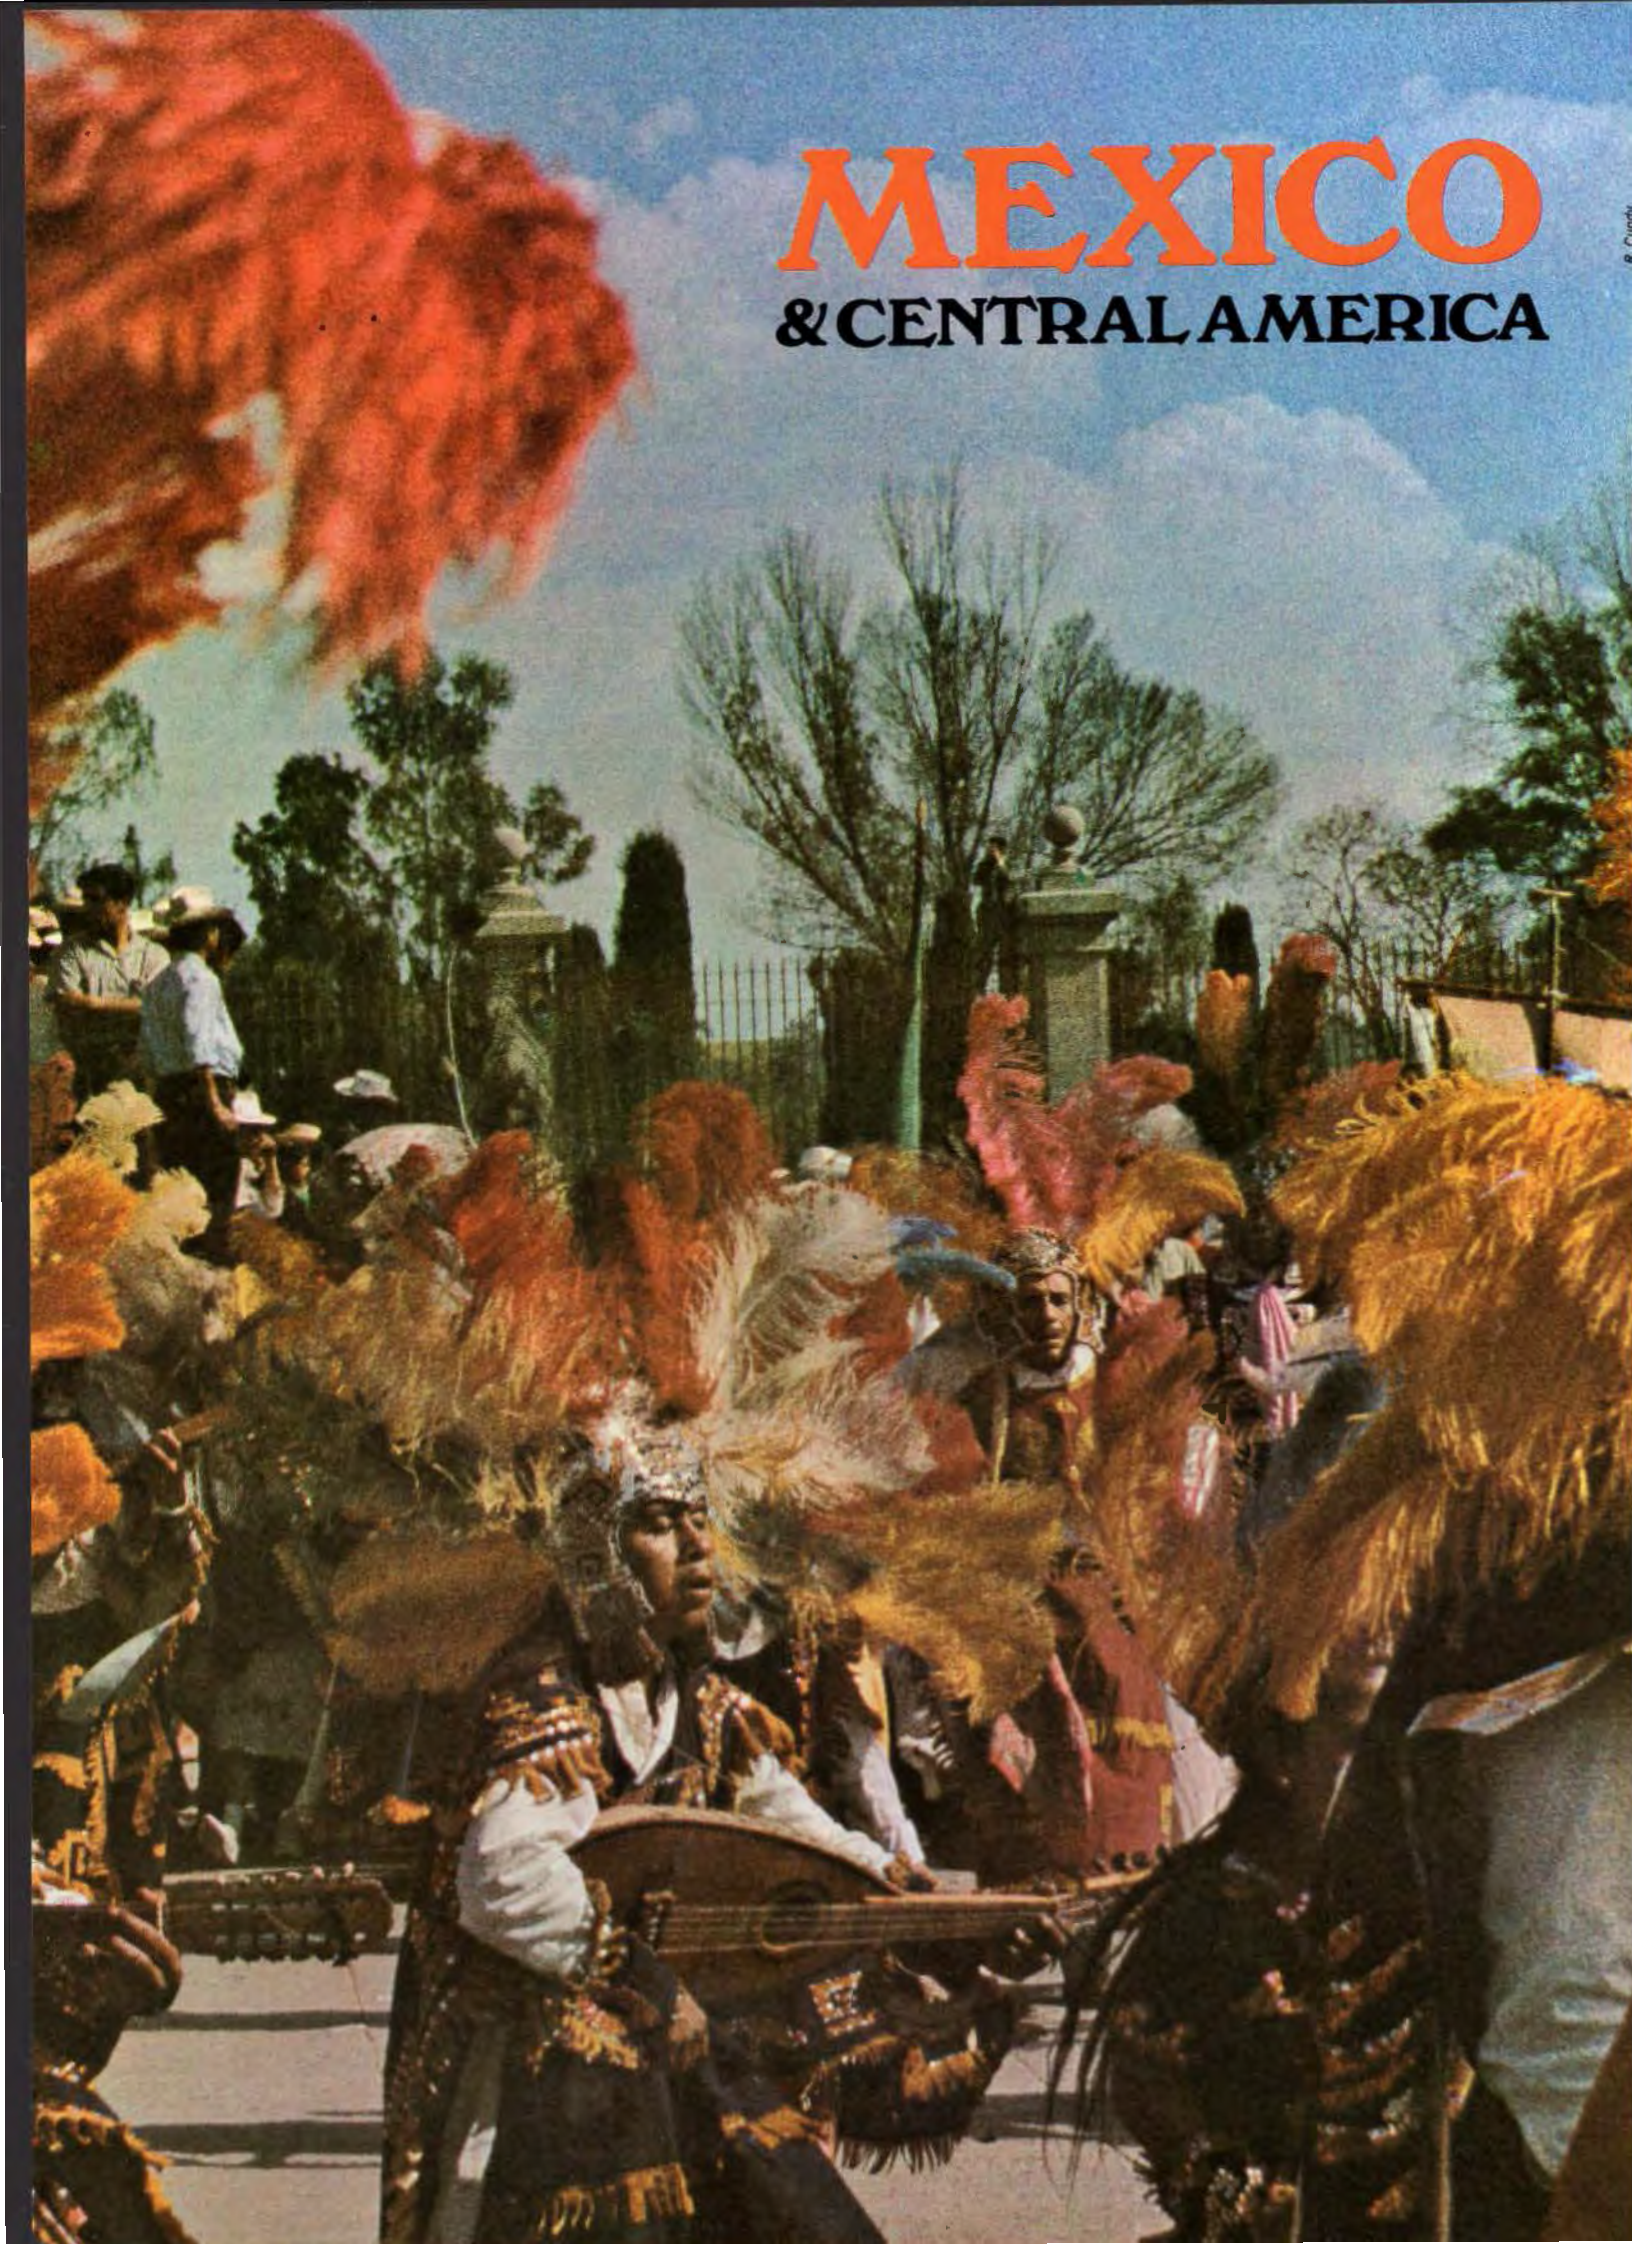
While meteorites seem usually to have been venerated for themselves, rather than as signs, meteors ('falling stars') have always been interpreted as portents or else as actual spiritual beings, very often malevolent or unlucky in either case. Among the tribes from Central Asia, some of whom turned north to settle in Finland and along the Baltic, and others south to Hungary, meteors were called 'fire serpents' and were believed to be the souls of the living or the dead, or spirits bearing a load of treasure. If you unloosed your clothing when you saw one, the spirit would crash to earth and yield you its riches. The Votiaks of Western Siberia also thought that 'fire worms' could be shot down by this strange procedure. But according to their ideas, the shooting star was a terrible species of celestial vampire, a dead soul or a living magician that fed on the blood of the sleeping. Other Siberian peoples saw the sky as a huge tent-roof made of hides sewn together. Occasionally the gods would peer through to see what was happening on earth. Then, through this crack in the sky, you might see a meteor, a flash of the heavenly radiance. If you did and quickly made a wish, whatever you asked for was certain to be granted.

In the fourth volume of *The Golden Bough*, Frazer has a famous chapter on kingship, in the course of which he recalls a custom in ancient Sparta. After a king had reigned for eight years, the ephors (the five annually elected supreme magistrates) would watch for one clear moonless night. If they saw a meteor, it was taken that the king had failed in his office and he would be suspended from his duties until he had been cleared by the Delphic or Olympian oracle, or even summarily deposed. This prompts Frazer into a fascinating review of beliefs about falling stars, most of them connected with ill-luck of one form or another and many, not unexpectedly, with fire. Thus, for the inhabitants of the Andaman Islands, meteors were blazing torches wielded by malicious spirits of the forest out hunting men. For many aborigines of Australia, they were the fire-sticks of sorcerers or dead enemies, still seeking to do harm. They might also show where there was a man who had killed another by a magic pointing-stick or bone. If one of a band had died in this fashion, his comrades would watch for a meteor, seek the murderer in that direction and slay him in vengeance. In some Islamic stories, falling stars are demons who attempt to reach heaven but are hurled flaming to their doom by the angels.

Other legends link meteors with the moon. Californian Indians called them the 'children of the moon'. If a young girl saw one she would cover her head lest her face become pitted and scarred like the moon's surface. The people of the Laughlan Islands (near New Guinea) thought a meteor was the old woman in the moon trying to capture someone to take her place, so she could leave her dreary exile and find a happier home among the spirits.

All over the world and for many centuries, it seems, shooting stars have been associated with the souls of the dead. Frazer records one particularly imaginative belief from Queensland. There it was said that when you died you climbed a rope to heaven. When you reached your place among the stars, the rope fell away and was consumed in fire, telling your family and friends that your journey was safely accomplished. There has also been the idea – in Europe, Africa and Asia – that every human being has his own star in the sky, that shines brightly or dimly according to his fortune and falls when he dies.

MEXICO
& CENTRAL AMERICA



The effect of the Spanish invasion was surprisingly small. In the spirit of the American Indian there was an urge for peaceful continuity

The Earth Goddess of the Otomi Indians has become a fashionable lady wearing Spanish shoes, and in neighbouring villages people may equally call on Christian saints and angels or consult the shaman; in areas of Mexico there are clear relics of pre-Columbian religious ritual

THE REGION from Mexico to the border of Colombia, known as Central or Middle America, in ancient times had no unity apart from the Aztec Empire and Maya region; south of Mexico the area had no real unity at all. It had been used as a corridor of migration for centuries, and nowhere was there any great cultural unity. Archeological evidence covering two millennia shows constant cultural change, with stability only in limited areas. A similar story can be deduced from the linguistic surveys of the area. When the Spanish invaders arrived, the native peoples were each speaking a local language. On the whole the northerly languages had affinities with Mexican tongues, the southerly with the Chibcha languages of Colombia. But even groups speaking related languages were usually separated by wide areas in which totally different tongues were spoken.

The level of culture before the invasion varied immensely. All the peoples were agriculturalists subsisting mainly on maize, complemented with the many other plants available in the rich tropical conditions. They all made pottery, but with widely differing styles in form and decoration. To the south the peoples of Costa Rica and

Panama were capable metallurgists, having a knowledge of casting and plating techniques. Their golden ornaments were traded widely. They were skilled in working hard green stones, similar to jade in appearance, which were widely dispersed by barter.

However, even in the rich Chiriqui province of Panama, there seems to have been no centralized power. No stone buildings were made, but there is evidence of large towns built in wood on earthen mounds. There are signs of organized religion, the symbols of which are to be found in golden figurines and on pottery vessels. The difficult rain forest terrain of the mountainous and volcanic region restricted inland contact, but on the coasts there was a regular canoe-borne trade. Fishing was an important source of food, and from the Pacific coast pearls were exported from Panama northwards as far as Mexico. Archeological evidence shows that a period of great cultural richness occurred in the 12th century, and then declined. Almost certainly the decline took place due to the passage of other people who brought war as they fled from one enemy to engage another.

The effect of the Spanish invasion was surprisingly small. True, the gold and pearls were taken over by the strangers, and the harbours of Panama and Colon became the great centres through which the riches of Peru reached Europe; but the inland tribes and some of the coastal peoples remained isolated. In the spirit of the American Indian there was an urge for peaceful continuity. Almost everywhere there was a tendency to withdraw and not to fight. Luckily the terrain of Central America provided places which held no attractions for the white settlers.

The general pattern of the Spanish colonial period was for commercial development, exploitation of known mineral resources and the establishment of the *encomienda* system, whereby the native Indians were given in trust to the local landowners. Sometimes this worked well but in general it led to the breakdown of local cultures and the establishment of a state of near slavery. However the agricultural estates growing sugar and vanilla were not very large, and not so very important. The local populations were not

Robert Cundy/Robin Bath

big enough to encourage developments on the scale seen in Mexico and Peru. Thus in the 17th century it was possible for Surgeon Wafer, left behind in central Panama by the buccaneer and governor of Jamaica, Captain Morgan, to live and recover his health amid a well-governed tribe who, two centuries after the conquest, preserved all the characteristics of pre-Columbian life.

An important feature of the period was the body painting which represented certain sacred animals, such as the jaguar, serpent and eagle. Nearly three centuries later the descendants of the same people have a considerable degree of freedom, live in towns and villages under their own administrative officials, speak their ancient language, and consult pictorial history and religious books. They wear most marvellous appliqué shirts with patterns similar to those which the ancestors painted on themselves, and to those which have been found painted on ancient pots.

This one example of the persistence of native culture among the Cuna Indians of Panama, can be paralleled in many areas of Central America. People who lived in poor and inaccessible areas were neglected by the colonists and visited only by missioners from the religious orders. Therefore the change has been gentle and gradual. However, since the Spanish conquest there have been bitter struggles for freedom. The Maya rising known as the War of the Castes was anti-European, and for a long period the Mosquito Indians in the Republic of

Honduras kept up a guerilla war. Mainly one may say that native Indian cultures of Central America were not totally overwhelmed, and there has been a considerable survival of ancient custom and language.

The degree of change has varied for each aspect of life. For instance, the Huichol Indians of northern Mexico wear a costume now truly native, but which was the normal dress of Mexican Indians in the most civilized areas at the early part of the 19th century. But Huichol religious rituals have retained much of the pre-Columbian custom of their ancestors. They still make symbolic religious pictures which illustrate by formal patterns the influences of the four directions of the world, and predict the falling of fate for the individual family.

The local shaman is a well-liked person who has much practical knowledge of illness and its cure, and to this adds ability as a consultant psychiatrist. The advantage of this continuing relationship between

members of the community is that confidence is maintained; every member of the village knows that within the group of neighbours there will be ready help in almost any difficulty. The mayor and councillors are also Indians, and the healer is a natural doctor, and comforter of souls as well as bodies.

Goddess in Spanish Shoes

Among the Otomi Indians of central Mexico a great deal of ancient custom survives, and is strongest in the more remote villages in the highland areas of the Mizteca Alta. Here the people are all good Christians, and in their healing and divining ceremonies they call on the saints and angels and fear the demon powers. But the shamans, most often women, still use figures made from the ancient *amatl* paper which represent the powers of the five directions of the universe. Prayers, incense, and deep concentration are the ingredients of ritual. Each action is repeated many times and arrangements of symbols are made around a grouping of the paper figures. They give their answers to the shaman because each is linked with a group of meanings which have been transmitted by word of mouth from the past. It is no accident that the Earth Goddess has become a lady of means who wears Spanish shoes, or that the Tree of Life has become a charming plant with monkeys in its branches. The representations of the ancient powers have moved gently into contact with modern life to precisely the same degree as the people who make their images.

This underlines the point that the shaman and the spirits which appear in his visionary world are a unity. The performance of the ritual induces an expected state of mind in which reality and vision are linked. The visionary aspects are conditioned by two forces: the experience of the current facts of life in the everyday world, and the expected traditional qualities of the revelations of the otherworld beings. Thus the perfectly genuine visions are given a more or less rational interpretation in the process of divination.

The Otomi figures in amatl paper are seen today as modern manifestations of the spirit world. They assume the current ideologies about saints, angels and demons. They are shown in modern dress, and yet the symbols associated with them retain so much of the past that an archeologist is able to interpret them immediately in terms of pre-Columbian mythology.

The same kind of adaptation is to be found in the curative rituals of some of the Miztec villages in the mountains of Oaxaca. The most important of these includes the use of hallucination-inducing drugs, which are used not to provide random colourful experiences, but as a means of giving release to pre-conditioned concepts. The process is strictly within the realms of applied psychology of ancient origins. The home of the *curandera* (native 'wise woman') is little different from other houses except perhaps that the lady has accumulated rather more pictures of her favourite saints. The gathering is a simple prayer-meeting. Prayers to the saints, and hymns are a preliminary. Incense may be burnt to help give the right atmosphere. Then the participants who have previously fasted on bread and water for three days take the drug, which may well include the 'magic' mushrooms carefully sliced as in ancient times. Then more prayers and intense non-action until the individual suppliant becomes sick. Typically an American Indian idea, the wish is to clear out everything from the stomach in order to cleanse the personality and promote receptivity for the visions to come. After this, the period of meditation varies but the visions, usually of a dead relative or a protective saint, occur. Advice is given, sometimes by symbolic action, sometimes in words heard within the mind. This advice is often quite unexpected and it is practical and effective in easing the suppliant's problems.

In such a ceremony the preliminary fasting, the use of prayer, and hymns all condition the person to accept the probability of an experience which will give an answer to besetting problems. The hallucinogens will stimulate the projection of visionary forms and symbols from the deep unconscious. But the mind will interpret them in terms of the problem given and the saints invoked. The good result is most likely due to the release of the unconscious mind so that it can sum up the whole of experienced events in a way that the limited conscious mind is unable to understand. In this case the ceremony is a practical process, and the use of hallucinogens is effective and not random.

These considerations explain the survival of the ritual from pre-Columbian ceremonies into the modern world. Whether it will survive for much longer is questionable. As 20th century culture gains a foothold in Central America, more and more Indians will come into contact with the latest theories of the conscious mind as expounded by scientists. The emotional depths of the uncertificated and uneducated *curanderas* will for some time yet be beyond the reach of scientific classification, but not beyond the opposition of those qualified in the new rational sciences.

Further south in the highlands of Guatemala there are also survivals of Maya Indian rituals among the Quiché-speaking peoples. As is common throughout the Americas the Indian population prefers to withdraw and remain silent when confronted by the

Ferdinand Anton

pressures toward commercialism. Their attitude of group solidarity is totally foreign to the drives of individualistic *laissez-faire* economics. Thus within the framework of the modern state there remain enclaves of Indian villagers who can develop their own way of life in isolation, albeit in poverty. Among themselves there is some echo of past magic. The Christian religion answered the philosophic hopes of the ancient priests. As usual the gods who were integrated within the agricultural calendar have been fused with the saints whose festivals fell at the same time of year. The people around Lake Atitlan follow an ancient ritual before Mass by burning balls of sweet scented 'Pom' incense on the church steps, and replace it by burning rubber when rain is desired. Ceremonies are held in the hills in which those who know the secret make offerings before stone statues of old deities. Many of these massive figures seem to have survived from very early times before the forms of Maya gods had crystallized into a national art form; nevertheless, they are now addressed by the names of Christian saints, and their old names, such as Chac, giver of rain, have become epithets for the new quality of the ancient powers.

In 1968 the International Congress of Americanists in Stuttgart was shown a film of a Quiché Maya town official performing his duties as a priest, foretelling the growth of the plantations, and even the fate of the individuals who consulted him. The ritual consisted of a great deal of muttered lists of days and their protective spirits, the constant repetition of numbers in the old dialect in which numerals for counting time are different from those used for counting things or people, and a scattering of beans in regular rows of 13 until either 18 or 20 rows were completed. At the conclusion of each count selected symbolic objects, which gave the information on which the prognostication was based, were placed in position. The whole ritual, fascinating but monotonous to watch, would have taken several hours of repetitive work on the part of the shaman. He was in a state of mild dissociation during the periods of counting, mostly because he had chosen to be more sensitive to spiritual influences at the time. Thus the final result was partly due to the repeated patterns of events throughout the ancient Maya ceremonial calendar, and partly to the subjective interpretations of these events on the part of the shaman. His work was so successful that he had a large clientele extending beyond the village where he worked.

Following the isthmus southwards, the general character of Indian survivals changes. The major factor has been the different basic level of culture inherited from ancient times. On the whole the fragmented tribal structures could not develop a high culture, neither was it possible for a unified religious system to develop as it had done in the Mexican area. There had been no basic common inheritance for the peoples of Nicaragua, Costa Rica and Panama to build upon. The structure of the village, with its houses of poles and cane, and the techniques of food preparation and of manufacture of wooden and ceramic utensils

Altar of Blood

The Spaniards visit the temple of the Mexican King, Montezuma

On each altar was a giant figure, very tall and very fat. They said that the one on the right was Huichilobos, their war-god. He had a very broad face and huge and terrible eyes. And there were so many precious stones, so much gold, so many pearls and seed-pearls stuck to him with a paste which the natives made from a sort of root, that his whole body and head were covered with them. He was girdled with huge snakes made of gold and precious stones, and in one hand he held a bow, in the other some arrows. Another smaller idol beside him, which they said was his page, carried a short lance and a very rich shield of gold and precious stones. Around Huichilobos' neck hung some Indian faces and other objects in the shape of hearts, the former made of gold and the latter of silver, with many precious blue stones.

At the very top of the *cue* (temple) there was another alcove, the woodwork of which was very finely carved, and here there was another image, half man and half lizard, encrusted with precious stones, with half its body covered in a cloak. They said that the body of this creature contained all the seeds in the world, and that he was the god of seed-time and harvest. I do not remember his name. Here too all was covered with blood, both walls and altar, and the stench was such that we could hardly wait to get out. They kept a very large drum there, and when they beat it the sound was most dismal . . .

Bernard Diaz *The Conquest of New Spain*

Ferdinand Anton

In a custom which combines European pre-Christian and Christian practices with traditional Indian beliefs, skulls are offered to the dead each year on 31 October, the eve of the Christian festival of All Hallows

continued. But in the absence of the old organization of the tribe the more advanced arts of decorative pottery, weaving and gold-working fell into abeyance and reverted to greater simplicity. This was partly due to the occupation of the richer areas by the Spanish settlers, and the change of culture which swept over the Indian peoples who had been absorbed as labourers and craftsmen. It was only in the less populated and inaccessible areas that old traditions survived. Elsewhere the oldest traditions, such as the masked dances representing the battle of the Moors and Christians, which are often assumed to be Indian, are derived from 17th century Spanish culture.

In the villages the old customs survived, but in a diluted form. The shaman and healer, together with the village leader who usually became known by the Spanish title of Alcalde, remained. The last intrusions into their more remote homes came at the turn of the 20th century when a world demand for sisal, tropical fruits and orchids brought new settlers and farmers into the hills. The general relationship with the Indians was paternalistic exploitation under which the Indians gained some material benefits; however, they rapidly became interested in social advancement which might eventually lead to political emancipation.

The Cuna Indians of the Atlantic coasts of Panama and neighbouring Colombia, on the other hand, had developed a higher level of culture than most, and guarded their independence remarkably well. Among them there was a willingness to progress, but in their own way, which would preserve much of their past. Among their most precious possessions was a book of religion, magic and history, the *Mu Igala*, which in pictorial symbols told the story of the gods and peoples of the past. It was consulted by the local chiefs and shamans as the repository of past wisdom. Its symbols are radically different from those of Mexico, and bear little resemblance to the decorative arts of either modern or archeological times. It may well be that the book was drawn up by shamans who had seen the books used by Spanish missionaries. However that may be, the *Mu Igala* in all known copies uses pictorial material of a comparatively modern style. Its interpretation rested with local elders who had learnt its meaning from relatives who had handed down their knowledge. It was a volume of tradition which could be used both for divination and healing. There is no record of such books being seen at the time of the Spanish conquest, but the early conquerors only had eyes for gold and pearls. Perhaps something of the tradition was inherited from the old Tairona people a little further to the east, in Colombia.

Thus in a sporadic way the Indian traditions of ancient Central America have survived, altered and adjusted, thus proving that they are sufficiently alive to be worth such affectionate remembrance.

MIDSUMMER EVE

SINCE OUR ANCESTORS relied upon the sun for warmth and light, the arrival of Midsummer, which marks the passing of its seasonal apex, inevitably brought a reminder of approaching darkness and cold. It was a time of uncertainty when, so it was once believed, poisonous dragons thronged the air. Excited by the heat of summer, they copulated, and their emission fell upon the earth, polluting the drinking water: 'There was soo greate hete the which causid that dragons to go togyther in tokenynge that Johan dyed in brennynge love and charyte to God and man.'

This curious reconciliation of early myth and Christian tradition explains the transfer of pagan usage from the solstice, 21 June, to a celebration three days later. This was the Nativity of John the Baptist; but some churchmen voiced their objections. An entry in the Register of the Synod of Caithness and Orkney for 21 June 1708 reads: 'Johnmas fires which are commonly observed sometimes in this month are very common in many paroches. Therefor recommends to the several ministers where this or the like superstitious custome is to deall with persons and to bring them to a sense of yr sin and that they continue to rebuke the same from yr pulpits.'

Bonfires, supposedly honouring St John, are still lit in Cornwall; at one time they blazed all over Europe, to strengthen the weakening sun and keep evil creatures at bay. The vigour and extent of the crops were believed to be governed by the distance from which the fires were visible, and the height which people reached by jumping over them. Leaping of this kind was once a common folk custom, intended to stimulate the crops by sympathy. Burning torches were carried through the fields to guard against mishaps, and fires were lit to the windward so that their smoke would blow over the grain. A piece of blazing turf was thrown in the growing corn or carried round the cattle, and wheels covered with burning straw were rolled downhill to imitate the sun's descending course.

The bonfires were often a social occasion. An old account records: 'For making the king's bonefuyr, 10s'. One was lit at Augsburg in 1497 in the presence of Emperor Maximilian, and Philip the Handsome led the first ring dance around it. Louis XIV, crowned with roses, is known to have kindled the flames himself, and he also joined in the dancing. The custom still survived of burning live animals in the fire; usually foxes or cats, probably because witches were thought to assume these forms.

Keystone Press

Druids at Stonehenge on Midsummer Day, one of the principal stages in the 'life-cycle' of the sun, and so of life on earth

Night of the Witches

Midsummer, when the sun's power began to diminish, was traditionally a dangerous time, during which malevolent beings were unusually active. Witches were said to hold their sabbath on Midsummer Eve, riding on toasting forks or a black three-legged horse. In parts of Yugoslavia, armed with tree stumps, they attacked baptized Christians on this particular night so, as a precaution, people disposed of these natural weapons in advance. The 17th century antiquary John Aubrey wrote: 'Tis Midsommer-Night, or Midsommer-eve (St. Jo: Baptist) is counted or called the Witches night . . . of the breaking of Hen-egges this night, in which they may see what their fortune will be'. Anyone brave enough to sit in the church porch at midnight saw a procession of apparitions pass into the church; those who did not reappear were doomed to die in the course of the year. And young girls would busy themselves in

various activities in order to conjure up or dream of their future husbands.

Alternatively, plants were often used for a similar purpose. Yarrow, gathered from a young man's grave and laid under the pillow on Midsummer Eve, produced the shade of one's husband-to-be; or slips of orpine, a purple-flowered stonecrop, popularly known as Midsummer Men, were stuck in a convenient crack. If they leant together, the marriage omen was good.

St John's Wort, a yellow plant blooming at this time, which resembles a miniature sun, was also known as *Fuga Daemonum* ('flight of demons') because, so people said, it repelled evil spirits. In the Middle Ages it was applied to the mouths of accused witches in order to make them confess (see ST JOHN'S WORT).

Midsummer Eve fern seed was supposed to make men invisible. Shakespeare referred to this property in *Henry IV*, Part 1: 'We have the receipt of fern seed. We walk invisible.' Also a protective plant, it possessed the property of revealing treasure, glowing deep in the earth with bluish flames.

A branch of hazel, cut on Midsummer Eve, also guided the user to hidden treasure. It had to be obtained at night – by walking backwards, then cutting it with both hands between one's legs. A test was to hold it near water and, if all this had been properly done, it would squeak like a pig. This was a German idea; belief in the mystical powers of vegetation at Midsummer Eve used to be common throughout Europe and the Middle East. The historian John Stow, in his *Survey* (1598), describes the magic plants which at one time were hung up in London on St John's Eve: 'On the eve of this saint . . . every man's door was shaded with green birch, long fennel, Saint John's Wort, orpin, white lilies, and the like, ornamented with garlands of beautiful flowers. They . . . had also lamps of glass with oil burning in them all night; and some of then hung out branches of iron, curiously wrought, containing hundreds of lamps lighted at once, which made a very splendid appearance.'

VENETIA NEWALL

The romantic conception of Satan as the doomed hero who sets himself up against God was drawn largely from Milton's epic poem; the Middle Eastern gods who throng the infernal council chamber reflect the poet's abiding interest in pagan mythology

MILTON

THE IDEA of a personal Devil has drifted out of most forms of theology and Christian belief in Britain, as in many other countries. Yet during the 17th century Satan was very much alive in the creeds of the Puritans and the superstitions of the people.

The majestic power of Milton's epic poem *Paradise Lost* has won a primary place in poetic imagery for God's defiant foe. Rebellious and defeated, this fallen angel was flung into the fires of hell and a lake of flame. Unflinching and defiant, he continued to plot against the Almighty and, by turning himself into a serpent and penetrating the garden of Eden, he tempted and corrupted Eve and Adam. With 'man's first disobedience' came his Fall and the fiend's temporary triumph.

In the book of Genesis there is no mention of Satan. He does not appear in the Old Testament until the much later book of Job in which he is 'going to and fro on the earth'. There is no suggestion in the early legend that the Devil has sneaked his way into Paradise inside the reptile; the snake is sufficiently evil in itself (see DEVIL).

Milton's 'Arch Fiend' is so powerfully drawn in his pride, courage, eloquence and refusal to accept defeat that he has gained sympathy as well as detestation. Beside him the Almighty and the loyal, obedient angels seem to be almost pallid figures. It is a commonplace that vice is usually more exciting to read about than virtue, and for the average reader, Satan, as the sovereign of sin, starts with that advantage which is increased by the picturesque nature of his undaunted villainy. This has prompted the theory that he is really the hero of *Paradise Lost*. That cannot have been Milton's intention, but the error is easily understood. Satan is outrageously wicked but he is undeniably exciting. It has often happened in fiction that the worse the rogue the greater his magnetism.

We might expect Milton, who became a pillar of the anti-Royalist and Republican party and a superb spokesman for the Puritan faith, to be horrified by the personification of sin. But he was not one of the square-toed fanatics of the 'Praise-God Barebones' type who resented all the pleasures and graces of life. His grandfather had been a Roman Catholic and his father had composed secular music. Though his parents intended him to be a clergyman of the Church of England he refused to take holy orders. With his parents' approval he was determined to be a poet and a great one; he succeeded beyond expectation. But in his writing there is as much appreciation as rejection of worldly pleasures; the reader of his secular poems is quickly made aware of this. He had an eye for beauty and a feeling for things generally enjoyed by any civilized and sensitive man.

A Full and Worldly Life

His classical education at St Paul's School and Christ's College, Cambridge, introduced him to a supernatural world of romantic myths and tales about the strange and often scandalous doings of the anthropomorphic deities of Olympus and of the impish, rustic gods like Pan. Their appeal to the poet was as powerful as was the Christian doctrine of salvation to the theologian.

In his private life, Milton was no recluse; he had social contacts with the nobility and wrote the masque *Comus* for the Earl of Bridgwater. His nephew related that he frequented elegant company and dressed as stylishly as any of them. A man who was three times married – he was twice widowed – cannot have been of a cold nature, or as we would now say, under-sexed. He was the champion of chastity and of marital constancy yet to understand his portraiture of Satan it is essential to realize that Milton's attitude to life was not that of the ascetic.

His great epic is based on supernatural happenings as it sweeps from heaven to hell. But Nature itself was seen as part of the divine scheme. Milton in his best-known poems, most notably in *L'Allegro*, shows his delight in what Shakespeare called 'foison', the rich fertility of the earth and the lushness of vegetation. The seasons work their miracles for him. The old gods are not forgotten; the fruits of the earth are there to be tasted. The revelling Comus is given a remarkable defence of good feeding and good living:

> If all the world
> Should in a pet of temp'rance feed on pulse,
> Drink the clear stream and nothing wear
> but frieze,
> The All-Giver would be unthank'd, would be
> unpraised,
> Nor half his riches known.

Ascetic man, he adds 'would live like Nature's bastards, not her sons'. No severe and sour enemy of the common indulgences could have put such conviction into that rebuke of pious self-denial. Again one can see why the poet, confronted with the concept of a fallen angel, gave the Devil his due.

Satan as a person has died away. But the name Satanism is still given to the practices of the decadents who delight in blasphemies, obscenities, and the Black Mass. There is a striking description of such a macabre and malignant character in Somerset Maugham's early novel *The Magician* which the author said was based on a real person of his time.

In Tudor and Jacobean Britain the Devil was thought (and by hysterical and fanciful people was seen) to be very much at work in private and public places. He possessed women and turned them into witches. It was not only ignorant rustics who were scared. Queen Elizabeth revived the anti-witchcraft law which had been repealed in the reign of Edward II. King James I, though well-educated, was morbidly obsessed by the study of demonology. He had no sooner succeeded to the English throne than a new Act of Parliament was passed at his demand, against 'dealing with evil and wicked spirits'. Scotland, he thought, was in special danger of becoming Satan's chosen country. The Devil was busy in Edinburgh and among the covens of witches along the coast at North Berwick.

On both sides of the border there was a frantic witch-hunt. The victims, convicted on flimsy evidence, were killed without mercy. In London the translation of a German book, *The Damnable Life and Deserved Death of Dr Faustus* was widely read and a popular ballad was sung in the street about the Doctor's sale of his soul. Marlowe's play on the Faustus legend was his most successful, and was continually revived (see FAUST). It was said that the Devil himself had several

Tate Gallery

times entered into the actor who played Mephistophilis and that once the whole audience ran out in terror. The extreme Puritans continually denounced the theatre as 'Satan's Workshop' and raged at the players as 'limbs of the devil'.

Speaking of Devils

The Israelites of the Old Testament had their single God Jehovah confronted by his Adversary. While these two concepts were personified they also stood for the rival powers of light and darkness. It is likely that the Jewish religion was influenced by a similar rivalry in the Persian creed later preached by Zoroaster in which the good Ahura Mazdah fought with the evil Ahriman for Day against Night (see AHRIMAN: ZOROASTRIANISM). After the Jews had been driven into exile their theology was further bedevilled by contact with other faiths and other fiends. New diabolic names appeared in their scriptures: Azazel in the book of Leviticus and Asmodeus in the apocryphal book of Tobit. The warfare in Heaven described by Milton in *Paradise Lost* is thus embroidered and enriched by a company of false gods and is much more complicated than the story of the Fall in the book of Genesis.

The neighbours and enemies of Israel had a number of strange deities in whom Milton saw the old allies of his outcast Satan. They were taken to be incarnations of the fallen angels. Beelzebub, god of flies, was one of them. They made a strong appeal to the poet because he was fascinated by the music and the mystery of old and strange names. In the first book of his epic there is a sonorous cascade of geographical names, sometimes Italian such as Vallombrosa, sometimes drawn from the Near and Middle East. The heathen gods in Satan's army contribute their own menacing sound to the verbal harmony. Phoenicia gave him Astoreth or Astarte, the moon goddess, and Lebanon Tammuz, the fertility god. In Sodom was Belial with his insolent and

drunken sons and in Gath Dagon, half-human and half-fish. For a poet with a rich vocabulary there were fine opportunities to build a memorable line by listing the deities of the Philistines and other polytheistic tribes, 'idolatrous, uncircumcised, obscene'. To Moloch, the Canaanites offered human sacrifice. So it has happened that *Paradise Lost*, a poem piously devoted to the victory of the Christian Almighty and the temptation, punishment and redemption of his human creation, became also a record of the myths and superstitions of the Middle East.

Samson's miraculous discovery of strength renewed provided Milton with a splendid chance to mingle a biblical legend with the dramatic form of Greek tragedy. In *Samson Agonistes* there is magnificent material for recitation; it is more a feat of rhetoric than a composition for the theatre. Blind himself, the poet has deep compassion for the blind hero. Satan is not a character in the play, but since he is the symbol of sensual passion he is manifest in the bewitching person of Delilah. In *Paradise Lost* Satan has incestuous leanings towards his own daughter, Sin. In *Samson Agonistes* Delilah is the embodiment of the lust that destroys the sensual man. Milton did not hesitate to make her a fascinating temptress; there is a rapturous description of her entry, 'bedeckt, ornate, and gay' like a stately ship, 'with all her bravery on and tackle trim'. Samson, fearing another surrender to her beauty, cries in vain, 'My wife, my traitress, let her not come near'. Yet he withstands her lovely presence and her appeals for reconciliation since he can now oppose and defeat the Satanic dominion of 'ladies whose bright eyes vain influence'.

National Portrait Gallery

John Milton, by an unknown painter c 1629. It is ironic that this great Puritan spokesman should have created, in *Paradise Lost*, a Devil 'so powerfully drawn in his pride, courage, eloquence and refusal to accept defeat that he has gained sympathy as well as detestation'; Satan has been considered the real hero, but this can hardly have been Milton's intention

Satan is abroad in Gath at the great feast of the Philistine god Dagon and is completely defeated when the debauched worshippers are annihilated by Samson's upheaval of their 'spacious theatre' and slaughter of the revelling host. It is a savage myth in which there is no mention of the Son of God or of redemption. Death settles all. The righteous man dies with the wicked and all accounts are paid. In Gath, symbolic of the sensual world, suffering brings peace, consolation, and 'calm of mind all passion spent'.

Nobody could suggest that Satan is here presented in heroic form. But there is a sense of awe in the presence of God which was missing in *Paradise Lost*. Satanic sin has lost the size and dignity which was first bestowed on it. The false gods, like their debased devotees, are overwhelmed in the catastrophe. They live on, however, in the imagination and Satan's courage, no longer evident in the Samson legend, survives because in the earlier epic it was given vivid and compulsive portrayal in poetry of such dynamic quality. *Paradise Lost* includes the myths and superstitions of many credulous tribes. There is worship of the sun god whom Satan hates. There is the battle of light and darkness and the cosmic contest is enhanced by the wonderful orchestration of the barbaric names to be met in the diabolic palace of Pandemonium.

Tate Gallery/John Webb

To define a miracle generally as a visible sign of God's power transcending the natural order brings us no nearer to identifying one specifically; we can say with certainty what a miracle is, but not which event is a miracle. Today it seems that many of those related in the Bible may be explained within the framework of what we know of man and his environment

MIRACLES

THE WORD 'MIRACLE' comes from the Latin *miraculum* which was used originally to denote an occurrence which excited wonder. Although it is still employed loosely to describe an unlikely but natural event, as in 'It was a miracle that I escaped unhurt', even in ancient times the word tended to imply a supernatural interference with Nature. A belief in the supernatural only had meaning if contrasted with the belief that Nature, left to itself, operated in a regular and constant fashion. This latter assumption had become well established, at least for the educated classes, by the time of Christ. Pagans and Christians alike tended therefore to regard some of the events that were difficult to explain scientifically as due to the operation of beings in a realm separate from and superior to Nature.

The earliest Christians were less concerned to deny the validity of pagan miracles than to stress the Old Testament and gospel miracles as evidence, not of God's existence, but of his moral superiority over all supernatural beings and of his providence for mankind. But from the 2nd century AD Christian writers attacked pagan miracles as the products either of priestly trickery or of diabolical agency. The works of Satan and his minions were admittedly supernatural but occurred only by permission of God who allowed some licence to the fallen angels to use their powers before their final binding at the Last Judgement. In modern times belief in infernal miracles has faded. The Church has always dwelt more on the positive miracles of God, which proceed from the divine power even when operating through agents such as saints, prophets or relics.

In traditional theology a miracle is defined as any event perceptible to human senses which transcends the powers of Nature and which is caused by divine intervention. A miracle may involve the temporary suspension of natural forces as well as the operation of a supernatural power, but this is possible in Christian theology because the laws of Nature continue to operate only as a result of the divine will.

A miracle, as officially defined, is restricted to visible marvels and so does not include all supposed instances of God's miraculous power, such as the acts of the Holy Spirit in promoting conscience, bestowing inspiration or conferring grace. Nor is a miracle an act of special providence, such as the calm sea at the time of the evacuation of Dunkirk in 1940 could be supposed to have been; weather is very unstable, a characteristic which would enable the Almighty to manipulate it easily without the fact being overtly known. Theology does not attempt to limit God's secret acts, but at the same time it does not class them as miracles in the technical sense. A miracle, strictly speaking, is a marvel which is also an outward and visible sign of God's presence. It has a purpose over and above what it actually effects. Divine intervention is always for spiritual ends and in the interests of salvation. God parted the Red Sea not merely to allow the Children of Israel to cross, but also to show that he would never abandon them.

Similarly, theology says that God does not need to resort to miracles to remedy defects in the natural world due to his own lack of foresight. Admittedly, he might act to remedy those deficiencies which result from the sin of men or angels; but this is the work of salvation. God does not improvise. His existence is timeless and eternal; his omniscience sees past and future as ever-present. A miracle occurs not because of a sudden decision by God, but through the proceeding of an eternal decree. Theology disapproves the suggestion made by Sir Isaac Newton (1642–1727) that the Deity might occasionally intervene to make small adjustments to preserve the stability of the solar system – as if it were a car being serviced.

Impact of the New Science

Newton's views on the universe represented a curious transitional stage between theism on the one hand and deism and atheism on the other. As a result of the intellectual upheavals of the Renaissance, the Reformation and the growth of science, the 17th and 18th centuries were racked by controversies concerning the relation between God and Nature. Theism is the belief common to many religions that God is an active force in the world: miracles therefore do not present a fundamental difficulty. For atheists, of course, miracles are impossible. The essence of deism, an outlook which began to emerge in the 17th century, was that God, having created the world, tended not to interfere with it. The soul, admittedly, was supernatural and God might act spiritually; but he was sparing with miracles and, sufficient revelation having been made in biblical times, few miracles were now to be expected. The philosopher Thomas Hobbes (1588–1679) declared that since miracles had ceased, revelation was now conveyed entirely by holy scripture. Contemporary inexplicable happenings, he hinted, were due to obscure natural causes. Benedict Spinoza (1632–77) who regarded God and Nature as two harmoniously related modes of existence of a single Being, denied all miracles past or present. But Spinoza was ahead of his time and not until the next century were deists and free-thinkers openly antagonistic to miracles.

Victoria & Albert Museum/Michael Holford

Medieval stained glass window, showing the prophet Elijah praying to God to restore a widow's dead son to life (I Kings, chapter 17): the fact that so many reported marvels are healings has concentrated attention on possible psychological factors in 'miracles'

The way for deism was opened by the failure of a group of Cartesian philosophies, so called because they received their impetus from René Descartes (1596–1650). He aimed at a philosophy in which traditional religious beliefs could be united with the new scientific view of Nature. His method was to reason from certain 'clear and distinct ideas' innate in the human mind. Since, as Descartes claimed, we can form clear ideas of mind, God and matter, these three entities exist but are of totally different kinds. Being essentially different, mind and matter cannot influence one another. Each is subordinate to God who in a miraculous way recreates the universe anew at each instant of time. God was needed also in Cartesian philosophy to keep our minds and bodies in step. So Nicholas de Malebranche (1638–1715) suggested that God continuously regulated both. Gottfried Leibnitz (1646–1716) propounded a similar theory of 'pre-arranged harmony'. Bishop George Berkeley (1685–1753) resorted to a far-reaching supernaturalism, maintaining that matter could not act of itself and was moved by spirit. Somewhat earlier Newton, neither a philosopher nor a Cartesian, continued to occupy his half-way house, saying that in the beginning God created atoms (of matter) and the void (space), but that matter could act of itself and that the force of gravitation was therefore perpetually operated by God's miraculous power.

Nature's Random Element

The Cartesian systems were hopelessly artificial. Their death-knell was sounded by John Locke (1632–1704) the first of the 'empirical' philosophers, who pointed out that innate ideas, however 'clear and distinct' they might seem, could not be relied on without testing their accuracy. This can only be assessed empirically, by observing Nature and analysing how ideas arise. Locke's influence consolidated the trend to deism on the Continent, particularly in France, where its arch-representative was Arouet de Voltaire (1694–1778).

But it is to David Hume of Edinburgh (1711–1776) philosopher and historian, that the bitterness of theological controversy has principally adhered in respect of the

15th century Flemish illustration of Christ feeding the 5000: the two miracles of feeding the 4000 and 5000 (Mark, chapters 6 and 8) are increasingly interpreted in terms of 'spiritual feeding'. Jesus himself is described in the gospels as despising mere wonder-working to impress, and his numerous healing miracles are said to have accompanied the cure of patients' spiritual illnesses through faith

chapter 'On Miracles' in his *Inquiry Concerning Human Understanding* (1748). He argued that the uniformity of Nature had been shown by general experience to be true with a very high degree of probability. A miracle is therefore so extremely unlikely that it can only be accepted as genuinely a miracle if the evidence that it actually occurred is exceptionally strong. Hume added that for his part he could envisage no evidence that would be sufficiently compelling to convince him. He has frequently been taken to task for the illogicality of this latter remark, which has been felt to be unworthy of a confessed empiricist; it was also inconsistent with his own principles, for he pointed out that the uniformity of Nature is only a hypothesis based on experience.

In our own day Hume's denial of causality as being necessarily true has, unexpectedly, been vindicated in the sub-microscopic realm of atomic events where there appears to be a marked degree of randomness and inconsequentiality. For instance, it is impossible to predict that an atom of radium will disintegrate at any particular time. An atomic disintegration has to be regarded as an uncaused event. But the objects of everyday experience contain so many atoms that the law of averages applies. The chance of a 'miracle' such as a table rising off the floor because all its molecules in their random motion chance to move upwards is totally negligible. But events happening at random to individual molecules in the brain or in a gene (the unit of biological inheritance) could conceivably have consequences out of all proportion to the magnitude of the events themselves. Thus modern physics suggests the possibility of further secret acts of God by imposing direction on these random events. Such an occurrence would be scientifically undetectable. Some theists feel however that clandestine intervention would detract from the dignity of God.

Hume's special contribution to the problem of the supernatural was to emphasize the need to evaluate testimony. At the close of the 17th century, reaction against the Calvinistic doctrine of predestination led to an examination of the scriptures as documents assembled by human authors. But the 18th century was dominated by attempts to reconcile the Bible with deism, and the miracles were explained away in a somewhat arbitrary fashion. This led to a counter-reaction in which miracles assumed a new significance as evidence for theism.

But, during the last 150 years genuine scholarship has put both the Old and New Testaments into proper perspective as a varied group of works written at different times and with somewhat varying aims. The Old Testament is partly history and partly imaginative epic or saga of the prehistory of

British Museum

the Jewish people. It contains both real history and history transmuted in oral tradition. Composed from a primarily religious point of view it is also a 'mythology of God', with an evolving concept of the Deity. The God who drowns mankind in the Flood is not quite the same as the God of Isaiah or the God who rebukes Jonah for desiring the destruction of Nineveh. Indeed the books of Job and Jonah illustrate the Bible's varied contents, for these are not histories but imaginative dramas which debate deep religious problems.

Fact and Fiction

The Hexateuch, which comprises the books from Genesis to Joshua, was constructed from documents written between the time of King David (c 1000 BC) and the return from the exile in Babylon (c 500 BC). These documents were assembled from oral tradition and songs, and from inscriptions and earlier documents now lost. The literal truth of all that is said about the patriarchs, Abraham to Joshua (perhaps 1750 to 1400 BC), cannot be insisted on. But archeology and comparative studies of ancient folklore, myth and literature have confirmed a substratum of historical fact and furnished clues to the natural sources of some of the miraculous elements in the Hexateuch. The Euphrates valley was flooded about 4000 BC and Noah's story is the legend of Utnapishtim, his Babylonian counterpart in the *Epic of Gilgamesh* (see FLOOD). The mark of Cain was a clan-mark denoting blood-vengeance for slaying. The destruction of Sodom relates to volcanic activity and subsidence of the Dead Sea bed, while the story of Lot's wife being turned to salt was suggested by the salt slopes of the Dead Sea's banks. The birth-story of Moses is that of King Sargon of Akkad (c 2300 BC). The story of Joseph and Potiphar's wife is the Egyptian Tale of the Two Brothers (see FOLKTALES).

But the Hexateuch is not all legend. Reference to the tribe of Benjamin has been found during archeological research at Mari which is not so far from Harran where, according to the book of Genesis, Abraham settled. The Semites dominated Egypt in the Hyksos period, and an inscription contains the name of Jacob. The bond-cities of Pithom and Raamses, places of forced labour, have been identified in Goshen. The Red Sea can be forded or bypassed through the Reed Sea (now altered by the construction of the Suez Canal). Mount Sinai could have suggested a pillar of fire by night and cloud by day. The reference to the Israelites catching quails by hand, in the book of Numbers, is probable enough, for these birds can be caught in this way when exhausted; similarly manna, the food that sustained the people in the desert, can be collected from the tamarisk bush. The Sinai region had the earliest alphabet and was a mining and smelting district and tradition might well have believed it an appropriate place to inscribe tablets of stone and fabricate brazen serpents and calves of gold. In brief we cannot reject the Hexateuch as fiction but must admit that many natural events have been heightened in the telling or recollection. Thus, except in fundamentalist sects, there is nowadays a marked tendency among churchmen to use Old Testament miracles in a symbolic or metaphorical way to illustrate stages in the development of religious consciousness.

In the historical books of the Bible from Samuel to Chronicles, and some of the later ones, miracles are rare except in the accounts of Elijah and Elisha, which appear to have been based on more slender historical records; as a result, there was a tendency to fill out with legendary material, probably promoted by the 'Sons of the Prophets', a group with whom Elisha was connected. Folklore themes may be recognized, as well as hagiographic tales. We must suppose that in ancient hagiography the same tendencies worked as in the Christian era; writing in an innocent spirit with the best of intentions, biographers of holy men tended to ascribe marvels retrospectively to saints or to their sacred relics.

The Attitude of Jesus

For most modern Christians the gospel miracles alone are the real focus of discussion, while less importance is attached to those in the Acts of the Apostles or mentioned in the epistles. There is almost no direct historical evidence to corroborate Jesus's existence (see JESUS). One extreme view proposes therefore that his life is completely mythical, and that the belief in the advent of a religious Messiah had engendered the belief that he had actually come. This view requires no interpretation of the gospel miracles. However, even free-thinkers will be struck by certain peculiarities of the gospels which suggest that there was a historical Jesus. From the content and manner of the four gospels it can be inferred that Matthew, Luke and John derive from more than one source, but one of these sources is the same source as that on which the gospel of Mark is based. The Marcan gospel is therefore the fulcrum of criticism.

Notably, Mark does not relate the childhood of Jesus or the Virgin Birth, a miracle that has been much debated (see MARY). Discussion has often been at a low level: an ancient slander made Jesus the son of 'Panthera', a 'Roman legionary', but the name is simply a corruption of the Greek *parthenos*, a virgin. In modern times the biological term parthenogenesis is used to denote the reproduction without sexual union found in some insects; if it occurred in humans, a mother would produce a daughter almost a twin of herself.

Mark relates the Transfiguration, possibly a hagiographic addition or a visionary experience. He tells of darkness at the Crucifixion and the rending of the veil of the Temple, but his account of the empty tomb is indecisive as to the significance of the Resurrection. Mark's own conclusion to the gospel is lost and the brief account of the resurrected Jesus was added by another writer. It is notable that the other miracles are all of healing, exorcism or revival of persons doubtfully dead. The exceptions are the feeding of the 4000 and the 5000, which is now largely accepted as 'spiritual feeding'; the walking on the sea, which many respectable theologians accept as visionary; and the blasting of the fig tree. This last miracle, in which Jesus causes the tree to become barren, shocks modern religious sensibility, which plausibly supposes the report to be based on an illustrative metaphor used by Jesus. The content of the remaining miracles shows that the Marcan gospel is not a tale of 'wonder-working' which Jesus consistently despised, and in this respect it differs strikingly from apocryphal gospels and pagan romances like *The Life of Apollonius of Tyana* (see APOLLONIUS). However, a third of Mark is devoted to miracles and Jesus's own attitude to them. Though the gospel is based on oral tradition, innocently condensed and modified, it leaves the impression that it records a historical and highly individual Jesus. The meaning of healing miracles becomes decisive for interpretation.

The Healing Dream

The ancient Greek world ascribed healing functions to no less than 38 gods or heroes (see HEALING GODS). The hero Amphiaraus, regarded as a great man whose benign spirit survived death, had a temple by a sacred spring at Oropus in Boeotia, in central Greece. Patients underwent purification and fasting, and then slept in the temple: the practice called incubation (see DREAMS). Cures resulted if the patient had a favourable dream. At length the healing cult of the hero Asclepios surpassed all others; he was revered as a god and his shrines appeared throughout the Mediterranean region. As with Amphiaraus, Asclepios's patients undertook incubation after elaborate preparations. A patient often dreamt that the god examined him, made a diagnosis and prescribed a treatment. Sometimes in the dream the god would heal then and there, perhaps by surgery.

Inscribed on the stonework of the temples were accounts of many cures, some so remarkable as to be indeed miraculous, if true, but their veracity is suspect. However many cures were perfectly genuine according to the testimony of great physicians like Galen (c 130–200 AD). The priests may have edited or heightened some of the descriptions but there is no real evidence that they employed systematic fraud, such as appearing disguised as Asclepios. The genuine cures can be explained in normal ways. Some patients would have recovered in the ordinary course of events. Belief in the god and expectancy can account for the regularity of the dreams. But the most interesting and significant cures were those of ailments with a strong psychological component, which today are called hysterical or psychosomatic. For example, a man with paralysed fingers, very sceptical of the inscriptions, dreamt that Asclepios stepped on his hand and straightened it. On awaking he found himself cured of his ailment.

The Miracle of St Damian and St Cosmas, **a painting in the Prado, Madrid. A man with a diseased leg went to sleep in their church and dreamed that the two saints cut off his leg and gave him a new one: when he woke up, his leg was healed. Similar dream-cures are reported from pagan shrines in antiquity**

Releasing the Unconscious

In a pamphlet called *The Faith that Heals*, the great French neurologist Jean Martin Charcot (1825–1893) drew comparisons between the cures of Asclepios and modern healings, as for example at Lourdes (see LOURDES). The idea of a pilgrimage is mooted, followed by discussion and preparation, a lengthy journey, prayers, fasting, ceremonies and processions, and in this way hope and expectancy are built up. Anecdotes of cures, and votive offerings on display tend also to heighten confidence. Finally incubation, immersion in the sacred waters or contact with the holy relics, as the case may be, may sometimes, but not always, complete a psychological process so that the ailment spontaneously heals. It is to be expected therefore that healing at shrines at all times and places will have been most successful with ailments that are psychologically determined at an unconscious level (see FAITH HEALING).

Healing at Christian churches may have followed with continuity from pagan days, the shrines often being converted to churches. In early days incubation was still practised, but gave way to the cult of relics, not necessarily those of official saints. The tomb of the Jansenist Deacon François de Pâris at Saint Médard in Paris in the 18th century yielded cures of great scientific interest because the symptoms before and after cure were carefully recorded by a lawyer, Carré de Montgeron; his descriptions suggest that hysterical ailments comprised the majority of cures. Moreover the cures were not instantaneous but progressed by stages in accordance with well-known physiological laws (see CONVULSIONARIES).

Hysteria can take the form of 'the Hystericks' as known to our ancestors, or other types of hysterical fit, but can also manifest a bewildering range of other symptoms: deafness, mutism, partial or complete blindness, anaesthetic patches on the skin, paralysis of hand, arm or leg, permanent contraction of muscles, wry-neck, ill-defined aches and pains and, strangest of all, astasia in which the patient has his full strength when lying down, but falls as soon as he tries to stand. There is no physical cause for hysteria but the patient is not shamming. He is genuinely ill and ignorant of the cause of his illness, which is psychological, locked away without access in the unconscious part of his mind.

In the 19th century much was learned about the cure of hysteria. Sometimes the patients responded to shock, like one of Charcot's patients whose symptoms vanished forthwith when he had occasion to scold her. Another patient was persuaded that she would undergo a marked improvement on her saint's day, and this duly happened. Other patients responded to exercise and persuasion. But relapses were common, this being all too often a typical feature of hysterical cures.

Suggestion and Faith

Modern treatment employs psychological means to enable the patient to discover the subconscious origin of his condition, and also tries to relieve those pressures of everyday life which contribute to his illness. Hypnotism is often efficacious, because it is a condition in which the patient may be susceptible to remedial suggestion. 'Suggestion' is a difficult term to define precisely or completely understand. Sometimes suggestion received consciously is effective but generally it works in ways as yet unknown. To be successful in healing it must stimulate some unconscious layer of the mind.

The history of hypnotism and suggestion is complicated because a suggestion need not be conveyed in words. Moses set up a brazen serpent to heal the people of serpent bites. Here we have a hint of sympathetic magic ('a hair of the dog that bit one'), but also the old trust in the power of metals, which has recurred in more recent times. In the 18th century metal plates were attached to patients by Perkins in the United States and by the Abbé Lenoble in France. Magnetism and electricity had their vogue also. In James Graham's Temple of Health in 18th century London, the patient, at a fee of £50, received 'magnetic vapours' overnight. From 1860 to 1880 'metallotherapy' was seriously studied by reputable physicians. The interesting point is that it too had its genuine successes in curing hysterical patients.

The Three Saints of Trecastagni in Sicily are believed to heal the sick and to prevent Mount Etna from erupting. Successful cures at religious shrines are now generally explained as resulting from factors in the patients' minds rather than as 'miracles'

Axel Poignant

The Austrian physician Anton Mesmer (1734–1815) brought his theory of 'animal magnetism' from Vienna to Paris in 1778 (see MESMER). He believed that magnetism was a cosmic force or 'fluid' which also resided in the body, and that illnesses were due to this fluid being badly distributed. By stroking the patient he claimed to adjust the fluid. Mesmer also achieved cures.

By Faith Alone

During the 19th century, when extensive researches were made into methods of inducing hypnosis and employing it for cure, 'magnetic passes' were found to be unnecessary because hypnosis could be induced by verbal suggestion. Belief in the 'magnetic fluid' waned; hypnotism came to be regarded as a psychological state induced by suggestion alone, as were the cures effected under hypnosis. It was recognized that the curable ailments were either hysterical, or purely psychological (hypochondria), or psychosomatic (effects of emotion on circulation, respiration and other internal processes). In about 1880, a French country doctor named Liébeault carried out an interesting experiment. Instead of showing his patients a bottle of 'magnetical water', (water which had been 'activated' by mesmeric passes), he obtained equally good cures with a bottle of untreated water provided that the patients believed it to be magnetized. When magnets were used in the Paris hospitals the results depended as much on the personality of the doctor as on the magnet. Patients would often react favourably to an electro-magnet provided they believed it to be switched on.

Thus 'faith' can cure certain ailments. It can be activated by a device such as a magnet, or by a relic, or a person or even by a situation. In 1849 a country child, Louise Requin, was healed of a general paralysis merely by being brought from her home to the famous Hôtel Dieu hospital in Paris. Clearly anything that strikes the imagination can be effective, but there is no guarantee that a cure will be achieved; to be effective 'suggestion' must reach the hidden layers of the mind and this depends on the whole situation. Nothing can be laid down as to what kind of personality constitutes a good faith healer or spirit healer. French and English kings in the past could cure some skin conditions by touch (see KING'S EVIL), but exalted rank alone is insufficient. Only a few ancient rulers such as Pyrrhus, King of Macedonia (318–272 BC), are reported to have had curative powers. It was said of the celebrated healer Prince Alexander Hohenlohe - Waldenburg - Schillingfürst, Archbishop and Grand Provost, that his name and titles had much to do with it, but he was also a saintly personality.

Psychological Cures

What of Jesus? The evangelists did not write as biographers telling us of Jesus's physical presence, voice or manner. Mark's aim, writing perhaps within 20 years of the Crucifixion, was to record those stories of Jesus which were in use in the Church to illustrate the essential nature of his mission, as conceived by Jesus himself. Though there is no consensus between scholars, many believe that Jesus regarded himself as the messenger of an imminent apocalypse in which the *dynamis* or power of God would break through and heal the spiritual sickness of Israel. He deplored 'signs and wonders'. The coming of the Kingdom of God must be perceived by Faith alone. But in those in whom this Faith was awakened, cures of their bodily sicknesses would follow in accordance with the curing of their spiritual illness. For Jesus and the evangelists the healing miracles were not the cause of Faith but the result of Faith. This view is not essentially different from the modern view of cure by suggestion or faith. In the gospel context it is convenient to write Faith with a capital letter, because many scholars draw the line at equating the Faith demonstrated in the gospels with ordinary everyday faith. For them the Faith of Jesus's audience is the true and central gospel miracle.

This point of view must be respected and there is no logical ground for disallowing it. In fairness, however, it must be said that the view is equally tenable that the gospel Faith differed at most in degree, but not in kind from ordinary faith. Looking at the Marcan miracles of individual healing, and bearing in mind that a condensed oral tradition is not a set of doctor's case notes, it appears that they are all capable of being interpreted as psychological cures: exorcisms, cures of paralyses, haemorrhage, or skin disease (the term 'leper' was not a specific medical description) or catalepsy (the affliction of Jairus's daughter). Even the 'absent healing' fits into the picture. In Catholic countries intercessors sometimes make the pilgrimage that the patient is too weak to undertake on his own behalf. Interestingly enough Mark said that in his own country (where 'the prophet is not honoured') Jesus 'could work no miracle there'.

Studies of the miracles at Lourdes show that where sufficient data are available, the cures appear to fall into the regular pattern of healings by suggestion. About one case a year, admittedly, remains puzzling. But medicine is an incomplete science and even hospital physicians are sometimes puzzled by spontaneous remissions. There may be true miracles of healing, but as yet they cannot be proved.

Nowadays the patient who wanders into 'fringe medicine' has an ample choice of 'gimmicks'. Magnets may be out of fashion but bee-stings, acupuncture and so on have come in. Spirit healers perform surgery after the manner of Asclepios. Healing temples will perform absent healing. No doubt every method has its proportion of cures and also of relapses.

Other forms of faith healing such as church circles for prayer, laying on of hands, and group therapy are financially safe and perhaps more healthy because they involve a social milieu and elements of genuine spiritual value and psychotherapeutic efficiency. But, whatever one's symptoms, and whichever form of faith healing one resorts to, it is essential to persist in orthodox medical investigation at the same time, in case there is an obscure but physical cause which it might be dangerous to neglect or which is rectifiable through the resources of modern medicine.

A still lake or woodland pool reflecting the human face was the first mirror; despite fears that the reflection was his soul which might be stolen by evil spirits, man has used the 'looking-glass' in one form or another for divination throughout the centuries

MIRROR

THE MAGIC OF THE MIRROR, whether the reflecting surface of a looking-glass or the image seen in the woodland pool, can still stimulate the imagination today as profoundly as in ancient times. Mythology and superstition alike bear testimony to the powerful influence of mirror magic upon human thought as recounted in the story of Vulcan's mirror which revealed past, present and future; the magic mirror of Merlin which gave warning of treason; the mirror of Cambuscan in Chaucer's *Canterbury Tales* which told of misfortunes to come; or Lao's mirror in Goldsmith's *Citizen of the World* which reflected thought itself. And in the magical world of the *Arabian Nights*, there is the all-seeing mirror of Al-Asnam which indicated by the lightening or darkening of its surface the chastity or otherwise of the girl whose image it reflected.

The earliest looking-glasses known were the still waters of lakes and pools. Primitive people generally seem to have regarded the human reflection in water as the soul, for it was widely believed that the soul could exist separately from the body without involving death. The people of the Andaman Islands believed the soul to be the human image they saw reflected in rivers, and significantly in mirrors. Yet the rivers and lakes which offered man his first vision of himself were supposed also to have been the haunts of water spirits, some kindly but others hostile, to whom sacrifices had to be made and who on occasion snatched at the human reflection and captured the soul.

It is understandable, therefore, that the ancient Greeks should have considered it an omen of death to dream of seeing one's reflection in water, for the water spirits might drag the soul into the dark depths below, leaving its owner to perish. Despite

these dangers, men and women have always peered at their reflections to discover what the fates hold in store. If the image was broken or disturbed it was taken as a sign of disintegration, of trouble to come and even death itself, but if it remained clear and unruffled it was a clear indication of future serenity and therefore of hope. The broken reflection of the human image seems always to have been interpreted as a symbol of disaster. In course of time the man-made mirror inherited these superstitions, firstly the bronze or silver type used by the Egyptians, Greeks and Romans, and later the glass mirrors which first appeared in Venice at the beginning of the 13th century. In classical times the art of catoptromancy, as mirror divination was called, was practised by seers or 'scryers'. They dipped a metal mirror into water and, according to whether the reflection of the sick person who looked into it was disfigured or clearly defined, decided whether he would live or die. This type of divination took a number of highly specialized forms, using tools such as plates of silver, beryls, water in a bowl, and even the polished finger nail.

The Devil's Looking-Glass

As in so many other types of divination, this art demanded for its effectiveness the immaculate purity of the officiating seer and for this reason a virgin girl or boy was usually selected as scryer. For many centuries the scryer had an important social role, being consulted by statesmen anxious about the future and by the ordinary citizen beset by domestic problems. As he peered into the liquid depths of his magic mirror the scryer foresaw the fate of kings and the whereabouts of stolen property, missing people and buried treasure. During the great witch-hunts of the Elizabethan era scrying was frequently used to discover the identity of witches whose faces were conjured into the mirror. By far the best known of mirror diviners was the magician Dr John Dee (1527–1608), known as Queen Elizabeth's Merlin, who with his confederate Edward Kelley penetrated the future by means of a black polished stone (see DEE). At one time credit for the discovery of the Gunpowder Plot of 1605 was ascribed to Dee, to whom the secret was said to have been revealed in the magic mirror. This incident is supposed to have led to the fashion of wearing an ornamental mirror in one's hat in the early years of the 17th century, but it is far more likely that these mirrors were intended to protect the wearer against the Evil Eye.

The use of a mirror to deflect the rays of the Evil Eye was once a very common

Michel Vuillemin

European practice. In Italy a looking-glass was once found smeared with poison after it had been glared at by a particularly malevolent witch. Among the Chinese, small mirrors were hung up in the house to scare away evil spirits since these were capable of being utterly shocked at the sight of their own reflections.

Mirror magic of one kind or another has been practised all down the ages and in England has continued almost into our own times. As recently as the latter half of the 19th century, the Cunning Men (the name by which the last surviving representatives of the medieval magicians were known) eked out a meagre existence from the rapidly declining industry of rustic divination, by then reduced to little more than scrying for lost watches or nightshirts purloined from washing-lines.

The basic principles of mirror magic can be clearly recognized in our surviving popular superstitions, the best known being the fear that breaking a mirror will be followed by some kind of disaster, varying from death and sickness to seven years' bad luck. This is particularly interesting in view of the old anatomical myth that the human body underwent a complete physical renewal every seven years. Presumably it was only at the end of this period that bad luck could be eradicated from the system. There are several antidotes to the misfortunes resulting from breaking a mirror, one being to bury the shattered pieces in the earth and another to cast them into a stream flowing south, so that the waters will wash the curse away.

A relic of the ancient concept of the presence of an evil spirit in a pool of water is represented by another superstition, according to which the mirror is the abode of a presence who takes revenge upon anyone who damages his home by breaking the glass. It was also a common belief that if anyone looked long enough in a mirror the face of the Devil would materialize.

The danger involved in projecting the soul out of the body is responsible for the superstition that a sickroom mirror must never be left uncovered; it was once a common fear that the weakened soul, if allowed to leave the body, might not have the strength to return and that death would inevitably result. Even today, a mother may still refuse to let her baby see its reflection in a mirror until it is a year old and therefore of sufficient strength to survive the temporary separation from its soul. The old custom of covering up a mirror in a room where someone has died originated in the fear that the ghost of the deceased might snatch at the soul of a living person reflected in the glass, to accompany it to the underworld.

An interesting relic of mirror magic was the custom in which a girl looked at the moon's reflection in a looking-glass to discover how many years must pass before her wedding day. A similar Hallowe'en rite was supposed to produce the reflection of her husband-to-be looking over her shoulder in the mirror. Of all the superstitions and myths associated with mirror magic none is perhaps so intriguing as Lewis Carroll's creation *Alice Through the Looking-Glass*. In that contradictory world where left is right and time and space run counter to reality. Alice must walk backwards to meet the Red Queen, while the Queen screams with pain even before her finger has been pricked.

The mirror has been described as a door through which the soul may find freedom, but the Greek legend of Narcissus is the perfect allegory: grasping at his reflected image in the fountain, the youth was absorbed, and then embraced by death, to remain the undying symbol of self-love.

ERIC MAPLE

The wood of Christ's cross, the 'burning bush' of Moses and the dart which killed the Norse god Balder were all, according to legend, members of the mistletoe family, while to be kissed under its boughs was a magical insurance of fertility

MISTLETOE

THE GOLDEN BOUGH, which was the title of Sir James Frazer's classic work on magic and religion, is also a name for the mistletoe. Frazer refers to a belief that this magical plant at certain times 'blazed out into a supernatural golden glory', a belief on which Virgil based his description of Aeneas being led by two doves to the 'leafy gold' of mistletoe, shining where it grew on a holm-oak in the dark forest. It is a curious fact that when it becomes dry, the plant does indeed take on a golden tinge.

The many species of mistletoe are objects of veneration all over the world, but there is little doubt that the main myths, and certainly those which Frazer studied, concern the familiar native species *Viscum album*. Mistletoe is a parasite, springing from seeds which have been deposited by birds on the bark of trees. The plant inserts its woody 'sinkers' into the host plant from which it derives almost its entire sustenance. The most magical mistletoe grows on oaks, but its commonest host is probably the apple, although it also grows on many kinds of deciduous tree, and very occasionally on evergreens, including conifers.

The magic of mistletoe derives largely from its striking appearance, different from the host yet apparently part of it; from the fact that it is evergreen when the host is bare; that it does not grow in the soil but above it, and that it seems to have a mysterious vitality despite its apparent rootlessness. If cut for magical purposes a knife or sickle of sacred gold had to be used. According to Pliny the Druids did this, taking the utmost care to prevent it touching the ground, which not only destroyed the plant's god-given virtues but brought calamity. The white-robed priest would cut the mistletoe on the sixth day of the moon, letting it fall onto a white cloak. Two white

bulls were then sacrificed. After this, the efficacy of the plant was assured. It was placed in water, and this water was distributed as a talisman against evil. Pliny also describes the cutting of mistletoe by others than Druids for its magico-medicinal powers which, he explained, were strongest if the plant was gathered on the first night of the new moon without using iron. The warning to avoid iron was a frequent injunction in the gathering of such herbs.

The importance of the mistletoe to Frazer's theme was based on the Norse legend of Balder, as recorded in the *Prose Edda*. Balder was the son of Odin, wise, gentle and much loved. He told his fellow gods of dreams which seemed to foretell his death. They gathered together and agreed that the goddess Frigg should extract an oath from every conceivable creature, plant and substance, promising not to harm Balder. This was done and the oaths were tested by striking the god and throwing at him everything possible, and he remained unscathed. However, the resentful god Loki was jealous of Balder. Disguised as an old woman, he contrived to trick Frigg into admitting that she had not troubled to gain an assurance from the mistletoe, because it seemed too young to take an oath. Loki went away, gathered mistletoe, and rejoined the gods, who were still amusing themselves proving Balder's invulnerability. He spoke to blind Hoder and asked if he would not like to join in and, in effect, do honour to Balder. He gave Hoder the mistletoe branch and directed his aim: the branch struck home and Balder fell dead. The god was ceremonially cremated at sea, amid universal mourning.

Frazer wrote that the tale 'suggests that it belongs to that class of myths that have been dramatized in ritual'. He sets out to illustrate that the main incidents – the cutting of the mistletoe, followed by the death and burning of the god – had many counterparts in primitive rites. In parts of Scandinavia, mistletoe was until very recently, and perhaps still is, gathered for the Midsummer festival, when bonfires called *Balder's Balar* (Balder's balefires) are lit. Almost certainly an effigy of Balder was burned on these fires in former times.

It seems likely that burning an effigy was a more civilized version of an older custom of burning a human representative of the god, the end – according to Frazer – of 'the sacred drama which was acted year by year as a magical rite to cause the sun to shine, trees to grow, crops to thrive, and to guard man and beast from the baleful arts of fairies and trolls, of witches and warlocks.' The victims died 'as living embodiments of tree-spirits or deities of vegetation'. Such a sacrifice was, the historian Strabo recounted, carried out in remote ages in Italy at a Midsummer fire festival in the Arician Grove or Glade of Diana, where the one-year King of the Wood was burned on a perpetual fire doubtless fed with oak-wood.

Frazer argued that Balder must have been a tree deity, the personation of the oak. And the sacred oak had to be burned, just as the god had to die, for the good of man. The evergreen mistletoe represented the life-spring of the oak-tree, so before burning the tree the mistletoe had to be ceremonially removed to preserve its virtues; in any case if the mistletoe were not cut off, the oak would remain invulnerable. In any reference to Frazer's theory of a connection between the plant mistletoe and the god Balder, however, it must be emphasized that many scholars today consider that this is problematical (see BALDER).

There is an interesting additional reason for oak-mistletoe being especially sacred; oaks seem to be much more prone to being struck by lightning than many other trees; and no doubt mistletoe-bearing oaks were often struck. Our ancestors could readily believe, to paraphrase Frazer, that the sky god, after calling in his awful thunder-voice, had sent down his sacred plant-token in a lightning flash.

Freedom to Take Liberties

The commonest present-day association of mistletoe is the custom of kissing under the mistletoe bough at Christmas. There are two reasons for this practice. The first is the fertility symbolism of the plant, which the modern writer Geoffrey Grigson considers partly due to the way the berries are carried. Thus for a woman to be kissed under the mistletoe was originally a magical way to ensure she would bear children, while the plant itself could be used as an aphrodisiac. The mistletoe endows man with the freedom to kiss any woman; this derives from the general amnesty and 'universal liberty' allowed as long as this plant lay on the altar of the local church or cathedral – a practice recorded at York as recently as the 18th century.

The second reason is connected with the general all-healing, protective, good-luck reputation of mistletoe. In pagan times, as Pliny recounts, the plant's medico-magical properties were recognized to include not only the magic of encouraging fertility, but the power of reducing epileptic spasms as well. It was also given to sheep and cows after they had given birth. It was well known as a protection against witchcraft, the Devil and other kinds of evil; it could enable one to see ghosts and to make them speak, could open locks and lead to treasure. In the northern countries, appropriate to its link with Balder, it was a plant of peace.

Because of its healing virtues, in many primitive societies mistletoe was regarded as sacred. This was recorded, for instance, of the Ainu of Japan who favoured the mistletoe that grew on willows. Similarly, in 1827 Baron Roger wrote concerning the Walas of Senegambia in West Africa that they 'have much veneration for a sort of mistletoe which they call *tob*; they carry leaves of it on their persons when they go to war as a preservative against wounds.'

Exactly why mistletoe should be associated with Christmas in Britain, rather than with Midsummer as in Scandinavia, is not entirely clear; the most likely reason is its association with other evergreens, notably holly and ivy (see HOLLY AND IVY), whose red and black berries were a contrast to the white of the mistletoe. But this association is certainly deeply engrained in British country customs. The mistletoe might be hung up on Christmas Day or on New Year's Eve. In most cases it was left a twelvemonth and then burnt – the cremation ritual once more, geared perhaps to the Celts' anxiety about the ever-shortening days of winter, and certainly, like other bush-burnings, to ensure successful crops next year. In Worcestershire the bough, decorated with nuts, apples and ribbons, might be fixed on a cord and pulley so that the woman who was kissed could pull down a berry which she would then throw over her left shoulder.

Victorian modesty under the mistletoe; but the ancient symbolism of this custom was that to be kissed under the mistletoe ensured fertility

Mansell Collection

These local customs together with the romantic interest in the Druids of the 18th and early 19th centuries (see DRUIDS) encouraged the commercialization of the mistletoe, according to Grigson. It was during this Druid 'craze' that imitation Stonehenges were erected beside a mistletoe-infested apple tree and artificial mistletoe-oaks were made. It was then that churchmen began to distrust mistletoe as a 'pagan' plant, and would not have it in the church. This is curious because there are ancient legends that mistletoe was *sanctae crucis lignum*, the wood of the holy cross, or in France *l'herbe de la croix*; it had once been a strong tree but since its sad use degraded to a parasite.

There is another biblical but pre-Christian association with mistletoe: it seems probable that the scarlet-flowered *Loranthus acaciae*, a member of the mistletoe family which grows on acacia bushes, was the origin of the flame of fire from the burning bush, from which the Lord spoke to Moses.

In the Victorian language of flowers, the message of the mistletoe was 'I surmount difficulties'.

MITHRAS

'If Christianity had been arrested in its growth . . . the world would have been Mithraist', said the French philosopher Ernest Renan, and there is no doubt that this austere, soldierly cult, with its rigorous ordeals undertaken in subterranean chambers, gained an immensely powerful hold in the Roman Empire: there are five temples to Mithras in Britain alone. The Mithraic mysteries made their appeal to soldiers and to officials in the service of the Roman emperors. But exactly how an ancient Persian god found his way to Rome, to be adopted by high-ranking army officers, is still not fully known

Roman relief of the 3rd century AD, from one of the Mithraic sanctuaries, which were constructed underground, showing the god sacrificing the bull. It was this act which created the world, for all living things on earth arose from the body, blood and seed of the bull

DURING THE PERIOD between 1400 BC and 400 AD Persians, Indians, Romans and Greeks worshipped the god Mithras. The god was particularly important in the old polytheistic religion of the Persians between the 8th and 6th centuries BC and again in the Roman Empire in the 2nd and 3rd centuries AD. No direct evidence remains of Persian paganism, and if we wish to get an idea of this polytheistic religion we must fall back on reconstruction from texts of a later period. Plenty of material is available, however, and many points can be discovered which are very probably accurate.

There are four important sources for Mithraism. The first is a cuneiform script tablet from Boghazköi in Turkey which contains a contract between the Hittites and the Mitanni, an Iranian-speaking tribe in Mesopotamia c 1400 BC. In this contract, Mithras is invoked as a god before whom an oath may be sworn. Secondly, there are some Indian texts in which the god Mitra appears as a 'friend' and as a 'contract', and has connections with the sun. Unwillingly, he participates in the sacrifice of the god Soma, who frequently appears in the form of a bull or as the moon. Thirdly, great hymns of praise (*yashts*) were written, probably in

the 5th century, in honour of Mithra and the goddess Anahita. The Mithraic yasht extolled the god as the Lord of Contract, who in war grants victory and in peace prosperity. Finally, the Roman monuments reveal some important aspects of Mithraic mysteries that spread to far-flung areas of the Empire.

By comparing these sources we may infer that in Persian paganism Mithras was a god of friendship and of contract and had close connections with the sun. These three points are interrelated, as contracts are the basis of friendship among people; as a witness to contracts the sun has often been called upon, as he is all-seeing. The sacrifice of bulls was also part of the Mithraic cult. It is closely connected with Mithras as god of contracts, as in ancient times contracts were sanctioned through common sacrifice and a common feast. According to Plutarch, Mithras was the 'mediator'. This corresponds to what we know about the old Persian Mithras. The contract as a bond between humans, friendship and feasting after the sacrifice which was a unifying force, and the sacrifice itself linking men with the gods are all examples of Mithras's role as a mediator. Mithras, the sun, was in old Persian times also closely connected with kingship. People swore oaths by the king and by the sun. Kingship also incorporated above all else the idea of law and order at a time when the abstract concept of the state was still unknown and there were no written laws. Order was visibly present in the person of the king; the king was the law, and when he died chaos erupted, as law and order were gone (see KING).

The Persian social system was feudal, in the sense that there were no abstract legal rights and duties but only reciprocal personal obligations between man and woman, parents and children, lord and peasant, and so on. Mithras, who represented law and order, was the divine exponent of the Persian system as god of contracts and of all reciprocal relationships.

Eclipsed by Zoroaster

The Persian religion was completely changed by Zoroaster (see ZOROASTRIANISM). The exact period of the prophet's life is uncertain; at the latest it was about 550 BC, perhaps considerably earlier. Zoroaster taught that there was a single god, Ahura Mazdah (see OHRMAZD) and he rejected the other gods of the old Persians. The Persian word *daivas*, which originally meant 'gods', has since Zoroaster signified 'evil demons'. Zoroaster fought passionately against polytheism and against Mithras. He protested against the bull sacrifice, the principal festival of the Mithraic religion. In later generations, the doctrinal teaching of Zoroaster was gradually interspersed with elements of the older polytheism, and the wide gap between the two religions was bridged by compromise. After Darius, who died in 486 BC, the Persian kings were Zoroastrians. But the aristocracy probably continued to be attached to Mithras and the old gods. Despite this difference of opinion, the Persian kings seem to have made allowance for those social groups who did not want to replace the old cults entirely by Zoroastrianism. Indeed, the kings were practical politicians, and considerate of the feelings of their subjects. In the 4th century BC the Kings Artaxerxes II and III mentioned Mithra and the goddess Anahita in their inscriptions. But by this time, Zoroastrianism was the dominant factor in the blending of the two religions and we hear no more of the Mithraic bull sacrifice.

A Song to Mithras

Mithras, God of the Morning, our trumpets waken the Wall!
'Rome is above the Nations, but Thou art over all!'
Now as the names are answered, and the guards are marched away,
Mithras, also a soldier, give us strength for the day!

Mithras, God of the Midnight, here where the great Bull dies,
Look on Thy Children in darkness. Oh, take our sacrifice!
Many roads Thou hast fashioned – all of them lead to the Light!
Mithras, also a soldier, teach us to die aright!

Rudyard Kipling

After the destruction of the Persian Empire by Alexander the Great nothing more is heard about the Persian worship of Mithras. Yet over three centuries later Mithras was worshipped in the states between the Parthian Empire and the Graeco-Roman world, for example in Armenia, where Mithras was again god of kings and feudalism. In a Mithraic ceremony, King Tiridates I submitted to the Roman Emperor Nero in the 1st century AD and made his kingdom a fief under Nero's control. Mithras was also the god of the kings of Commagene, to the south of Armenia. It is likely that Mithridates of Pontus (1st century BC), the great enemy of the Romans, worshipped Mithras; his kingdom included the northern coast of modern Turkey, and the Crimea. Finally, we know from Plutarch that the pirates of Cilicia, the south coast of Turkey, also worshipped Mithras during this period. On the other hand, Mithras was of no importance in the Greek-populated areas of Asia Minor. The Persians were the national enemies of the Greeks and consequently their god Mithras had no chance of success with the Greeks.

Powerful Roman Following

It is an open question whether the Roman Mithras mysteries were the same religion as the Persian Mithraic cult. The Persian religion changed to accommodate the different conditions of the Roman Empire. Certainly, many elements of the old religion were retained, but at the same time the Roman theology contained elements unknown to the Persians. For example, the Romans took their doctrine of the fate of the soul from Plato's philosophy. One could say that the Roman mysteries were a completely new religion. It may be that there were one or more founders of the new cult, dating from perhaps c 100 AD. The dated Roman Mithras monuments start from c 140 AD.

It is puzzling how this religion came to Rome. It is unwise to postulate that its spread can be compared to the spread of the Christian mission, for the Mithras mysteries were addressed to entirely different social strata, to the soldiers and officials in the imperial service, and only men were initiated into the cult. It has been suggested that the Mithraic cult spread slowly, by way of Syria and Asia Minor, and then came to Rome by sea. However, this theory is contradicted by the hostility of the Greeks in Asia Minor towards the god. It has also been suggested that the Roman legions became acquainted with the cult of Mithras on the Persian frontier and that when troops were moved from the eastern front to Europe they brought Mithras with them to the west. It should be remembered, however, that a religion would only have been able to spread in the army of the Roman emperors if it were regarded favourably by those at the top. It is therefore probable that the founder, or founders, of the Roman Mithraic mysteries must have been active in Rome itself, and that he or they must have enjoyed the benevolent encouragement of higher generals, perhaps even of the *praefectus praetorio*, the commander of the Praetorian Guard. The Mithras cult was probably introduced into the legions from above, by officers who were posted from their headquarters in Rome to legions on the frontiers of the empire.

The geographical distribution of archeological finds supports this hypothesis. Many Mithraic remains have been excavated in Rome and in areas of military conflict on the frontiers, such as the Euphrates, Danube, Rhine and in Britain; but almost none have been found in the pacified provinces such as Gaul or Spain, apart from the Mithraeum or temple in Mérida, Spain, the seat of the Roman governor.

There are numerous Mithras initiation inscriptions that do not originate from soldiers but from officials in the imperial service, particularly from freedmen who were able to obtain very influential positions in finance and customs administration if they proved their worth. Such men worshipped one god only if it did not prejudice their career. It is characteristic of the Mithraic cult that it was a religion of loyalty, of respect for the social system, unlike Christianity which was a religion of rebellious aloofness from the state, and of revolutionary hope in the Last Judgement.

Initiation Underground

The Mithraic sanctuaries in the Roman world were underground grottoes. The ceiling symbolized the heavens, and the cavern the world. The chambers were never very large, with space for barely 100 men. Around the central chamber there were sometimes labyrinthine systems of artificial passages, as beneath the church of St Clemente in Rome. There was always a spring in the cavern. The Mithraic monuments were certainly not built secretly below ground, but a hole was dug in the same way as when a cellar is constructed, perhaps behind a high fence.

There were seven grades of initiation into the Mithraic mysteries, each with a symbolic name: *corax* (raven), *nymphus* (bridegroom), *miles* (soldier), *leo* (lion),

Roger Wood

The gods Ohrmazd and Mithras, flanking the Persian King Ardeshir II: the Persian Mithras was a god of contract, a mediator between gods and men, and was closely connected with both the sun and the kingship, the principle of law and order in society

Perses (Persian), *heliodromus* (courier to the sun), *pater* (father). The raven wore a raven's mask, the lion a lion's mask, the Persian a Persian cap, and so on. Literary records state that the initiate into the Mithraic mysteries had to submit to corporal punishment, that he was bound and then released. The initiation signified a ritually symbolic regeneration. The person being initiated as a 'soldier' had to undergo a test of courage. He had to force his way, apparently by means of a duel, to a wreath. This done, an officiant came up to him and put the wreath on his head, but the candidate had to reject the wreath and say that Mithras was his wreath. For the rest of his life he was not permitted to wear a wreath, as this honour was due only to the god.

There were various initiation ceremonies, such as baptism, the common meal, obligation through shaking hands (in this ceremony we can recognize the old Persian god of contract). Those being initiated wandered through the underground passages; at some points passwords were demanded. On one fresco at Ostia, in Italy, the mystic is dressed as a 'bridegroom'. In Rome beneath St Prisca the fresco depicts a procession of 'lions'. At Capua, Italy, the initiate is being led towards the initiation point with his eyes bound. He then kneels down before the mystagogue (teacher or leader) who wears a Persian cap, and finally lies stretched out, humbly on the ground.

On some occasions lighting effects were used: there were reliefs which could be illuminated from the rear revealing a crescent or the head of Mithras or Sol (the sun) surrounded by a halo. There were also statues of Chronos, the god of time who swallows everything, which were hollow at the back and able to spit fire. At some shrines the relief showing the sacrifice of the bull, at the end of the grotto, could be turned round, revealing on the other side, for example, the common repast of Mithras and Helios. Either side could be shown, according to the demands of the liturgy.

Some verses from hymns of the Mithraic mysteries have been found as wall inscriptions under the church of St Prisca in Rome. There are also frescoes testifying to a syncretism of the Persian with old Roman ceremonies. The Mithraic sacrifice of the bull is connected with the old Roman feast of *Suovetourilia* (the sacrifice of a boar, a ram and a bull); this sacrifice was offered up on the day of *Palilia*, another old Roman festival, when the founding of the city of Rome was celebrated. *Suovetaurilia* and *Palilia* were Roman national festivals, which were celebrated under the patronage and with the participation of the emperor. The Mithraeum under St Prisca, where these representations may be seen, lay in a large complex of buildings which were imperial property. The Persian religion was thus set completely into an 'old Roman' framework, with the approval and even the encouragement of the emperor; in particular the Emperors Commodus, Septimius Severus and Caracalla probably favoured the Mithraic mysteries, for an exceptionally large number of dated Mithraic inscriptions originate from their period. Also characteristic of the blend of Persian and Roman ideas is a representation found in a Mithraeum at Ostia of the Roman god Silvanus, and instead of *pater* in the inscriptions we sometimes read *Pater patratus*. This is an old Roman title for a priest whose task it was to form alliances. Thus, in the service of the Persian god of contract, there was the renewal of a priest's title which had been in use in ancient Rome for the negotiation of contracts.

From Death to Cosmic Birth

The sacrifice of the bull had been the great holy deed of Mithraism. The sun god, through his messenger, the raven, had commanded Mithras to sacrifice the bull; on some reliefs the raven flies to Mithras on a sunbeam. The god carried out the sacrifice with great reluctance: in many representations he is sadly averting his gaze, he is innocent of the animal's suffering. But when the bull died, a great miracle occurred – the world began: the cloak of Mithras was changed into a celestial globe on which planets, the zodiac and fixed stars were shining; the white bull, now a crescent, was moved into the heavens. (Luna, the moon

G. Drury/Guildhall Museum

Roman statue of Mithras: the god's cult was converted into a mystery religion, under the influence of ideas drawn from Plato. He made a powerful appeal to soldiers and imperial officials and was probably introduced into the legions by high-ranking officers from Rome

goddess, is seen in the reliefs frequently averting her eyes from the sacrifice). From the tail and from the blood of the bull arose ears of corn and the vine. Then came all the trees and plants, the four elements, the winds and the seasons; from the seed which issued from the bull there arose the good animals and all living things. This Mithraic deed was a blessing: 'Thou hast saved us also by pouring out the blood eternal', according to one of the few verses we have obtained from a Mithraic hymn. The power of evil wanted to prevent the creation; the scorpion, snake and lion try to drink the seed of the bull. Evil will not be destroyed until the end of time; as long as he is on earth man must always struggle for good and against evil.

Particularly instructive is a relief in London on which Mithras is sacrificing the bull not in the cavern but in the celestial sphere, which is indicated by the zodiac: the heavens arose following the sacrifice of the bull. Each sunrise signifies a repetition of this cosmogony. The stars began to revolve in the sky, and this was the birth of time. The sun circling around the earth caused the day, the orbit of the moon the months, and the path of the sun through the zodiac (the ecliptic) the years.

There are numerous other Mithraic myths to be seen in the reliefs, often in the small pictures near the main scene: the birth of Mithras from a tree; Mithras shooting at the cloud with an arrow (bringing the rain), or at the rock (causing a spring to gush forth); cutting the corn; taming the bull; his contract with the sun god; the holy meal; the ascent to heaven on the chariot of the sun god. The myth of the birth of Mithras from the rock has the same significance as the sun rising over the mountains on the horizon and the cosmogony in the sacrifice of the bull. The birth of Mithras from an egg depicted on the relief at Newcastle-upon-Tyne shows the egg turning into a celestial globe, represented by the zodiac; here Mithras is equated with the Orphic primeval god Phanes (Eros) who arose out of the egg.

The beautiful Mithraic statues of Venus, Mercury and Jupiter show that, as well as Mithras and Chronos, the god of time, the gods of the planets were worshipped.

The Mithraic myths have been interpreted into a complete theology, in accordance with the Platonic myths. The cavern of the mysteries was the world, as in the cave allegory of the Platonic state. The mystic had to try to free himself from the shackles of materialism and ascend to the true sun, like Mithras on the chariot of the sun god. The way up led through the spheres of the seven planets, a progress already anticipated on earth in the Mithraic initiations, when the mystics ascended through the seven grades of initiation, each of which was related to a planet. This ascent was symbolized by the seven-runged ladder at Ostia; at each initiation the mystic passed through a new gate. On the reliefs at Capua and Rome there is the Platonic Eros, or the Orphic Phanes (Mithras), guiding the psyche of the mystic. The ascent of Mithras has been compared with the ascent of the soul to the firmament in Plato's *Phaedrus*.

The cosmogony of the mysteries was interpreted from the cosmogony in Plato's *Timaeus*. Mithras was named 'father and creator of the universe', in words reminiscent of the *Timaeus* and the attack by the evil animals, shown on the reliefs, corresponds with the attack of the elements on the newborn babe in the *Timaeus*. Above all, however, the dualistic outlook of Persian religion found its philosophical interpretation in the two rotations of the heavens seen on the Mithraic reliefs: the constant rotation of the vault of heaven with the fixed stars to the right and the variable orbit of the planets through the zodiac to the left. From the combination of these revolutions arose inconstant time. But man must strive for the eternal and, by-passing the gods of the planets, ascend to the one true eternal.

This Platonizing interpretation of the Mithraic myths is secondary in relation to the old Persian religion; but the Roman mysteries were probably first established on the basis of this allegorical interpretation. The founder or founders of the religion must have been Platonists. They rendered the philosophical teachings into the myths and rites of the Persian god and thus created an entirely new religion.

The Mithraic mysteries were therefore completely Hellenized and Romanized. The Persian god could be accepted as a traditional god of the Romans. There is a characteristic inscription from Carnuntum, near Vienna, from the year 307: the old Emperor Diocletian had consulted with the reigning emperors in order to settle disputes; together they restored a Mithraic sanctuary and dedicated it 'to the patrons of their empire'. The cult was to thrive as long as the emperors supported it.

Under Constantine the Great the Mithraic cult lost imperial favour. He publicly supported Christianity and while there are several dated Mithraic monuments up to 312 AD, after that there is only one from the military frontiers of the empire.

A collection of inscriptions from Rome, in which Mithras is mentioned, are dated from 357 to 387 and originate from the group of pagan Roman senators who had rebelled against the new Christian Empire in Constantinople. They were connected with the Emperor Julian the Apostate, who had wanted to reintroduce paganism into the whole empire. These cults of the Roman opposition are no longer characteristic of the Mithraic mysteries, as at that time in Rome a fierce syncretism was being practised; the inscriptions mention Mithras only as one of many pagan gods. The genuine Mithraic mysteries ceased under Constantine, and the triumphant Christian Church erected its basilicas above the underground Mithraic caverns in Rome.

R. MERKELBACH

MODERN WITCHCRAFT

Wicca has worship as its main object, but the additional element of magic lends the cult an illicit and undoubtedly attractive aura

Until the early '50s, most people assumed that witchcraft had flown out of the window when the industrial revolution came in at the door; is the modern revival of interest in magic a deliberately trumped-up anachronism with decadent undertones, or is it a belated recognition of a religion which is older than Christianity?

IN RECENT YEARS increasing publicity has been given to the activities of people claiming to be 'witches'. With a few notable exceptions these people dress in a normal fashion, earn a living in ordinary jobs, are married and have children and, in fact, show few outward signs of their strange beliefs. Yet they firmly maintain that witchcraft is as relevant to the 20th century as to any time previously.

Modern witches refer to their religion as 'Wicca', the feminine form of an Old English word, *wicce*, meaning a witch, possibly a derivative of the verb *wiccian*, to practise witchcraft. Wicca is a largely urban cult drawing principally upon a membership of lower middle and middle class people between the ages of 30 and 50. In common with more orthodox religions, Wicca has worship as its main object, but the additional element of magic lends the cult an illicit and undoubtedly attractive aura.

Both male and female members of Wicca are known as witches, although the cult is mainly matriarchal, the high priestess being looked upon as the personification, and in some ceremonies the incarnation, of the mother goddess who is the principal deity of witchlore. In some respects she is not dissimilar to the Virgin Mary of Roman Catholicism; she is Queen of Heaven, and her symbols are the moon and stars. She is light, love and above all fertility and is sometimes referred to by the names of old pagan goddesses – the Celtic Arianrhod, the Roman Diana, the Egyptian Isis. Her consort, personified by the high priest, is the horned god – Cernunnos, Pan, Osiris – the dark, male factor. Out of the union of the god and goddess came the universe, and between them they control the turning of the seasons, bring fertility to crops and animals, bestow magical powers upon their faithful followers, and generally operate the clockwork of the cosmos.

Wicca is basically a fertility cult and its great festivals are geared to the seasons. They are the spring equinox, on 21 March; May Eve or Beltane, on 30 April; the summer solstice, mid-summer on 22 June; August Eve, or Lammastide, on 1 August; the autumn equinox on 21 September; Hallowe'en on 31 October; the winter solstice, or Yule, on 21 December; and Candlemas on 2 February. The witch meetings on these dates are known as sabbats, and additional sabbats are also held on the nights of the full moon, in honour of the goddess. Weekly or monthly meetings, less formal affairs at which cult business is attended to and new members initiated, are known as esbats.

Garter and Knife

The basic working unit is the 'coven'. This may consist of between four to 14 or sometimes 20 members, although 13 is considered the ideal number, partly because of tradition and partly because a nine-foot circle, in which the group operate during their ceremonies, nicely accommodates 13 people. The late Dr Margaret Murray is among those who have put forward certain theories concerning the coven. Many witches point out that Christ, with his twelve apostles, had an ideal coven with the Virgin Mary as 'high priestess'. Some maintain that the semi-mythical Robin Hood, Maid Marion, and 12 'merry men' were in fact a group of witches, and a similar theory is applied to King Arthur, Queen Guinevere, and the knights of the Round Table. According to a fanciful theory, even the British monarch, taken in conjunction with the 25 knights of the Order of the Garter – two 13s – has been associated with witchcraft. Tradition has it that the Order of the Garter came into being around the year 1348, when Joan, Countess of Salisbury, dropped her garter during a court ball. Edward III saw the incident and, to relieve the lady's embarrassment, picked it up and tied it to his own leg, saying, 'Honi soit qui mal y pense': 'Evil (or shame) to him who thinks evil of it.'

According to modern witches, the garter has always been the badge of office of the high priestess of a coven (though there is little textual evidence to support this), and the countess could have therefore been a witch. In the relatively permissive days of Edward III few ladies at court would feel shame at merely losing a garter, and Edward donned the garter himself to show that he too was a witch; he subsequently founded the 'double coven' of the Order of the Garter in the witches' honour.

Witches worship powerful cosmic forces which are personified as the mother goddess and the horned god, from whose union came the universe ***Previous page*** **The high priest of this coven holds the sword of power and wears a horned helmet which connects him with the god**

In any case, the modern high priestess in some covens wears a single garter to show her rank; a priestess who is head of more than one coven may have a silver buckle on her garter for each of her covens, displaying them with pride. On her head, the priestess wears a crescent head-dress, symbol of the moon, and around her waist is tied a girdle consisting of three cords, each cord commemorating the degree of her initiation, and symbolizing her bondage to the service of the mother goddess and her coven. The priestess, like the priest, also carries a sword as a mark of office; on his head the priest often wears the horned helmet of the god.

The girdle is common to all members of a coven, as is the 'athame' or black-handled knife. This weapon, inscribed with magic symbols, is presented to each witch on initiation, although ideally it should be made by the witch himself. It is used to mark out the magic circle and, held point upwards, to draw down magical power into the circle. Often, the 'circle' is no more than an invisible boundary drawn around the coven by the high priestess. Sometimes, however, it may be an elaborately drawn affair, with symbols and 'names of power' marked on the floor of the coven room.

In the centre of the circle stands a small altar, upon which are placed the 'Book of Shadows', the liturgy of Wicca, containers for salt and water, a censer, a scourge, a wand, the pentacle or plate, and a chalice: fewer or more items of equipment are used depending on the practice of each coven, and on the nature of the ceremony.

Ceremonial, within the broad outline of Wicca, differs from coven to coven. At the average esbat, usually held indoors on a Saturday night, the circle is marked out and four candles are lit, one at each point of the compass. The naked witches stand just

inside the circle, with the high priestess at the centre, kneeling at the altar, and the high priest standing with his back to the north, his arms crossed on his breast. Using the point of her athame, the high priestess mingles the salt and water together in a small bowl and then sprinkles the mixture around the perimeter of the circle and upon the heads of the witches present. The water symbolizes purity, the salt life and freedom from corruption. She herself is sprinkled with the mixture by the high priest. Thus purified, the high priestess takes her sword in her right hand and, arms outstretched, stands at each of the four points of the compass in turn, invoking the 'Mighty Ones' of Air, Fire, Water and Earth, the traditional elements from which the god and goddess created the universe. Air is attributed to the east, fire to the south, water to the west and earth to the north.

Drawing Down the Moon

On the nights of the full moon, and at certain of the major festivals, the high priest performs a short ceremony known as 'drawing down the moon' on the high priestess, during which, her followers believe, she becomes the goddess incarnate. The 'power' is generally achieved by a process of dancing and chanting. Witches believe that the build-up of power is achieved much more readily when the participants are naked and when a certain sexual tension is present; some claim to have 'seen' this power as a golden conical aura, its base resting upon the heads of the dancers. In this charged atmosphere the witches begin to cast their spells. Only three pieces of magic can be performed at each meeting, they claim, and the spells should always be for good; an evil spell rebounds threefold upon the head of its creator. Sometimes the spell is cast telepathically; for instance, in the case of a spell cast to cure a person of a bad leg the witches would stand silently and 'will' the leg to heal. On other occasions they might use a doll, or 'fith-fath' to represent the sick person – and bathe the doll's leg with a healing potion, or the high priestess might 'bind' the spell, wrapping her girdle around the blade of her athame in a special way.

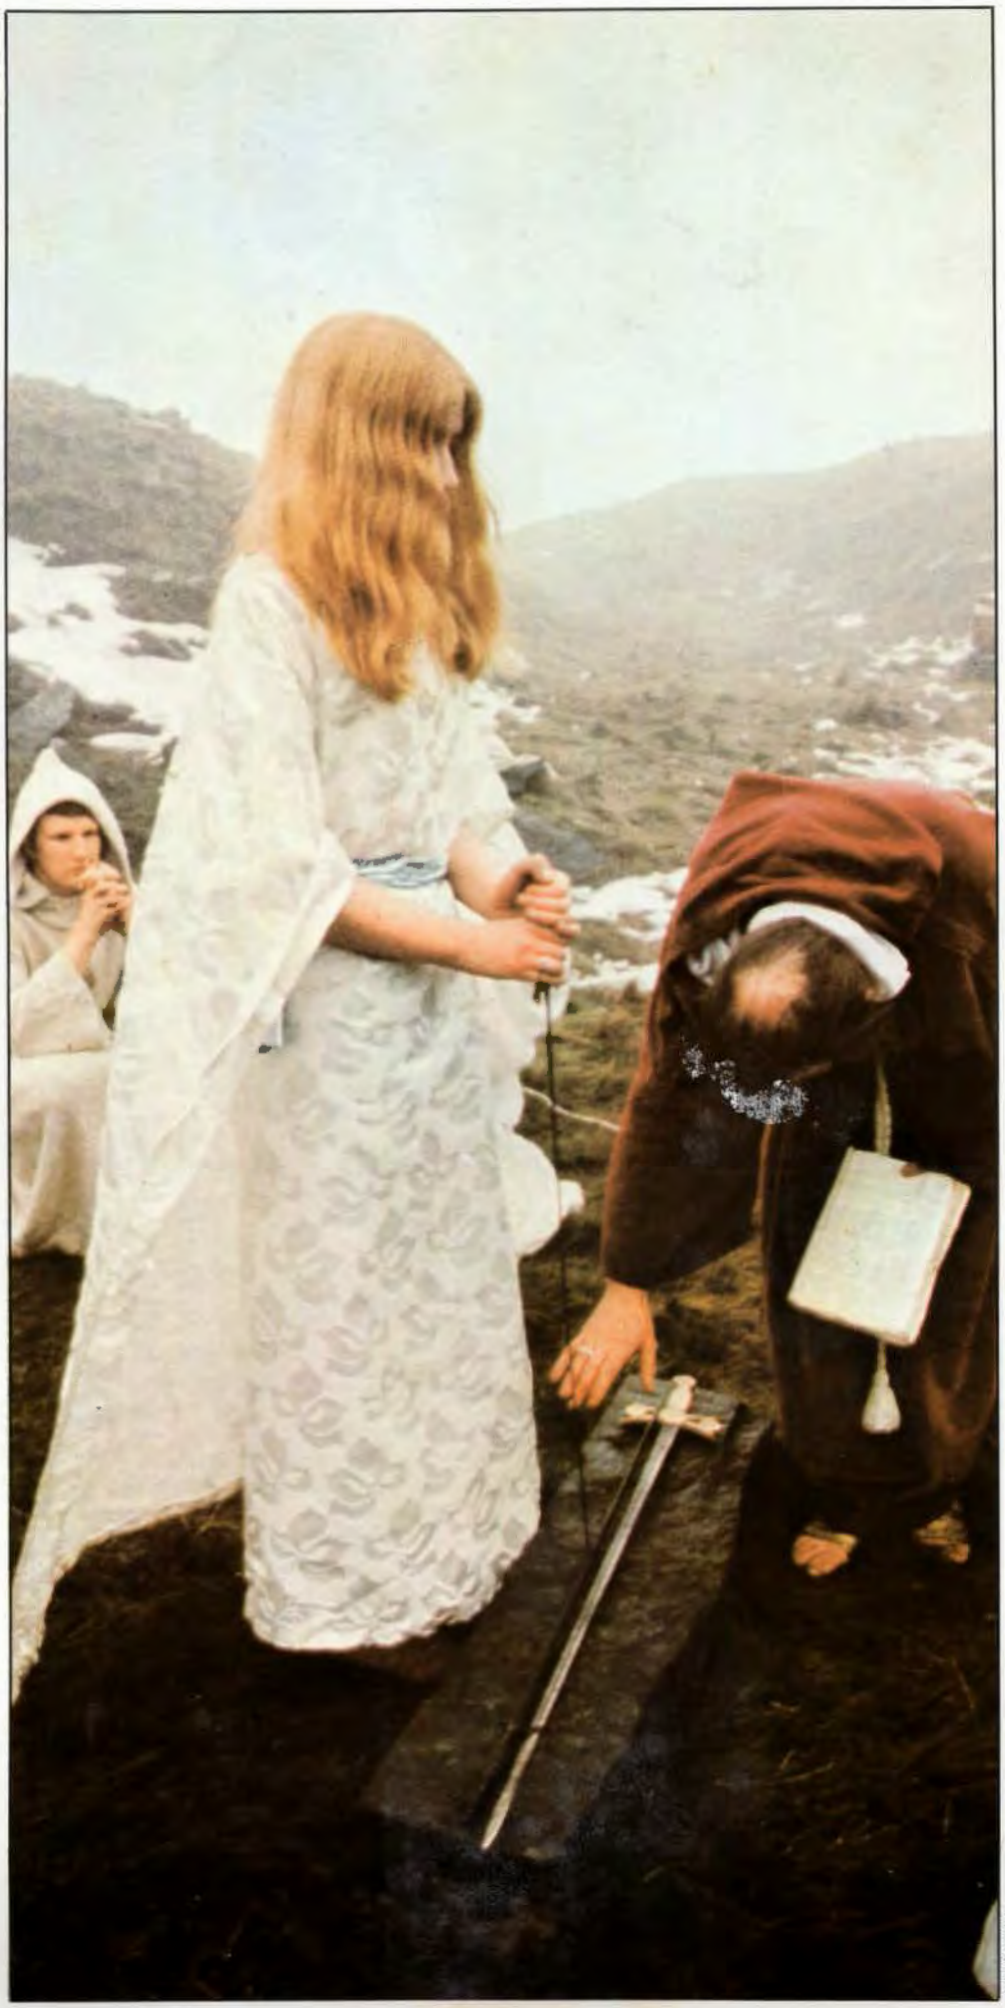
The spells suitably cast, the circle is closed, the Mighty Ones are dismissed, and the witches settle down to a ceremony with cakes and wine. The wine is consecrated by the high priest and priestess together, the latter dipping her athame into the wine which the priest holds up to her in the chalice – an obvious piece of sexual symbolism. The cakes are then consecrated by having the athame passed over them in the form of a pentagram, and cakes and chalice are passed around to each witch in turn. Despite protests to the contrary, witches claim that the cakes and wine ceremony is not a travesty of the Mass; it is, they say, simply a form of thanksgiving for the grape and the grain.

The motives of modern witches are often thought to be questionable, and certainly a considerable element of sexuality is present at many meetings, although charges that Wicca is an excuse for sexual orgies are hotly denied. The nudity of the coven, the frantic dancing, the incense and the slightly illicit atmosphere contribute to this, as do certain ceremonial acts. The binding and whipping of a new initiate for 'purification' purposes, for instance, is highly titillating for those with sado-masochistic tendencies (though the 'whip' is usually of embroidery silk) while the 'five-fold kiss' bestowed by the high priest or priestess on the feet, knees, genitals, breasts and lips of new members speaks for itself. The 'Great Rite', performed at certain ceremonies and consisting of token or actual sexual intercourse between the high priest and priestess, is justified by the witches on the grounds that Wicca is, after all, a fertility cult. Only the high priest may initiate a female member, while the the high priestess initiates the males.

The Revival

In the eyes of Wicca members the cult is of vast antiquity, predating Christianity by thousands of years. In fact, as a modern cult, Wicca has been in operation for less than 20 years; it was only with the passing of the Fraudulent Mediums Act of 1951 that it was able legally to present itself to society at all. This Act, which restricted prosecution only to those who obtained money from the public under the pretext of possessing supernatural power, enabled spirit mediums and astrologers, as well as witches, to practise their arts legally in the open for the first time in hundreds of years.

After the witch-hunting fury of the 17th century, witchcraft declined in England.



John Drysdale

'Wicca', as witches call the cult, is primarily a fertility religion, strongly influenced by the theory of the late Margaret Murray that medieval witchcraft was a survival of the pagan fertility religion of pre-Christian Europe. 'Witches believe that the build-up of power is achieved more readily when the participants are naked and when a certain sexual tension is present'; they also work naked because they believe that clothes hinder the flowing out of power from their bodies

John Drysdale

Margaret Murray argued that witchcraft had not been an anti-Christian perversion but the survival of pre-Christian paganism

Some 300 years after the Witch-Finder General, Matthew Hopkins, had terrorized the eastern counties, a series of books appeared which set the scene for the modern reappearance of the ancient craft. Margaret Murray's *The Witch-Cult in Western Europe* (1921) argued that witchcraft had not been an anti-Christian perversion but the survival of pre-Christian paganism. In 1949 Gerald Gardner published a novel *High Magic's Aid*, which purported to give authentic details of witchcraft practice; this was followed five years later by a non-fiction book, *Witchcraft Today*. In this he claimed to be a witch and maintained that his fellows in the New Forest coven to which he belonged had appointed him their 'publicity officer'. Gardner proselytized for the witches in a further book, *The Meaning of Witchcraft* published in 1959, and attracted a great deal of largely hostile publicity from the newspapers before his death in 1964.

In the absence of any evidence except hearsay, there is a strong case in favour of the suggestion that Gardner invented the cult of Wicca to satisfy his own sense of the esoteric, drawing upon magical texts – he was a great admirer of Aleister Crowley – Margaret Murray's theories, and a smattering of witch lore and assorted mythology. His rituals were far more heavily based on sex than the ones most commonly practised today, so that it is reasonable to suppose that Gardner's sexual whims were gratified by the 'religion' he had created.

Gardner's followers in the '50s were often referred to as Gardnerian witches; for the last few years they have been increasingly superseded by the 'Alexandrian' variety, whose leader is a Manchester-born man named Alex Sanders, who refers to himself as 'King of the Witches' and claims to be descended, through his maternal grandmother, from Owen Glendower, the legendary Welsh chieftain said to have been given the same title by his followers. Alexandrian witches differ from the Gardnerian variety principally in that they lean far more strongly towards ceremonial magic although, like the Gardnerians, they worship the god and goddess and carry out the same fertility rituals.

It is through the witchcraft of Alex Sanders that Wicca in the long run seems

The writings of Aleister Crowley *(top left)*, the most famous or infamous magician of the century, influenced both Alex Sanders (*centre*, seen here invoking the sun) and Gerald Gardner *(right)*, principal propagandist of the modern witchcraft revival *Above* A 'dance of the wheel' performed on Beltane, the old Celtic festival which marked the opening of the second half of the turning wheel of the year

most likely to establish itself, if at all. The Alexandrians seem to have a far greater percentage of young people in their ranks, than had the Gardnerians, and most of them are of a high educational standard. Sanders loses no opportunity of explaining the beliefs of his followers and himself, using any modern medium available. He has made numerous radio and television appearances, has appeared in several films in Britain, the Continent, and Canada, and is the subject of a book by June Johns, *King of the Witches*. He has made a long-playing record of his rituals, and his engagements and contracts are handled as professionally as those of a 'pop star'. But Alex Sanders is firmly at the helm of his enterprise; if he appears ambitious, he also has the future of Wicca at heart, expounding the principles and beliefs of the cult with all the sincerity of any missionary.

To some, modern witchcraft is a smutty, underground cult whose sole objective is sexual licentiousness carried out in the name of religion; to others it is healthy and rational, the nudity being a symbol of the stripping away of material things, and the idea of worshipping the creative forces of the universe being the most logical and simple method of worship. Whatever the truth of its claims to ancient roots, its basic aims seem harmless enough, and give a certain spiritual satisfaction to many people whose faith in established religion has flagged.

Hoyt, *Witchcraft* (S. Ill. Univ. Press, 1981).

At first derided and persecuted, Mohammed became leader of a large community, which grew into one of the world's major religions

MOHAMMED

BORN IN MECCA about 570 AD, Mohammed (more correctly Muhammad) was a citizen of an important commercial city, for Meccan caravans travelled annually to south Arabia, the Mediterranean and the Persian Gulf. Mecca was also a religious centre, with the Kaaba to which pilgrimage was made from many regions. Other sacred sites in the neighbourhood were also visited by pilgrims. So Mecca derived profit from both its commerce and its sanctity.

Tradition says that Mohammed belonged to an influential family, but though he had some influential connections, he lived in obscurity and even poverty in his early days. The Koran (sura 93) says, 'Did he (God) not find you an orphan and give you shelter? Did he not find you erring and guide you? Did he not find you poor and enrich you?' Before Mohammed's birth his father died, and when he was five his mother died. He came under the care of his grandfather Abd al-Muttalib and, when he died, of his uncle Abu Talib. Mohammed is said to have been employed as a shepherd and he is also said to have travelled with traders into Syria. Such a journey would bring him in contact with Jews and Christians, whose religions had made little impression on Arabs, though Arabia had Jewish and Christian communities. Yet there was an indirect effect, for some Arabs, called haneefs, had abandoned idolatry for the worship of one God.

When Mohammed was about 25, a prosperous Meccan widow named Khadeeja, employed him as her agent in a caravan to Syria, and was so pleased with his success that they married. While Mohammed probably continued to conduct business, he now had time for leisure, part of which he occupied visiting a cave on Mount Hira, near Mecca, for meditation.

Divine Inspiration

Eventually, at about the age of 40, he had a vision. Tradition says that an apparition appeared before him and commanded him to read (or recite) in God's name. He protested that he could not do so, and the command was repeated twice more. Then he recited the words at the beginning of sura 96 of the Koran, 'Read (recite) in the name of your Lord who created, created man from congealed blood . . .' Mohammed doubted the divine origin of the message, fearing that some devil had taken possession of him, but due to Khadeeja's encouragement he became convinced that he was divinely inspired.

Sura 3 speaks of two visitations. In the first the visitant is said to have given his servant (Mohammed) the inspiration he conveyed. Sura 81 says, 'Your comrade is not jinn-possessed; he saw him on the plain horizon, nor does he grudge to communicate the unseen.' Dr Bell has argued (in his *Introduction to the Qu'ran*) that Mohammed first thought he had seen God, but later interpreted the visitant as Gabriel. But whatever development Mohammed required in understanding, once he was assured that the message had a divine source he no longer doubted that he was called by God to be a prophet.

A period of depression followed, without inspiration, but messages later began to come regularly. Mohammed started to preach publicly and was ridiculed. But when the Meccans began to fear that his denunciation of idols might deprive them of the income from pilgrims, persecution followed. Mohammed had the protection of Abu Talib's clan, but most of his followers were poor, some being slaves, so he advised those without protectors to go to Abyssinia where they could live in safety under its Christian king.

The Koran depicts a lively controversy with the Meccans. The salient points of Mohammed's teaching were that there is only one God, who has appointed him as his prophet, that the rich must treat the poor justly and be honest in their business dealings, and that judgement follows death, when mankind will be rewarded or punished. Though the Meccans acknowledged a supreme God, Allah (from *al-ilah* 'the god'), local objects of worship meant more to them,

An angel reveals the Koran, the sacred book of Islam. Shiite doctrine speaks of the light of Mohammed which was created in time immemorial and passed on to his successors from generation to generation.

Museum of Turkish and Islamic Art, Istanbul

and they refused to abandon polytheism or to accept Mohammed as a prophet. Some called him jinn-possessed and a poet, an accusation he vehemently rejected, because poets were believed to be inspired by a familiar spirit.

Mohammed insisted that he was inspired by God. He recounted stories of former prophets who had been rejected, ending with an account of the terrible fate of the unbelievers. The Meccans replied that he rehashed stories at second-hand. They also ridiculed his teaching about a bodily resurrection, arguing that everyone knew the body decayed after burial. To this Mohammed had the reply that God who had created the body in the first place surely had power to bring it back to life.

Flight to Medina

Mohammed lost both his encourager and his protector when Khadeeja died in December 619 and Abu Talib died the following month. At the pilgrimage season, he met 12 people from Yathrib (later Medina), a town about 180 miles north of Mecca, who were willing to accept his teaching, and he sent back a missionary with them. The following year, 70 people from Yathrib met Mohammed and agreed to protect him if he came to Yathrib. With this assurance he decided on emigration.

This emigration (the Hegira) in 622 AD was a turning-point in Mohammed's career. Many difficulties remained, but the change improved his fortunes and Islam became established as a separate religion. The earlier preaching suggests that Mohammed considered himself in the line of the prophets, proclaiming the monotheism of Abraham; but circumstances made him realize that Jews and Christians did not accept all his teaching. The importance of the emigration was early recognized, for when the calendar was fixed in the time of the second caliph, 622 became the year 1 of the Hegira.

Times were still hard, and not all the people of Yathrib welcomed Mohammed. Those who did were called Helpers and those who did not declare themselves were called Hypocrites. The phrase 'the Emigrants and the Helpers' became a technical term for the Medina Moslem community.

Hostility towards the Meccans led to fighting. Meccan caravans passing to the west of Medina were sometimes raided by men who owed allegiance to Mohammed, and in the second year of the Hegira he himself led out a number of followers to attack a rich caravan. The caravan escaped, but Mohammed with 305 men met a Meccan supporting force three times as large and defeated it. The booty brought some relief but the knowledge that they could win gave the battle even greater significance. Mohammed declared that squadrons of angels had come to assist the Moslems, marking the victory with God's approval.

Mohammed gradually strengthened his position, engaging in many expeditions against Arab tribes, resulting in an oath of allegiance being sworn to him by tribes which recognized his strength. At the beginning of 630, in a practically bloodless victory, he conquered Mecca, clearing it of its idols and sacred stones, leaving only the Black Stone in the Kaaba, which is venerated, but not worshipped, by Moslems to the present day. Henceforth Mecca was the most sacred town to Moslems, but Mohammed returned to stay in Medina.

He had early drawn up a constitution recognizing him as leader in all matters and making provision for peaceful relations with the Jews. But he soon realized that the Jews were unwilling to welcome him, for they disputed his prophetic claims and questioned the accuracy of his knowledge of earlier revelation. He first showed his disapproval by changing the direction of prayer from Jerusalem to the Kaaba in Mecca, and substituting the fast of Ramadan for the Atonement previously observed, and the summons to prayer by the human voice for the Jewish trumpet and the Christian bell. Soon Mohammed had reason to suspect the Jews of dealings with his enemies and he expelled them, a tribe at a time, from Medina. Some rich Jewish settlements to the north were also conquered.

God's Messenger

Mohammed was so sure of his position as God's messenger that he could brook no ridicule, opposition, or discrediting of his inspiration. The phrase 'God and his messenger' occurs in Medina sections of the Koran concerning decisions made, or regulations formulated. This is not self-magnification but rather an expression of

Sonia Halliday

Topkapi Museum, Istanbul

Exquisite paintings from the Topkapi Museum in Istanbul depict scenes from the history of Islam. The faith was established on the basis of revelations from God around 610 AD.

Mohammed's being God's mouthpiece, for the laws were God's.

The Medina suras of the Koran differ in style from the Meccan. In his early teaching Mohammed was merely a preacher, not responsible for the reception of his message; in Medina he exhorted his followers to fight in God's path, at times using force and at others winning followers by presents. Such methods seemed justifiable, for the orders came as divine inspiration, and Mohammed must obey. In the Medina suras there are laws to guide the community but though much of the material is not so inspiring as the Meccan, Mohammed remained a prophet with a message still sounding forth in the Medina suras. Indeed, they contain some of the finest verses in the Koran.

Mohammed died in 632 AD. Starting as a prophet with an unpopular message, he ended as leader of a large community. From beginning to end his driving motive was to bring men to belief in God's unity, and to abandonment of idolatry. Something of the nature of a totalitarian state resulted, and was implicit in his doctrine, for if God is universal king, every sphere of life is subject to his control.

Mohammed taught that he was no more than one of a line of prophets; but his message is God's final word. He therefore has a high position. The Koran (sura 33) says, 'God and his angels bless the Prophet. Invoke blessings on him, believers, and give him a salutation'; so the usual practice when Mohammed's name is mentioned is to add, 'God bless him and grant peace.' The observance of his birthday, condemned unavailingly by theologians, is widespread. Customs vary but processions, recitation of the Koran, eulogies on Mohammed and the amusements of a fair are common.

Sonia Halliday

'The enemies of the Prophet had elephants, camels and horses, but he had none': the flight from Mecca to Medina in 622 AD, which became the year 1 of the Islamic calendar, was the turning-point in Mohammed's career; in Mecca he had met fierce hostility but from Medina he strengthened his position by raiding Meccan caravans and subduing neighbouring Arab tribes. In 630 AD he conquered Mecca, which became the most sacred city of Islam

Tradition speaks of Mohammed as intercessor for his people at the last judgement. He will have an exalted place over all prophets, and through his intercession will deliver his people from hell. Shiite doctrine speaks of the light of Mohammed which was created in time immemorial and passed from Mohammed to the imams. Sunnites reject this doctrine, which seems to approach an idea of superhuman status. They insist that Mohammed was no more than a man whom God used. But they can look on him as a model for mankind, as he combined all the qualities most admired. He lived a normal human life, being married, engaging in various occupations, and showing characteristics of resolution and compassion. It is argued that by his experiences and fine qualities he is the one to be imitated. He must clearly have been a man of attractive character, if one may judge from the manner in which he made and held close friends.

FURTHER READING: W. Montgomery Watt's *Mohammed at Mecca* (1953) and *Mohammed at Medina* (1956) were published as *Muhammad, Prophet and Statesman* (Oxford University Press, 1961); B. K. Narayan, *Mohammed* (Verry, 1980).

MOHARRAM

MOHARRAM, meaning 'forbidden', 'declared sacred', is the name of the first month of the Moslem lunar year. In pre-Islamic times it was one of four sacred months when tribes generally refrained from fighting. The last two months of the year, Dhul Nada and Dhul Hijja, formed with it a peaceful quarter of the year, when markets could be held and pilgrimage observed. The fourth was Rajab, the seventh month.

The tenth day of Moharram was for a time observed by Mohammed as a 24-hour fast, following the Jewish practice on the Day of Atonement; but when he became displeased with the Medina Jews, he substituted the fast of Ramadan, the ninth month, when fasting is observed daily from first morning light till after sunset. The 10th of Moharram was, however, retained as a voluntary fast day, and is still observed as such by some Sunnites, the main body of Moslems.

But the chief observation of the 10th of Moharram takes place among the Shiites in Persia, Iraq, India, Pakistan and elsewhere. It is held in commemoration of the death of Ali's son al-Husayn at Karbala in 680 AD.

The Shiites hold that Ali, Mohammed's cousin and son-in-law, should have become caliph after Mohammed's death, and that the Caliphate should have been continued in his line. Ali became fourth caliph, succeeded by his son al-Hasan, who very soon abdicated in favour of the Umayyad Mu'awiya. Husayn, a finer character than his brother, but too trustful of unreliable followers, later laid claim to the Caliphate. Those who encouraged him proved faithless, and he had to face the dominant Umayyad power with a comparatively small band of followers. He was called upon to surrender, but refused and after severe privation, including being cut off from water, he and his followers were eliminated. He was beheaded and his head was sent to the Caliph Yazid in Damascus. Later it was said to be buried in Cairo, the mosque of the Hasanayn being its reputed burial place, but it was returned by Yazid and buried beside the body at Karbala.

The Twelvers

The Shiite imam differed from the Sunnite caliph in his inheritance from the Prophet of not only his temporal sovereignty but his spiritual authority as well. In that capacity he was an infallible leader, exacting unquestionable obedience and possessing the divine gift of impeccability . . . The founder of Islam imposed a revelation, the Koran, as the intermediary between God and man; all Shiites made a man, Ali, the intermediary. From Ali the imamship passed to his son al-Hasan and then to his other son al-Husayn. The succession was continued in nine descendants of al-Husayn. The bulk of the Shiah owe allegiance to these twelve imams, whence they are called Twelvers.

Philip K. Hitti *The Near East in History*

This event at Karbala has great significance to Shiites who invest it with sacrificial value. The Shiites use the term imam (leader) instead of caliph. They believe that a divine light was granted to Mohammed, from whom it was transmitted successively to the imams. Love of the imams is essential for salvation, especial honour being paid to Husayn because of his martyrdom.

Tears and Flagellation

The early part of the month of Moharram, up to the 10th, is a period of mourning, when people gather to hear the story of Husayn recited, and indulge in violent weeping. In some places processions are held during this period; in others they are reserved for the 10th. These processions rouse great religious fervour. Among those who take part are groups who beat themselves front and back with chains, causing blood to flow. The present writer has watched Moharram processions in Lahore, in Pakistan, during which the flagellants kept shouting 'Hasan, Husayn'. The flagellation continued, for it was a mark of distinction to pull on a shirt after a while and walk about, showing it covered with blood. Some may go to the extent of cutting their heads.

A horse is led in the procession decked with trappings covered with red to represent Husayn's blood, and with arrows fixed in its harness to represent the arrows shot at him. Replicas of Husayn's tomb at Karbala are carried in the procession. In some regions they are called *toziya* (literally

'consolation'), and it was the custom after the Lahore procession to commit them to the Ravi. This is not a practice in all countries, and it may preserve a relic of some Hindu rites. In many districts these ornamental replicas are preserved and brought out annually.

In many regions the same word, taziya, is used for the passion play which is presented. This play varies in its setting and quality according to the circumstances, for cities naturally can present a more elaborate production than smaller communities. In the more developed forms of the play the fighting is represented very realistically, with the result that there have been casualties. A lengthy form of Moharram play was published by Sir Lewis Pelly, *The Miracle Play of Hasan and Husayn* (1879). This represents a developed form of doctrine regarding the effect of Husayn's death. Not content with dealing with the events at Karbala, it goes on to the Day of Resurrection. Husayn is made intercessor, and is the means of delivering from the pains of hell all who have in any way mourned for him. He is also represented as having died for his people's sins. His death is treated as a vicarious sacrifice which avails for all who mourn because of his suffering.

Moharram is particularly important to Shiite Moslems, who commemorate the martyrdom of Husayn, a 7th century claimant to the Caliphate, with mourning processions, flagellation and the performance of passion plays

The practices vary in detail in different countries, but all relate to a historical event and its significance. Ancient details of ritual may have been adapted here and there, but it should be remembered that, however one may attempt to trace the history of certain ritual practices, Shiites themselves are interested in a historical figure whose sufferings are the source of their salvation.

It is customary to meet again 40 days after the 10th of Moharram, when readings of the story are heard and copious tears are shed. At Karbala it has been customary at this time to have a continuation of the play; known as the 'Return of the Head', this records the sending home of Husayn's head to his sister and son by the Caliph Yazid.

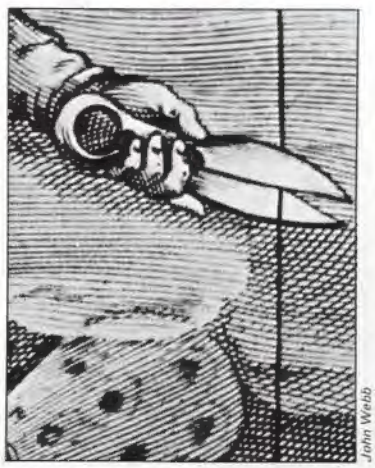
M. E. B. Banks

Moirae

The three Fates of Greek mythology, Clotho, Lachesis and Atropos, first named in Hesiod's *Theogony*; *moira* originally meant a person's 'lot' or 'rightful portion' in life: the Fates were sometimes said to be present at birth because that is when an individual's lot is decided; in modern Greek folklore they appear on the third night of a child's life and fix the course of his life.

See FATE.



John Webb

Moly

In Greek mythology, a magic herb given by Hermes to Odysseus to protect him against the enchantments of Circe (*Odyssey*, book 10); it is described as having a black root, a flower like milk, and being hard to uproot; it has not been convincingly identified with any real herb, though mandrake, garlic and rue have been suggested.

Chris Barker

Monkey
A sacred animal in India, probably because of its resemblance to man; there are several famous monkey chieftains of Indian legend, including Hanuman: there is an Africau belief that apes can speak but refrain from doing so because they would be made to work: in Egypt the baboon was sacred to the god Thoth.

Bodleian Library

Monotheism
Belief that there is only one God, distinguished from polytheism, belief in several gods who preside over different departments of life; this distinction cannot be drawn as clearly as was formerly thought, and the old theory that religion evolved from polytheism to monotheism has been discredited.

See CHRISTIANITY; HIGH GODS; HINDUISM; ISLAM; JUDAISM; RELIGION.

MONTANISTS

THIS CHRISTIAN SECT of followers of the prophet Montanus originated in Asia Minor and spread to other parts of the Roman Empire. The Montanists are known only from the writings of their opponents, the Catholic Christians, and from a few funerary inscriptions. The movement seems to have begun in Phrygia c 156 AD, when Montanus as a convert to Christianity practised and encouraged ecstatic prophecy. He was soon joined by two prophetesses named Prisca and Maximilla. Together they endeavoured to promote what they called 'the new prophecy', reviving the prophetic enthusiasm they regarded as essential to the life of the primitive Church. St Paul had said (1 Corinthians, chapter 14):

> Make love your aim, and earnestly desire the spiritual gifts, especially that you may prophesy. For one who speaks in a tongue speaks not to men but to God; for no one understands him, but he utters mysteries in the Spirit. On the other hand, he who prophesies speaks to men for their upbuilding and encouragement and consolation. He who speaks in a tongue edifies himself, but he who prophesies edifies the church.

They also laid emphasis on rather rigorous asceticism and on voluntary martyrdom. Most important they believed that the heavenly Jerusalem was about to come down to earth in Phrygia. Because of this apocalyptic expectation they found themselves in conflict with the leaders of the Christian Church in Asia Minor, where accommodation with Graeco-Roman culture and the Roman state was being sought. In c 172 synods of bishops in Asia condemned them, while individual bishops tried to drive out the demons they believed were possessing the Montanist prophets. One of the leaders opposed to the movement is known to have welcomed Christian service in the Roman legions, and there were therefore probably political overtones to the condemnation of Montanism.

The movement has sometimes been traced to pagan sources, but if these played any part it was insignificant. Montanism was a self-conscious revival of primitive Christianity, and it originated in the traditional Jewish Christianity of Phrygia. A generation before Montanus, Papias, Bishop of Hierapolis, had made lavish use of oral traditions and Jewish apocalypses, and had collected traditions derived from the early Christian prophetesses who were daughters of Philip the evangelist (Acts, chapter 21). The attitude of Papias, which lost influence as Christianity became established in Graeco-Roman Asia, was expressed anew by Montanus and his followers. Indeed, the details of his prediction of the descent of the new Jerusalem are paralleled in the Jewish apocalyptic book known as 2 Esdras, used by other Christians in his time. If we look for the specific occasion which prompted Montanus's initial proclamation, it is probably to be found in the martyrdom of the aged Polycarp, Bishop of Smyrna, in 156. This event shocked Christians throughout the Roman Empire and must have suggested that accommodation to the life of the Empire was impossible.

Prophets with Dyed Hair

As time passed and Jerusalem did not come, the Montanists lost much of their original enthusiasm and, as their critics observed, came to be more at home in the world. Montanism became a more rigorous form of Christianity, and the rigour was not always maintained. The Montanists were said to employ agents to collect funds and to pay their officers regular salaries; the prophets were accused of dyeing their hair, painting their eyelids, gambling, and lending money at interest. Church leaders at Antioch and Rome joined in attacking the sect. The Montanists might claim to have the tomb of the apostle John; the orthodox argued that there were two tombs of John at Ephesus, one for the apostle and one for someone else. In addition, the Roman Church possessed the tombs of both Peter and Paul. As for the Montanist claim to rely on the book of Revelation (the heavenly Jerusalem) and the gospel of John (Montanus was said to be the promised Paraclete of John 14.16), a Roman Christian writer went so far as to deny that either book was canonical, though few of his allies agreed with him.

By the early 3rd century the Montanists outside Phrygia no longer looked for the descent of Jerusalem there; instead, they expected it to come to Palestine. Such was the view of their most important leader, the Carthaginian layman Tertullian. This brilliant and fanatical Christian, in the course of conflicts with the state, the Church and (one must add) himself, gradually turned toward Montanism, laying emphasis on the truth of Montanist prophecy and on the value of ascetical rigour. The sequence of his writings suggests that he began turning to the movement in about the year 203 and broke with the Church of Carthage in about 207. A decade later, his last writings, *On Fasting* and *On Chastity*, contain militant and bitter defences of Montanist severity as contrasted with Catholic laxity.

Mass Suicide

The conversion of the Roman Emperor Constantine and the rise of the Christian Empire resulted in edicts that made Montanism illegal, though tombstones from Asia Minor show that there were adherents of the movement in the 4th century. Christian writers against heresies still discussed the Montanists and occasionally described their cult practices, including sacred dances by virgins. As late as 550 a bishop of Ephesus dug up the corpses of Montanus and the prophetesses, and burned them. Under Justinian, a large group of Montanists committed suicide.

By the 6th century the movement had obviously outlived its original purpose, the preparation of the Christian community for life in the heavenly Jerusalem which was to appear immediately. It lived on, however, as a movement of protest against the worldliness of the Byzantine Church. In this regard it resembled many other millenarian movements that have arisen within the Christian Church. Its importance lies in the fact that, as far as can be determined, it was the first of them. In doctrine it differed only slightly from the Christianity traditional in Phrygia when it arose; it was not heretical and, in intention, it was not schismatic. It led to schism only when it was condemned by the bishops of Asia Minor. We cannot tell what would have happened had it been accepted. Obviously the Christian Church would have been different from what it was; conceivably it would not have survived.

MOON

Scala

'It is the very error of the moon', said Othello, 'she comes more nearer earth than she was wont, and makes men mad'; the idea that among the moon's many powers was that of influencing the minds of men was implied in the Lunacy Act of 1842, which referred directly to its phases

IF THE SUN is the most important of all the celestial bodies for the inhabitants of the earth, the moon is still, despite recent events, undoubtedly the most mysterious. As opposed to the life-giving properties and warmth of the sun, the moon is said to give out an occult power, and to rule over growth, the hidden processes of Nature, the hollow spaces of the earth, and the movements of all the fluidic elements within and upon the earth's surface

The Babylonians, the greatest astronomers of antiquity, worshipped the moon as the queen of the night, and hailed her as the ancestor of the sun which she exceeded in power. The earth was thought of as the child of the moon, whose rays cast a strange influence over our planet. Curious notions such as these are by no means extinct. Mme Blavatsky, founder of modern Theosophy, declared: 'The moon is far older than the earth, which owes its being to the moon.'

There is a magical power in the moon, for it is supposed to draw to itself the hidden potencies of the stars and constellations. It used to be called the 'funnel of the earth' because it was said to receive and concentrate the radiant emanations from the other celestial bodies and filter and transmute them before pouring their bounty upon the earth. If the moon were to vanish, it was believed, all mental activity would come to a standstill.

Marking Time by the Moon

The lunar month extends for approximately 28 days and this period became a convenient unit for reckoning, especially among nomadic peoples who depended on the moon during their wanderings, since they often travelled in the cool of the evening, night and early dawn, in order to avoid the glare and heat of the day. The number 28 therefore assumed some significance in their calculations, and lies at the basis of the sacred number seven, which was a shorter division of the 28 day lunar month. This seven day

There is a magical power in the moon, for it is supposed to draw to itself the hidden potencies of the stars and constellations

The Sleeping Endymion **by Cima da Conegliano: Endymion was loved by the Greek moon goddess Selene and, according to one story, fathered on her 50 children, evidently the 50 months or 'moons' between each celebration of the Olympic Games. The lunar month was the unit of reckoning in many early calendars**

week is now generally observed, a relic of the lunar calendar permanently embedded in the system of solar reckoning (see also SEVEN).

The earliest calendars marked the passage of time not by the sun and seasons but by 'moons', and the day started with the evening, when nomadic life stirred into wakefulness. A relic of this again survives in the custom of celebrating the eve of the previous day on many festive occasions, such as Christmas and New Year's Day.

Lunar reckoning still exists, among the Mohammedans for instance, and in many parts of the world the lunar and solar calendars are both used. The festivals of several religions are still lunar, including some of the greatest Christian celebrations. Easter is determined by the moon, and so are the various Church celebrations whose date depends on this great religious occasion.

The period of the moon's rotation around the earth is the same as the period of its rotation on its own axis, so that it always presents the same face to the earth. This face consists of vast plains, 'seas', pits and craters, some of which have star-like ridges and crests radiating from them. Seen with the naked eye from the earth these configurations and the resultant shadows they throw assume strange shapes, as of a man, a woman or an animal, and various legendary origins have been ascribed to them.

In Rumanian myth the sun had an incestuous passion for his sister the moon, so the moon in order to avoid meeting her brother, went about only at night when he was not in sight. She also took the precaution of making ugly marks on her face to discourage him. In an Eskimo legend the sun is a woman and the moon is her lover who visits her by night. Curious to find out who he really is, she smears his face with ashes and the marks thus left outline the shadows visible on the moon. In yet another legend a peasant is found gathering sticks in the forest on Sunday, and on being questioned why he is working on the day of rest replies casually that it makes no difference whether he works on the day of the sun or of the moon, whereupon he is gathered up and taken to the moon, there to continue his labour till Doomsday.

Another curious legend gave rise to the familiar nursery rhyme of Jack and Jill. The roots of this legend have been traced back to a Scandinavian story about a boy and girl named Hjuki and Bila. One day as they were drawing water from a well, the moon, who wished them to serve her, carried them off to heaven in a bucket. To this day the two children may be seen with their bucket, and as they make the ascent up a hill the moon waxes, and as they descend the moon wanes. The names of the two children signify 'increasing' and 'dissolving', and are thus devised to fit the phases of the moon. Since the moon was believed to influence the waters of the earth and to control rainfall, the 'pail of water' forms part of the nursery rhyme.

Moon-Begotten Monsters

In a number of legends the moon is regarded as male, and the 'Man in the Moon' is said to have a lustful attraction for all females. Every month the belly (phallus) of the moon swells and this incites a corresponding increase in the womb of women. A disturbance takes place in the womb which becomes responsive to the vibrations from the lunar sphere and ripens to receive the mysterious influence of creative energy. There existed a curious belief, in England among other places, that every month each woman is fecundated by the moon and conceives a child which is fed by emanations of the lunar radiance. But this child is imperfectly developed and is aborted as a 'moon-calf', a misshapen foetus that passes into limbo.

Among certain tribal communities the moon is also regarded as a lecherous male who roams the earth, especially during the bright nights of the full moon, seeking whom he may deflower. He succeeds in ravishing every single maiden on earth, and the token of his success is the phenomenon of menstruation. One of the most primitive tribes, the Uaupe Indians of the Upper Amazon, believe that the first menstruation of a girl is, in fact, 'defloration by the moon'. In other places, because of the moon's ability to impregnate women, girls were warned not to stare at the moon or lie in the moonlight without a covering in case they conceived and gave birth to a monster.

In most mythologies the ruler of the moon was a female deity of some kind. The Canaanite moon goddess Jerah gave her name to the city of Jericho, one of the most ancient historical cities of the world. The Egyptian goddesses Isis (see ISIS) and Hathor were associated with the moon, the latter represented as a cow and a milk-giving mother, with the head surmounted by golden horns within whose cusp lay the moon. The Babylonian god Sin ruled the moon, but the more important moon deity in their pantheon was the goddess Ishtar (see ASTARTE; ISHTAR). The Greek Artemis and Latin Diana were both connected with the moon; later, in medieval Europe Diana became the patroness of witches (see DIANA). The moon is thus seen to be generally regarded as female in nature, and its influence is essentially feminine, reproductive, watery and emotional. In Chinese belief the moon is the force behind all that is Yin (female) as the sun is behind all that is Yang (male).

There prevails an almost universal belief that the physiological life of women is linked with the moon. Those who have studied the subject believe that there is statistical evidence to confirm that the cycle of human ovulation approximates to the lunar month, a fact which is preserved in the term 'menstruation' which signifies 'monthly', occurring every lunar month.

Besides these popular beliefs about the influence of the moon on human beings, there are numerous lesser superstitions which are fairly widespread in one form or another. It is unlucky to look at the new moon for the first time through the branches of a tree, or through glass (fortunately this superstition does not include spectacles). It is unlucky to point at the moon at any time; one should always bow to the new moon, especially to the first new moon of the year, as a sign of respect. At first sight of the new moon a silver coin should be turned in the purse or pocket, for silver is the metal of the moon. A wish should be made at the same time.

Various omens are also read from the state of the moon. If two moons occur in a single calendar month (especially May) there will be floods and other calamities. Rings around the moon presage storms, the

'The Hare and the King of the Elephants at the Well of the Moon', from a 14th century MS, probably Syrian. The elephant is a beast of the moon, possibly because of its crescent-shaped tusks, and in India the first of all elephants was said to have emerged from the Churning of the Ocean: the moon is connected with water, and with wells or depths, because of its link with the tides and the menstrual flow. The hare is also a creature of the moon, partly because of its fertility, and is also involved in many stories of shape-changing: the fact that the moon changes shape in the sky is one of the principal bases of its symbolism

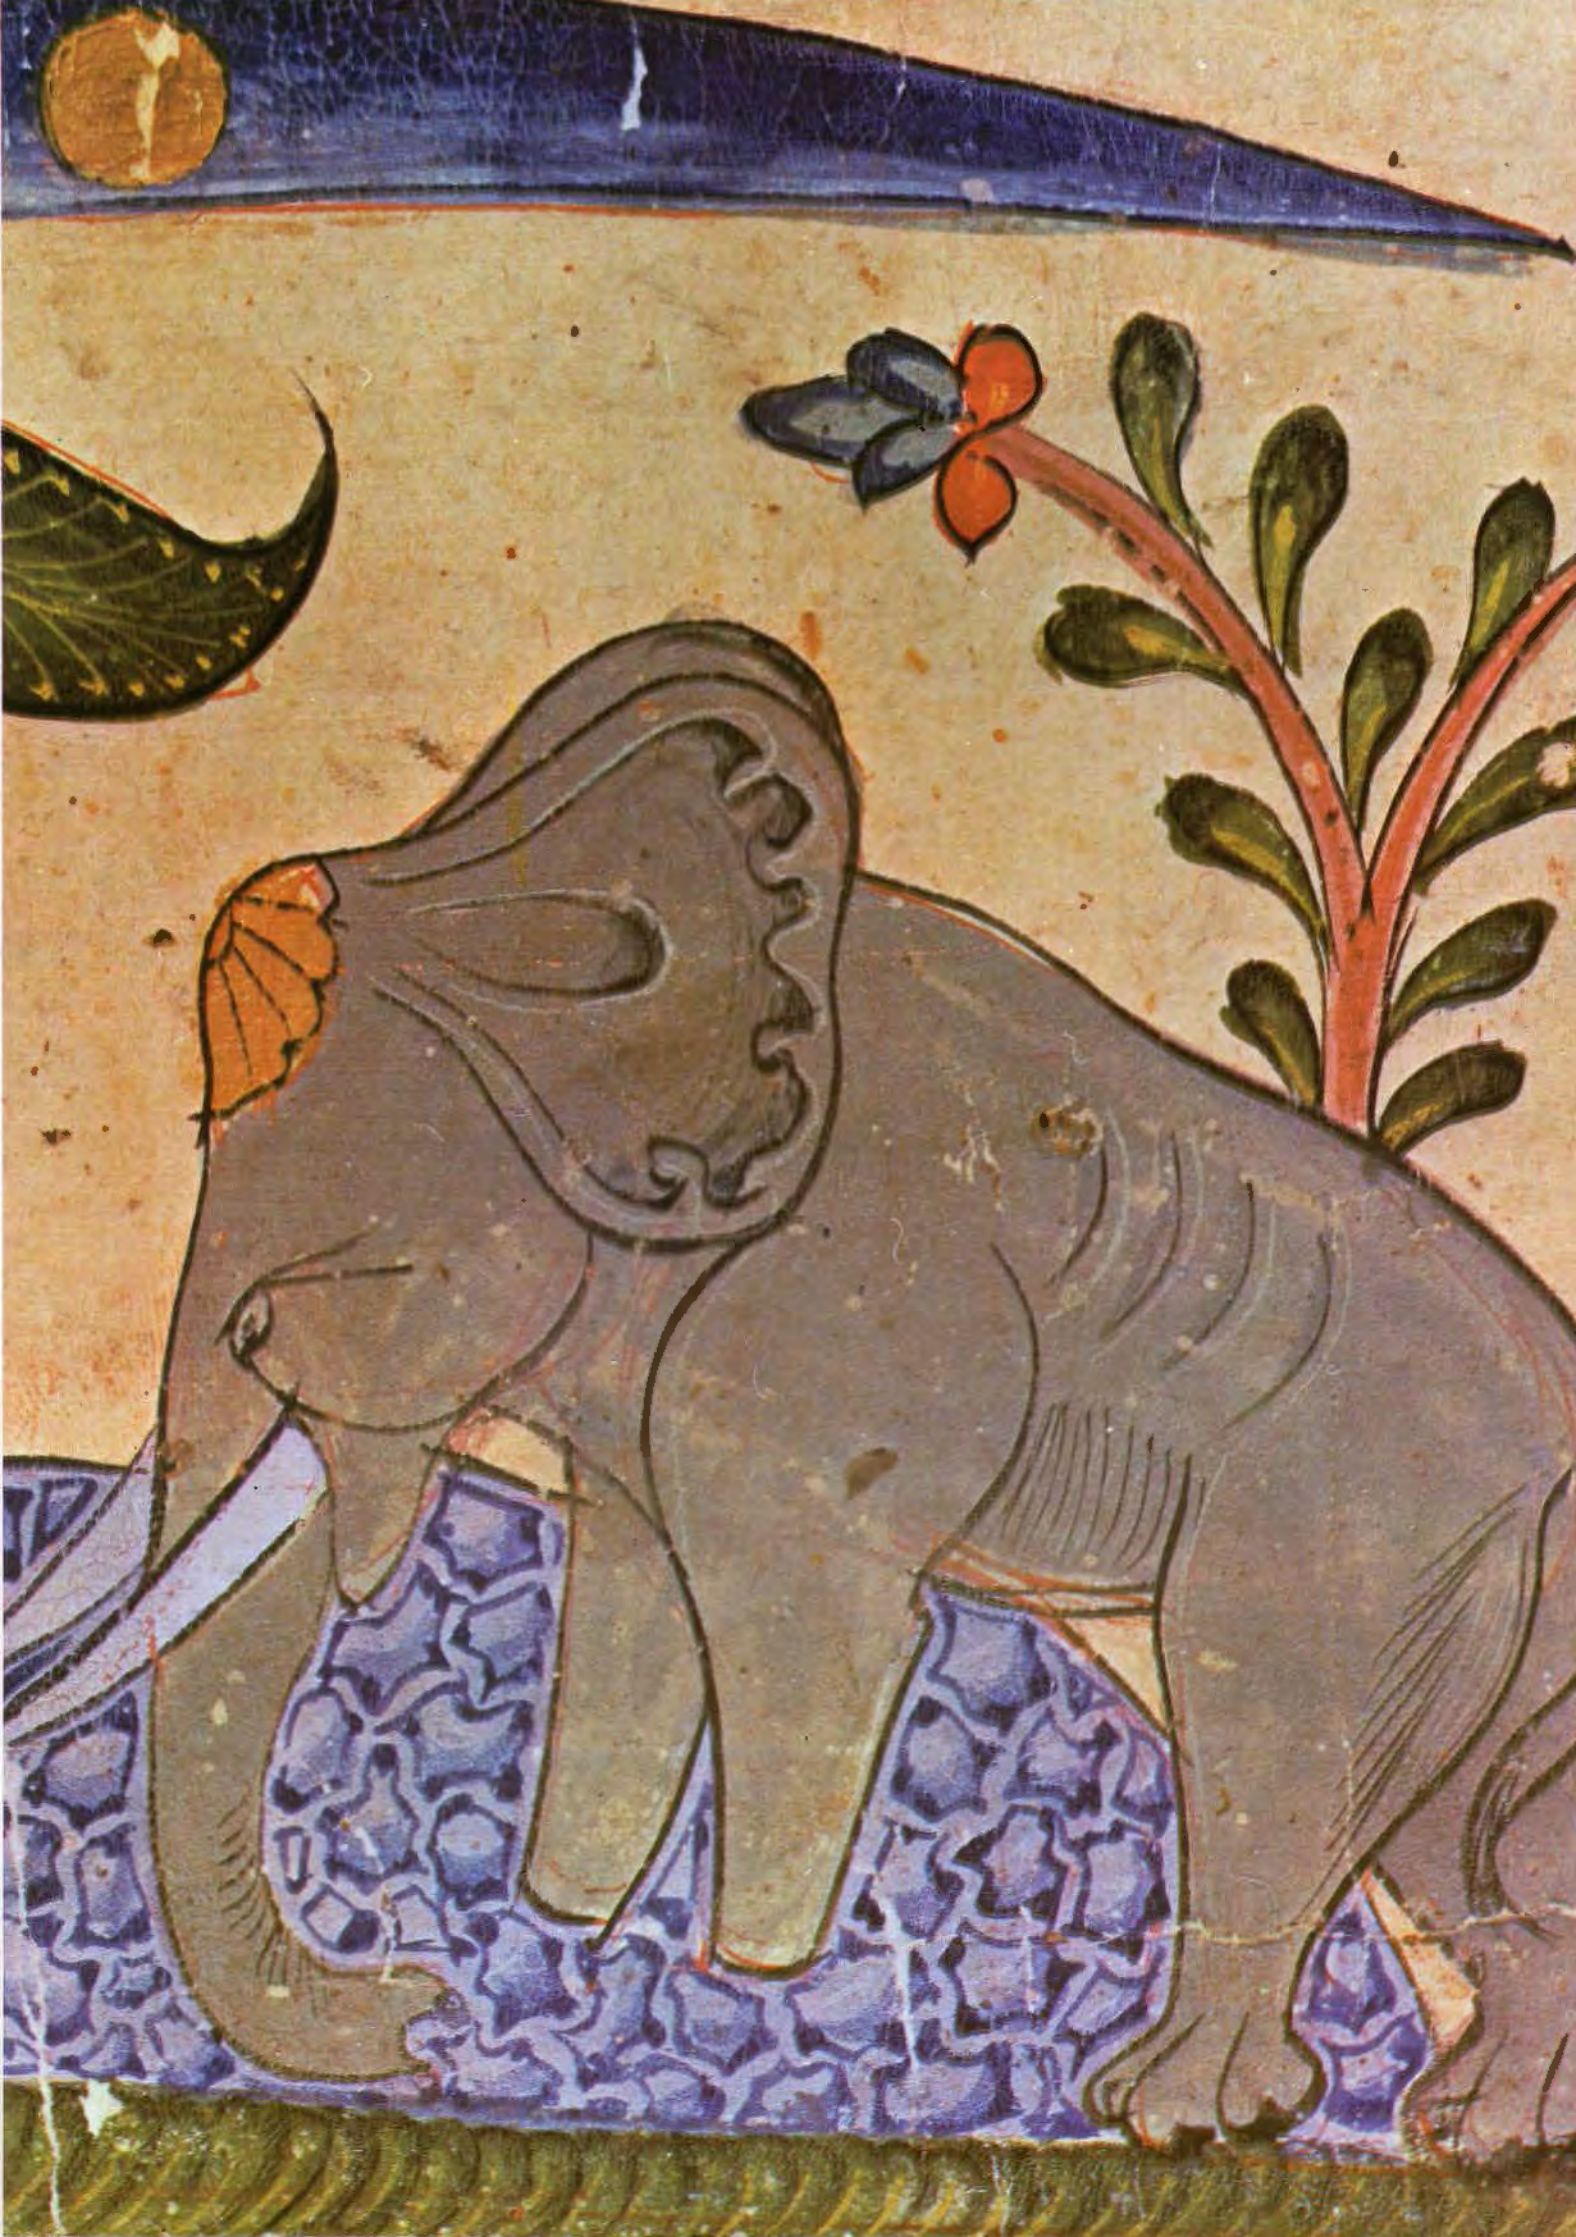
more rings the worse the storm. Heavy rains occur most frequently in the days immediately following the new and full moon. Dew falls richest on moonlit nights. A full moon at Christmas presages a poor harvest in the coming year. A new moon on Saturday brings foul weather, and a full moon on Sunday brings bad luck. If the new moon is first spied on your right or straight ahead it is lucky. But it is unlucky to see the new moon on your left, or behind you. Particularly among people living on the sea coasts, there is a belief that an unusually large number of births occur at the time of high tide when the moon is full over the local meridian, because the moon affects uterine contractions.

The moon's periodicity is of greater concern to men on earth even than that of the sun. The sun is constant throughout the year, and variations in its warmth and intensity follow a seasonal gradation of slow change, but its size and shape remain the same through the course of the year. The moon, on the other hand, is a prime example of perpetual change. It starts like a slender crescent, goes through a period of development till it reaches a state of fullness, and thereafter follows a decline. Then for three nights it vanishes completely. It seems to epitomize the cyclic rhythms we find in the cosmos, in the physical world around us, in plants, animals and in our own lives. Small wonder then that it has become so intimately linked with the inner processes of man. Some scholars think that this cycle of the moon's phases may be the probable origin of death and resurrection myths throughout the world. The moon is regarded as a realm of the dead, and as the first station of the soul on its journey after death through the celestial regions.

Influence Over All Nature

Almost a quarter of a million miles away from us, the moon has an immense attractive power, which affects even the land masses of our planet. But the moon's influence on the sea is especially strong; the whole watery surface is moved by the magnetism of our satellite, and it is responsible for the tides of the sea. This tremendous magnetic quality was well known to the ancients, and in the 1st century AD the natural historian Pliny wrote, 'The moon draws the sea after her with a powerful suction.'

Bodleian Library



Bibliothèque Nationale, Paris

French Tarot trump, 'the Moon': the dividers are a sign of the moon's role in the calendar. The waxing, waning, vanishing and reappearing of the moon has caused it to be linked with all the cyclical rhythms of Nature, and its connection with the tides has reinforced its occult links with the 'deeps' of human nature. The Tarot card is often interpreted as a symbol of the unconscious mind

The obvious inference is that our bodies, and the bodies of all living things, constituted as they are largely of liquid elements, may be similarly affected by the power of the moon. Might not the human brain, a mass of semi-liquid pulp, be stirred in some strange way by the suction impulses from the moon? Such is the occult view.

In folklore and mythology the moon is said to have a profound influence on all living things. The waxing moon sends powerful impulses of 'growth' energy to the earth, and this affects all things that grow, causing them to increase in size and strength. As the moon wanes or declines in size, growing things similarly decrease in energy. This belief can be found among all peoples, primitive and advanced, all over the world.

On the basis of this theory, it is thought that the best time for picking flowers and herbs, and for felling trees for fuel and timber, is when the moon is on the decline. Trees are weaker and yield more easily to the axe during the moon's wane. Similarly, trees will bear good fruit if pruned during the moon's increase. Plants are said to grow best if sown two days before the full moon, so that they gather strength as the moon grows. Peasants in many ancient communities used to sow by the moon, and there are many gardeners and farmers even today who will plant according to the moon. Many people believe that seed sown with the waning moon will not prosper. The fact that experiments do not always support these beliefs in no way diminishes faith in them.

The various species of the animal kingdom are likewise affected by the moon. A 'lunar periodicity' is observed in the movement of fish in the sea, in the spawning of various marine animals like mussels, crabs, oysters and sea-urchins. The mating urge of large animals also seems to be heightened during the waxing of the moon. In the past farm stock was managed on the lunar analogy. It was thought that if pigs were killed when the moon was waxing the bacon would be richer and fatter, but if the slaughter took place during the wane the bacon would be shrunken and lean. The sheep's wool grew thick and rich with the waxing moon, so sheep were sheared at this time. Animals were never gelded during the moon's wane lest they sickened and died. Farmers said that stock born when the moon was on the wane would not thrive.

The moon, from a 14th century Flemish MS. Though not invariably female – the moon deities of some societies have been male – the moon is frequently associated with a goddess, and there is an almost universal belief that the physiological life of women is linked with the moon: the word menstruation means 'monthly', occurring every lunar month

Lunatic Behaviour

Men too respond to the fluctuations of the moon. In the past mothers used to show their children to the growing moon to increase their stature and strength, and people would avoid cutting hair and nails in the moon's decline. In times when bloodletting was a regular part of medical practice, it was done when the moon was waning to reduce the risk of haemorrhage.

The peculiar effect of the moon on the minds of men and women has been noted from ancient times. The fuller the moon the more turbulent, excitable and impressionable the mind becomes. It is a commonplace observation among those who have to deal with people en masse that there occurs a noticeable increase in unusual, eecentric behaviour during the time of the full moon. Fire brigades have to deal with more fires and false alarms, policemen on the beat report more cases of drunkenness, more thefts, more wife-beatings; the frequency of rash driving and accidents is heightened; nurses in mental hospitals have to cope with increased restiveness among patients; surgeons record more post-operative haemorrhages. These facts do not, of course, amount to scientific proof of a connection with 'disturbing' radiations from the moon.

Nevertheless, there has always been a widespread belief in a direct connection between the moon and lunacy, and the notion of 'moon madness' has in some cases been privately subscribed to even by psyehiatrists. The moon is popularly held to have a definitely disturbing effect on the minds of idiots and the insane, and all those who are afflicted with nervous disorders. The word 'lunatic' itself is derived from the Latin word *luna*, 'moon', thus preserving the basis of the age-old theory. Paracelsus, the famous medieval physician, regarded the brain as a 'microcosmic moon', and observed that lunacy grows worse at the time of the full and new moon. Until about the middle of the last century the connection between the moon and madness was almost everywhere taken for granted. The Lunacy Act of 1842 defined a lunatic as a demented person enjoying lucid intervals during the first two phases of the moon, and 'afflicted with a period of fatuity in the period following after the full moon'.

Another belief common to many peoples relates to the maleficent character of the moon's influence, which is said to manifest as an actual baleful emanation that can be materialized and precipitated to earth by those who have occult knowledge of such matters. The ancient Greeks spoke of the power that the witches of Thessaly had of drawing down the moon itself, by which they meant that these witches were able to make use of the subtle and malignant influence of the moon for their rites. In other parts of the world the magician is believed to be able to cause the moon to drip its poison into a dish of water which foams and bubbles for a time and is then ready for the evil purposes of the sorcerer.

The actual power of moonlight was said to reside in the rays themselves, and was transmitted from the moon through them. A very common superstition was that since the moon caused a disturbance in the distribution of the bodily fluids, if a person slept without covering in the direct light of the moon his face would become twisted. The absence of a moon was also regarded as having a special bearing on human affairs. The Babylonians spoke of the black nights of the moon's total disappearance from the sky as fraught with great peril that could only be neutralized and overcome by fasting and religious observances.

Many Moons Ago

Perhaps even to a greater extent than the sun, the moon figures in occult cosmology, or the study of the origin of the universe. Theories of the beginnings of the solar

Far right Diana, the Roman goddess of the hunt and equivalent of the Greek Artemis, was connected with the moon, and was later the patroness of witches who were believed to 'draw down the moon' or the moon's influence *Right* The waning moon, depicted as Selene on horseback: detail from a Greek vase. In magic and folklore growing things increase and decrease in energy as the moon waxes and wanes

British Museum

Radio Times Hulton Picture Library

system give curious accounts of how the moon came into existence, and the significance of the moon in its relation to the earth's history. According to a theory put forward in comparatively recent times, the earth in the course of its long history has had a succession of satellites before our present moon: Each of these satellites in turn was drawn into the earth's orbit, revolved around the earth for several thousand years, before crashing into its surface. Our present moon is only the last of at least four moons.

The capture of these earlier moons by the earth, their slow encroachment into the earth's sphere of influence and their final collision with the earth has each in turn brought about cataclysmic changes, and was each responsible for the great geological eras and the great biological transmutations that have occurred on our planet in the past. The increasing pull of the approaching moon resulted in sudden genetic mutations, in the gigantic growth of creatures in bygone ages, and in the evolution of species as a whole.

The hypothetical satellite before our present moon is called the tertiary satellite. It was smaller than the present moon and was captured about 30,000 years ago. This capture was responsible for floods, earthquakes and storms around the globe. Legends of a great flood and other catastrophes are preserved by most of the early races of mankind. Those who uphold the theory of the earth's many moons believe that the book of Revelation also records what had already taken place when the tertiary moon plunged down to earth and buried itself in the terrestrial surface.

After the tertiary satellite crashed into the earth there came a long period when the earth remained without a satellite. Ancient writings from various parts of the world tell of the time when the earth was without a moon. Arab and Hindu writings speak of those who lived before there was a moon in the sky. Even the Greeks have a tradition of the Proselene (pre-moon) people who once dwelt in Arcadia.

The present (quaternary) moon was originally a small planet revolving around the sun on an irregular orbit between Mars and the earth, and in the course of its journeys was deflected from its path, possibly by a passing comet, and began to circle the earth between 10,000 to 12,000 years ago. Even now it is thought to be spiralling closer and closer to us, although it will still be several thousand years before the final catastrophe.

BENJAMIN WALKER

The Moon in Astrology

In astrology the moon is today considered secondary to the sun. Yet the ancient Romans would probably have thought the moon the more important of the two, for they classified a man as belonging to that sign in which his moon (which goes into a different sign approximately every two and a half days) was placed, rather than his sun, which changes its sign only 12 times during the year.

FURTHER READING: For the 'many moons' theory, see H.S. Bellamy, *Moons, Myths and Man* (Faber, London, 2nd rev. ed., 1950); T. Harley, *Moon Lore* (E.P. Publishing, 1973, c1885); A. Manning, *Moon Lore and Moon Magic* (Pan Ishtar, 1980); A. Rush, *Moon, Moon*. (Random, 1976).

MOONIES

THIS IS THE POPULAR NAME for a cult religion founded by the Korean Sun M. Moon (see DIVINE PRINCIPLES). As early as the 1950s, parents in Korea and Japan were worried by the robotizing effect the cult had on their children. As the cult grew in the West, right through to the 1980s, young devotees were subjected to skilled brainwashing procedures to make sure of their complete dedication. Several American parents, aided by the controversial Ted Patrick arranged to have their children literally kidnapped from the Moonies. They were then 'deprogrammed' by Patrick, with backup support from psychiatrists and the family. Several books written by ex-Moonies have vividly described the experience.

FURTHER READING: Christopher Edwards, *Crazy For God* (Prentice-Hall, 1979).

Critical self-examination and public confession, and the solicitation of daily orders from God were practised by the Oxford Group, as the MRA movement was known in its early days; despite a creed which had much in common with the Quakers, it has been accused of snobbishness and a dangerous degree of political naivety

MORAL REARMAMENT

FURTHER READING: Christopher Edwards, *Crazy For God* (Prentice-Hall, 1979); J. Bjornstad, *Sun Myung Moon and the Unification Church* (Bethany House, 1984); W. Lewis, *Moon* (Beacon Press, 1984).

1878 at Pennsburg, a small town in Pennsylvania, in the United States.

The present name of the movement was coined by Buchman in Germany in 1938, when he stressed the need for 'moral rearmament'. Previously it had been known as the Oxford Group or Oxford Group Movement. This name excited disapproval in some quarters at Oxford University and among Anglo-Catholics who feared that it might cause confusion with the Oxford Movement of the Tractarians, the Catholic revival in the Church of England which had begun in 1833. A. P. Herbert, too, denounced the Oxford Group in Parliament and the press, alleging that it had no right to suggest an official association with the University. The Group retorted that it had, in effect, been formed in an undergraduate's rooms at Oxford in 1921; but that the words 'Oxford Group' had been attached to it in 1929, almost by accident, a South African railway porter having scribbled the phrase on their luggage.

Until then, Buchman having had a 'conversion experience' at Keswick, the movement had been known as 'A First-Century Christian Fellowship' or, by outsiders, as Buchmanism or the Buchmanites. The later names – particularly the non-denominational Moral Rearmament – have proved more convenient in commending the movement to non-Christians in Asia and Africa. In this later

Left **Dr Frank Buchman, the Lutheran pastor from Pennsylvania who founded MRA: the movement offers 'an ideology for democracy', intended to 'overarch' both Communism and anti-Communism** ***Right*** **Scene from an MRA play,** ***The Vanishing Island,*** **written by Peter Howard, who succeeded Dr Buchman on the latter's death in 1961**

manifestation the movement has offered 'an ideology for democracy' which is said to 'overarch' both Communism and anti-Communism; but throughout its history its propaganda has been far from neutral and has chiefly been directed against Communism; while its supporters have rarely been of the Left politically and have included many leading industrialists.

Orders From God

Despite this ideological preoccupation, the movement remains also a religious one. As in some other post-Reformation cults and sects, its central doctrine is similar to that of the Quakers – the doctrine of the Inner Light. This is the belief that the individual believer can communicate direct with God and thus receive infallible guidance. 'Guidance', indeed, became a keyword of the movement, in practice as well as theory; those who had been 'changed' (Buchman's word for 'converted') were expected to lie on their beds every morning, pencil and paper to hand, and receive 'the orders of the day' direct from God. To guard against mistakes – against attributing divine inspiration to stray thoughts or desires – one person's guidance could be checked against others' and, if necessary, cross-checked by that of the leader of the group. In recent years there has been a relaxation of this somewhat mechanical process; but the theory remains constant. As Buchman, who had a penchant for slogans and acrostics, put it: 'P-R-A-Y equals Powerful Radiograms Always Yoors!'

Rule of Life

Asia, and especially India, must have seemed to MRA and its Washington advisers a key sector of the global struggle: MRA must, therefore, be so projected in India that it would not seem to the most devout Hindu or Moslem to be just another Christian mission. So we find that in MRA propaganda designed for the oriental market there is practically no mention of Christianity: Christ, if named at all, is sandwiched unobtrusively between Gautama the Buddha and Mahatma Gandhi; the suggestion is that, whatever your faith, you will be the better – a better Hindu or Buddhist or Moslem – for accepting MRA's rule of life; and this rule of life, so far as it is theistic at all, is consistent . . . with a relatively undogmatic pantheism.

Tom Driberg
The Mystery of Moral Re-Armament

Another keyword of the movement is 'sharing'. This means total and, if necessary, confessional confidence between the members of the group. It would seem natural to one of them to say to another, 'I want to share my guidance with you' – and then to proffer advice on the other person's conduct which had been obtained from the unquestionable source of guidance. Here again, after embarrassing disclosures and even scandal, practice has been to some extent modified.

The movement's creed, or summary of its ideals, is contained in its 'Four Absolutes' – Absolute Honesty, Absolute Purity, Absolute Unselfishness, and Absolute Love. Some critics have found, in the actual practice of MRA and its adherents, a disproportionate emphasis on Absolute Purity and an abnormal obsession with sexual matters: in particular, over-indulgence in sexual intercourse, even between married couples, is condemned, along with masturbation and the 'flow of filth' broadcast by the B.B.C. With this unbalanced prudishness, these critics allege, goes a frequent failure by MRA to practise the other Absolutes: in their newspaper advertisements, for instance, they are lacking in Absolute Honesty. MRA's reply is logical and unanswerable: the Absolutes are a code of standards which they try to live up to; they may often (like other believers) fall short of their professions, but it is important to keep the standards high – indeed, Absolute – and constantly to test individual behaviour against them.

Buchman himself was a member of the Evangelical Lutheran Ministerium of

Pennsylvania and Adjacent States, and remained one, 'in good standing', all his life, despite repeated attacks on him by influential fellow-pastors. These were often occasioned by his absence from the annual meeting, attendance at which was, normally, obligatory. Buchman's world-wide mission was the excuse for his absence, and his letters explaining this were accepted.

There was talk also of a 'risk of schism' and even of heresy; but he was never convicted on any such charge. Yet his extreme formulation of the doctrine of the Inner Light was almost as far from orthodox Lutheranism and the other main Protestant sects as it was from Catholicism. It is possible that Buchman was first attracted by this idea in his childhood; for he was sent to a private school run by a small sect, the Schwenkfelders, who were the descendants of a breakaway from early Lutheranism led by Caspar von Schwenkfeld in the 16th century. Some of the Schwenkfelders emigrated to America, where they were highly regarded; and they continued to preach von Schwenkfeld's distinctive doctrine – that God communicates himself directly to every individual believer. It may well be that this boyhood lesson was the source of Buchman's insistence on the reality of daily and hourly guidance.

Another of his watchwords was 'God-control'. A few God-controlled men in key positions, he declared, could change a nation so that it, too, became God-controlled: that is, though he did not use this more controversial word, a theocracy. His belief in this possibility led to some of the most damaging criticisms that he and his movement had to suffer.

'If Hitler Surrendered'

Because he believed, or seemed to believe, in first 'changing' 'key' people, he was accused of snobbery, of 'hob-nobbing with nabobs', and of 'name-dropping'. Yet his association with the powerful and influential was a logical outcome of his theory of God-control; and so was an incident which has reverberated in anti-MRA propaganda down the years – an interview in a New York newspaper after a visit to Germany in 1936. The most frequently-quoted sentence in this interview was Buchman's statement: 'I thank heaven for a man like Adolf Hitler, who built a front line of defence against the anti-Christ of Communism.' But the explanation of what was, perhaps, an indiscretion is contained in the same interview: 'Think what it would mean to the world if Hitler surrendered to the control of God. . . Through such a man God could control a nation overnight and solve every last, bewildering problem.' The critics were on firm ground when they observed that the use of such a word as 'overnight' suggested a degree of over-simplification too great to be credible. It is not surprising that MRA has reacted hypersensitively to reminders of this unfortunate interview and has stressed that, so far from being Nazi or Fascist in sympathy, many of its supporters fought against Hitler.

Buchman died in 1961. Notable admirers from all over the world, including a grandson of Gandhi and many Christian prelates, attended his funeral at Allentown, Pennsylvania, where he had been ordained nearly 60 years before. His successor as leader of MRA was Peter Howard, a gifted British journalist and propagandist, and an eloquent speaker. In 1965 MRA suffered a severe blow in Howard's unexpected death, at the age of 56. In the last few years the movement, though still active in Asia (especially in Japan), at its European headquarters at Caux, Switzerland, and through plays conveying its message to (largely) invited audiences at the Westminster Theatre, London, has been less heard of in Britain and America.

Britons known to be prominent supporters of the movement include Mrs Mary Whitehouse, the tireless campaigner against B.B.C. programmes of which she disapproves, who alleges that the B.B.C. is Communist-influenced. She has denied that her 'National Viewers' and Listeners' Association' is backed by, or is a front for, MRA; but many of her utterances are almost identical with the late Peter Howard's denunciations of the B.B.C.

MORGAN LE FAY

AMONG the weirder figures in Arthurian legend is Arthur's sister Morgan le Fay. Her English name comes from the French Morgain la Fée, the 'fay' or fairy. In Italian she is Fata Morgana.

Her family background, in her earliest literary guise, is quite different. She is a daughter of Avallach, king of the enchanted island best known as Avalon. Morgan is thus placed in an otherworldly setting, derived from pagan mythology. Besides Avallach, tradition mentions a second lord of the island. The romancer Chrétien de Troyes calls him Guingamor and says Morgan was his mistress. But both male rulers fade out. In Arthurian lore generally, Morgan is lady of Avalon in her own right, with another parentage.

As a literary character, she seems to have taken shape during the early 12th century in the Arthurian lays of Breton minstrels, racially akin to the Welsh. When they adopted her she was a water nymph of Breton folklore. But Welsh legend furnished a similar figure called Modron, said to have been Avallach's daughter, and her attributes were annexed to Morgan.

Can we say what Morgan was originally? Giraldus Cambrensis, writing about 1216, scoffs at Breton fantasies of an 'imaginary goddess' of Avalon. He is almost certainly right. The Morgan whom the legend-makers adopted was an ancient Celtic deity, cut down by Christian belief to a nymph or fay. The Welsh lady Modron, whose attributes she acquired, is known to have been the river goddess Matrona. Morgan herself may have been the Breton form of a goddess whom the Irish called Morrigan.

This composite being, neither divine nor strictly human, is first linked with Arthur by his voyage to her island domain after his final battle, 'for the healing of his wounds'. Geoffrey of Monmouth describes it in a poem composed about 1250, in which he sketches Avalon as a Fortunate Isle in the Atlantic. Morgan, who lived there with her eight sisters, set the hero on a gold bed, examined his wounds, and promised that he would recover if he remained on the island and made use of her healing arts.

Here, Morgan is essentially a 'good fairy'. Later stories in the same vein portray her, with attendant fairies, befriending Arthur during his mortal career. At his birth, for instance, they bestow the gifts of strength, dominion and long life. But the pressure of Christianity drove romancers to make the ex-goddess more human and also, because of her pagan associations, more sinister.

In 1190, when the Glastonbury monks unearthed Arthur's supposed grave, Avalon was transferred to Somerset, and Arthur's sojourn was explained as a fancy based on his burial at Glastonbury. Morgan's detractor Giraldus reduced her to 'a noblewoman who was ruler of that region and closely related to Arthur', and who brought him to Glastonbury after the fatal battle, in the vain hope of nursing him back to health. Her relationship to the King, which other writers also assumed, was said to have been sisterly or half-sisterly: she was the daughter of Arthur's mother Igraine, perhaps by a different father, the Duke of Cornwall.

Because of her fairy origins, the Morgan le Fay of courtly romance is an enchantress, a pupil of Merlin (despite a convent education). She always has touches of evil, and they grow darker, because medieval Catholicism had no clear place – as Celtic Christianity had – for benign or neutral magic. As Arthur's equivocal sister, Morgan presides over a 'castle of maidens' near Edinburgh, and has obscure links with places farther afield.

Her pleasanter aspects are survivals from her Celtic nature. She is a healer, and can turn herself into a bird to give help which she cannot give in human shape (the Irish goddess Morrigan also had a bird form). She still ends, sometimes, as Arthur's kindly hostess in an overseas Avalon. In the French *Mort Artu*, after the King falls on the battlefield, Morgan approaches over the waves in a barge with her ladies in attendance, and bears him away. Even Malory, who makes her a witch, adopts this gentle close.

La Faula, a tale by Guillem Torrella of Majorca, describes a journey to Avalon by a later hero. The island lies far eastward

In Arthurian romance Morgan le Fay ruled a 'castle of maidens' near Edinburgh. She was also a queen of the enchanted land of Avalon and took Arthur there when he was mortally wounded. The castle of Morgan le Fay, from a 15th century French manuscript

near India. Morgan looks no more than 16 years old. Her palace is decorated with pictures of Arthurian scenes. At her best, here and elsewhere, she carries an atmosphere of art and culture.

But even her artistic aspect becomes involved with the mischief-making and plotting which are ever more freely ascribed to her. She is blamed for the fatal disclosure of Guinevere's affair with Sir Lancelot. In one version she brings Lancelot under her own roof, tries unsuccessfully to seduce him, and allows him to paint a mural which betrays the secret of his amour to subsequent visitors. In another version she exposes Guinevere's guilt by sending a chastity-testing drinking horn to the court. Her plots are also directed against others besides the King and Queen. She makes trouble for Sir Tristram.

Morgan is sometimes given a lover or husband. Yet there is a recurrent suggestion that her malice is due to frustrated passion. Like other fairy-women, she wants to keep a mortal man in a sensual paradise of her own. She creates a 'Valley without Return' to entrap her victim.

Outside the Arthurian cycle, Morgan appears in the romance *Ogier the Dane* as the lady of Avalon, and in Ariosto's *Orlando Furioso* as the enchantress Morgana, living under a lake. She gives her name to the *Fata Morgana*, a mirage seen in the Straits of Messina, once attributed to her magic.

Morgan le Fay occasionally appears in two aspects, an older and a younger. When she fails to seduce Lancelot she sends one of her damsels, who is, in effect, her second self. The same motif occurs in *Sir Gawain and the Green Knight*. It was often part of the feminine divine nature to have habitual guises as a younger woman and as an older one. These incidents may take us as far back toward Morgan's origins as any.

'The possibility of men building the city of God on earth and finding there a type of salvation' was the driving force behind the fervour and discipline of the Latter-Day Saints

MORMONS

THE CHURCH OF JESUS CHRIST of Latter-Day Saints, whose members are commonly known as Mormons, came into being shortly after the publication of the Book of Mormon in 1830, in New York State. Today there are about two and a half million Mormons, the great majority of whom live in the mountain states of the United States, particularly in Utah, where the Church has its headquarters at Salt Lake City. In the revelations that led to the establishment of the new faith, in its structure, organization and ethic, Mormonism is a thoroughly American religion which still bears the imprint of the social ideas that were current at the time of its foundation. In the opening up of the American West in the middle of the 19th century the Latter-Day Saints were of considerable social, economic and political importance, both in their internal migrations in America, and in drawing to Utah thousands of converts from Britain and Scandinavia.

Meeting God Face to Face

The founder of Mormonism, Joseph Smith (1805–1844), was the third son of an impoverished New England family that had settled in New York. In adolescence Smith was known locally as a romantic who professed on several occasions to know the whereabouts of buried treasure, revealed to him through a luminous peep-stone (a kind of crystal), and once he was brought before the courts because of these activities. Treasure seeking was a not uncommon

From Darkness into Light

Behold, I am Moroni; and were it possible, I would make all things known unto you. . . And I am the same who hideth up this record unto the Lord; the plates thereof are of no worth, because of the commandment of the Lord. For he truly saith that no one shall have them to get gain; but the record thereof is of great worth; and whoso shall bring it to light, him will the Lord bless. For none can have power to bring it to light save it be given him of God; for God wills that it shall be done with an eye single to his glory, or the welfare of the ancient and long dispersed covenant people of the Lord. And blessed be he that shall bring this thing to light; for it shall be brought out of darkness unto light, according to the word of God; yea, it shall be brought out of the earth, and it shall shine forth out of darkness, and come unto the knowledge of the people; and it shall be done by the power of God.

enthusiasm in this part of America in that period, and Smith, who was a fluent talker and a young man of considerable charm, certainly convinced some people of his exceptional talents. In later life he claimed to have had revelations in which he encountered God face to face at the age of 14, but of greater importance for Mormonism were the visitations to him of the angel Moroni, during the years 1823 to 1827. Smith claimed that Moroni had revealed to him the existence of a record engraved upon gold plates which was hidden in a hill not far from Smith's home. Inscribed in mysterious characters on the plates was the Book of Mormon. With magic spectacles supplied by the angel, Smith transcribed this work, with the assistance of his wife and of his first converts.

'The golden Bible', as the Book of Mormon was locally called, recounted the story of tribes of Israel who by divine command had migrated to America centuries before Christ. Constant warfare between their descendants, the Nephites, and the renegade red-skinned tribe of Lamanites continued for about a thousand years, interrupted briefly by the appearance of Christ to the Nephites after his resurrection, and their conversion to Christianity. Finally the Nephites were overwhelmed, but Moroni succeeded in hiding the book written by his father, Mormon. The descendants of the Lamanites were the American Indians, and Smith's exposition sought to explain the mounds and forts that were commonplace features of the New York State countryside as the work of these warring tribes. Other contemporary influences have been noted in the work, particularly the similarity of a group called the Gadianton band in the Book of Mormon to the Freemasons, who were at that time the subject of vigorous political opposition in New York State.

The style of the book is reminiscent of the Old Testament; the names of its characters are borrowed from, or similar to, those of the Bible, and some chapters of the Bible are incorporated in it or are closely paraphrased. The return of Christ to earth is an explicit and recurrent theme. The Mormons were avowed Adventists, but so many other elements were fused in the Mormon faith that they did not, even at that time, when millennial enthusiasm was sweeping the area with the preaching of William Miller and his associates, indulge in the extreme adventual excitement that occurred in other movements.

Threats of Extermination

Smith and his converts soon migrated westwards, first to Ohio where, at Kirtland, Smith became strongly influenced by a former revivalist preacher, Sidney Rigdon, who had embraced Mormonism. Acting on revelation, Smith established the United Order of Enoch, which instituted collective ownership among Mormons under the direction of the Church. But in Kirtland, where Smith opened a private bank to finance land purchase, the new Church fell into difficulties, particularly when his bank collapsed. Smith took his followers to Missouri, where other Mormons were already engaged in intermittent conflict with their neighbours. Mormon property was burned and innocent women and children were killed before the Saints rose in their own defence. Armed encounters occurred and a group of Mormon avengers, the Danites, came into being in this period. But in the face of the threat of extermination by the Governor of Missouri, in 1838 the Mormons finally fled to Illinois.

There for a few years they were allowed to plan and build a new city, Nauvoo, until the growing power of the Saints provoked their neighbours. Internal dissension occurred partly from suspicion that Smith furthered his private interests in buying and selling land, and partly because he, and to some extent other leading Mormons, were now practising plural marriage which Smith sanctioned, though only among a limited elect, as a revealed ordinance for the Church. A serious dispute with the Governor of Illinois led to Smith's flight, voluntary return, arrest and imprisonment, and finally to his murder in Carthage jail by a disorderly mob in June, 1844.

Smith's martyrdom divided but did not diminish the Mormons. The majority elected to follow Brigham Young, the President of the Council of Twelve Apostles, one of Smith's right-hand men, and he elaborated plans that Smith had already entertained of taking the Mormons out into the west to settle a new territory. A smaller party chose to follow a recent convert, James J. Strang, who set up a polygamous community on Beaver

Island, proclaimed himself 'King in Zion' and became an influential force in Michigan politics. Others remained in Illinois and Iowa, and formed in 1860 the Reorganized Church of Jesus Christ of Latter-Day Saints under the patronage of Emma Smith, Joseph's (first) wife, and under the presidency of his son, also Joseph. This Church never accepted the doctrine of plural marriage, and Emma Smith always denied that her husband had ever had any other wife, although there is evidence that he was married to at least 27 other women, and perhaps to 21 more. The splinter sects are known by the names of their leaders, as Strangites, Cutlerites, Hedrickites and so on.

The Building of Zion

The main body of the Mormons left Nauvoo in some haste in 1846 and after an epic trek across the prairies finally reached the Great Salt Lake in 1847. There, under Young's dynamic leadership they irrigated the land, settled in villages built on the distinctive Mormon plan, built up the spacious Salt Lake City, and established an elaborate system for the transportation of converts from Europe to Utah. In many respects, Utah had become the veritable Zion, and to the millennialism of the Book of Mormon was added the possibility of men building the city of God on earth and finding there a type of salvation. Mormon activism was stimulated by this goal. The appeal of gathering in Zion was enhanced by the importance in the Mormon faith of temple ritual: for a long time the only temples were in Utah.

European missionary work had already borne good fruit for the Mormons before the move to Utah, and at certain periods in the later 1840s and early 1850s there were more Mormons in Europe than in America. Steadily these converts were transported to their new homeland. Mormon emigration became a model of organization, and their ships and discipline were frequently the subject of favourable comment. Transportation across the American continent was not always so successful, even though order and control were always evident. In 1856, Brigham Young put into operation a scheme for immigrants to walk from Iowa City to Salt Lake pushing their belongings on a handcart. In its first year the handcart scheme led to the deaths of more than 200 Mormons, caught in the blizzards of an early winter.

Young announced the previously secret teaching of polygamy in 1852 and leading Mormons took several wives, convinced that thereby they ensured a blissful afterlife. Plural marriage was a fertile cause of dissension with the United States government, who displaced Young as governor of the territory. Other disputes led to the dramatic conflict known as the Mormon War in 1857, and to the brutal Mountain Meadows massacre when Mormons and their Indian allies fell upon a 'gentile' wagon train. After years of stubborn defence of plural marriage, in 1890 a later Church President issued a manifesto discontinuing the practice, although some Mormons continued to live polygamously and such families (now disowned by the Church) have been periodically prosecuted even in recent years.

Baptism for the Dead

Mormon belief changed considerably in course of time, not only in respect of polygamy (which is explicitly condemned in the Book of Mormon) but also in theological matters.

Smith's ideas have been summarized by Mormon theologians in the phrase, 'As man is, God once was; as God is, man may become.' God had evolved, and a stage of his evolution was as a man: he was one among many gods, and godhood was a prospect for every faithful Mormon who obeyed the ordinances of the Church.

Of particular importance in attaining this most complete salvation, to occur after the second resurrection at the end of the millennium, is baptism. Smith declared that even the dead who had had no knowledge of the truth might, through the meritorious intercession of their descendants, attain eternal life. Baptism for the dead is undertaken by a proxy in a secret temple ceremony; the millennium, it is maintained, will be a period in which temple rituals of this kind will be extensively undertaken.

Other rituals of importance are endowment and sealing, which may also be performed vicariously for the dead. Sealing is the establishment of a marriage bond 'for time and eternity' and was of special importance in the days when plural marriage was

practised. Endowment is a ceremony of bathing and anointing with oil in which all parts of the body are treated (a process that has given rise to unfounded rumours of sexual license). The individual is given temple garments, and good Mormons continue to wear this underwear all their lives as a special protection against evil. Mormon ritual shows many similarities to that of the Freemasons and was instituted at very much the time when Joseph Smith was inducted into Masonry. He explained the similarity by declaring that Masonic ritual was a corrupt form of original Hebrew ritual which was now properly restored in Mormonism. It is a paradox that the Book of Mormon contains a thinly veiled condemnation of secret fraternities of which Masonry is the prototype, whilst Mormon ritual bears striking resemblance to Masonic ceremonial.

Mormonism carries little of the concern with sin that characterized much of the fundamentalist Christianity of the period of its emergence, even though the prophet frequently demanded that men repent. The mood of the later revelations to Smith is a mood of promise and optimism, and this is associated with the mood of expanding American society. Men are seen as inherently good with immense potential in this life and the hereafter. The warnings of hell-fire, found in the Book of Mormon, disappear in the prospects of universal, though somewhat differential, salvation in the later revelations. Smith was himself a joyful man, and one of the prophets of the Book of Mormon declares that men are intended to have joy. Contemporary Mormonism reflects this orientation. Sport is highly valued and Mormon missionary work often uses sport as an aid to proselytizing. Dancing is encouraged, and education and health are both given due emphasis. Mormons do not drink, smoke or take tea or coffee, but there is little of the ascetic in their way of life. They are active in both business and politics, and for a time in the early development of Utah the Church leaders were often state politicians. The Church itself also has considerable business interests.

An element of the expansiveness of Mormonism may be seen in the structure of its priesthood. Priestly status has normally been a distinction reserved for the few and deeply respected in traditional Christianity: in Mormonism this status is widely diffused. All good Mormons are priests. Boys enter the Aaronic (lesser) priesthood at 12, and through a series of stages qualify for the office of priest before they reach full manhood, when they also become elders in the greater, Melchizedek priesthood. This element of democracy does not, of course, prevent the Church being governed by full-time officials, a president, 12 apostles, a presiding bishop, councillors and a patriarch. Responsibility is, however, distributed to local level, to the stakes (units of several thousand Mormons) and wards (further subdivisions that are under the control of a bishop). Through these units the religious, regulatory and welfare activities of the Church are organized, and the system of tithing (giving one tenth of one's interest) is instituted.

Mormons are vigorous proselytizers, and many young men go out into other parts of the world at their own expense for a two-year missionary period. They are, to Mormons, priests, although they are unlikely to become full-time ministers in the Church. In the early years Mormon missionaries induced their converts to go to Utah: later this policy changed and the Mormons began to build temples (essential for the indispensable rituals necessary for the fullest salvation) in other parts of the world. Apart from those built in other American states, temples have been constructed in Hawaii, New Zealand, Canada, Switzerland, Austria and London, England. The need for these temples becomes evident when it is realized that over three and a half million temple rites for the dead may be performed within one year. Unlike the temples, Mormon chapels, which act as religious meeting houses, are open to non-Mormons.

MORRIS DANCES

THE OBSCURE TITLES Morris-men or Morrice dancers, as they have been known for centuries in England, convey little or nothing of the significance of these luck-bringers, life-dispensers or medicine-men. Their dance is a ritual ceremony, performed by a group of young men at a seasonal fertility festival, which has parallels in the tribal life of primitive societies and which is still discernible in the folk custom of today. These companies of dancers, which under different names have survived in many parts of Europe, inherit a pagan tradition, which has persisted, especially among country people, in spite of much discouragement from Christian authority.

The name Morris or Morrice seems to be a corruption of *Morisco* or Moorish, probably in the sense of strange or outlandish. The word may also signify blackness, for it is a common practice among these dancing companies to blacken the face as a form of disguise. In Rumania such dancing companies are known as *Calusari*, 'calus' meaning a little horse. In Macedonia one such group is known as the *Rusalia*, or fairies. Whatever name is used locally, it serves to indicate that while they are taking part in the ritual, the young men are not of this world; they are superhumans rather than humans. If not fairies, then they are the ghosts of ancestors or attendants on strange gods, disguised against recognition simply as village lads. In England, faith in the

G. L. Carlisle

magical powers of the ritual folk dances has weakened with time so that they are now regarded as vaguely lucky; today the Morris Dancers are welcomed more for their vigorous, athletic skill than for their healing powers. But the ancient belief in this medicine still persists in eastern Europe and an idea of what the Morris must once have meant in rural England can be formed by following a day in the comparable Calusari dance ceremony, as it was recorded and filmed in Rumania on the eve of the Second World War.

A typical Calusar group is composed of seven or more dancers, two or three musicians with fiddle and cobsa (portable dulcimer), two 'clowns' wearing masks made of a rabbit or hare skin and each carrying a club with a handle carved to represent a phallus in erection. The performers all wear white clothes, which are plain for the musician but decorated with ribbons, braid and bells for the dancers. The clowns have the exposed parts of the head and hands blackened with soot. They are forbidden to speak throughout the festival season, although they may be spoken to, and they must not enter a church. Otherwise they are free to behave and fool with the utmost licence. The group carry a short maypole which is tipped with a piece of wild garlic and round which at times the dancers perform circular figures. Each dancer carries a stout staff which he can use as a walking stick or as a vaulting pole or simply to brandish and clash. They wear soft-soled shoes with bells, pulled over a thickness of rags wound round the feet for protection.

The ceremony starts with the initiation of the entire group, to the continuous accompaniment of the musicians who themselves go through the several stages of initiation. First they pass through an arch made by the leader or 'captain' placing the point of his staff against the tip of the maypole, round which the dancers are circling. Then the initiates take it in turn to lie flat on their faces, side by side, to form a bridge which the others cross over, the mute clowns taking every chance to stamp on or slap the posteriors thus exposed. Throughout these proceedings and, indeed, at any moment throughout the dance performance the 'mutes' behave badly, mocking the celebrants and teasing the spectators and occasionally thrusting their clubs between their own legs and acting the fertility god rampant.

Infusion of New Life

In the final stage of initiation, each man comes forward for a ceremonial beating, beginning with the captain. He lies on his back and his raised feet are clamped between two sticks held by two of the dancers, while a third with a bundle of staves firmly belabours the upturned soles, giving the victim a final crack on his posterior before he is released. The mutes struggle fiercely to escape this ordeal and often succeed in breaking loose before the purging is complete.

Once initiated, the behaviour of the troupe changes dramatically. The musicians strike up a regular march measure, the captain brandishes his staff and leads his dancers in a single file round the maypole, shouting at regular intervals, their cry 'Calu-Sar', which goes echoing across country to be heard over a wide area. The march round is succeeded by a straight line of dancers facing front, the march rhythm giving way to a rapid vibrating sound to which the dancers shout and 'step' and jump and caper, using the staff to press their leaping bodies up in the air. With a final high spring the captain signals the musicians, who revert to the march motif, and he leads off the single file procession to the call of Calu-Sar.

Each part of this medicine dance arouses its particular brand of excitement and the alternating rhythms produce a cathartic effect on any spectator exposed to the medicine which is now being constantly distilled and dispensed. For the inhabitants of the community, the visitation of the Calusari would seem to be an annual infusion of new life, dispensed generally by the perambulations of the group from point to point round the village.

At one point in the day's ritual, the mothers of sick and ailing babies seek out the dancing doctors for individual treatment. The captain invites one mother to step forward with her babe, which he dandles in his arms while he dances a few gentle steps. Then he places the rolled bundle, by now hypnotized into a watchful silence, on a soft piece of ground and carefully hops and springs over the small body before gathering it up to hand back 'revived', to its grateful mother. Later in the day, another group of candidates for special treatment gather round the 'life savers'. These are the unmarried maids who pin their faith in this kind of medicine to promote fertility. At first the dancers seem unaware of the slowly circling group of girls closing in on them, but soon they are all linked up in one large circle, the men suiting their steps to their new partners, who have probably performed them since early childhood. After this dance dispensation, they can expect to be married within the year.

While the life-giving function of the Calusari is made evident in their annual ritual, the comparable men's dances in England and other parts of Europe are not so explicit. Without the Rumanian and other eastern European examples for comparison, these would be, and were for long, difficult to interpret. The western European examples, including the English Morris, are incomplete and fragmentary as rituals, their local names and local explanations being often misleading. Before the material for comparative study became more readily available, a good deal of guesswork was inevitable and in England, the name of 'Morris' was widely used for several different folk or near-folk customs, ranging

from Christmastide mummers to carnival drum majorettes.

The rather shadowy figures of clown, hobby-horse, Maid Marian, and the other characters who accompanied the Morris dancers suggest that the dances were part of a fertility rite and that somewhere behind these shadows there lurked a pagan god. But with the eastern European analogues and other apparently isolated or disconnected customs, the picture has been and is still being filled in. Christian influences seem to have been most effective in western Europe in 'playing down' the pagan trappings and fertility aspects of the May games, where the Morris Dance had a place and where the maypole or 'tree' was a focal point (see MAY DAY). The various animal-men, in the guise of goats, horses, sheep and even dragons who appear in this widespread ritual may possibly be shadowy representations of the old god.

God Gives Way to Men

There are a number of cases of the Maytime folk customs in which the god is still a fairly dominant figure, while the band of young 'medicine-men' merely attend on the god. This is the position of the Mayers of Padstow in Cornwall, who on May Day 'work' the 'Hoss' or Horse, providing also the groom or teaser and the musical accompaniment of drums and voices (see HOBBY-HORSE). So it is with the 'cadets' who man and drive the complicated mechanical dragon of Tarascon, in the south of France, the *Taresque*, which once needed to consume so many young maidens in order to perform its annual perambulation, breathing fire and smoke and at the same time bringing new life to Tarascon. But in the majority of the surviving men's dance customs, this central figure has declined in importance and interest, and attention has long shifted to the young men themselves. A survey of the ceremonial dances in Great Britain, published in 1960, indicates that there were more than 600 localities where some type of Morris Dance was or had been until recently in existence. (See also DANCE; FOOL.)

MOTHER GODDESS

Figure of Love and Fear

The mother goddess is a being in whom opposites combine; human love is one of her areas of influence, but so is the urge that leads men into war; the giver of life, she is also the deity who takes it away

'CONCERNING EARTH, the mother of all, shall I sing; firm earth, eldest of gods, that nourishes all things in the world. . . Thine it is to give or to take life from mortal men.' These words from the Homeric Hymn to Earth typify a religious belief that is as old as history.

From time immemorial man has reflected in wonder and amazement on the earth upon which he lives, and which nourishes himself, his family, his tribe and his animals. As long as man has felt himself dependent on the earth, he has personified it and worshipped or at least reverenced it, in the most potent of all images, the image of the mother.

Today in a Western society which has to a very great extent lost its hold on the realities of agricultural existence, it is said that the earth has become desacralized. Reverence has given way to ruthless exploitation. The mystery has fled, to be replaced by concrete carpets and factory farming. Nevertheless, it is still possible to see shadows and hear distant echoes of what was once an unquestioned item of faith.

Not long ago the suggestion was made that a certain bestseller in the field of religious literature would be a book entitled 'God is a Woman'. The suggestion may have been partly frivolous, but bearing in mind that it is only very recently in the history of mankind that deity has been credited with exclusively masculine attributes, the possibility of depicting supernatural power in feminine terms is far from unreasonable. In the West, God is generally spoken of as 'Our Father which art in heaven', but the naive question 'If God is Father, then who is Mother?' still deserves to be asked. Historically the answer would be: 'The earth on which we live'.

The history of religion reveals a panorama of gods and goddesses, higher and lower spiritual beings, among whom personifications of the earth occupy a prominent place. As a rule these personifications bear all the attributes of female sexuality and motherhood. Sometimes they are

Mistress of All the Elements

Lucius prays to Isis:

Blessed Queen of Heaven, whether you are pleased to be known as Ceres, the original harvest mother who in joy at the finding of your lost daughter Proserpine abolished the rude acorn diet of our forefathers and gave them bread raised from the fertile soil of Eleusis; or whether as celestial Venus, now adored at sea-girt Paphos, who at the time of the first Creation coupled the sexes in mutual love and so contrived that man should continue to propagate his kind for ever; or whether as Artemis . . . or whether as dread Proserpine . . . I beseech you, by whatever name, in whatever aspect, with whatever ceremonies you deign to be invoked, have mercy on me . . .

To which the goddess replies:

I am Nature, the universal Mother, mistress of all the elements, primordial child of time, sovereign of all things spiritual, queen of the dead, queen also of the immortals, the single manifestation of all gods and goddesses that are. My nod governs the shining heights of Heaven, the wholesome sea-breezes, the lamentable silences of the world below. Though I am worshipped in many aspects, known by countless names, and propitiated with all manner of different rites, yet the whole round earth venerates me.

Apuleius *The Golden Ass*
(trans. Robert Graves)

paradoxically believed to be virginal. Often, still more paradoxically, they combine within themselves attributes of generosity and grace and also those of horror and destruction. If human love is one of their areas of influence, the senseless urge which leads men into war is another.

Their icons and images may be of the order of the Venus de Milo, an idealized form of female beauty; or, equally, they may suggest a mind diseased – skinny, skull-festooned hags, their fangs dripping with the blood of generations of men. Clearly the mother goddess of human history is no romantic figure, but rather one in which opposites combine, in which the giver of life is clearly seen as the being who also takes it away, and in which promises are hollow and temporary, and hope a mockery.

The tension and paradox appear to have been almost universal. From Scandinavia to Melanesia, goddesses in which precisely these characteristics predominate have been worshipped, feared and propitiated. This universality has led some scholars to suggest that what we are in fact seeing is the reflection of a human psychological trait which is always and everywhere the same, though clothed in slightly different images and symbols. This psychological interpretation is not without its risks, however. The Paleolithic 'Venuses' for instance cannot simply be equated with medieval figures of the Virgin Mary. The figure of the mother goddess in India is not the same as the Great Mother of the Mediterranean world, however much they may appear to have in common. The hypotheses of Freud and Jung must not be made to carry more weight than they can bear. As well as similarities, there are significant differences.

Among man's earliest artefacts, dating from the late Paleolithic period, are coarse and crude figurines of pregnant women, their breasts and hips grotesquely enlarged. These, it has been supposed, represent in human form that concern with human reproduction that was a pattern of man's condition of survival on the face of the earth (see FERTILITY). It is not known whether these in any sense represent mother goddesses and there is no way of finding out. The possibility is there, but it is only a possibility.

It is interesting, though, that these figurines are seldom more than approximately human. Apart from their lack of proportion, their faces and other personal characteristics are hardly even hinted at. This same characteristic is found in female figurines from Bronze Age peasant cultures and many of the earliest urban cultures, for instance those of north-west India. Excavations made on Indus Valley sites have revealed many such artefacts, often smoke-stained in such a way as to suggest some form of household worship. If this is a continuous line of development, it would seem to suggest something more than merely 'good-luck charms' or magical amulets. The pattern is consistent, at all events: a female figure with rudimentary features, but with prominent breasts and hips, often dressed in a girdle and necklaces, and wearing a head-dress.

Even today the visitor to an Indian village may be surprised to find that the temples of the great gods, Shiva and Vishnu, are regarded by the people as being of less importance than the little shrine of the local goddess, or Grami Devi. She may have many names, most of which are not found in the standard textbooks on Hinduism. But she is 'of the earth', and directly responsible for the fertility of the fields surrounding the village. She may be linked mythologically with the consorts of the great gods, Parvati, a consort of Shiva, Kali his wife, or Lakshmi who was Vishnu's wife, but to all intents and purposes she is the guardian of the village and the one to whom the people turn for everyday purposes. She has her festivals and her particular responsibilities, and it is probable that her nature and function have not changed for more than 5000 years.

However, the most authoritative evidence concerning the worship of mother goddesses comes from the Mediterranean area, from Iran in the east to Rome in the west, and covering Mesopotamia, Egypt and Greece. Indeed, in this area, the names and functions of the great goddesses were so interchangeable as to make comparative study a highly complex undertaking. The primary identification of the goddess with the fruitful earth is unquestionable, but starting from Mesopotamia there is an involved pattern, in which celestial elements combine with those of the underworld in such a way as to suggest that the Great Mother may be a composite figure, as complex as the human mind.

The Semitic names for the greatest mother goddess were Inanna in Sumeria, Ishtar in Babylon and Astarte or Anat among the Canaanites. Commonly identified with the planet Venus, her most typical title is 'queen of heaven', though she is also known as 'mistress of all the gods' and 'the lady of the world'. In time, she gathered to herself the attributes of a host of other goddesses, so that in Mesopotamia the word *ishtar* came to mean simply 'goddess'.

She was believed to be the giver of vegetation; a hymn contains the words: 'In the heavens I take my place and send rain, in the earth I take my place and cause the green to spring forth.' She was the creator of animals, and the goddess of sexual love, marriage and maternity. In another hymn it was said: 'I turn the male to the female, I turn the female to the male; I am she who adorneth the male for the female, I am she who adorneth the female for the male.' Her worship was frequently connected with the practice of sacred prostitution (see PROSTITUTION).

Two other characteristics of the Semitic mother goddess are worth mentioning in this context. The first concerned her connection with a male figure who could be described as son, brother or husband. The best known of these figures was Tammuz (Sumerian Dumu-zi), a god of vegetation and in particular of the growing corn. Every year a festival was held at which his 'death' and 'resurrection' was celebrated (see DYING GOD; TAMMUZ).

Naked Before the God

The vegetation god was believed to die and rise again annually, and in the myths of the descent of the mother goddess into the land of the dead there is a dramatic image of the search of the mother for her lost son and lover, the search of the earth for the temporarily lost fertility which the new spring restores. A Sumerian version of this myth, *Inanna's Descent to the Nether World*, is one of the earliest examples.

Inanna descends, perhaps in order to free Dumu-zi; she approaches the subterranean temple of Ereshkigal, god of the dead, through seven gates, at each one of which she has to remove part of her clothing, until she finally stands before him naked. An interesting feature of this myth is that on her return, she brings with her all manner of evil and malevolent beings: 'They who

preceded her, they who preceded Inanna, were beings who knew not food, who knew not water, who eat not sprinkled flour, who drink not libated wine, who take away the wife from the loins of man, who take away the child from the breast of the nursing mother.' Similar myths were current all over the Semitic world, for instance in Canaan, where the mother goddess Anat attacks and conquers Mot (death) in order to free the fertility god Baal.

The cult of the mother goddess moved westward, perhaps through Cyprus and Crete, into Anatolia and Greece. Significantly, the most popular image of Venus, the Greek Aphrodite, depicts her emerging from the sea on the coast of Cyprus, while her consort, Adonis, is a Semitic figure, with a Semitic name. In her purely Greek form, as Aphrodite, the goddess's cult was fairly decorous, but on the borders of the Greek world, in Corinth, sacred prostitution was practised.

However, on entering the Greek culture, the cult of the mother goddess encountered another similar cult deriving from the Indo-European culture. In Iran, Anahita the goddess who 'purifies the seed of males and the womb and milk of females', described in sculptural terms as 'a beautiful maiden, powerful and tall', was worshipped. Her cult spread through the Persian Empire, and she gradually coalesced in various ways with Athene, Aphrodite, and the Anatolian Cybele. It was Cybele who eventually came to be honoured in the Roman Empire as the Great Mother of the gods, a temple being erected to her honour on the Palatine Hill in Rome in 204 BC.

The cult of Cybele remained, even after its adoption in Rome by the Romans, the responsibility of native Phrygians, who wore their hair long, dressed in female clothes, and celebrated the goddess in wild orgiastic dances to the point of exhaustion. It is believed their consecration to the goddess sometimes involved self-emasculation.

Although this type of worship was not unknown in Greece, particularly in connection with Dionysus, worship of the mother goddess took more decorous forms. The Mysteries of Eleusis (see ELEUSIS) incorporated most of the elements already mentioned: a dying and rising pattern linked with the corn, with fertility and with the rhythm of the seasons. The rites of Eleusis were celebrated in honour of the mother goddess Demeter and in honour of her daughter Persephone.

Originally pure fertility rites, they gradually came to be an acted parable of the relationship of man to his surroundings, assuring initiates of the protection of Persephone in the world beyond the grave. The myth is outlined in the Homeric Hymn to Demeter.

'Demeter's People'

Persephone, daughter of Demeter and Zeus (earth mother and sky father) was out gathering flowers. The earth opened and out leaped Pluto, god of the underworld: 'He caught her up reluctant in his golden car and bore her away lamenting.' For nine days Demeter sought her; on the tenth day she learned the secret from Helios, the sun. Angry, she closed the womb of earth until her daughter was restored to her; however, Pluto made Persephone eat pomegranate seeds, in this way keeping some hold on her. Demeter accepted the arrangement, and before leaving for Olympus, showed the people her mysteries, '. . . awful mysteries which no one may in any way transgress or pry into or utter, for deep awe of the gods checks the voice'. The secret was well kept, and many details of the Eleusinian Mysteries are unknown, save that the cult became established in Athens.

Another popular form of the worship of the mother goddess in the Roman Empire was that of the Egyptian goddess Isis. Originally the wife of Osiris, identified with the dead

Left **The epitome of feminine charm, Venus influenced the fertility of plants and animals: mosaic showing the goddess at her toilet** ***Above*** **Many of the attributes of the Great Mother of the Mediterranean countries were transferred to the Virgin Mary**

pharaoh, she was the mother of Horus, the living pharaoh, who gave birth to her son after having conceived magically on the body of her dead husband. One common representation of Isis is as a mother suckling the infant Horus, thought by some to be a prototype of later Christian images of mother and child.

Indeed, the queen of heaven, the universal mother, was known by many names in the ancient world. For example there is Artemis or Diana, the huntress and mistress of animals: in Acts, chapter 19, there is recorded a celebrated encounter between Paul and devotees of 'Artemis of the Ephesians', a local, many-breasted form of what may have originally been a moon goddess. There was the Anatolian goddess Ma, whose priests were known as *fanatici* (servants of the *fanum* or temple) and from whose wild excesses comes the word 'fanatic'. Farther north, there were Celtic and Teutonic tribal goddesses.

Among the latter, the goddess Freya was said to have had sexual relations with all the male members of the pantheon, and as goddess of the dead shared with Odin the custody of warriors slain on the field of battle. This is the same kind of ambivalence that is to be observed in most mother goddesses; because the earth receives the dead in corruption and also gives birth and sustenance to crops, men and animals, the connection between the mother goddess and the kingdom of the dead is common. In Greece, for instance, the dead were sometimes called 'Demeter's people'.

The coming of Christianity to the Mediterranean countries and Europe had the effect, on one level, of devaluing the indigenous cults by demoting the ancient deities to the rank of demons. In the case of the Great Mother, however, popular belief reasserted itself by transferring many of her attributes to the Virgin Mary (see MARY). In the same way, local deities often came to be identified with the saints. This interesting development can be paralleled in many parts of the world. Its roots are certainly psychological: the hold of the Great Mother on the mind of an agricultural people was too strong to be broken overnight. Legends and attributes came to be attached to the name of Mary, in her role as the Mother of God, which lack all scriptural support, but which clearly correspond to needs in the popular mind.

At Bethlehem for instance there is, or used to be, a cave known locally as the 'milk grotto'. Legend has it that the Holy Family once took refuge in the cave, and that as Mary nursed the infant Jesus, a drop of her milk fell on the floor. Because of this, it was believed that to enter the cave would cure barrenness in women, and increase their milk and even the milk of animals. It seems clear that this particular cave was once the shrine of a local form of mother goddess, and that the legend is merely a Christianization of the site.

It is worth emphasizing that doctrines and dogmas concerning the Virgin Mary have always been formulated as a result of popular religious practices. On the theological level, as long as God and Christ were thought of in terms of the dispensation of justice, both appeared remote and, the nature of man being what it is, frightening. The Virgin, on the other hand, was unquestionably human, although elevated to near-divine rank and crowned Queen of Heaven. Who better to intercede for sinful mankind at the judgement seat? In this, she was in effect doing what the mother goddess, whatever her name, had always done from time immemorial.

Mankind's worship of, and reverence for, the divine figure of the mother, is a religious phenomenon far deeper than creeds, councils and dogmas. It reflects man's profound need for security in a frequently unfriendly world, his own inadequacies and his own fears. In it can be seen the tension between good things and evil, between the gift of life and the fear of death, personified in the goddess who gives and takes away, who creates and destroys, but who is never as aloof and unconcerned as her consort, the sky god. As long as man retains any of his roots in the earth, reverence for the earth – whether personified or not – will remain, and the Great Mother will still have human children.

(See also EARTH; ICONOGRAPHY; RELIGION; and articles on individual goddesses.)

FURTHER READING: E. Neumann, *The Great Mother* (Princeton Univ. Press, 1964); J. Preston, ed., *Mother Worship* (Univ. of North Carolina Press, 1983).

Mountains have been seen as symbols of pride, created as a punishment for human sin, but they are also widely regarded as being the source of inspiration and strength

MOUNTAIN

ACCORDING to an old Navaho legend, at one stage in the creation of the world the First Man and the First Woman raised up seven sacred mountains with the help of the two gods Black Body and Blue Body. The mountains were arranged in a pattern, with one at each point of the compass, and three in the middle. The mountain at the eastern point was fastened to the earth with a bolt of lightning, and its creators put two pigeon eggs on the summit to make wings for it. The western mountain was riveted to the earth with a sunbeam, the northern with a rainbow, and the mountain in the south was pinned down with a great stone knife.

How much of this myth the Navaho invented for themselves, and how much they derived from alien traditions, it is impossible to say. But several elements in it are paralleled in other parts of the world. The association of the number seven with sacred heights, for example, is found in the Iranian myth of the seven gods that dwell on the heavenly mountain, and in the ancient Hindu legend of the seven-sided world-mountain.

Another Asiatic people, the Kalmuks of Astrakhan, also associate the holy mountain of their cosmogony with the four cardinal points. Their mountain has four sides, each facing a different point of the compass, and each glowing with a different colour reflected from the precious metals covering its surface.

This idea of colours is echoed perhaps in the Navaho's black and blue gods, and in the rainbow that binds the northern mountain. The Hindu world-mountain's seven sides are also coloured, each one with a different colour of the rainbow. In an ancient Egyptian myth there is a sacred mountain in the east, and another in the west. The sun god rises at dawn from the eastern mountain, and retires into the western mountain in the evening.

It is natural enough that mountains, as conspicuous landmarks, should be associated with the cardinal points and, as vast natural objects, with other dominant phenomena in Nature. But one point of detail in the Navaho myth is unique and puzzling, the item about the pigeon eggs. The idea here is that mountains aspire towards the sky, that they strain to take off from the earth's surface. The myth echoes a legend in the Vedic sagas of India, according to which the mountains once had wings. It seems rather cruel of the Navaho to have provided their eastern mountain with wings at the same time as they fastened it to earth with a bolt.

Beautiful and uplifting to the spirit, or barren, rocky and sinister, mountains have been regarded as sacred throughout the world: Mount Olympus, the awesome dwelling-place of the Greek gods

Creations of the Devil

Although the Navaho distributed their sacred mountains impartially round the compass, and the Egyptians put theirs in the east and west, in central Asiatic myths, probably all ultimately derived from India, the sacred world-mountain is set in the north. This mountain, worshipped by peoples in places as far apart as Mongolia and the western shores of the Caspian, was the dwelling-place of the gods. Its peak rose to the sky at the Pole Star. In one version of this myth, there was a temple on the summit, and the Pole Star was the golden spire of the temple's tower. The king of the gods had his golden throne in the temple.

The fame of this cosmic mountain spread far and wide in the ancient world, and in the Old Testament it seems to be equated with Mount Zion. God's 'holy mountain, beautiful in elevation, is the joy of the whole earth, Mount Zion, in the far north, the city of the great King' (Psalm 48); and Isaiah (chapter 14) has an even more striking reference to this myth, when, addressing Lucifer, he says: 'You said in your heart, I will ascend to heaven, above the stars of God I will set my throne on high: I will sit on the mount of assembly, in the far north: I will ascend above the heights of the clouds, I will make myself like the most High.'

The Hebrews had more than one sacred mountain – Mount Sinai, the place where, on the initiative of Moses, the sacred covenant was enacted between the Israelites and Yahweh, Mount Tabor, south-west of the

C. M. Dixon

Sea of Galilee, and Mount Zion, the holy hill of ancient Jerusalem. In Christian tradition, mountains play a more equivocal role. The disciples of Jesus remembered the words of Isaiah: 'How beautiful upon the mountains are the feet of him who brings good tidings,' and the Messiah preached his greatest sermon on a mountain. But Isaiah had also prophesied that 'every valley shall be lifted up, and every mountain and hill be made low', and mountains came to be seen as symbols of pride and worldly exaltation.

The idea grew up that God originally created a smooth, egg-shaped world, and that the mountains came later (as a punishment for human sin, it was sometimes said). The legend is echoed in many English authors from Sir Walter Raleigh and Thomas Burnet onwards. A similar belief flourished among peoples influenced by Asiatic dualistic conceptions of the universe. In Siberia and Mongolia myths are recorded in which God creates the smooth, round earth, and the Devil creates mountains and swamps, either by kicking up the earth's surface, or by chewing up lumps of earth in his mouth, and spitting them out.

These dualistic, and the later Christian, beliefs about mountains take us a long way from the Psalmist's: 'I will lift up mine eyes unto the hills, from whence cometh my help.' But the belief that mountains are the source of strength and inspiration is widespread outside Christendom. In Scandinavia, this idea is linked with the equally prevalent belief that mountains are the abodes of dead souls. The Finnish Lapps believed that these spirits protected them, and they hoped to join their particular set of mountain guardians after death. An ancient Finnish magic song contains a curious echo of the Psalm just quoted: 'I call for help from the hill, I seek for folk from the hill.' Obeying the same instinct that made the ancient Greeks place their gods on Mount Olympus, the Lapps of Finland placed strange stone idols on their holy mountains of the dead, and it is said that even today their descendants cannot pass by these mysterious mountain gods without feelings of awe.

Mansell Collection

The embalming of the dead was a religious ritual to the Egyptians, who believed that the physical body was an essential constituent of the human personality, and that without it an afterlife was impossible

MUMMIFICATION

EGYPTIAN MUMMIES are always objects of curious and somewhat awed attention when exhibited in museums. Most people feel a strange fascination in gazing at the bodies of persons who lived thousands of years ago. In a special room of the great Museum of Egyptian Antiquities in Cairo, it is possible to look upon the very faces of the pharaohs; some, such as Seti I, who reigned between 1312–1300 BC, are still remarkably well preserved.

The ancient Egyptians have been unique in their concern to preserve the bodies of their dead. For their practice of embalming dead bodies was not just an exercise of the mortician's craft; it was a religious ritual, inspired by a distinctive conception of human nature and destiny. The custom was already well established when the Pyramid Texts were composed (c2400 BC), and it was still being followed in the 4th century AD, when Christian influence led finally to its abandonment. Throughout that immense period, despite great vicissitudes of political fortune, the people of Egypt continued patiently to mummify not only their human dead but sacred animals also. The practice was both costly and gruesome, and its long continuance attests to the strength of the belief that inspired it.

The explanation lies in the Egyptian idea of man. The physical body was regarded as an essential constituent of human personality, and an afterlife could not be imagined as being possible without it. As the Egyptian funerary texts show (see BOOK OF THE DEAD), the decomposition of the body consequent on death was profoundly feared. Action was taken to prevent it from a very early period, as the following passages from the Pyramid Texts show. In the first, Tait, the personification of the linen bandages used for wrapping the corpse (in this case of King Teti) is being invoked: 'Hail Tait . . . protect the head of Teti, so that it becomes not detached. Bind together the bones of Teti, so that they do not fall apart'. The purpose of embalming is realistically stated in this assurance given to King Pepi: 'they (the goddesses Isis and Nephthys) prevent thy putrefaction from flowing on the earth . . . they prevent the odour of thy corpse from being evil for thee . . .'

Beautiful Memory Picture

Alas, poor Yorick! How *very* surprised he would be to see how his counterpart of today is whisked off to a funeral parlour and is in short order sprayed, sliced, pierced, pickled, trussed, trimmed, creamed, waxed, painted, rouged and neatly dressed – transformed from a common corpse into a Beautiful Memory Picture. This process is known in the trade as embalming and restorative art, and is so universally employed in the United States and Canada that the funeral director does it routinely, without consulting corpse or kin. He regards as eccentric those few who are hardy enough to suggest that it might be dispensed with.

Jessica Mitford *The American Way of Death*

Magical Amulets

These passages in the Pyramid Texts refer to the process of embalming and they show that it was essentially a ritual transaction that was based upon the legend of Osiris (see OSIRIS). The Egyptians believed that the ritual re-enactment, on behalf of a dead person, of the acts that were supposed once to have raised Osiris from death would ensure to the person concerned a similar resurrection.

But this ritual magic was reinforced by practical action, taken in the light of contemporary knowledge and experience, to preserve the corpse from physical disintegration. As the first of the passages quoted shows, the corpse was wrapped in linen bandages to hold it together; the other passage suggests some action to arrest its putrefaction. This early literary evidence is supported by specimens that have been found of mummies dating from the Thinite Period (3200–2780 BC). Already attempts appear to have been made to preserve the body by the application of salt or natron, a form of soda, while the bandages were impregnated with a resinous substance and moulded to the shape of the body. In these

Michael Holford

earliest examples the body is contracted, with the arms, legs and fingers separately bandaged.

The contracted position was also used in pre-dynastic burials, when the body was not embalmed but often preserved by direct contact with the dry desert sand. The extended position later became invariable.

The technique of embalming gradually improved, though all its various stages cannot now be discerned from the available archeological material. Obviously experiments were made, with varying success. During the Middle Kingdom (2052–1567 BC) the embalmers had learned how to remove or reduce the flesh, while leaving the skin and bones intact. Mummies of this period are dark-coloured, and the skin is dry and brittle. Amulets of various kinds, giving magical protection, were placed on the body or in the wrappings; the heart-scarab (see SCARAB) was already in use, being set sometimes in the breast-cavity.

Artificial Eyes

During the New Kingdom (1567–1085 BC), the art of mummification reached its highest point of achievement. This was probably due not only to increasing experience but also to Egypt's political power, which enabled the embalmers to obtain costly spices and medicaments from a wide area of Africa and the Middle East. Such notable mummies as those of Thothmes IV and Seti I attest to the ability of the embalmers of this period to preserve the facial features of the dead; artificial eyes were sometimes inserted and the contours of the face filled out by packing mud beneath the skin.

A detailed account of the process of mummification was given by the Greek historian Herodotus, who had visited Egypt in the 5th century BC. Although he wrote

The Egyptians, more than any other nation, persistently attempted to stop or reverse the consequences of death. For thousands of years they mummified not only their human dead, but also their sacred animals, the ibis-bird, crocodiles and snakes; to please the cat-headed goddess Bast, who protected men against contagion and evil spirits, her worshippers buried the mummies of cats, her sacred animal, near her sanctuaries *Left* and *Below* Mummified cats, now in the British Museum

C. M. Dixon

Roger Wood

long after the zenith of Egyptian civilization and was often fanciful, or misinformed, in his descriptions, his account of mummification is generally confirmed by examination of mummies. After describing the lamentation that follows a death and the taking of the body to the embalmers, he writes: 'There are a set of men in Egypt who practise the art of embalming . . . These persons when a body is brought to them, show the bearers various models of corpses, made in wood, and painted so as to resemble nature. The most perfect is said to be after the manner of him whom I do not think it religious to name (Herodotus means Osiris) in connection with such a matter; the second sort is inferior to the first, and less costly; the third is the cheapest of all. All this the embalmers explain, and then ask in which way it is wished that the corpse should be prepared.'

Herodotus then proceeds to describe the first process: 'They take first a crooked piece of iron, and with it draw the brain through the nostrils, thus getting rid of a portion, while the skull is cleared of the rest by rinsing with drugs; next they make a cut along the flank with a sharp Ethiopian stone, and take out the whole contents of the abdomen, which they then cleanse, washing it thoroughly with palm wine, and again frequently with an infusion of pounded aromatics. After this they fill the cavity with the purest bruised myrrh, with cassia, and every sort of spicery except frankincense, and sew up the opening. Then the body is placed in natron for seventy days, and covered entirely over. After the expiration of that space of time, which must not be exceeded, the body is washed, and wrapped round, from head to foot, with bandages of fine linen cloth, smeared over with gum, which is used generally by the Egyptians in the place of glue, and in this state it is given back to the relations who enclose it in a wooden case which they have made for the purpose, shaped into the figure of a man.'

Herodotus then describes the other two methods, the first of which consisted of injecting cedar-oil by syringes, which, according to the historian, dissolved the stomach and intestines and was drained out through the anus. The body was also steeped in natron, which dissolved the flesh, leaving only the skin and bones. In the third method,

William MacQuitty

The desire to achieve physical immortality spans many thousands of years ***Facing page*** **The Egyptians profoundly feared bodily decomposition after death, believing that without the body there could be no afterlife; mummification was in fact a ritual re-enactment, on behalf of a person who had died, of the acts that were supposed to have raised Osiris from the dead, in the belief that this would ensure a similar resurrection for the person concerned: relief showing a mummy being sprinkled with water** ***Top*** **Mummy of a young boy who lived during the 3rd century AD; he is wrapped in a shroud on which his full-length portrait has been painted and is shown holding a bunch of laurel leaves, symbols of immortality** ***Below*** **Mummified monks, preserved by a drying process, in a monastery at Palermo**

used by the poorer classes, the intestines were removed by clyster, a process involving the injection of a liquid, and the body soaked in natron for 70 days.

This account by Herodotus omits to mention the frequent use of bitumen for packing the cavities from which the organs had been removed. This substance had the effect of making the body black and heavy, but rendered it almost indestructible except by burning. The word 'mummy' derived, incidentally, through Byzantine Greek and Latin, from an Arabic word meaning bitumen.

The organs that were removed from the body, namely, the heart and lungs and the viscera, were separately embalmed in bitumen and wrapped in bandages. They were then placed in what are traditionally known as 'Canopic' jars, of which four were used for each person. The covers of the jars were shaped, respectively, as the heads of the four sons of the god Horus, under whose protection their contents were placed. These jars were put into a special chest and interred with the mummified body.

For burial the mummy was enclosed in a coffin. From the Middle Kingdom period onwards this coffin was usually anthropoid, in the shape of a human body with the facial features carefully moulded and depicted. It was also brightly painted both inside and outside with images of protective deities, particularly of Nut, the sky goddess, and magical symbols and hieroglyphic texts taken from the Book of the Dead. The bodies

of royal persons and nobles were often placed in a number of anthropoid coffins; Tutankhamen (c1354–1345 BC) was enclosed in three, the inner one being of pure gold. These coffins were usually placed in a massive stone sarcophagus, as if to ensure the utmost security to the dead.

The tomb in which the embalmed and coffined body was finally laid was furnished with a variety of goods, according to the status of the deceased, and it became his 'eternal house', at which food offerings were regularly made. Among this funerary equipment were 'ushabtis', little mummiform figures on which a magical text was inscribed commanding the ushabti to answer in the next world for its owner, if he were called upon to labour there.

'Opening the Mouth'

Despite their many strange ideas and fantastic customs, the ancient Egyptians were essentially a practical people. They faced up to the fact that mummification, though it preserved the body from decay, left it immobile. Consequently, they made provision to restore to the body its ability to see, hear, eat and speak by a magical ceremony known as the 'Opening of the Mouth', which was performed just before the body was lowered into the sepulchre chamber. A similar ceremony was also performed to animate statues of the gods.

Mummification was not confined to humans. The Egyptians embalmed their sacred animals, from the great Apis bulls to creatures such as the ibis-bird, crocodiles and snakes. No other nation has ever sought so carefully and persistently to stop or reverse the consequences of death. The people of Egypt did in fact try to achieve immortality by a combination of magic, the chemical means of embalming, and by massive stone tombs.

The multitude of their mummies which can be seen in the museums of the world are the pathetic memorials of their frustrated hopes; yet even more ironic perhaps is the fact that during the Middle Ages, and even later, their embalmed bodies were often pounded up and sold as a drug.

JAMES MURRELL

Cunning Murrell claimed to be 'the Devil's Master' and to have the power of invoking elementals and evil spirits; he was also said to be a skilled astrologer: illustration of Murrell studying the stars, from *The Strand Magazine* (1900)

BETTER KNOWN as Cunning Murrell, James Murrell of Hadleigh in Essex was possibly the last representative of a class of witch-doctor who had practised in English rural areas for many hundreds of years. Born at Rochford in Essex in 1780, the seventh son of a seventh son, he was apprenticed for a time to a surveyor and later worked for some years as a chemist's stillman; but by 1812 he had established himself as a shoemaker at Hadleigh. He soon abandoned this occupation for the more lucrative profession of herbalist, cattle-doctor and seer. He claimed, in his own words, to be 'the Devil's Master' for, in addition to exorcizing evil spirits from haunted houses, he claimed the power to overcome witchcraft.

As a seer, Murrell was adept at discovering the whereabouts of lost and stolen property by gazing into a small glass, described as being somewhat 'like a bird-cage mirror'. At other times he would spread a black liquid on the surface of a bowl of water and those who consulted him insisted that within this they had seen events that took place many miles away. As an astrologer his predictions were said to be uncommonly accurate.

The principal weapon in Murrell's armoury against witches was the witch bottle, a receptacle containing specimens of the blood, hair and nail parings of the victim of witchcraft, and nails from a horseshoe. Those used by Murrell were made of iron especially forged for him by the village blacksmith, whose descendants still live in the village.

Murrell's reputation as a witch-doctor is mainly preserved in a number of curious legends which were in circulation in the area until recently. A typical example was the story of the girl who barked like a dog after having been cursed by a gypsy woman. Half-mad from fear, and still hysterical, she was brought to Murrell for treatment. He immediately diagnosed witchcraft and prepared one of his witch bottles which he heated up on a cottage stove at midnight. The object was to cause by counter-magic a corresponding sense of burning in the body of the witch which would force her to remove the spell. In this case the bottle exploded and, oddly enough, the half-burned body of a woman was found in a lane on the following day.

Belief in the power of witchcraft survived for many years in Hadleigh itself, no doubt because of the presence of an active witch-doctor in the village. Typical of the prevailing state of mind is that of the villager who, at Murrell's direction, plunged a pen-knife into the footprints made by a reputed witch in the dust of the road. The suspect was later discovered to be limping from an injured foot.

Murrell made great capital from the presence in the village of a Mrs Eves, who was supposed to be the local witch. Although she was treated with studious politeness by her neighbours, she was held responsible for every local calamity, from epidemics among children to sickness in cows. All who were forced to pass her in the street averted their eyes and crossed their fingers at the same time, as a defence against 'overlooking' by the Evil Eye. The legend that arose after her death, to the effect that animal familiars had been discovered in a box in her cottage, was no doubt the direct result of Murrell's calumnies.

Advised by Angels

Murrell claimed to have the power to invoke elementals, and charged his clients anything from sixpence to half-a-crown for the service: but there was always some dispute in the community as to whether these spirits were angels, as he claimed, or fiends from hell, as many thought.

A number of handwritten manuals of conjuration and geomancy were found among Murrell's effects after his death, among which was a volume in which the names of his spiritual mentors were given as the good angels 'Adonay, Elohim, Raphael and Tetra strong and powerful'.

In spite of his deep interest in magic, Murrell was an extremely religious man, 'knowing his Bible backwards'. There were many arguments between the wizard and the local vicar with whom Murrell's relations were far from cordial; like the white witches of old, he regarded clergymen and doctors as trespassers upon his territory.

In December 1860 Cunning Murrell, feeling death coming upon him, called for pencil and paper and calculated the time of his passing, 'to the minute' it is said. He died on 16 December 1860, and was buried in Hadleigh churchyard. On his death certificate his profession is given as 'quack doctor'.

MUSES

IN THE EARLIEST Greek traditions the Muses were goddesses who inspired poetry and song; gradually they came to be thought of as presiding not only over different kinds of poetry but also over the arts and sciences in general. As a result, Greek education in historical times was thought of as a combination of 'music' (roughly, any art over which the Muses presided) and gymnastic (or physical education). A museum (*mouseion*) was first a shrine, seat or haunt of the Muses, a home of music or poetry, and later a philosophical school and library, such as that of Plato at Athens, or the Museum ('temple of the Muses') at Alexandria.

The latter is described by Strabo, the geographer, who paid a visit to Alexandria in 24 BC, as being in the royal quarter of the city. It included a covered walk, an arcade with recesses and seats, and a large building with a common hall where the scholar-members of the Museum went for meals. This scholarly association had a common fund. Its president, who was a royal nominee, was known as 'the priest of the Muses' shrine'. It is probable that members of the Museum were given an annual salary, but it is not known what detailed branches of scholarship were pursued. Certainly schools of medicine and mathematics were formed, lectures were delivered, and there was organized scientific research. There were two libraries, the chief librarian's post normally going to a man of letters who was also tutor to the royal household.

A Company of Nine

Apparently the Muses were once three in number, but were later thought of as a company of nine. They were: Calliope or Calliopeia, 'the beautiful voiced', the epic Muse, who was represented with a tablet and stylus and sometimes with a roll of paper or a book; Clio, the Muse of history, who was depicted either sitting or standing, with an open roll of paper or chest of books; Erato, 'the lovely', Muse of erotic poetry and of mime, who was sometimes shown with the lyre; Euterpe, 'the well-pleasing', Muse of lyric poetry, was represented with a flute; Melpomene, 'the singer', was portrayed with a tragic mask, the club of Hercules, or a sword; Polyhymnia or Polymnia, 'Muse of the many hymns', was depicted in attitudes of meditation, normally without any characteristic symbol or object; Terpsichore, 'delighting in dance', was shown with lyre and plectrum, an instrument used for plucking stringed instruments, as Muse of choral dance and song; Thalia, or Thaleia, 'the festive one', Muse of comedy, of playful and idyllic poetry, was portrayed with a comic mask, shepherd's staff or ivy wreath; Urania, the heavenly Muse of astronomy, was represented with a staff pointing at a globe. These neat distinctions were developed in later antiquity, however, and names and functions differ according to the sources.

The traditional association of Apollo (see APOLLO) and the Muses is as familiar in Greek mythology as is their joint patronage of poetry, dancing and music. This association appears to derive from prehistoric times and is comparable with actual choral performances by a female chorus under a male leader. The poet Pindar (5th century BC), in one of his odes, describes how the Muses danced in a chorus led by Apollo with his seven-stringed lyre at the marriage of Peleus and Thetis, the parents of Achilles.

In Homer's *Iliad*, after the Olympian deities have feasted, Apollo plays his lyre as the wine goes round and the Muses sing, 'answering one another'. In one of the Homeric Hymns the Muses sing, again antiphonally, of the immortal gifts of gods and the trials of mankind, while the *Horai* (Hours) and *Charites* (Graces) dance hand-in-hand to Apollo's music, and the god himself actually takes part in the dancing.

Originally goddesses who inspired poetry and song, the Muses eventually came to be thought of as presiding over the arts and sciences generally: Terpsichore, the Muse of choral dance and song; Greek vase, 440 BC

Michael Holford

The old bards derived their inspiration and usually their real knowledge of things from the Muses who were, for the epic poet Hesiod, 'the daughters of Memory'. The epics begin with invocations to the Muses. Odysseus, for instance, in Homer's *Odyssey*, compliments a minstrel by saying he must be inspired by Apollo or the Muses.

Although Apollo's association with these goddesses is clearly attested in the early epics, and can reasonably be assumed to have derived from prehistoric times, the Greek traditions also suggest that the Muse goddesses and the god Apollo were brought by different routes to form their association on the Greek mainland, perhaps in Boeotia in central Greece. For the Muses were originally mountain goddesses from the north, from Pieria and Olympus, whose later cult extended southwards to Helicon and Parnassus. In historical times in antiquity their main centre was at Thespiae, an ancient town in Boeotia, where they were worshipped by a society named after Hesiod.

The origin of Apollo is more controversial, some scholars favouring a northern, and some an eastern origin, while others suggest a compromise twofold origin from north and east. However that may be, those who argue for the more primitive and separate role of the Muses, before their association with Apollo, emphasize that the god was absent at the funeral of Achilles, as Homer describes it. For the poet says that the Nereids stood around the body, weeping bitterly as they wrapped it in the winding-sheet, while the nine Muses, answering one another, sang the dirge. A male would have had no part in an old traditional dirge such as this, performed exclusively by women.

The Muses have exercised great influence on the European cultural tradition. This is natural, as they were deeply embedded, from the earliest times, in the most basic cultural impulses of social life.

R. F. WILLETTS

What exactly was ambrosia, which drove Dionysus' followers into frenzy? Robert Graves suggests that many puzzling references in literature can be explained if taken to imply the use of certain hallucinogenic mushrooms

MUSHROOM

THE PROFOUND importance of mushrooms in primitive religion had remained undetected until some 20 years ago, when Mr R. Gordon Wasson, an American banker, and his Russian-born wife Valentina first called attention to it. The new science of ethnomycology, meaning the attitudes of different races to mushrooms, began with the Wassons puzzling over the division of Europe into two distinct camps: mycophobes (nations traditionally afraid of mushrooms) and mycophages (nations addicted to eating them). The mycophages of Europe are found in Spain, southern France, the Balearics, Bavaria, the Balkans and Russia. Russians are the greediest mushroom-eaters and recognize over 90 varieties of edible ones.

Until recently the English ate only the white field mushroom *Psalliotis campestris*, except in the Midlands where blewits, lilac-stemmed mushrooms, were sold in the markets.

Mushrooms had been regarded by the Hebrews as holy and reserved for priests, kings and other privileged people; and to prevent the unprivileged from eating a sacred mushroom, a general *syeg* or taboo was put on mushroom-eating and reinforced by treating all mushrooms as poisonous. However, an unexplained relaxation of the taboo in England allowed the eating of white field mushrooms, though the most deadly European mushroom of all, the *Amanita phalloides* with which Nero's step-father the Emperor Claudius had been poisoned, was equally white and has often been mistaken for it. It is therefore reasonable to guess that the sacred mushroom originally protected by these taboos grew in forests, not fields, and was scarlet (a colour which in the context of food was taboo among the ancient Greeks); and that the taboo explains the diabolic or disgusting names given even to the highly edible other mushrooms.

But why was the scarlet mushroom (which can easily be identified with the white-spotted one now favoured by red-coated gnomes in suburban gardens) held sacred? This spectacular mushroom grows by the million all over the British Isles, but only in birch forests.

A simple answer is that this was the magical mushroom, on which sat the caterpillar smoking his hookah, that Alice found growing in Wonderland. Lewis Carroll had read about its properties not long before he published his book; they included the same hallucinations about height – 'curiouser and curiouser' – from which Alice suffered after nibbling it.

This mushroom is named *A. muscaria* – popularly 'Fly agaric' – and has now been proved by Gordon Wasson's detailed examination of the Vedic hymns to have been the food of the gods. It is there named 'soma'. That it is also 'ambrosia' and 'nectar' (both these words mean 'immortal'), famous as food and drink of the Greek Olympian gods, I had myself shown some 12 years previously. Two early Greek poets, Sappho and Alcman, had preserved the ancient tradition of ambrosia as a drink, not a food. This was because the juice of the mushroom – which lost its virtue when cooked – was squeezed out of it between boards, then mixed with milk or curds, and the pulp was thrown away. According to the Vedic hymns, Agni the Hindu god of mystic illumination and holy fire, who was also expressly identified with the sacred drink soma, had been created when the father god Indra threw a lightning bolt at the earth.

Dionysus, the Greek god of mystic illumination (see DIONYSUS), was similarly born when his father the god Zeus threw a lightning bolt at the earth goddess Semele; the bolt killed Semele but her child was saved and sewn up in his father's thigh, whence he was later granted a second birth. Dionysus is said to have eventually conducted his mother to heaven where she changed her name to Thyone, meaning 'queen of the maenads' (or raging women) and presided over Dionysus' ecstatic October festival, called 'the Ambrosia'. October was the mushroom season. The effect of the *A. muscaria* taken without other intoxicants is to give the taker the most delightful hallucinations, if he is in a state of grace, but horrible nightmares otherwise. Fortified, however, with beer and the juice of yellow ivy it would send Greek men and women mad.

The pre-classical priests of Dionysus, a god now known to have been active in Mycenean times, seem to have claimed sole rights in this scarlet mushroom, the memory of which they had brought from their original homes in central Asia and which is not found growing further south towards the Equator, except at a great height and always in birch groves. The Vedic priests of Agni seem to have imported their supply from the groves of the high Himalayas. Throughout the world mushrooms were believed to be begotten only by lightning.

That Dionysus was ambrosia, as his Indian counterpart Agni was soma, is proved by the legend of his birth from Zeus's thigh. The Vedic hymns make it clear that the priests of Indra and Agni used the two different ways of taking soma still found among the paleo-Siberians called Koryaks, and also in a small Mongol enclave of Afghanistan. The first was a simple drinking of the juice pressed from the mushroom between boards and mixed with milk or curds. The hallucinogenic substances it contained entered the stomach; but a great many more entered the kidneys and were later discharged with the urine. Clean-minded classical scholars have until now shut their eyes to the possibility that the Vedic hymn-writer may have meant exactly what he said with 'the great gods piss out together the lovely Soma'. Yet it has been known for at least two centuries that the Koryaks do so after drinking the mushroom juice, and that their friends strain the urine through wool and, after drinking it, enjoy the same ecstasies.

And this, of course, explains Dionysus' second birth from the thigh of his father Zeus and his subsequent release to worshippers in a stream of hallucinogenic urine. Yet Dionysus' source of intoxication has always been politely attributed by Greek scholars to wine, and ambrosia is identified in the Oxford English Dictionary with *asclepias* (milk weed); and by various encyclopedias with almost every sort of plant except mushrooms.

The Norse berserkers were magicians and sages, and seem to have used the scarlet *A. muscaria*, as did the Koryaks, for inducing prophecies. They were called 'berserkers' because they worshipped the bear goddess, and wore bear skins in her honour. Their cult was suppressed in the 11th century AD by Christian converts, not only in Scandinavia but in Iceland, where dwarf birches in the centre of the island provided the berserkers with their *Amanita*.

The proverb quoted by the Emperor Nero 'mushrooms are the food of the Gods' was true in the sense that they provided the passport to a paradise from which the mushroom-eater was permitted to return, like a god, after his celestial visions. Yet Nero who, having been excluded from the Eleusinian Mysteries for murdering his mother Agrippina, had not himself visited paradise, quoted the proverb only in a mocking sense: for his step-father Claudius, after dying from *A. phalloides* poisoning administered by Agrippina, had afterwards been deified.

I have eaten the Mexican hallucinogenic

National Museum, Guatemala

Hodder & Stoughton/Colourcel

To ensure that the sacred mushroom was eaten only by priests, kings and other privileged people the Hebrews put a taboo on fungi-eating generally, and reinforced this by treating all mushrooms as poisonous *Previous page* The sacred mushroom has been identified as the toadstool traditionally associated with fairies: elfin dance by the 19th century artist Richard Doyle *Right* Sculptural representation of the hallucinogenic mushroom of the Mexicans *Far right* The juice of 'Fly agaric', *Amanita muscaria*, may have been the principal ingredient in soma, the drink of the ancient Indian gods, and in the ambrosia of the Greeks

mushroom *Psilocybe Heimsii* myself in Gordon Wasson's company, with the intention of visiting the Mexican paradise called Tlalocan to which it gives access. The god Tlaloc, who was toad-headed, corresponded exactly with Agni and Dionysus. I also wanted to know whether I had been right in supposing that all religious paradises except the Christian (which is based on a 1st century Eastern potentate's court) such as the Hebrew, the Sumerian, the Indian, the Mexican, the Polynesian and the Greek (known as the 'garden of the Hesperides') were not only very much alike but corresponded also with individual paradises seen by such mystics as the Welsh religious poet Henry Vaughan. The word *paradise* means 'orchard' in the Semitic languages: an orchard garden of fruit trees, flowers and running water.

Paradise of Jewels

I found that I had guessed right though there are, I believe, certain dissimilarities: for instance elephants appear in the Indian paradise and in others the inevitable serpent, familiar to readers of the paradise chapter in Genesis (chapter 3), may appear, as it did for me, as an intricately patterned gold chain. A bright snake-like formation is, by the way, a common symptom of a cerebral de-oxygenization induced by hallucinogenic drugs; and seeing snakes is a common occurrence among alcoholics, saints who starve themselves, drowning sailors and sufferers from meningitis. My experiences included not only an orchard paradise where one can see sound and hear colours and watch trees growing leaf by leaf, but a paradise of jewels like that described in the book of Ezekiel (chapter 28, 13–14).

The *Psilocybe* mushroom used in the Mexican rites is small, brown in colour, slender-stalked and bitter, but sculptural evidence from Central America suggests that it had supplanted *A. muscaria* in ritual use, probably because it was easier to obtain and because the hangover did not last so long. The same change seems to have occurred in Greece: the discovery of a new hallucinogenic mushroom (a Stropharia or a Panaeolus) which, unlike the *A. muscaria*, could be ground up and baked in sacrificial cakes for religious use in the Mysteries without losing its powers.

When, according to the Greek myth, the corn goddess Demeter (see DEMETER) visited Eleusis, the Attic city where the Mysteries were to be celebrated for another 2000 years (see ELEUSIS), she is said to have ordered Triptolemus, son of the local king, to drive around the civilized world in a chariot drawn by snakes, spreading the arts of agriculture as he went. This myth is clearly deceptive. Corn had been sown and harvested in Palestine for several thousands of years before Demeter's arrival at Eleusis. What may have happened is that the local priestess sent a message about the newly-discovered mushroom to priests and priestesses throughout the civilized world – hence the snakes in Triptolemus's chariot.

A fox-coloured variety of the *A. muscaria* has the pine as its host-tree; it is equally hallucinogenic. That it was ritually used in biblical times is suggested by an unwritten Hebrew taboo on mushrooms, broken only by the non-Orthodox. (Arabs, by the way, are mycophagous which perhaps accounts for mushroom-eating in those parts of southern Europe occupied by the Saracens during the early Middle Ages.)

A concealed reference to their use appears in the book of Judges (chapter 15): the unlikely story of how Samson collected 300 foxes and sent them into the Philistine's cornfields with torches tied between each pair of tails. The Palestinian fox is not gregarious and the task of capturing 300 of them, at the rate of one or two a day, and feeding them all until he had collected the full number would have been a senselessly exhausting one. Besides, how could he make sure that the foxes would run into the cornfields and keep the torches alight? The truth seems to be that Samson organized a battalion of raiders – 300 was the conventional Hebrew battalion strength – and sent them out with torches to burn the Philistine's corn. Indeed, in the 1948 Jewish 'War of Liberation' a raiding battalion was named 'Samson's Foxes'.

Chris Barker

'One side will make you grow taller, and the other side will make you grow shorter,' the caterpillar told Alice: effects of eating *A. Muscaria* include the hallucinations about height which Alice suffered after nibbling at the magical mushroom on which the caterpillar sat: illustration to *Alice in Wonderland* by Arthur Rackham; Victoria & Albert Museum

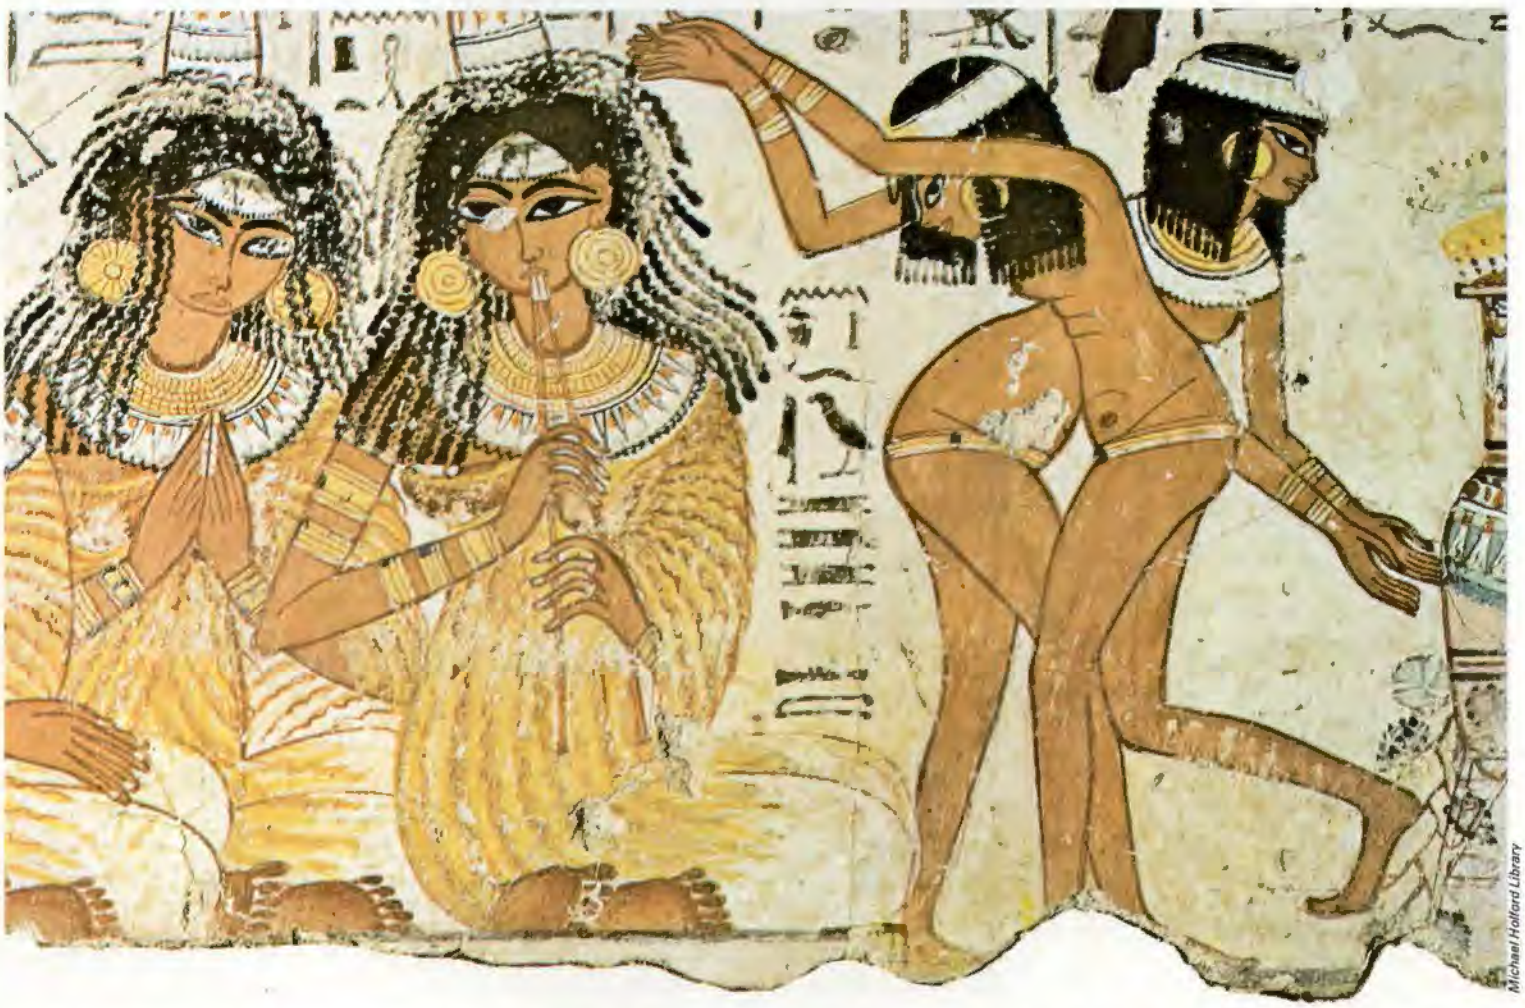
But why foxes? Because the juice of the *A. muscaria* mushrooms (which still grow under pines on Mount Tabor) could be laced with ivy juice or wine to make the raiders completely fearless, and because this variety is fox-coloured. So are other mushrooms, such as the popular *chanterelle* which the Russians call *lychenko* 'little fox'. In the Song of Solomon (2.15) the Shulammite bride about to take part in a sacred marriage, urges her lover to catch her 'the little foxes, that spoil the vineyards, for our vineyards are in blossom'. She means that Solomon must fortify his manhood with mushroom juice laced with wine, the better to enjoy her young beauty.

Why mushrooms were called 'toad's bread' or 'toadstools' by mycophobes can readily be explained. When the toad is attacked or scared the warts on its back exude *bufonenin*, the same poison that is secreted in the white hallucinogenic warts of the *A. muscaria*. In ancient Greece the toad was the emblem of Argolis, the leading state of the Peloponnese. The capital city was Mycene ('mushroom city') said to have been built by the legendary king Phoroneus's successor Perseus ('the destroyer') who had found a mushroom growing on the site beside a spring of water. The toad was also the emblem of Tlaloc, the Mexican god of inspiration, and appears surrounded by mushrooms in an Aztec mural painting of Tlalocan, his paradise.

The Slavs are not mycophobic probably because their remote ancestors were nomads on the treeless steppes and unacquainted with the *A. muscaria*. Their fermented mare's milk satisfied their need for occasional intoxication. Like the Arabs in their desert poverty they had learned to eat any growing plant or living animal that was not poisonous. (See also DRUGS; PEYOTE CULTS.)

ROBERT GRAVES

Note: Certain fungi which are widespread are poisonous, and some people have an allergic reaction to others which are in general harmful. It is very unwise therefore for anyone lacking specialized knowledge to experiment with them



Michael Holford Library

'At its best music can heighten holy word and ritual action alike, and can point beyond itself'; the drumbeats of primitive societies and the chanting of Gregorian plainsong are aspects of music's essential role in religious rituals

Music is an important and emotive element in religious ritual, accentuating the symbolic actions of ceremonial dancers: girls dance to the sound of pipes and the rhythmic beat of hands being clapped; wall painting from an Egyptian tomb, c 1400 BC

MUSIC

THERE ARE FEW religions in which music has played no part at all. On the surface, there is all the difference in the world between the music of an African tribal ritual, for instance, and Bach's *St Matthew Passion*, but beneath the differences there is the fundamental resemblance that music is being used to help express and heighten the content of ritual action of some kind. Music is part of the universal language of ritual, and without it ritual must always be impoverished. Remove the musical content from the average Christian act of worship and most members of the congregation would feel deprived of something essential.

Even in those cases where music has no immediate connection with the ritual act, it is common to find people claiming to derive 'spiritual sustenance' from music of all kinds – from pop to Pergolesi, from Bach to beat. Music, then, can become an emotional substitute for ritual. But for the most part it follows the ceremonial of religion in this world, and life beyond it. The angels in Christian mythology are consummate musicians, and musical performance is believed to be a suitable occupation for the timeless life of heaven; while in this life, the words of Scripture may be sung as well as spoken; temple, church and synagogue musicians, choirs and cantors, psalms and hymns, rhythms and Hindu *ragas*, all are part of that vast and complex phenomenon called religion.

Music is one of several elements in cult or ritual, for it is in the context of ritual that 'religious music' has found, and still

finds, its main area of expression. First there is purely physical movement and action, with the dance as its most important aspect (see DANCE). Probably imitative in its earliest forms, the dance came to include a vast range of symbolical actions, no doubt partly magical in intention. For instance, by dancing in such a way as to imitate the movements of an animal which was to be hunted, the dancer 'became' for magical purposes the animal in question; the symbolical hunt culminated in the 'killing' of the individual. The action itself was such as to remove the participants from the limitations of the everyday world, and to establish them temporarily on the 'other side' among the powerful supernaturals.

The second element begins with the rhythmical movement of the dance. The rhythm of the dance, which in primitive societies often has directly sexual connotations, particularly where fertility rites are involved, is 'accompanied' at first by means of hand-clapping, stamping and the beating of improvised percussion instruments. Improvisation passes into more deliberate accompaniment, usually by the drum, probably the most widespread of all ritual instruments. Examples of 'sacred' drums are found all over the primitive world. Among the best-known are those of the shamans of northern Europe, Asia and North America, indispensable items of equipment, for by them the spirits were called, and in them they were gathered.

Link with the Spirit World

A further stage is reached when the voice is brought into play. The participant may strain his or her voice to imitate animal noises, or to pass outside the normal range of vocal expression. This, too, could be thought of as a potentially or actually sacred act, forming a link with the all-powerful spirit world. A particularly gifted performer would assume the role of leader, and the remainder would respond, usually by simply repeating the short phrases first announced by him. The dance, then, leads naturally into a simple form of music, with heavily accentuated rhythms but little or no harmony, and very simple and short melodies. Both together combine to provide a setting for a magically effective ritual which breaks the bounds of the everyday and normal.

Dance and rhythmical music together are, of course, highly emotive, a phenomenon which can be observed in all types of culture. Today they may serve as no more than a safety-valve, a release from the pressures of 'civilized' society; but the chanting of, for instance, 'Hare Krishna Hare Krishna Krishna Krishna Hare Hare!' as practised by the International Society for Krishna Consciousness, has more than a purely therapeutic aim. It is a sophisticated application, brought to the West from India, of a ritual action as old as mankind. In some cases, the apparently monotonous repetition of short musical phrases in the context of the dance can lead to trance and catalepsy, and it is quite clear that in primitive societies the object of the exercise was to make contact with the spirit world. Cataleptic trance was the clearest sign of this contact. The Plains Indians of the North American continent believed that a man was immature until he had achieved contact with a personal guardian spirit; this was held to have been accomplished when the spirit revealed itself and taught the seeker a 'spirit song', which no other man might ever know, and which the individual might use whenever the spirit was to be summoned.

Dance and rhythmical melody are two aspects of religious music. The third is verbal and conceptual; to dance and music is added the holy word. As man began to live in more permanent settlements, music tended to become less spontaneous and more elaborate. This was largely because of its use in connection with sacred texts such as hymns and prayers which were used in temples and other holy places. The development of writing rendered these more permanent. It is a curious fact, incidentally, that many of the holy scriptures of the ancient world were composed in verse forms rather than in prose, and it is known that these were originally chanted in order to heighten their sacred quality. In ancient Mesopotamia, Egypt, India and elsewhere, holy places were commonly provided with a complement of musicians and dancers, whose task was to praise and give pleasure to the gods, and to enrich the various daily and seasonal cycles of worship.

In ancient times, therefore, there seem to have been two potentially distinct ways in which music was used in the context of religion. The first of these was emotive and magical, and is seen most clearly in the link between music and the dance. The second was more conceptual and intellectual (though the emotive element was never far distant), and depended on the link between music and the holy word. At times there could be a degree of tension between the two. In the Old Testament, for example, music and dance were known to be part of the stock in trade of the cultic 'prophets' of Canaan, and were regarded with suspicion by the more orthodox Yahwists.

In Greece, certain instruments were condemned in some quarters on the grounds of their capacity for arousing the baser passions, largely because they had traditionally been used in the ecstatic cults of Dionysus, Cybele and other deities (see CYBELE; DIONYSUS). It would not be too far-fetched to see the present-day tension in Christian circles between advocates of 'serious' church music and those who make use of 'revivalist' techniques in music as being substantially the same quarrel.

Aesthetic criteria for the judgement of musical quality were introduced in the West from the 17th and 18th centuries onwards. Whereas music had previously been either a matter for personal involvement as a performer, or a medium for the transmission of the content of the religious tradition, it now became possible for music to be ritual no longer, but to remain 'religious'; it could escape from its ceremonial setting and become a purely subjective experience for the listener. But while certain types of music could easily be accepted as religious (or appreciated as edifying), other types were regarded with the gravest suspicion, usually because of their associations with otherwise suspect activities.

Just as some Greek philosophers had once condemned the *aulos* (a sort of crude oboe) because of its links with the ecstatic cults, some Christians have tended to associate the violin with Satan, and to depict devils playing bagpipes. It did not seem unreasonable to suppose that the Devil had taught Tartini one of his violin sonatas, or to accuse Paganini of being in league with Satan. Churches of the Puritan tradition refused for many years to allow their hymn-singing (or more strictly, psalm-singing) to be led other than vocally, and schisms were caused over the introduction of the organ.

As Christianity spread into Africa and the East, Western musical standards were introduced. In Africa, for instance, the drum was held to be part of the 'pagan' religious background, and was therefore excluded from Christian worship. Recent attempts to encourage an indigenous character in African church music have met with a somewhat mixed reception; enthusiasm in some quarters, shock in others, as it has seemed to some Africans that to return to the use of the drum is to return to a rejected past.

Emotional Appeal

The recent history of religious music in the West is a chequered one. On the Lutheran wing of the Reformation, the degree of emotional response which music has always been able to arouse was never underestimated. Luther himself was a musician, and gave music a prominent role in worship. He recognized, as did John and Charles Wesley in Britain, that congregational singing of 'psalms and hymns and spiritual songs' is, or can be, a powerful means of affirming belief as well as a profoundly satisfying emotional experience. A similar technique can be observed in more modern revivalist movements, from Sankey and Moody, the 19th century American evangelists, to Billy Graham; here the object is to create an atmosphere of receptivity by means of simple, direct music which makes an emotional appeal to the people.

In other Christian circles, music need be neither simple nor direct. Aesthetic considerations may he as important as evangelical ones, and the performance, instead of being a matter for the congregation as a whole, will often be left to skilled professionals or semi-professionals. But perhaps the distance between the individual listening to Handel's *Messiah* and the individual singing 'Blessed assurance, Jesus is mine' is less than might be supposed.

An important contrast of principle is seen if the general practice in Lutheran churches of placing organ and choir as far away from the altar as possible, in a gallery at the west end of the church, is compared with the Anglican practice of placing the choir and organ in the chancel, and of entrusting them with the greater part of the liturgy, and not merely with comment upon it. In the long perspective of the history of religion, the Anglican practice is the more easily justified, even though it may have a deadening effect on congregational participation. Music in religion began in the context of ritual: so

John Moss

Above **Musicians beating drums, probably the most widely used of all ritual instruments: 13th century Ethiopian wall painting *Right* Mary ascends to heaven to the accompaniment of music played by angels, traditionally consummate musicians: *Assumption of the Virgin***

much is certain. And in Christian terms, ritual centres on the altar. In so far as music is an integral part of ritual, then singers, too, are servants of the altar, singing not in order to produce a satisfying emotional experience in themselves or others, but to the 'greater glory of God'.

Religious music may perhaps be summed up, in broad terms, as having a subjective or an objective character. Subjective music may aim at intensive participation or aesthetic appreciation, the latter being a particularly Western development. Objective music may engage man's feelings, but it is not aimed at them; it seeks to be a means by which the Real and Eternal may be pursued, whether in Gregorian plainsong, an Indian *raga*, or in the organ music of the French composer Oliver Messiaen. Frequently it derives its meaning from the holy word with which it is associated. Subjective music will always be popular; objective music will always be serious, and seldom popular.

Music, then, is simultaneously a medium, a language and an independent form of expression in which subjective and objective intertwine. At its best music can heighten holy word and ritual action alike, and can point beyond itself. In G. van der Leeuw's words: 'Music represents the great struggle of reaching the wholly other, which it can never express.' And in so far as religion also embodies man's efforts to reach, or to respond to, that same 'wholly other', then music has its given place; without it, man's quest would be immeasurably harder, and his pilgrimage immeasurably poorer.

MUTILATION

'Man is the only animal who deliberately mutilates himself': circumcision, scarification and other mutilations and deformations are inflicted for religious and magical reasons, and some of the early Christians castrated themselves in religious fervour

MEN AND WOMEN have mutilated themselves for religious or aesthetic purposes from the very beginning, and we can still see examples of this behaviour in civilized societies today. The wearing of ear-rings, plucking the eyebrows, and various forms of plastic surgery are, in a sense, relics of ancient tribal customs. Circumcision, for instance, began as a religious or fetishistic mutilation, while tattooing and piercing the ears belong to the same class of ornamental deformations as knocking out the front teeth and elongating the lips with wooden plugs.

It would seem that as man became aware of vast natural forces over which he had no control, he assumed that storms, winds, earthquakes and the rest were animated by spirits who had to be constantly appeased if he and his family were to escape death and destruction. Hence the idea of suffering as a means of placating a 'jealous god', and religious rites involving the spilling of blood, by human sacrifice, or by cutting or piercing the victim's face or body. An example of this religio-magical rite is the intended sacrifice of Isaac by his father Abraham; and while this holy murder, if carried out, would not have been precisely a case of mutilation, the principle involved is the same: the appeasement of the god by infliction of pain on some innocent victim (see SACRIFICE).

Eunuch Priests

The magico-religious origins of castration are seen in the ancient laws of certain Germanic tribes who made this mutilation the punishment for robbing temples, while in India it was inflicted on a man who urinated on a person of a higher caste. There were a number of Graeco-Roman cults in which the priests were man-made eunuchs. At Ephesus, the chief priests of the goddess Artemis, the virgin goddess and protector of women, were at one time required to be castrated; so were the servants of the goddess Hecate at Lagina, and the priests of Cybele and Astarte. Astarte, a mother goddess in origin and later the deity of sexual activity, fertility and maternity, was particularly partial to the mutilation of her priests. Her temples were served by sacred prostitutes and eunuchs, and we are told that the priests of Astarte used to run through the streets carrying their severed organs which they tossed into some house as a promise of fertility to a barren woman (see ASTARTE; CYBELE).

Even in the early Christian period, castration was considered desirable in view of the apparent commendation of eunuchs by Christ in the New Testament. According to Matthew (19.12), Jesus said: 'For there are some eunuchs who have made themselves eunuchs for the sake of the kingdom of heaven. He who is able to receive this, let him receive it.' The original Greek can, in fact, be more literally translated as, 'He who is capable of performing the act, let him do so.'

Origen, one of the most learned and respected of the early Fathers of the Church, castrated himself when a young man 'to quench the ardour of his youth'. Many other Christian priests between the 2nd and 5th centuries were also eunuchized 'for the sake of the kingdom of heaven' and self-castration apparently continued even after 325 AD when the Council of Nicaea explicitly forbade it. In 489 AD a bishop proved his innocence of charges of fornication brought against him at a Church conference by visually demonstrating to his accusers his inability to perform the sexual act because he was a eunuch.

But the Christian Church continued to condemn the practice severely, though it lingered on in the special case of the *castrati* who sang falsetto in the cathedral choirs. This mutilation of singers, however, was expressly forbidden by Pope Benedict XIV in 1752, though it is said that the castration of male singers for the opera stage in Italy continued as late as the second half of the 19th century.

Otherwise castration had been officially forbidden throughout the Western world during the late Roman Empire, when the merchants who bought and sold eunuchs were punished by fines and long periods in the mines. But the operation seems to have been performed despite the opposition of the religious and civil courts, for we read that eunuchs were used to gratify Roman matrons in the 5th and 6th centuries. This suggests, as does other evidence collected by anthropologists and medical men, that castration does not necessarily destroy desire in eunuchs, many of whom were married, though unable to have children. Women, too, have been subjected to castration for religio-magical reasons in an operation called oophorectomy, the excision of the uterus and the ovaries, performed among certain Australian aboriginal tribes in order, it is believed, to prevent their conceiving by men of a hostile group.

The last vestiges of this ritual mutilation in the Western world are found among a Russian religious sect known as the Skoptsy (or 'self-castrators'). The Skoptsy appeared on the scene during the 18th century, when a certain Kondrati Selivanov declared himself to be Tsar Peter III and a son of God. Selivanov was at one time banished to Siberia as insane and then given quasi-divine honours in St Petersburg. He based his creed on the statement in St Matthew, quoted above, calling complete castration the 'royal seal' and partial castration the 'second purity'. Skoptsy women achieved the latter condition by having their breasts or nipples amputated. (See also SKOPTSY.)

Pepper for Pain

Closely related in the religio-magical sphere is the ritual of circumcision, which may have originated as a substitute for total emasculation. The operation appears to be as old as man himself, for it is practised all over the world among widely different primitive tribes. Interestingly, the Australian aborigines perform the operation with a flint knife, exactly as it is described in the Old Testament where Zipporah took a flint and cut off her son's foreskin (Exodus 4.25). Some anthropologists see in this rite a desire for rebirth, as the foreskin is sometimes buried and sometimes eaten.

The religious connotations of this type of mutilation are clearly emphasized in the deliberate infliction of pain in primitive societies. Where circumcision is part of the initiation ceremony, for instance – as it is with the Bantu – pepper is shaken over the

In many societies deformations have become a mark of tribal belonging; as well as being regarded as an aid to beauty, cicatrization may also have an underlying social purpose: the scarring on this Sudanese girl's back indicates that she is married, and also shows how many times she has been pregnant

wound to ensure that the young man is inured to the dangers and sufferings that lie ahead of him. His pain is supposed to appease the gods and spirits. Some tribes go so far as to practise sub-incision, or slitting open the underside of the urethra.

The full religious connotations of circumcision are best seen, of course, in the ancient Jewish custom, for it is impossible to be an orthodox Jew unless this operation has been performed, with all the accompanying rites and prayers. When the Romans tried to suppress the practice during their occupation of Palestine, they met with a fanatical resistance. The Jews were quite adamant that any attempt to prevent them circumcising their male children was an interference with their basic beliefs.

Circumcision of males is often justified today on prophylactic grounds, and it is no longer regarded as a mutilation. But all civilized people denounce the circumcision of females, or clitoridectomy, as an inhuman practice. Yet many African tribes regard it as an essential part of the initiation of girls into adult society. Early explorers in both Egypt and South Africa noted the prevalence of clitoridectomy and associated it with what was known as the 'Hottentot Apron', an extension of the *labia minora*, which was snipped off by old women who supervised the upbringing of young girls.

A comparable mutilation of the sexual organs is infibulation, the partial closing off of the penis with a button and of the vagina with a clasp. Infibulation, like partial castration (circumcision) and total emasculation (eunuchism), has its origin in old religious beliefs – beliefs or taboos which have survived, though in more sophisticated forms, to this day. The underlying attitudes are much the same: a consciousness of guilt on the one hand and the need to inflict pain to atone for the guilt on the other. Consequently deformation became a mark of tribal belonging and of personal adornment, common to all periods of history and all types of society, sophisticated as well as primitive.

Perhaps the most obvious example of this is tattooing, which was reintroduced into the Western world from the South Seas, though the ancient European tribes, the British among them, had also disfigured their bodies

Carl Fuchs

One of the most ancient forms of mutilation, circumcision is part of the initiation rites of primitive societies all over the world; the deliberate infliction of pain is thought to appease the gods and spirits, and to inure young men to the dangers that lie ahead of them: youth of the Omar tribe in the Sudan undergoes circumcision during his initiation

in this way. The 'magical' effect, or implications, of tattooing are as apparent when found on an Englishman's chest or arm as on the body of a Polynesian. In the latter case, however, the process is much more painful, for the staining of the skin is usually accompanied by scarification caused by scratching with thorns, fish spines, shells or bones.

The Magic of Scars

It is often difficult to know where mutilations for religio-magical purposes end and those for aesthetic or ornamental reasons begin. Deformations in the form of scars and welts, extremely common among African tribes, are often regarded as aids to beauty, as the application of cosmetics is with us. But we have a clue to the origin of some of these mutilations in the custom of scarifying the bellies of Kikuyu women, the purpose being to cause 'sickness' in illicit lovers.

The scarred and disfigured faces of African warriors, on the other hand, have the obvious object of intimidating their enemies and conversely, of attracting the opposite sex. By the same token, the scarification of African women represents a complementary 'magic', whence Bantu girls, for instance, are judged for their beauty by the number of scars and welts on their faces and bodies. They achieve these mutilations by fastening ridges of flesh on their foreheads and stomachs with hooks, and rubbing dust into the wounds.

Teeth have always come in for their share of deformations, with some primitive people knocking out one or more of their incisors for reasons whose origin is now obscure. Such painful practices, however, are usually connected with initiation ceremonies, a fundamental part of which is the sacrifice of some part of the body as an offering to the gods or spirits. The same is true of such practices as making holes or slits in various parts of the face in order to insert rings in the ears or pegs in the nose. A bizarre example of this deformation is found among the Ubangi of central Africa, whose women have their upper and lower lips slit and then distended with saucer-shaped wooden plugs. Cases have been reported of women with their lips stretched in this fashion to a diameter of four inches for the upper and seven inches for the lower lip. Brass rings are used by Burmese women to elongate the neck to a point where the head cannot be bent at all. At the other extremity of the body, Chinese women once had their feet deformed by having them bound in childhood.

We see remnants of many of these mutilations in our own Western fashions, particularly where personal adornment is concerned. A study of human behaviour through the ages proves that men have always been willing to suffer bodily pain, either as a concession to religion or to current fashion. Man is the only animal who deliberately mutilates his body, which some observers argue is proof that he alone has a soul.

JAMES WELLARD

F. W. H. MYERS

BORN AT Keswick in Cumberland on 6 February 1843, Frederic William Henry Myers was the eldest of the three sons of Rev. Frederic Myers by the latter's second wife, Susan Harriet Marshall. The Myers were an old Yorkshire family, and his mother was the youngest daughter of John Marshall, founder of the famous flax-spinning factory at Leeds, and prominent in the Lake District.

Myers's father died in 1851. His mother then settled at Cheltenham, and sent her son to school at Cheltenham College. He showed outstanding classical and literary ability there, and later at Trinity College, Cambridge, which he entered as a scholar in 1860. After a brilliant academic career, he graduated in October 1864. Immediately afterwards he travelled in Italy and in Greece, and in the summer of 1865 he toured Canada and parts of the United States; in the course of this tour he one night swam the Niagara River below the Falls. Later in the same year he was offered, and accepted, a Fellowship and college lectureship in Classics at Trinity. He held this until 1869, when he resigned in order to devote himself to the higher education of women. In 1873 he became a school inspector, a career which he followed until shortly before his death in 1901.

Myers wrote, and had privately printed in July 1893 for six of his most intimate friends, a pamphlet of about 40 pages, mainly of prose but partly of verse, entitled 'Fragments of Inner Life'. It throws much light on his personality and on certain phases of his emotional life. According to his own statement, he had very strong sexual inclinations, which he indulged. These would seem to have been mainly homosexual in his youth, but in later life he was wholly heterosexual. Behind all this was his unusually intense love of life, his horror at the thought of extinction for himself or for others, and his semi-mystical feeling that the diversity of this world concealed a higher unity with which he might hope to make personal contact.

Brought up as an Anglican, he had become a kind of neo-classical pagan by the time of his Greek tour. But in 1865,

influenced by the social reformer Josephine Butler, he entered on a phase of highly emotional Christianity. During this he wrote two religious poems, *St Paul* (1867) and *St John the Baptist* (1868). The first of these, at any rate, won a good deal of admiration. By the beginning of 1869, however, Myers realized that he was no longer a Christian. He never reverted to Christianity nor came to accept any other form of allegedly revealed religion, and he passed through a period of (for him) severe depression and spiritual deadness. This was terminated by an emotional interlude, with a tragic ending, which occurred in the 1870s, and had a profound effect on the whole of his later life. The essential facts, so far as they can be ascertained, are these.

Walter James Marshall, a maternal first cousin of Myers, was married to Annie Eliza Hill, one of the daughters of a Yorkshire clergyman. Walter was liable to what appear to have been manic-depressive alternations of mood, which were a constant source of worry to his wife. She early confided her troubles to her aunt by marriage, Myers's mother. Myers came to admire more and more Annie's courage and good temper under the extremely trying conditions of her married life. By the summer of 1873 this admiration had passed into love, which she returned. In chapter 4 of 'Fragments of Inner Life' this is described as 'love that never found its close'. From this, and from a poem in chapter 5 entitled *Honour*, it seems pretty certain that, after an intense struggle at any rate on his part, they resolved to refrain from physical intercourse, and kept their resolution.

At the beginning of May 1876 Walter Marshall entered into an acute manic phase, and was for a time confined under medical supervision, first in an asylum and then as a private patient in the house of a specialist in mental disease. (He eventually recovered sufficiently to become a Deputy Lieutenant and a Justice of the Peace in the Lake District.) In September of that year Annie drove with Myers's mother from Keswick to her home at Old Church nearby. They parted at about seven in the evening. Next morning Annie's body was found in Lake Ullswater. She had first tried to cut her throat with a pair of scissors and, failing in that, had then drowned herself in the lake.

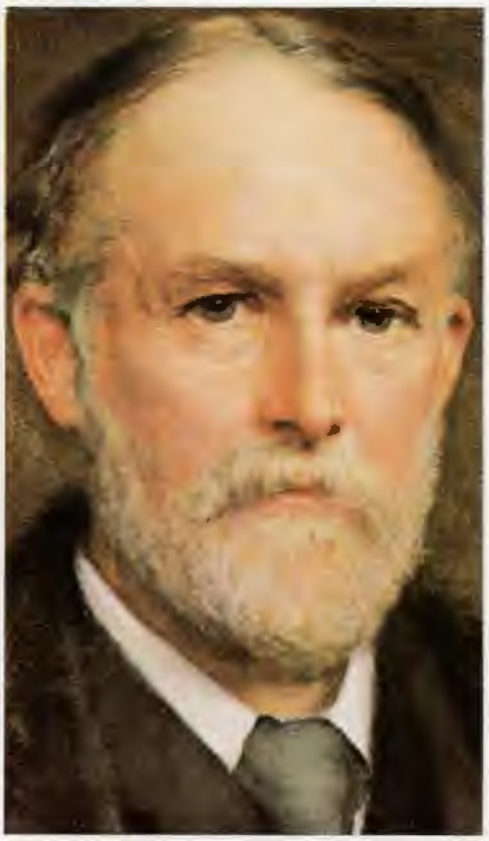
Myers was out of England at the time, on a trip to Scandinavia with his youngest brother Dr A. T. Myers. He describes in 'Fragments of Inner Life' his first reactions to this shattering blow. Naturally, he does not refer to the details of Annie's life or of her death, and does not mention that she committed suicide. And he refers to her, not by her real name, but as 'Phyllis'. It is plain that he believed or half-believed that they had already known and loved each other in a previous non-incarnate state of existence. And he came to hope (with increasing confidence as he thought that relevant empirical evidence accumulated) that they would be reunited in a similar state, after the death of his present body.

On 13 March 1880, however, some three and a half years after Annie's death, he had recovered sufficiently to marry Miss Eveleen Tennant, then 22. She was a wealthy and fashionable young woman, the head of whose family was her brother, Charles Coombe Tennant of Cadoxton, whose wife became the celebrated non-professional medium known as 'Mrs Willett' (see WILLETT). The Myers made their home on what was then the outskirts of Cambridge. They had three children.

Early in 1900 Myers became seriously ill, and developed the 'Cheyne-Stokes symptom' of difficult and painful breathing on falling asleep. He bore his sufferings with great fortitude, in the full expectation of being reunited after death with 'Phyllis'. He died in Rome, where he had gone for unorthodox medical treatment, on 17 January 1901, and is buried beside his parents in Keswick churchyard.

Myers first came into close contact with the two men who became, with him, the chief founders of the Society for Psychical Research, in the 1870s. Both Fellows of Trinity College, Cambridge, they were his senior, and sometime teacher, Henry Sidgwick (1838-1900), and his junior, and sometime pupil, Edmund Gurney (1847-1888, see GURNEY). The S.P.R. was founded in February 1882 at the instigation of Sir William Barrett (1844–1925), and as a result of his efforts and those of Myers and Gurney. Sidgwick was President and Gurney was honorary Secretary. It may fairly be said that from that time onwards the society formed the focus of Myers's vigorous activities.

Myers became joint Honorary Secretary to the S.P.R. in 1888, after Gurney's untimely death, and President in 1900. He had helped Gurney in the immense labour of preparing *Phantasms of the Living* (1886), and had contributed the elaborate Introduction and an important section entitled 'Note on a suggested Mode of Psychical Interaction'.



One of the founders of the Society for Psychical Research, F. W. H. Myers believed that the human psyche almost certainly survives bodily death: portrait by C. W. Wontner, in the National Portrait Gallery, London

Doctrine of the Subliminal

During this period almost all important work on such topics as hypnosis, hysteria, multiple personality, and what may be called in general 'abnormal psychology', had been done on the Continent, particularly in France. English psychologists and philosophers had contributed almost nothing, and had largely ignored the work which was being done by others. Myers, who made a thorough study of the material published abroad, was almost the only Englishman at the time who had attempted to do so. He had met many of the leading authorities, and had witnessed and participated in some of their experiments. He combined tact and *savoir faire* with a quite extraordinary gift of absorbing and accurately summarizing a wide range of complex literature. His numerous reviews in the S.P.R. *Proceedings* of works by Continental authors on abnormal psychology are masterpieces of exposition, and were at the time almost the only source of information available in English.

Myers's characteristic views on the nature of human personality, and his grounds for holding that it survives the death of the body, are most fully stated in his posthumously published two-volume work *Human Personality and its Survival of Bodily Death* (1903). The first volume is concerned mainly with phenomena which are normal (like sleep and dreaming), or at most abnormal (like dissociations of the personality) but which are generally not even ostensibly para-normal.

The second volume, on the other hand, is concerned with phenomena which are at first sight paranormal (ostensible apparitions of the dead, communications through mediums, which purport to come from the surviving spirits of the deceased, and so on). The last chapter of volume I, entitled 'Sensory Automatism', constitutes a connecting link, for it deals with cases similar to those treated in *Phantasms of the Living*, which seem to involve paranormal awareness by one embodied person of the roughly contemporary state and surroundings (involvement in a street accident, for instance) of another.

Underlying the details of the book is one basic principle of arrangement and unification. Each particular species of alleged fact is viewed, not in isolation, but in relation to many others which may at first sight seem to have little analogy to it. The contents range from phenomena recognized by everyone (like ordinary sleep and dreaming) through those which are accepted by persons who have had opportunities and the interest to look into them, but which are generally regarded as isolated oddities (the 'inspirations' of literary genius, for instance), to those viewed askance by most sensible and educated contemporaries

(alleged cases of 'haunting', and mediumistic 'messages', for example). When viewed in this way, many of these phenomena are seen to fall naturally into series. There remain certain gaps, and Myers proposes hypotheses, illustrated by highly ingenious analogies, to bridge these. And he tries to unify the whole into a single coherent system by his doctrine of the 'subliminal'. This attempt to take a broad view of a vast range of normal, abnormal, and ostensibly paranormal phenomena, is a unique merit of the book.

According to Myers's theories each human being is composed of two intimately and uniquely interconnected substances, the body, which is purely physical and the psyche, which is purely immaterial. Experiences are events in, or states of, the psyche; an essential part of a person's character and dispositions (including the traces left by experiences) reside in the psyche.

Myers took very seriously the evidence for each of the following interconnected ostensibly paranormal phenomena: 'out-of-the-body experiences', 'travelling clairvoyance', and veridical (coinciding with realities) collective and/or reciprocal hallucinatory quasi-perceptions (apparent perceptions).

These suggested to him that a human being's psyche, though not material, is 'spatial' in at least the following respects. It is capable of having quasi-visual experiences; as of seeing things and persons as being in its immediate neighbourhood, from various positions remote from the one occupied at the time by the body of the human being whose psyche it is. And it is capable of occasionally causing, in certain other human beings, consistent quasi-visual hallucinatory perceptions as of seeing a shadowy likeness of its body, as if it were in a certain place in their neighbourhood.

Myers's doctrine of the 'subliminal' may now be stated as follows. Corresponding to each human being there is one and only one psyche, associated with his body in a uniquely intimate way in which it is not associated with any other body. In the case of the vast majority of human beings, each has a single personal stream of consciousness. But there are exceptional human beings who habitually have two or more personal streams of consciousness. These alternate with each other in 'controlling' the common body, in the sense in which the single personal stream of consciousness of a normal human being may be said to 'control' his body when, and only when, he is awake and fully responsive to his environment. Whether a human being has a single personal stream of consciousness or has several, all the experiences in it, or in them, are states of the *one* psyche that is associated with his body.

The Next Life

The effort to prove that there is a life beyond the grave is sometimes spoken of as *selfish*, by the very men who declare themselves most eager to promote the terrestrial welfare of their fellows . . . In reality, this confusion of mind has a deeper source; it is a vestige of the old monkish belief that man's welfare in the next world was something in itself idle and personal, and was to be attained by means inconsistent with man's welfare in *this*. Whether Christianity ever authorised such a notion I do not now inquire. It is certain, at any rate, that Science will never authorise it. We are making as safe a deduction from world-wide analogy as man can ever make regarding things thus unknown when we assume that spiritual evolution will follow the same laws as physical evolution; that there will be no discontinuity between terrene and post-terrene bliss or virtue, and that the next life, like this, will "resemble wrestling rather than dancing," and will find its best delight in the possibility of progress, not attainable without effort so strenuous as may well resemble pain.

F. W. H. Myers *Science and a Future Life*

Any experience which occurs as an item in a personal stream of experience of a human being, at a time when he is awake and in control of his body, may be described as 'supraliminal'. But even in the most normal human being, and even when he is fully awake and alert, events which are states of his psyche but are not items in any personal stream of experience are constantly occurring. And when he is asleep, or unconscious through illness, and so on, such events are going on in his psyche. Such experiences are presumably not in general items in any personal stream of experience but, in the case of a human being who has several personalities which alternate with each other in controlling the common body, the following may happen. When the 'second' personality is in control, experiences may occur which belong to the personal stream of experience of the 'first' personality, which is not then in control.

Any event of the nature of an experience which occurs in a human psyche, but which is *not* an item in the personal stream of experience at that time in control of the body, may be described as 'subliminal'; and the collection of all the events in a human being's psyche which are subliminal in the sense just defined may be described as his 'subliminal'.

Myers elaborated his doctrine of the subliminal against a background of ostensibly paranormal phenomena, such as alleged hauntings, communications by mediums, and so on. He held that the supraliminal level of a human psyche is a highly specialized and rather superficial level of it, developed in the course of evolution to respond to influences from the material environment acting on the body through the sense organs. The subliminal level is much more extensive and more varied. In its more superficial levels it contains a good deal of rubbish, described by Myers as 'dissolutive material'. But it is also the seat of telepathic and clairvoyant, and possibly of telekinetic, powers. It is only when such an occurrence in the subliminal levels of the psyche produces a noticeable change in the supraliminal stream of experience that telepathy or clairvoyance is recognized as having taken place.

Basing his opinion on the curative effects of hypnotic suggestion, of correct diagnoses and prognoses by patients of their own diseases, and so on, Myers held that there is, at some subliminal level of a person's psyche, a detailed knowledge of his own internal bodily organs, and the power to control their functions in various ways.

He came to accept, as practically certain, that the psyche of a human being continues to exist and to have experiences after the death of the body. He held that communication between unembodied psyches is through something analogous to telepathy and that their awareness of their environment is by something analogous to clairvoyance; and he believed that examples of human beings showing these powers are but feeble shadows of what may be attained by unembodied psyches.

Myrrh

Gum resin used in perfumery and medicine; the three magi or kings brought gold, frankincense and myrrh as gifts to the infant Jesns; used in ancient Egypt for embalming corpses; consequently connected in magic with Saturn, the planet of death, and, as a preservative, with the sun.

See PERFUME.

C. M. Dixon/Victoria & Albert Museum

Myrtle

As an evergreen, connected with death and resurrection; Greek emigrants carried myrtle boughs to the founding of a new colony as a symbol of the end of one life and the beginning of another; said to have been the principal scented tree of Eden; sacred to love goddesses in the Mediterranean area, and generally considered lucky in Europe and connected with fertility, love and marriage.

Pious in intention but containing elements of broad farce, the medieval mystery plays enacted the Bible stories; presented and performed by local craftsmen for the benefit of their fellow townsfolk, they were true community drama

MYSTERY PLAYS

THE PRODUCTS of English play-making in the Middle Ages have been variously known as miracle and mystery plays. The historians of drama have disagreed in their definition of the two kinds. Some maintain that the title of miracle play is properly applied only to a religious performance in which a miracle occurs, in particular one dealing with the lives of the saints. The date in that case is irrelevant, and it could be said that Bernard Shaw's *St Joan* is a modern miracle play.

The title of mystery play is applied particularly to pieces exclusively based on the Old and New Testaments. These contained miraculous events but the subjects were limited to the Bible. The dispute over classification is, however, an academic one. The various groups of dramatized biblical happenings have been generally known and are still sometimes revived as mystery plays, and it is these whose origin and nature are now to be described.

The English mystery plays were essentially public, being civic performances given in the streets of a town or outside a church. The players were the members of the craft guilds; they sometimes had small rewards but were essentially amateurs. Their make-believe was watched by their relatives, friends and neighbours, who may have been critical as well as appreciative when they saw figures familiar in the market and the workshop masquerading as biblical characters.

The result could be comic by intention as well as by accident. There were no Puritans then to insist that a religious exercise should be limited to the solemn and the sombre.

A modern version of the morality play *Everyman* is performed each year at Schwäbisch Hall in Germany. With their allegorical content and more formal construction, the moralities lacked the spontaneity of the earlier mystery plays

Fremdenverkehrsamt, Schwäbisch Hall

German Kulturinstitut

Homer Sykes

When belief in a creed is universal and unquestioned there is no offence in finding humour amid holiness, and in the Middle Ages religion could still be regarded by the pious as partly a laughing matter. The drunken bout of old Noah was the subject of a comic episode and the friends of the man who played the part could remind him without offence that he had set the street on a roar. But the principal purpose was devotional. The players celebrated the holidays, or holy days, of the Church, especially at Whitsuntide and on the Feast of Corpus Christi in the following week. At that time there was a better chance of fine weather for the parade to the churchyard.

Mounted on Wagons

The word mystery was used with no reference to secrecy, deriving from the Latin word *ministerium*, meaning service. Shortened to 'mistery' or spelled mystery it meant something done in God's honour by reverent men who did not believe that to mix entertainment with edification was in any way sacrilegious. They acted the biblical stories, whose truth none then doubted, in order to keep the faith alive and meaningful. The Church approved the principle and the laity approved the result. At least a general welcome for the players can be assumed since we hear of no opposition till the time of the Reformation and of no hostile accusation that the sacred books were coarsely or profanely abused by the actors.

The short plays, grouped in what were known as cycles, presented episodes which were called pageants. The members of the craft guilds who produced them frequently chose subjects related to their daily occupations. The word pageant had a double meaning: it signified both the play acted and the scene mounted on the wagon in which it was performed. An account of the proceedings in Chester stated: 'The pageant or carriage was a high place made like a house with two rooms, being open on the top. In the lower room the players apparelled themselves and in the higher room they played.' In this case the pageants were carried on a six-wheeled vehicle. Elsewhere they managed with smaller conveyances, but the larger the cart the better the chance of a sumptuous spectacle, and the players were ambitious showmen. The use of a moveable stage reaches back into prehistory: the legendary founder of Greek drama, Thespis, worked on a wagon like the mystery players.

Before the mystery plays reached their culmination in the 14th and 15th centuries, there had been a variety of earlier revels in which myth and mummery were combined. The Midwinter festival was derived from the ancient Roman Saturnalia, in which slaves were temporarily free to mock their masters and law and order were overturned. Its place was taken by the semi-Christian, semi-pagan Feast of Fools in which a Lord of Misrule was appointed (see CHRISTMAS). The Church objected to such frivolous and possibly subversive fun but public opinion was strongly in favour of it.

Unable to prevent these seasonal rites the Church naturally welcomed the transition to the performance of the mystery plays since in them, while mirth was included, there were no sacrilegious incidents. The crude elements of the ancient paganism were now submerged in the dramatic and devout presentation of the prevailing faith. The Bible stories, beginning with the Creation and ending with the Day of Judgement, were enacted by the people for the people in the vernacular tongue; it was emphasized that the divine purpose, inherent in the prophetic books of the Old Testament, was made manifest in the Messianic incarnation and suffering described in the gospels. It was not considered blasphemy to impersonate God, the Virgin Mary and Christ.

The four principal surviving cycles are those of York, Chester, Wakefield and Coventry, all in the north of England or Midlands; but biblical pageants of various kinds were known in Scotland and Ireland as well as in other prosperous English towns

Left **Christ carrying the cross on the way to Golgotha, a scene from the passion play performed every ten years at Oberammergau. As in the medieval mystery plays, the parts are taken by local people, not by professional actors** ***Right*** **A survival of the early folkplays, which also combined religion and drama, the 'soul caking play' performed at Antrobus in Cheshire: the Black Prince, slain by King George, is mourned by his mother Mary before being brought to life again. The medieval Church disapproved of such drama and promoted mystery plays, which taught the faith and contained no pagan or sacrilegious elements**

where the trade guilds had talents to display in this form of divine service. In Cornwall too, there were mystery plays whose texts, in the old Cornish language, have survived. The site of their performances can still be seen in circular amphitheatres now called rounds, such as the one at St Just.

The performance of the York cycle required 48 pageants, whose text survives in a 15th century manuscript. The vocabulary used by the authors was simple. The writing was the work of unknown men, some of them perhaps priests, and was begun in the middle and latter half of the 14th century and continued here and there till the Reformation.

The Latinity of the Renaissance, which so enriched the eloquence and word-music of the Elizabethan dramatists, had not infiltrated the language. Yet there is true poetry in the Chester play in which Joseph, convinced that Mary has been made pregnant by a divine miracle, humbly withdraws from his conjugal rights.

> And soothly, if it so befall
> God's son that she be withall,
> If such grace might betide,
> I wot well that I am not he
> Which that is worthy to be
> That blessed body beside,
> Nor yet to be in company;
> To wilderness I will for this
> Enforce me for to fare;
> And never longer with her deal;
> But stilly shall I from her steal,
> That meet shall we no more.

In contrast stands the naive rhetoric of the villainous and blustering Chester Herod, who assumes omnipotence:

> I am the greatest above degree
> That is or was or ever shall be:
> The sun it dare not shine on me
> If I bid him go down;
> No rain to fall shall none be free,
> Nor no lord have that liberty
> That dare abide, and I bid flee,
> But I shall crack his crown.

In the huge variety of episodes everything is included, from the hushed voice of reverent piety to the rustic humours of shepherds and the ranting of a scoundrel.

Comedy and Devotion

A text with a glossary is helpful to readers, since some of the old words have disappeared or changed their meaning. The actors of today, usually amateurs, who revive some portions of the mysteries can substitute a few modern words if the original seems baffling. One portion often attempted is *The Second Shepherds' Play* of the Wakefield cycle. In a scene of pastoral comedy the shivering Judaean shepherds watch their flocks by night. They unwittingly shelter from the cold a character named Mak, a crafty sheep-stealer. He abuses their kindness by purloining one of their flock and takes it to his home. His wife pretends it is her newly-born baby and conceals it in her cradle. When the search-party breaks in, one of the shepherds says he must kiss the child and then cries 'What the devil is this? He has a long snout.' There is turmoil.

Advice to Adam

Stage directions for an early Norman-French play

A Paradise is to be made in a raised spot, with curtains and cloths of silk hung round it at such a height that persons in the Paradise may be visible from the shoulders upwards. Fragrant flowers and leaves are to be set round about, and divers trees put therein with hanging fruit, so as to give the likeness of a most delicate spot. Then must come the Saviour clothed in a dalmatic, and Adam and Eve be brought before him. Adam is to wear a red tunic and Eve a woman's robe of white, with a white silk cloak; and they are both to stand before the Figure, Adam the nearer with composed countenance, while Eve appears somewhat more modest. And the Adam must be well trained when to reply and to be neither too quick nor too slow in his replies. And not only he, but all the personages must be trained to speak composedly, and to fit convenient gesture to the matter of their speech. Nor must they foist in a syllable or clip one of the verse, but must enounce firmly and repeat what is set down for them in due order. Whosoever names Paradise is to look and point towards it.

quoted by E. K. Chambers *The Medieval Stage*

Barnaby's

The Lord Mayor's Show, presented by the City of London: the medieval mystery plays provided similar opportunities for civic display, as elaborately decorated wagons were taken through the streets in procession

Then the action moves very suddenly and with striking contrast to the stable in Bethlehem where the shepherds greet the Virgin Mary and bring cherries, a tennis ball, some flowers and a bird as their offerings to the Christ-Child. The final scene of devotion is as exquisitely simple as the deceit and exposure of Mak has been broadly and robustly comical. Thus the spirit of the mysteries is doubly exemplified at its best.

W. Bridges-Adams, in his excellent chapters on the mystery plays in *The Irresistible Theatre*, described the players as enjoying 'a magic of their own, the age-old enchantment of let's pretend, the liberation of the spirit which follows when, by the practice of the immemorial art, we shed for a little our troublesome selves and become somebody else.' But there was nothing pretentious in their scripts which had the clarity, vigour, and sometimes naivety of the plain man's conversation lifted to a higher plane by the devotion of those who were writing and acting what they happily and unaffectedly believed. Sincerity does not need elaboration of style and may be all the more impressive without it.

The procession of pageants was prepared for the appointed holy day by the members of the craft guilds. Very early – York ordered a call at four in the morning – the wagons were assembled with the various sections known as 'houses' built on them. It was not necessary for the players to restrict themselves to this area. They could jump down and use a space among the crowd. The Chester Herod was directed to 'rage in the street'.

Immense trouble was taken with the costumes and properties. Skilled craftsmen were available and eager to show their appropriate skills. The shipwrights fancied the Ark, the goldsmiths had their opportunity with the Adoration of the Kings, the vintners specialized in the Marriage Feast at Cana and the bakers prepared the spectacle of the Last Supper. The cavalcade moved forward in procession, enabling the families of spectators to appreciate this picturesque service of the holy day without leaving their upper windows. No doubt the younger members of the audience were anxious to be out and about in the street and to see the raging Herod face to face. The phrase 'community drama' has lately become fashionable. Here it actively existed.

For Playing God, Sixpence

Accounts were very carefully kept and made known to the public. Some have survived in detail, for the reckoning went into the town's archives. A pageant-master was in charge of expenditure as well as of performance. The guilds contributed their own share of 'pageant-silver'; visitors to the town had to contribute. The players were given expense money for bread and ale at rehearsals. Reading of the pence allotted, it must be remembered that at Coventry in 1480 a joint of beef cost threepence and a pint of beer a farthing. Payments to the actors were made according to the size of the part rather than to its status, human or divine. At Coventry the impersonator of God had two shillings while Caiaphas and Herod had three shillings and threepence. At Hull the master mariners and pilots staged a Noah pageant in 1483. The costs included sixpence each for the minstrels, ninepence each for Noah and his wife, and 'to Robert Brown, for playing God, sixpence'.

Elaborate and even sensational scenic effects were somehow achieved within the small space of a pageant-wagon and with the transference of some action into the street. Winches were used for raising characters to the heights or dropping them to their doom. At Coventry in 1534 there was 'Hell-mouth, a fire kept at it. A windlass and three fathoms of cord.' Arrangements were made for an earthquake and 'paintings of three worlds'. Also there was a torch 'to set the world on fire'. The entrance to hell was suggested by a dragon's mouth; heaven could be entered on a balcony. At one Coventry festival the accountant stated that 'the sum of all costs, workmanship, and colour' amounted to 15 shillings. The artificers did their work with enthusiasm and economy. It was their 'ministerium' or service and their crafts were their 'mysteries'. While regarding the dramatic themes presented as truths not myths they had the relish of achieving magical effects.

In the late medieval period a new kind of play, the morality, was in the making. Of these *Everyman* is the most famous. The author is unknown, the date uncertain; but it has been frequently revived. The characters include, along with the title part, abstract qualities – Fellowship, Knowledge, Confession, Beauty, Strength, Discretion and so on. That kind of drama had dignity and its admonitory counsel was impressive.

> Be you never so gay!
> Ye think sin in the beginning full sweet,
> Which in the end causeth the soul to weep,
> When the body lieth in clay.
> Here shall you see how Fellowship and Jollity,
> Both Strength, Pleasure, and Beauty,
> Will fade from thee as flower in May;
> For ye shall hear how our Heaven King
> Calleth Everyman to a general reckoning.

Commendable doctrine, one must admit, but the warm heart of the medieval 'let's pretend' has been chilled. The allegory has replaced the sympathetically personal story presenting the ways of God with man, his lively, fallible creation.

Striking similarities have been noted between Christianity and the Mystery religions, cults which catered essentially for the needs of the individual and which developed in the same period, under Roman Imperial rule

MYSTERY RELIGIONS

ALL RACES and nations in the primitive and early periods of their culture had initiation ceremonies which possessed a certain similarity with the Mysteries of the ancient world, and which could be called 'Mysteries'. In this article, however, the term 'Mysteries' will refer purely to the type of religion developed in the culture of the Greeks and the Romans, a religion which postulated that a man was free to make his own decisions and that he was permitted to join a particular religious group in preference to another. These Mysteries therefore presuppose an already differentiated society, in which there was no longer a primitive initiation ceremony which all members of the group had to go through. This new type of religion becomes evident in the time of Imperial Rome, although it had its beginnings as far back as the 6th or 5th century BC.

Religious individualism makes its first appearance in the Orphic groups (see ORPHEUS AND ORPHISM). The Orphics wished to lead a life of purity and without sin; many of them refrained from meat dishes, wine and sex. This 'Orphic way of life' was not one followed by many people and it was therefore individualistic from the beginning. One of the roots of Orphism was certainly shamanism, a primitive cult which centred round the practices of religious and particularly sensitive individual clairvoyants and medicine-men. The Orphic circles in Greece never won any extensive influence over the population, but they established the principle of the individual who goes his own way, apart from the crowd.

The Cult of Demeter

Of far greater significance were the Eleusinian Mysteries. In the small town of Eleusis, between Athens and Megara, ceremonies were held as part of the cult of Demeter (see DEMETER; ELEUSIS). Originally these ceremonies were only for the inhabitants of the town and served to initiate members into the community: a person who had been initiated became a burgess of the town. When Eleusis was annexed by Athens about 600 BC, the nature of the ceremony changed. The person being initiated no longer acquired political rights; the ceremony was now purely religious. All Athenians were now entitled to become initiated into Eleusis if they wished to do so; many of them did, and Greeks from other towns began to be initiated into the Mysteries shortly afterwards. The Eleusinian Mysteries in this way acquired an 'international' character. A person who went to Eleusis to be initiated did so of his own free will and from purely religious motives. The complete development of the Mysteries was only possible because in the city of Athens a rich and highly differentiated culture had evolved which afforded the individual wide latitude for his specific way of life and religious beliefs.

When the East became Hellenized following the conquests of Alexander the Great, the Ptolemies – the Graeco-Macedonian kings of Egypt – expanded their capital Alexandria into a new, bigger and more beautiful Athens. One of the suburbs of Alexandria they called Eleusis and there they founded a cult of Demeter with initiation ceremonies which had been copied from the Eleusinian rites; the cult was established by Timotheus, one of the Eleusinian caste of priests. As the Greek goddess Demeter was always regarded as the equivalent of the Egyptian goddess Isis (see ISIS), a starting point was provided for the later Graeco-Eastern mysteries.

There had been Dionysiac initiations in all Greek towns since very early times (see DIONYSUS). Originally they were of the same type as race initiations. However, when a new and personal devoutness arose in Orphic circles, particularly in Eleusis, this affected the Dionysiac initiations, which gradually also took on individualistic

Michael Holford

Late Egyptian head of Isis: the cult of the Egyptian goddess became Hellenized after the conquest of Egypt by Alexander the Great, and in Imperial times developed into a Mystery religion offering the believer salvation and regeneration after death

tendencies. During the Imperial period the Dionysiac Mysteries were a religion of the same type as the other Mystery religions. There were Dionysiac mystics in all towns, but Eleusinian initiations were held only in Eleusis and Alexandria.

During the Hellenistic period (3rd-1st centuries BC) very little is heard about Mysteries. But at the time of the Roman Empire several such religions suddenly sprang up. The best-known are the Mysteries of Isis and Mithras (see MITHRAS). However, there were also groups which worshipped Attis and the Great Mother (see CYBELE), Men, the moon god of Asia Minor, the Syrian gods Adonis, Jupiter Dolichenus and Helios of Emesa. The fire cult of the theurgists had a Mystery character (see THEURGY) and Judaism and Christianity were partly assimilated to the new type of religion.

These religions have common features. Firstly, they are almost always the successors of cults which had originally been restricted locally or nationally. However, the old nationalities had been incorporated into the Roman Empire, and the cults had ceased to have any political dimensions. The destruction of the Persian Empire by Alexander was a precondition for the spread of the Mithraic Mysteries as far as Rome, and the conquest of Egypt by Augustus a prerequisite for the mission of the Mysteries of Isis. Likewise, the destruction of Jerusalem encouraged the spread of Judaism and Christianity.

Secondly, these religions carried on missionary work, although not to the same extent as Christianity. As the political boundaries within the Roman Empire fell away, there was complete freedom of movement: Egyptians could take up residence in Greece, Syrians in Rome, inhabitants of Asia Minor could settle in Gaul, those of Africa in Spain, and so on. They got together with other immigrants from their native land and collectively worshipped their old local gods. In this way the old primitive gods became cosmopolitan, as the immigrants naturally absorbed the civilization of their new homeland and transferred this to their cult; they also married into established families and gained proselytes for their religion.

Love Tales Hid Sacred Code

Thirdly, by living together with the more highly civilized Greeks and Romans the worshippers of the Oriental gods naturally absorbed, in particular, the regular custom of writing and the ideas of Greek philosophy. In the Eastern countries – Persia, Syria, Asia Minor – reading and writing had been a science restricted to the priesthood; very few people could read hieroglyphics, and the writing of consonants without vowels, as in the language of the Phoenicians and the Israelites, was also very difficult. But now reading became a matter for everybody, and books made their appearance, to be read by the individual in addition to following the traditional cult and the many rites. There arose a type of religion in which books played a central part, as exemplified by the Israelites. Probably in all temples of Isis there was one and the same text containing a self-revelation of the goddess; there were books of the Mithraic Mysteries; theurgists had a sacred book, the *Chaldean Oracles*. According to a fairly recent theory most of the ancient love stories which have been discovered were code forms of religious texts of the Mystery congregations; the eleventh book of the *Metamorphoses* by Apuleius quite openly preaches the Isiac Mysteries. More particularly, the Oriental cult religions now became considerably spiritualized. Almost everywhere in the Mysteries a psychology was being developed based on older Greek conceptions – the systems of Pythagoras, the Stoics and especially Plato.

If a Roman or a Greek now decided to accept the Oriental Mysteries, on the one hand the rather exotic nature of the Mysteries aroused the impression in him that he would be granted special, unusual and individual grace; on the other hand all these cults were so deeply impregnated with Greek thought that Greeks and Romans were completely at home with their fundamental philosophical and theological concepts. In a religion which at first seemed quite strange, they discovered something long familiar and intimate.

The various Mysteries appealed to sociologically different strata of society. The Dionysiac Mysteries were often a cult of the upper bourgeoisie; followers of Mithras were chiefly in the army and among the Imperial officials; the cult of Isis attracted the middle classes, wealthy freedmen and courtesans; theurgy was accessible only to a few philosophically educated people, being something quite exclusive. In principle, social classes were abolished within the communities of the mystics, all were equal in the sight of God, and even slaves were 'free' on festival days (as in many older cults).

The old nations of the East had always had a king as head of state. People were unable to think of a state in the abstract but only as an entity personified by a ruler in the flesh. For this reason the king had always been a central figure of religion in the Eastern countries. After the fall of the individual states in the East, the Roman emperor filled the vacuum. The Isiac and Mithraic mystics always included the emperor in their prayers. There were even ceremonies which must be called Imperial Mysteries. In Asia Minor especially, people were so grateful for the blessings of the Roman Empire – peace, prosperity and legal

The Dionysiac Mysteries spread from Greece to Italy, where the cult was for a time proscribed by the Senate because of its orgiastic elements ***Previous page*** **Section of a mural from the Villa of the Mysteries at Pompeii, which appears to have been a centre for the worship of Dionysus: on the left is Silenus, the fat, elderly drunkard who nevertheless had wisdom and prophetic gifts, and was a constant companion of the god** ***Below*** **A marble relief of Dionysus, shown as a youth with a panther-skin over his arm** ***Below right*** **Women lead a hooded youth to Silenus in a rite of initiation: Roman stucco of the 1st century BC**

Scala

security – that they expressed this feeling of esteem for the *Imperium Romanum* by ceremonies in honour of the emperor; he was the manifest personification of the Empire, in the same way as the Oriental king had been the visible embodiment of the old Eastern state. It is evident that in this respect there was a big difference between the Mysteries on the one hand and Judaism and Christianity on the other.

Links with Christianity

Christianity too arose under the first Roman emperors. Origen, the great theologian of the 3rd century AD, in his work *Contra Celsum* attributed to a divine plan of salvation the fact that Jesus was born during the reign of Augustus, who had unified the whole of the Mediterranean area under the rule of the Romans. It has always been clear that the Mystery religions and Christianity developed at the same time, but it was not certain how this could be explained. It was first thought that the emergence of the one must have been dependent on the other. This, however, does not seem to be the case. Dependence of the Mysteries on Christianity would be conceivable in the case of Mithras, theurgy or the cult of Helios, but it is out of the question as far as the Mysteries of Isis are concerned, since characteristic elements of this cult are evident in the poems of Tibullus between 30 and 20 BC in Rome. To assume the dependence of Christianity on the Mysteries seems a more hopeful thesis; but if this assumption is pursued point by point, it is impossible to produce detailed proof. The similarities in question are based on the fact that in both cases a very ritualistic national religion, under the new conditions of the Roman Empire, was re-fashioned into new forms, in the case of Christianity far more powerfully.

We may therefore say that the general resemblance of these cults and Christianity can be attributed to the fact that the various national cults all contained the same possibilities of development and came to fruition under the new conditions, common to them all, of Roman rule, just like plants which, in the same spring weather, grow out of the earth in which they have previously lain dormant as seeds. Entirely new conditions were present. A single empire comprised the civilized world, the old political units had dissolved, there was one ruler; there was complete freedom of movement, but society was truly differentiated; the people were cosmopolitans, the ideas of the Greek philosophers reached everywhere. It followed that in both types of religion, the Mystery religions and Christianity, there were many similar religious ideas and rites: communion, baptism, belief in regeneration. On the other hand, there were also distinct differences, such as the sexual rites of the Dionysiac and Isiac initiations and the military set-up of the Mithraic Mysteries.

One of the most profound reasons for the success of the Mystery religions must have been that the majority of the inhabitants of the Roman Empire had no opportunity of participating in the government of the state or of exercising any influence on it, as had been possible in the Attic democracy and the Roman Republic. Consequently, everybody's energy was directed towards an individual striving after happiness, either economic success in this world or religious bliss after death. In the large towns and cities of the entire Mediterranean area the individual was submerged in the great mass; he felt himself lost, a nameless nothing in the standardized multitude. If he wished to find a foothold or acquire an identity, then he needed a more intimate environment in which he counted as a real person and in which he had a voice; it is quite characteristic that in all Mystery religions (and also in Christianity) the same vocabulary of the old democratic autonomy keeps recurring, expressing the feeling that the believers were an individual 'people' of a new kind. In the festivals of these communities man could escape from the monotony of daily life, and their teachings promised him rebirth and bliss in the life to come; this was why Oriental Mystery religions achieved success not only among the immigrants from the Eastern countries but also among the Greeks and Romans.

MYSTICISM

The view that mysticism and the mystical experience are essentially the same in all religians is mistaken; on the contrary, there are important differences between, and within, the eastern and western traditions

MYSTICISM is a term that tends to be very loosely used; and so it will be as well to state at the beginning what it is not. In ordinary speech it is often associated with the occult and with paranormal phenomena such as thought-reading, telepathy or levitation. It is true that many authentic mystics have had such powers, but they are in no way essential to the mystical experience itself and often merely prove an embarrassment.

Etymologically the word mysticism derives from the Greek *mueo*, meaning to 'initiate' into a secret cult – into a 'mystery'. Among Christians, however, the word has come to mean a direct experience of God; and since, in theory at least, Christianity is the religion of love, the 'mystical' experience is spoken of as union with God or as a 'spiritual marriage'. During the Middle Ages and after, 'mystical theology' was recognized as a legitimate branch of theology beside 'speculative theology'. The difference between the two is clearly brought out by the 17th century French saint, Francis of Sales. What, he asks, do we talk about in prayer? What is our topic of conversation? God: nothing else. After all what does a lover talk about but his beloved? Prayer and mystical theology, therefore, are identical. Prayer is called theology, because it deals with God as speculative theology does; only there are three differences. First of all, speculative theology deals with God as the supreme Being – the divinity of supreme goodness; mystical theology deals with him as supremely lovable – the supreme goodness of the divinity. Secondly, speculative

Right **The story of St Catherine's vision of her betrothal to Christ is typical of the Christian view of the mystical experience as a 'spiritual marriage': *The Marriage of St Catherine* by Veronese *Below* This type of mystical experience is also recorded in certain forms of Hinduism: the loves of Krishna and the *gopis* could be allegorized to represent the love between God and the soul**

Robert Skelton

Chester Beatty Library

theology is concerned with God and man, mystical theology with God alone. Thirdly, speculative theology leads to knowledge of God – turning its pupils into learned scholars and theologians; mystical theology leads to love of God – turning out intensely affectionate lovers. This is the traditional Christian point of view: mystical experience is the immediate experience of the love of God, and any experience in which neither God nor love were felt to be present would scarcely be taken seriously as mystical.

In the course of the last century or so, however, the word has taken on a wider meaning. There seem to be two reasons for this: the rise of the secular 'science' of psychology; and the dissemination of knowledge of the religions of India and China, in both of which the mystical element is prominent. And yet in neither Buddhism nor in Taoism does love, or indeed God, play a significant part. In what sense, then, are they mystical? Let us turn to the Oxford Dictionary for guidance. On 'mystic' it says: 'one who seeks by contemplation and self-surrender to obtain union with or absorption into the Deity, or who believes in the spiritual apprehension of truths inaccessible to the understanding.' And for 'mysticism' it gives a similar entry: 'belief in the possibility of union with the divine nature by means of ecstatic contemplation; reliance on spiritual intuition as the means of acquiring knowledge of mysteries inaccessible to the understanding.' In neither entry is there any mention of love; and in both 'deity' has come to replace the more personal 'God'.

Cosmic Consciousness

But these definitions are still perhaps not broad enough, if we are to include in the category 'mystical' the Buddhist concept of Nirvana, considered by many non-Christian writers on this subject to be the mystical experience above all others. At the risk of over-simplifying I should define 'mysticism' as 'a direct apperception of eternal being', whether this eternal being is conceived of in personal terms or simply as a state of consciousness. This may take many forms, but perhaps the characteristic lowest common denominator is the loss of the sense of personality or ego-consciousness in a greater whole. Tennyson seems to have put it very well when he said: 'All at once, as it were out of the intensity of the consciousness of individuality, individuality itself seemed to dissolve and fade away into boundless being, and this not a confused state but the clearest, the surest of the sure, utterly beyond words – where death was an almost laughable impossibility – the loss of personality (if so it were) seeming no extinction, but the only true life.' Again, not a word about either love or God.

This kind of experience is usually called 'Nature mysticism'. It is as if one's everyday personality – one's ego – were dissolved and merged into the 'All'; and through this merging into the totality of existence the mystic now feels that he lives with the life of the All and therefore cannot die. This experience is perhaps not so uncommon as is often supposed: it comes unheralded, lasts only for a short time, but brings with it an absolute conviction of its reality. Examples of it turn up in the mystical traditions of Christians and Moslems but on the whole it is not central to them. On the other hand, it seems to constitute the core of the experience which the Zen Buddhists call *satori*, though it is quite different from what the early Buddhists called *nirvana*.

This Nature mysticism which R. W. Bucke, a Canadian doctor who wrote at the turn of the century, called 'cosmic consciousness' and which Freud called the 'oceanic feeling', can strike anyone at any time; and it can also be induced by yoga techniques and by drugs. It is not necessarily associated with religion of any kind but is liable to infiltrate the mystical tradition of any religion. Its most disturbing characteristic is that through it the mystic feels that he has transcended all the 'opposites' and contradictions of life, including good and evil. Bucke himself had such an experience and (as is the custom of most Nature mystics) he drew from it the most unwarrantable conclusions. According to him, cosmic consciousness 'shows the cosmos not to consist of dead matter governed by unconscious, rigid, and unintending law; it shows it on the contrary as entirely immaterial, entirely spiritual and entirely alive; it shows that death is an absurdity, that everyone and everything has eternal life; it shows that the universe is God and that God is the universe, and that no evil ever did or ever will enter into it; a great deal of this is, of course, from the point of view of self-consciousness, absurd; it is nevertheless undoubtedly true.'

R. K. Singh

William MacQuitty

Left **Drugs are sometimes used as aids to mystical illumination: an 18th century painting shows dervishes meditating while they smoke *ganja*, the dried leaves of the hemp plant, and drink *bhang*, also made from hemp *Above* A devotee of Vishnu, one of the many thousands of Hindu mystics in India *Right* A Zen monk contemplates a garden made of raked sand; the spiritual exercises of Zen, a form of Buddhism, are directed towards attaining *satori*, 'enlightenment'**

This is typical of the attitude of the Nature mystics. Their experience is usually momentary, but it is overwhelming in its impact: they simply cannot doubt that they have entered into a totally new and different form of consciousness which represents a truth of which they had never dreamt before and which they find it almost impossible to describe. Their attitude is that they have seen the truth and that they therefore know. They are, however, the amateurs at this very hazardous game and unfortunately they rarely think it necessary to consult the professionals. The professionals are, of course, the religious mystics; and of them the Indians are without doubt the most important. They are important because (unlike believers in Judaism, Christianity and Islam) they are not bound by dogma. Hence they feel no obligation to express their experience in terms of any given religious framework. Thus if love does not form part of their experience, they will not speak of love, the idea of love being only peripheral in their sacred texts.

It is a common error to suppose that 'mysticism is essentially one and the same, whatever may be the religion professed by the individual mystic', for any study of the Hindu and Buddhist mystical texts will very soon convince us that this is not true. There are varieties here which it is simply not possible to overlook: it is not a question of interpretation but of the experience itself. And it would seem that there are three recognizable types of mystical experience, all of which are to be found in the Hindu and Buddhist classics. The first is 'cosmic consciousness'; the second is the realization of eternity and 'deathlessness' within oneself from which the whole universe of change and time and space is excluded; and the third is the experience of the union of the soul with the Absolute or God in a supreme act of love. The first is typical of the *Upanishads*, the sacred mystical texts of the Hindus; the second is typical of early Buddhism; and the third is characteristic of Christianity, Islam and later Hinduism.

The Spokes and the Wheel

The classic formulation of 'cosmic consciousness' occurs in a very ancient Hindu text which says that, 'The whole universe is Brahman' who is also 'my Self within my heart', smaller than a grain of rice yet also 'greater than the earth, greater than the atmosphere, greater than the sky, greater than all these worlds . . . This my Self within the heart is that Brahman' (see also BRAHMAN).

This means that the inmost self of man is identical with the Absolute, with the unchanging power over against which the whole changing universe must be seen. One lives not with one's own life but with the life of the whole universe, which is founded in a changeless Being which is at the same time one's own eternity. It was this experience which made it possible for Tennyson to say that death was 'an almost laughable impossibility'. As Hugh of St Victor said in the 12th century: 'This one is all, and this all is one.' This is the experience of cosmic consciousness.

The Absolute is also commonly called the One, and you and I are in some sense that One: 'This finest essence – the whole universe has it as its Self: that is the Real: that is the Self: that you are.' The manifold universe is unified in the One, and so far as each conscious soul is aware of the One behind the many, he feels himself to be that One and through it interconnected with all the manifold existences that formerly had seemed to be separate from it. All things cohere in the One as spokes 'cohere' in the hub and felly of a wheel: there is identity of Being but not of function or of power.

There is identity in Being but at the same time diversity in function, power and relationship; and the identity does not exclude the relationship. This is, of course, a paradox. So be it, but paradox is of the very stuff of mysticism, particularly where cosmic consciousness is concerned. Thus though I may realize myself as the Infinite and the universal Self, this does not prevent me from having a passionate love-affair with that universal Self. This comes out clearly in

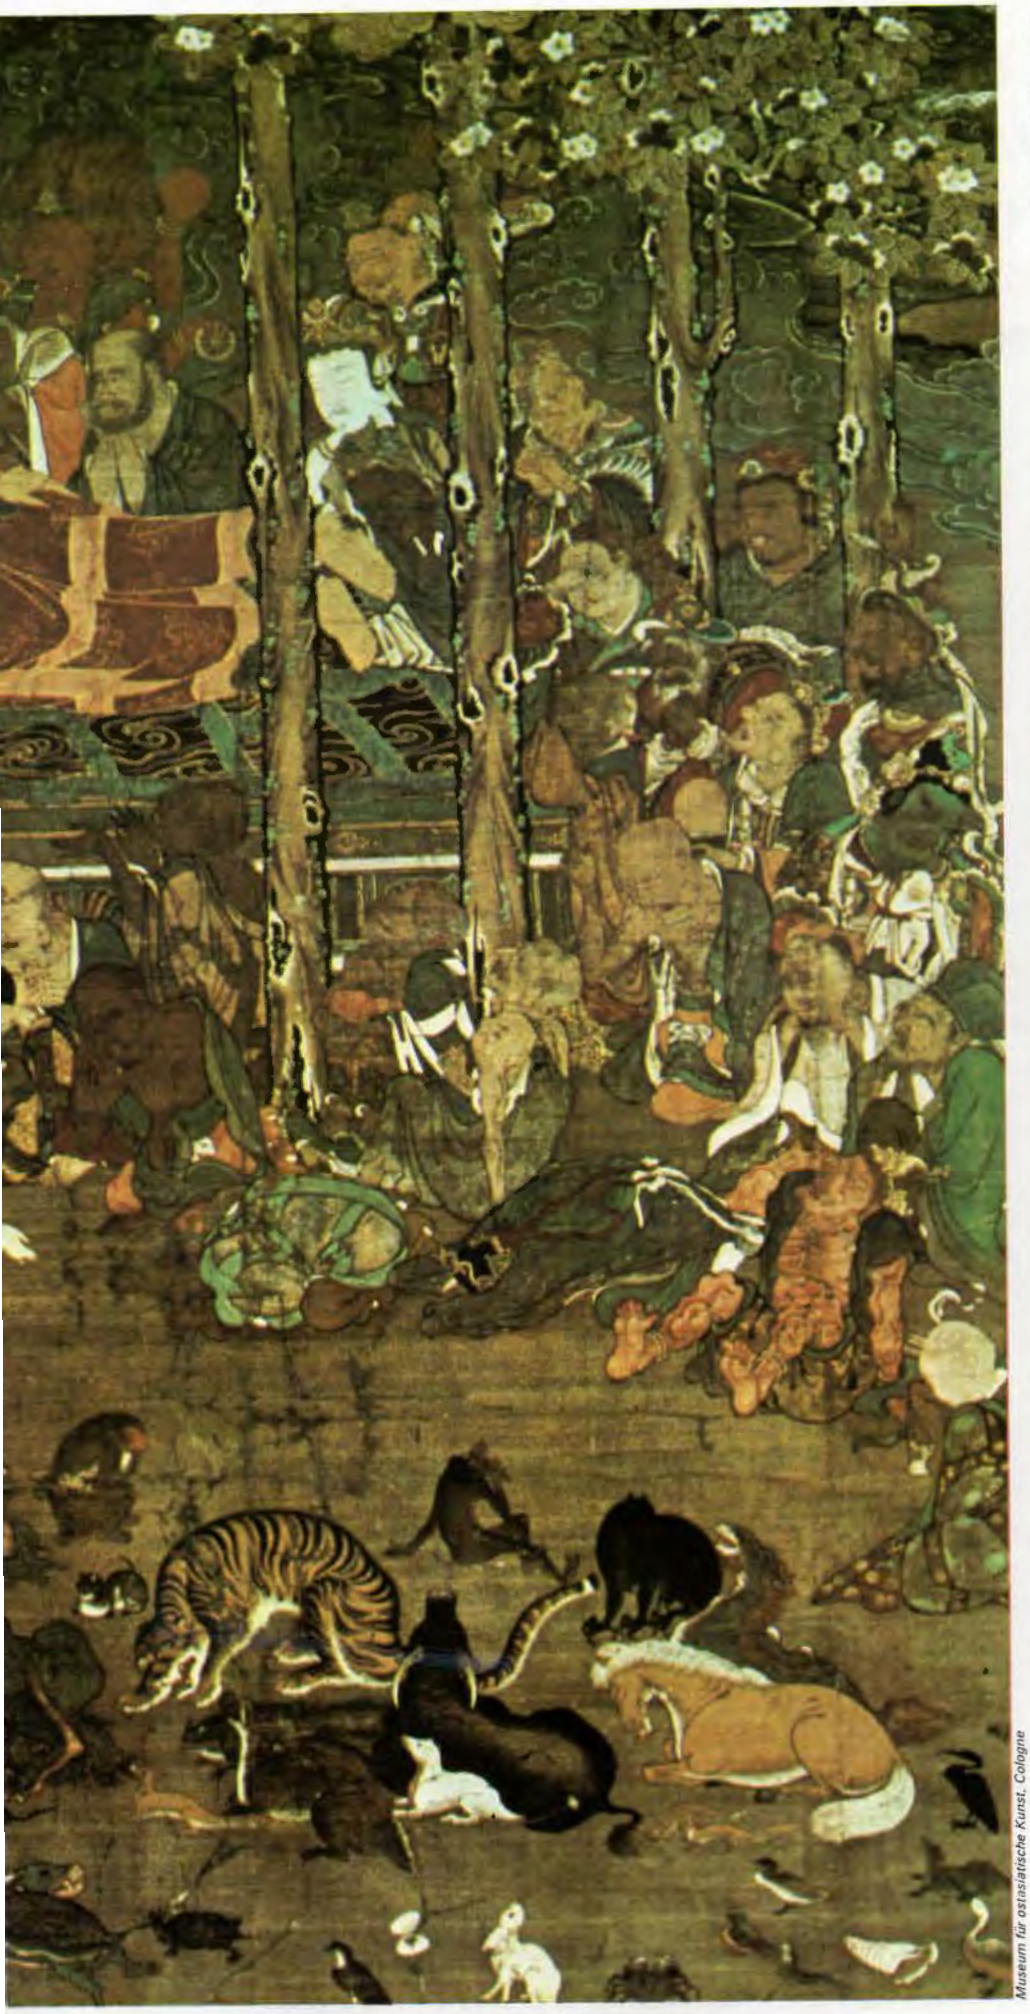
another passage taken from the *Upanishads:*

> The Infinite is below, it is above, it is to the west, to the east, to the south, to the north. Truly it is this whole universe.
>
> Next the teaching concerning the ego.
>
> I am below, I am above, I am to the west, to the east, to the south, to the north. Truly I am this whole universe.
>
> Next the teaching concerning the Self.
>
> The Self is below, the Self is above, the Self is to the west, to the east, to the south, to the north. Truly the Self is this whole universe.
>
> The man who truly sees and thinks and understands in this way has pleasure in the Self, plays with the Self, copulates with the Self, and has joy with the Self: he becomes an independent sovereign. In all the worlds freedom of movement is his.

Here cosmic consciousness merges into the mysticism of love – and frankly sexual love at that. The essence of cosmic consciousness, however, is the realization of oneness in and through diversity, 'that kind of knowledge,' as the *Bhagavad Gita* says, 'by which one sees one mode of being, changeless, undivided in all contingent beings, divided though they be.' It is to see the eternal in and through the transitory, and to see the transitory as itself eternal: no clear distinction can be made between the two. Clearly this is very different from our second type of mysticism, 'the realization of eternity and "deathlessness" within oneself from which the whole universe of change and time and space is excluded'.

Unconscious Reality

Unlike the *Upanishads*, early Buddhism draws the sharpest distinction between the world in which we live and eternity. Our world is in a state of continual flux. Nothing in it is permanent, nothing remains the same for two moments on end, and this applies just as much to mind as it does to matter. The man I am today is different from the man I was yesterday, and this means that I have no self, no permanent substratum which I can legitimately call 'I'. This applies to everything. Everything lacks substance, and because it lacks substance it is in a permanent state of unease. Hence no one can truthfully say 'I am', or 'this is mine', or 'there is a self', or 'this belongs to a self'. There is no means of deliverance from the unease of this world except by



Museum für ostasiatische Kunst, Cologne

A Japanese scroll of the 14th century shows Shakyamuni's entrance into Nirvana: the Buddha, Shakyamuni, dies surrounded by a mourning creation ranging from gods and human beings to animals, birds and insects. Nirvana, the Buddhists' ultimate goal, was a deathless state of perfect peace, wisdom and enlightenment

realizing that we have no individual and personal existence; and since we consider that we belong to the world of flux we have to detach ourselves completely from that world and everything which attaches us to it.

Only so can we realize Nirvana, which is a deathless state of being, totally separate and distinct from this world of flux, utterly at peace, not born, not become, not made or compounded, the cessation of phenomenal existence, the extinction of becoming, craving and pain, perfect peace, wisdom and enlightenment. In Christian terminology, it is *requies aeterna*, 'eternal rest', the peace of death. This would appear to be literally true, for life is flux, and it is therefore life as such that the early Buddhists would put an end to. This is not surprising, given their premises; for the Buddhist idea of salvation is conditioned by their unshakable belief in transmigration – what they call *samsara*, an endless process of birth and death, re-birth and re-death, in a form of existence which is forever impermanent, unreal and fraught with suffering. To put an end to this is very heaven – it is Nirvana. It is, as one of the Moslem mystics puts it, 'to isolate the eternal from the originated', perfect, static, timeless peace.

The guarantee that such a state of timeless peace exists and can be found is the Buddha's own Enlightenment. Once he had found it, however, he did not consider it expedient to define it in concrete terms. One thing only would he assert, and that is that Nirvana puts a stop to all becoming. In cosmic consciousness, eternal Being is seen as the cement that holds the whole world of becoming together: in early Buddhism, Being and becoming are forever separate.

Neither the Hindus nor the later Buddhist schools (the so-called Mahayana), however, were prepared to leave things so uncomfortably vague. On the Hindu side one of the late *Upanishads* defines what seems obviously to be the same as the Buddhist Nirvana in these terms: 'Conscious of neither within nor without, nor of both together, not a mass of wisdom, neither wise nor unwise, one with whom there is no commerce, impalpable, devoid of distinguishing mark, unthinkable, indescribable, its essence the firm conviction of the oneness of itself, bringing all development to an end, tranquil and mild, devoid of duality, such do they deem this fourth (and ultimate state

There is a state in which the bonds of the personal nature of life seem to have fallen away from us and we experience an undivided unity

of consciousness) to be. That is the Self: that is what should be known.'

This 'fourth' state of consciousness is beyond the other three states of dreamless sleep, dream, and our ordinary waking state. What is strange is that this fourth state which is really total unconsciousness is regarded as being the one Reality – the Absolute which is beyond the personal God himself; for in man, the microcosm, it is dreamless sleep, not the 'fourth state', which corresponds to the creator God in the macrocosm. It is considered that just as dream emerges from dreamless sleep, so does the phenomenal world emerge from God: but beyond God and beyond dreamless sleep there is the totally static One which is beyond change of any kind. In this 'fourth state', then, the mystic realizes himself as the Absnlute. Plainly, if this is really so, this is the one Reality beyond which one caunot go. Insofar as the mystic realizes himself as this One, he is superior to God, so far as God is operative in the material world. This, of course, makes nonsense of all religion.

But this is not the only way in which this experience of 'isolation' can he interpreted. According to another Hindu school of philosophy, this oneness which the mystic experiences is not the Absolute hut only the incommunicable essence of one individual soul. These 'souls' or spiritual monads are innumerable, each one being exactly like the others, each being a unit of pure consciousness, eternal, beyond space and time, isolated from all other spiritual monads and from matter. It is the misfortune of these monads, however, that they 'fall' into matter and are there imprisoned until, after countless more or less miserable incarnations, they are finally released by the evolutionary processes at work in matter itself. The experience again is the same – the Buddhist Nirvana, the final and definitive isolation of spirit from matter. Thus what the Buddha had refused to define in positive terms – the isolation of spirit from matter – is interpreted by the 'monist' Hindus as meaning that the mystic realizes himself as the sole Reality, as the Absolute 'One without a second', but by the 'pluralistic' Hindus as meaning the realization by one out of countless spiritual monads of its own timeless essence. The experience is the same, and it is the very reverse of cosmic consciousness, for the 'cosmos', the phenomenal world of change and life and self-consciousness, is totally excluded and transcended.

In the mysticism of 'isolation' there can by definition be no question of love. In that of cosmic consciousness a feeling of love may or may not be present. In the passage from the *Upanishads* quoted above the mystic feels himself to be present everywhere throughout the whole wide universe. There is no difference between him and the infinite 'Self' of all things, and yet he is able to 'have pleasure in the Self, play with the Self, copulate with the Self, and have joy with the Self'. The 'Self', then, is both an all-pervasive Absolute and a personal God with whom the mystic experiences the spiritual equivalent of sexual union.

The Spiritual Marriage

Christianity is, in theory, the religion of love, and its mysticism therefore naturally expresses itself in terms of love. But Christianity also exalts virginity as one of the greatest virtues, and virginity is not compatible with human love as it expresses itself in wedlock. This is rather awkward for Christians, the more so in that their mystics *experienced* the love ot God as a spiritual marriage, the consummation of which bore an uncomfortable resemblance to the sexual act in the physical world. Origen, who had castrated himself for the love of God, was painfully aware of this, but it did not prevent him from writing a commentary on the frankly erotic Song of Solomon. He knew very well that the spiritual espousals of which he wrote would be misinterpreted by the profane, and so he wrote:

> If any man who lives after the flesh should approach this subject, to such a one the reading of this scripture will be the occasion of no small hazard and danger. For he, not knowing how to hear love's language in purity and with chaste ears, will twist the whole manner of his hearing of it away from the inner spiritual man and on to the outward and carnal; and he will be turned away from the spirit to the flesh, and will foster carnal desires in himself, and it will seem to be the divine scriptures that are thus urging and egging him on to fleshly lust.

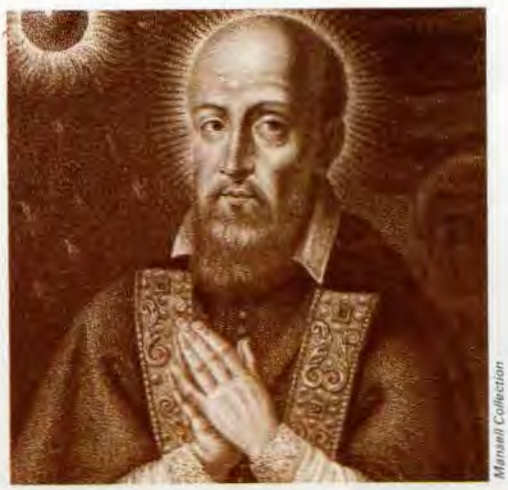
Love and marriage, of course, are only possible between two *persons*. The God of the pantheists – of cosmic consciousness – must therefore also have his personal side. In the *Upanishads* this is only occasionally recognized. In one of the later *Upanishads*, however, the existence of God as creator and sustainer not only of the physical universe but also of the timeless eternity called Brahman, is admitted.

> In the imperishable, infinite city of Brahman
> Two things there are –
> Wisdom and unwisdom, hidden, established there:
> Perishable is unwisdom, but wisdom is immortal:
> Who over wisdom and unwisdom rules, he is another.

This distinction between the personal God and the impersonal Brahman and the relationship between the two becomes even more apparent in the *Bhagavad Gita* (see BHAGAVAD GITA). The *Gita* is a dialogue between Krishna, who is God incarnate, and his friend Arjuna. It is, then, in the eyes of the Hindus the spoken word of God. The *Gita* starts where the *Upanishads* leave off, but it also takes for granted the Buddhist Nirvana, which it sometimes also calls Brahma-nirvana. Salvation or rather 'liberation', that is, the escape from matter, time and space, into a condition of timeless eternity, is taken for granted. This the *Gita* calls either 'to become Brahman' or 'to enter Nirvana'; but this is no longer the end of the affair, for Krishna, the personal God, is beyond and above both Brahman and Nirvana. Nirvana 'subsists' in him, and he is 'the base supporting Brahman – immortal Brahman which knows no change – supporting the eternal law of righteous and absolute beatitude.' This, then, is a personal God with whom it is possible to have personal relations and whom it is possible to love.

And then comes the final revelation which is, in essence, the Christian revelation too. Not only is man required to love God but God on his side loves man in return: 'And now again listen to this my highest word, the most mysterious of all: I love you well. Therefore will I tell you your salvation. Bear Me in mind, love Me and worship Me, sacrifice, prostrate yourself to Me . . . Give up all things of law, turn to Me, your only refuge, for I will deliver you from all evils; have no care.'

The development of mysticism is illustrated in Hinduism as it is nowhere else,



Mansell Collection

The 17th century French saint Francis of Sales described in his treatise *On the Love of God* the effects of divine love on the hearts of men: in the Christian religion mystical experience is equated with the immediate experience of the love of God

largely because Hinduism has no fixed dogmas. First comes cosmic consciousness, then the experience of the 'isolation' of man's innermost spiritual essence which is beyond time and space, and finally the union of this essence with God who is the essence of all essences.

Much the same happens in Buddhism, for with the development of the Mahayana, the 'Great Vehicle', some 500 years after the Buddha's death, the ideal of Nirvana is denounced as being only a stage on the road to absolute beatitude. The goal is now to realize the 'Buddha-nature' in oneself, and the Buddha-nature is not just perfect peace and infinite wisdom but also boundless compassion, which makes the salvation of all mankind the primary concern of all who have experienced the bliss of enlightenment.

Two Kinds of Unity

In all traditions, however, even in those which start from the love of God, there is a tendency to mistake the stage of 'isolation' for identity with the Absolute and therefore beyond all relationships of any kind including the consummation of the spiritual marriage. This tendency becomes the official teaching of the non-dualist Vedanta in India (see VEDANTA). But as the *Gita* makes plain, what is taken to be identity with the godhead turns out to be only the experience of the oneness and eternity of one's own soul. The modern Jewish mystic Martin Buber discerned this and warned against it in words that reflect the teaching of the Gita: 'Now from my own unforgettable experience, I know well that there is a state in which the bonds of the personal nature of life seem to have fallen away from us and we experience an undivided unity. But I do not know – what the soul willingly imagines and indeed is bound to imagine (mine too once did it) – that in this I had attained to a union with the primal being or the godhead. That is an exaggeration no longer permitted to the responsible understanding. Responsibly . . . I can elicit from these experiences only that in them I reached an undifferentiable unity of myself without form or content. I may call this an original pre-biographical unity and suppose that it is hidden unchanged beneath all biographical change, all development and complication of soul. Nevertheless, in the honest and sober account of the responsible understanding, this unity is nothing but the unity of this soul of mine, whose "ground" I have reached, so much so that . . . my spirit has no choice but to understand it as the groundless. But this basic unity of my own soul is certainly beyond the reach of all the multiplicity it has hitherto received from life, though not in the least beyond individuation, or the multiplicity of all the souls in the world of which it is one – existing but once, single, unique, irreducible, this creaturely one: one of the human souls and not the "soul of the All"; a defined and particular being and not "Being"; the creaturely basic unity of a creature.'

There is, then, a mysticism of the soul as it is in itself and a mysticism of the love of that soul for God. In the Christian tradition the two are rarely distinguished, for love is God, and God is timeless eternity. The exceptions are, among others, Ruysbroeck and Richard of St Victor. The case of Richard is particularly interesting, for he reads almost like a Christian *Bhagavad Gita*.

His predecessor, Hugh of St Victor, too was perhaps the most 'Buddhist' of the Christian mystics. Little concerned with love, he had a positive terror of time and regarded absolute changelessness as the ultimate goal of the mystic. 'The more a man gathers himself together in spirit, the more . . . is he raised in thought and desire; until, at last, when he comes to that supreme changelessness, he is altogether unchangeable.' This is to 'become Brahman' and to enter Nirvana. Richard, however, like the *Gita* goes further than this. This changelessness he calls self-knowledge, as does the *Gita*. Self-knowledge, however, is only the first step on the way to the knowledge of God. And so he says:

> The soul which is attempting to rise to the height of knowledge must make self-knowledge his first and chief concern. The high peak of knowledge is perfect self-knowledge. The full understanding of a rational spirit is as it were a high and great mountain. This mountain rises far above the top of all earthly learning and looks down from on high upon all philosophy and all the learning of the world . . . By as much as you make daily progress in self-knowledge, by so much you will be reaching out to higher things, for he who attains perfect self-knowledge has reached the top of the mountain.

What Christian mystics call the apex of the soul is the top of the mountain; and standing here the soul looks down and contemplates all the transitoriness of the world, realizing its own changelessness. Men, however, are not angels: they do not have wings. Hence it is impossible for the soul to rise higher than the top of the mountain. If it is to go further, then it must receive wings, and this can only come about by the grace of God. And so Richard goes on to say:

> Let a man rise up by himself above himself, and from self-knowledge to the knowledge of God. Let a man first learn from the image of God, let him learn from the likeness of God what he ought to think about God . . . A mind which does not raise itself to consideration of its own nature, how can it fly away on the wings of contemplation to that which is above itself? . . . If the mind has not yet been able to gather itself into a unity, and does not yet know how to enter into itself, when will it be able to ascend by contemplation to those things which are above itself?

It must, however, beware of resting content on the mountain-peak under the delusion that this is the journey's end, for this may lead to complacency and spiritual pride, as the Mahayana Buddhists had also seen. On this too the 14th century Flemish mystic, Ruysbroeck, is most emphatic:

> All those men are deceived whose intention it is to sink themselves in natural rest, and who do not seek God with desire nor find him in delectable love. For the rest which they possess consists in an emptying of themselves, to which they are inclined by nature and by habit . . . In this emptiness rest is sufficient and great, and it is in itself no sin, if they know how to make themselves empty. But when they wish to exercise and possess this rest without the works of virtue, then they fall into spiritual pride, and into a self-complacency from which they seldom recover. And at such times they believe themselves to have and to be that which they never achieve.

This was directed against the Brethren of the Free Spirit, who were almost certainly Nature-mystics and held, like some early passages in the *Upanishads*, that their spiritual experiences exempted them from both the religious and the moral code. This antinomianism we meet with in all the mystical traditions, and it is also true that mystics are on the whole not conspicuous

Fondazione Giorgio Cini Centro di Culture e Civiltà

Krishna, who is God incarnate as the charioteer of Arjuna, delivers the message of the *Bhagavad Gita*. This work, one of the later developments of Hindu mysticism, presents a personal God with whom it is possible to have personal relations: 'And now again listen to this my highest word, the most mysterious of all: I love you well'

for love of their neighbour. There are exceptions, of course, and Richard of St Victor was one of these. For him there are four stages in the mystical ascent – knowledge of self as changeless (and this would include cosmic consciousness as well as spiritual 'isolation'), ascent to God, absorption in God, and finally going forth from God – the infinite compassion of the Mahayana Buddhists. This is how he sums up the mystical quest: 'In the first degree God enters into the soul and she turns inward into herself. In the second she ascends above herself and is lifted up to God. In the third the soul, lifted up to God passes altogether into him. In the fourth the soul goes forth on God's behalf and descends below herself. In the first she enters into herself, in the second she goes forth from herself. In the first she reaches her own life, in the third she reaches God. In the first she goes forth on her own behalf, in the fourth she goes forth because of her neighbour. In the first she enters in by meditation, in the second she ascends by contemplation, in the third she is led into jubilation, in the fourth she goes out by compassion.'

NAGAS

THE MOUNTAINOUS border country between India and Burma is inhabited by a group of tribes known as the Nagas. They are of Mongoloid race and speak a variety of Tibeto-Burman languages. The total number of Nagas within the frontiers of India is about half a million, and although divided into a number of tribes, with different languages and customs, they are clearly distinguished from all surrounding populations.

Until the middle of the 19th century the Nagas lived in almost complete isolation from the inhabitants of the plains and the higher civilizations developed in India and Burma. Neither Hinduism nor Buddhism has influenced the Nagas and their religious and social practices, but the Nagas have close cultural as well as racial affinities with the hill tribes of the eastern Himalayas and in some respects resemble even such distant ethnic groups as the hill tribes of the Philippines and Borneo. All these hill people are characterized by an agricultural economy which, despite considerable efficiency in the cultivation of rice, has never made use of draught animals.

All Nagas live in substantial villages usually situated on hilltops or ridges; in the days of headhunting these villages were fortified with palisades and ditches. Houses are large and well built, often decorated with elaborate carvings indicating the social achievements of the owner. Most Naga tribes also build great community houses which serve as clubs, ritual centres and dormitories for bachelors. War used to be accepted as an essential element of life, and there prevailed the belief that the occasional capture of a human head was necessary for maintaining the fertility of the crops and the well-being of the community. As a result, to the Naga mankind appears divided between the small circle of his fellow villagers and clansmen, on whose loyalty he depends, and the entire outside world, which consists of village communities potentially and often actively hostile.

Naga villages are traditionally autonomous political units ruled either by a chief or, more frequently, by a village council. This council adjudicates disputes and punishes offences and breaches of taboos. The village council also decides matters of ritual and ceremony and enforces the observance of the many taboos which Nagas consider necessary precautions against magical dangers. If there has been an earthquake or an eclipse of the moon, for instance, the whole community must abstain for one or even two days from all activities outside the confines of the village and above all from work on the fields.

While the social system of most Naga tribes is egalitarian and democratic, others divide society into aristocratic clans and commoners. The aristocratic clans furnish the chiefs, who have many privileges and wield the arbitrary power of true autocrats.

C. von Fürer-Haimendorf

To ensure the continued prosperity of the tribe, the Nagas captured human heads; the skulls were kept and periodically fed

High rank involves obligations and to maintain their eminent position Naga chiefs have to preserve the purity of their noble blood by marrying within their own class. Chiefs of pure aristocratic blood are credited with radiating dangerous magical powers. It is believed that contact with such chiefs can cause illness, and commoners are afraid to look into a chief's eyes or to oppose him in any way (see MANA).

Among those Naga societies which lack hereditary chiefs, social eminence may be achieved by giving so-called feasts of merit: the social status of a man is measured by the number and lavishness of the feasts he has given. There is a recognized sequence of feasts of merit, and a wealthy man in quest of high social status must begin with the simplest feast and gradually work his way through one feast after the other, each more elaborate and costly than the one before. A man who has given certain feasts of merit is entitled to decorate his house with carvings symbolizing wealth and fertility. The passion for marking personal achievements with tallies extends even to the grave, and among some Nagas it is customary to place on a man's grave a large stone for every enemy head he has taken and a smaller stone for every woman he has sexually possessed.

Spirit in the Skull

According to Naga ideas man splits at death into several distinct invisible entities. The 'soul', to which a large portion of the individual's personality is attached, sets out on a long journey to the Land of the Dead. The approach is guarded by a spirit who questions the soul before allowing it entrance. There is a belief that everything on this earth has an exact counterpart in the Land of the Dead.

Another part of the personality remains attached to the skull and is capable of benefiting the living in various ways. The skulls of the dead, both those of kinsmen and those of slain enemies, are periodically fed; this reflects a belief in the power of a spiritual element which remains on this earth while the 'soul' settles down to a new life in the next world (see also HEAD).

The religious beliefs of the various Naga tribes are not uniform, but there is throughout a belief in numerous spirits, partly friendly and partly hostile to man, but

controllable by the performance of the appropriate rites. Above the host of earthbound spirits stands the figure of a supreme deity, whose name means literally 'Sky-earth', a term which reflects the idea of a universal deity comprising or dominating both spheres. Some Nagas imagine this supreme god as dwelling in the sky and as having existed before all other beings. They attribute to him the creation of the firmament and believe that he causes the thunder to roll and the lightning to flash. He is imagined in the likeness of a human being of immense size. At most important events in the life of a Naga the sky god is invoked, and in innumerable prayers and incantations he is asked to bestow blessings and success on individuals or on the whole community. The sky god is regarded as the guardian of the moral order. Nagas believe that he can see and hear everything human beings do, and that he is angered by offences against the ethical code. He is thought to punish wrongdoers by an early death or by misfortunes in this life.

Compared to the sky god, the spirits of the earth, the forests and the rivers are not very important in Naga religion, though at times they are placated with offerings of chickens and pigs. Nagas spend a comparatively large part of their time and resources on ritual activities, but do not seem to be open to religious experiences of great emotional impact. Their world view leaves little scope for mysticism, though there are Naga seers and mediums believed to be capable of entering the spirit world while in a state of trance. Some of these seers claim that when their body sleeps, their soul can enter the body of a tiger, and that in the shape of were-tigers they have experiences which they remember in their waking state. According to Naga belief, the bond between such a man and his tiger familiar is very close, and the death of the tiger is invariably followed by that of his human double. In recent decades large numbers of Nagas have been converted to Christianity, and the practice of the old tribal religion is on the wane.

C. VON FURER-HAIMENDORF

The name of the God of the Old Testament was so holy that it was only rarely pronounced, and the goddess Isis took the power of the sun god by discovering his real name. Survivals of the old belief in the magic of names still affect our behaviour today.

NAMES

WHEN WE HESITATE to use a word like 'cancer', or pronounce it only in a hushed voice with a wary look round first, or when we say that someone who has died has 'departed' or 'passed away', we demonstrate the continuing hold on mankind of the magical feeling that to speak the name of something dreaded risks summoning it. The magic of names is part of the magic of language in general, the belief that words encapsulate reality. Presumably, as language developed long ago, the use of words and the naming of things seemed to bring reality itself more closely within a man's grasp. From the magical point of view, to call a creature a 'frog' is not to attach a mere label to it but to state the essential nature of the animal. The name contains the essence of its being in distinguishing it from other animals, for if it had some other name, 'toad' perhaps, it would not be what it is but something different.

If the name of a thing *is* the thing, then the name can be used to capture it, to control it, and even to create it. A wax image made to harm an enemy may be formally given the victim's name, to convey into it his full identity. Writing the name of an enemy on a piece of lead and burying it magically 'buries' him (see CURSE).
